and Sphacelus, requires a Remedy which is hot in the higheſt Degree; ſuch a one is red-hot Iron, but not a potential Cautery, eſpecially Arſenic; for, tho' it be hot, it leaves a corrupt Humidity, as *Avicenna* calls it. (5.) Since the Part, which labours under a Gangrene, is extremely weaken'd, and from the Redundance of excrementitious Humours relax'd, it requires a drying and ſtrengthening Remedy: Now an actual Cautery both dries and corroborates, but a potential Cautery moiſtens and debilitates, both on account of the Malignity it communicates to the affected Part, and of its Operation, which is both ſlow and painful; ſo that the Pain procures a greater Conflux of Humours, which more and more relax and debilitate the Part. But the Pain of the actual Cautery is only momentary; for, as ſoon as the burning Iron is removed, it ceaſes, eſpecially if an Anodyne be applied. Thus far *Hildanus:* And the very learned *Fabricius ab Aquapendente*, after the Example of *Hippocrates*, prefers actual Cauſtics for cauteriſing the Joints, becauſe the others cauſe no Corrugation or Criſpation of the Skin, nor ſtrengthen the Joint, as does Fire. *Proſper Alpinus*, *Med. Ægypt. Lib.* 3. ſays, that potential Cauſtics can by no means ſtrengthen the Parts, becauſe of their poiſonous Nature, which deſtroys the natural Heat. Patients of a tender Conſtitution ſeldom admit actual Fire; the Application of which, however, is not more dreadful and cruel, than powerful and effectual; for the very Sharpneſs of the Pain which it cauſes, cannot but produce ſome ſurpriſing Revulſion. But potential Cauſtics exert their Influence in a milder, but ſlower manner, and with ſome ſort of Delay. The Strength and Force, however, of potential Cauſtics is very various, according to the different Subſtances of which they are made, and the different Manners in which they are prepared; or, according as a greater or ſmaller Quantity is applied to the Part. "Many, ſays the "ingenious Dr. *Freind*, in his *Hiſtory of Phyſic*, *Vol.* 2. prefer "the actual to the potential Cautery, becauſe the Eſchar it "produces, ſeparates ſooner than that produced by the other; "but, becauſe the Application of the former ſeems cruel and "barbarous, we uſe the latter more frequently, that we may "indulge People in their Delicacy, and Averſion to Pain: In "conſequence of which very Circumſtance, an Ulcer may "more commodiouſly be made deep at Pleaſure. But *Glandorp*, who has very accurately handled this Subject, ſo highly extols the actual Cautery, that he ſays, he would rather "ſubmit to have ſix Fontanels made by it, than one by the "potential Cautery, which, in a Courſe of fourteen Years "Practice, he only uſed twice." *Johannes Heurnius*, in *Tom.* 1. pronounces a red-hot Iron a highly ſafe Cautery. Cuſtom, the mercileſs Tyrant of the Skilful in every Profeſſion, often obliges the Surgeon to uſe the potential, rather than the actual Cautery; and then he thinks it left to his Judgment to chuſe, from the *Materia Medica*, ſuch as is moſt likely to anſwer his Intention, produce the deſign'd Effect ſooneſt, and leave the leaſt unſeemly Cicatrix. But Experience is the moſt faithful Director of his Choice in this Particular. That, beſides the *Arabians*, the barbarous Nations, and antient Phyſicians, made more Uſe of the actual than of the potential Cautery, we have already ſeen. But ſince the Subſtances, by means of which live Fire may be applied to any Part of the Body, are various, it now remains, that we ſay ſomething concerning the Differences between actual Cauteries. *Hippocrates* cauteriſed ſometimes with crude Flax, ſometimes with a red-hot Iron, ſometimes with a Piece of Box-wood, and at other times with the *Fungus*, according as he intended to cauteriſe more or leſs deeply. In cauteriſing the bony Parts of the Body, he uſed the Fungus; but, to the fleſhy and more muſcular Parts, he applied the Iron, as has already been ſaid. We have before obſerved, from *Proſper Alpinus*, that the *Egyptians* have a Method of Cauteriſing with Doſſils of Flax and Cotton; and the ſame Author informs us, that many barbarous Nations cauteriſed only with Doſſils of Flax boil'd, wrapt up together, and kindled. We muſt not here forget to enumerate the Reaſons and Arguments which this Author uſes, in order to perſuade the Rich, that the *Egyptian* Method of Cauteriſing is preferable to that of the *Europeans*, perform'd by means of Irons: "For, "ſays he, tho', in the Opinion of ſome, their Practice may "poſſibly ſeem trifling, when, in order to cauteriſe, they uſe "Doſſils of Flax and Cotton, wrapt up in a pyramidal Form, "kindling the ſmaller Extremity, and laying the Baſe on the "Part to be cauteriſed; yet, I think, they have very good "Reaſon for this Piece of Practice; for they do not uſe Iron, "or any other Metal, ignited, in order to cauteriſe, but the "Subſtance, already mention'd, kindled; becauſe the Fire, "when lodged in a more porous Subſtance, acts upon, changes, "and reſolves the Parts more gently, and produces a ſmaller "Pain in the Integuments, whilſt they are cauteriſing: Hence "the Method of Cauteriſing is not ſo terrible among them as "among us; for, by any ignited Metal, the moſt intolerable "and intenſe Pain is excited, which miſerably racks the Pa"tients; for which Reaſon our Countrymen deſervedly abhor "this cruel Kind of Remedy. I, therefore, think their Me"thod preferable to that in which the hot Iron is uſed, ſince, "by the former, the Reſolution of the Parts is more mildly "made, and a ſmaller Inflammation brought on; eſpecially in "Parts where Nerves and Tendons occur, which are in Dan"ger of being hurt by a too ſtrong and intenſe Fire. But "there is ſtill another Advantage attends this Method of Cau"teriſing, which is, that, by laying the Baſe on the Part to "be cauteriſed, and kindling the Apex, which is at a conſi"derable Diſtance from it, they ſeem, at firſt, as if they did "not intend to cauteriſe the Part. But the Reverſe of this "happens in cauteriſing with the Iron, and lays that Method "under a very great Diſadvantage, ſince Nature is often either "unable to bear ſudden Changes, or is conſiderably hurt by "them. But by their Method, the Part is gradually warm'd, "and ſo diſpoſed for the Action of the Fire, that the Pain is "leſs, when it comes to act immediately upon it. Two Ad"vantages, then, attend this Method of Cauteriſing uſed by "the *Egyptians*; the firſt is, that the Part itſelf is more mild"ly burnt; and the ſecond is, that it is previouſly and gra"dually diſpoſed for the Action of the Fire: By this means "the *Egyptians* ſubmit to the Uſe of the actual Cautery, with "far leſs Dread and Horror than Patients in *Europe* do." *Martianus*, in his Annotations on *Hippocrates*, informs us, "That he has found, from Experience, that all theſe Me"thods of Cauteriſing are good; and that they only differ in "this, that the more denſe and compact the Subſtance, which "receives the Fire, is, the more deeply it burns and caute"riſes; for which Reaſon this Subſtance ought to be varied, "according to the Nature of the Place affected, and the Sex, "Age, and Conſtitution of the Patient." As *Hippocrates* himſelf did not acquaint us with his Method of Cauteriſing with crude Flax, and the Fungus, *Martianus* gives us the following Directions, with reſpect to this Particular. "Crude Flax, "ſays he, is to be tightly wrapt up in the Form of a Pyra"mid, the Largeneſs of whoſe Baſe is to be indicated by the "Part to be cauteriſed; only we muſt not forget, that the "Burning will be ſomewhat broader than the Baſe of the Py"ramid. This, when kindled at the Top, is to have its Baſe "applied to the Part, and to remain there till the whole Py"ramid is conſumed; for the Fire, gradually approaching "the Skin, cauteriſes the Part; and what ſeems ſurpriſing is, "that it produces this Effect almoſt inſenſibly, and without "Pain. When the Fire was extinguiſh'd, *Hippocrates* ap"plied boil'd Leeks to the Part cauteriſed, till the Eſchar "fell off. The Moderns apply Butter and Cabbage, by "which means the Ulcer may be kept open at Pleaſure. "Cauteries of this Kind were ſometimes prepared by *Hip*"*pocrates* of that Species of Fungus, which is by ſome uſed "as Tinder." *Fabricius ab Aquapendente*, in his *Chirurg.* thinks, "That *Hippocrates*, by crude Flax, means twiſted "Flax, not boil'd, or a Rope made of crude Flax, twiſted, "ſuch as the Matches for diſcharging Cannon, which, when "kindled, keep the Fire; only this laſt Sort of Match is "boil'd." The learned *Le Clerc*, in his *Hiſtoire de la Medicine*, thinks, that, by crude Flax, *Hippocrates* meant new Linen Cloth, which had not been waſh'd in any Lixivium, a Method ſtill practiſed among the *Egyptians*. The ſame Author alſo obſerves, that, in the *Egyptians* Method of making Cauteries of flaxen Bags, fill'd with Cotton, we ought not only to conſider the Action of the Fire burning the Part to which it is applied; but alſo of the acrid cauſtic Oil dropping upon it, from the flaxen Bag, whilſt it is burning. The Cotton, according to him, ſerves only to kindle and keep alive the Cloth. This he remarks in Oppoſition to *Sydenham*, who informs us, that the Method of curing the Gout in the *Eaſt Indies*, by kindling the Moxa on the Part affected, agrees with that perform'd with crude Flax, in the manner of *Hippocrates*, imagining, that there is no Difference between the Flame produced by Flax, and that produced by the Moxa. I ſhall put an End to this Article with the celebrated Words of *Hippocrates*, in *Aph.* 85. *Sect.* 7. "What "Medicines do not heal, the Knife heals; what the Knife "does not heal, that the actual Cautery heals; and what the "actual Cautery does not heal, is juſtly eſteem'd incura"ble."

CAUSUS, καῦσος, from καίω, to burn. A burning Fever, one of the continual Kinds, and attended with a burning Heat, and moſt intenſe Thirſt. Its original Cauſe and Symptoms are deſcribed by *Hippocrates*, *Lib. de Rat. Vict. in Morb. Acut.* in the following manner: Καῦσος δὲ γίνεται, &c. "A Cauſus "ariſes in the Summer, when the Veins, being parched and "dry'd by the Fervor of the Seaſon, attract to themſelves an "acrid and bilious Ichor. It generally happens after a long "Journey, and long Thirſt, when the dry'd Veins attract to "themſelves hot and acrimonious Rheums. Under this Diſ"order the Tongue is rough, dry, and very black, the Parts "about the Belly are affected with a biting Pain, the Excre"ments are very liquid, and of a pale Colour; there is a vehe"ment Thirſt, want of Sleep, and ſometimes a Delirium."

To

To theſe Symptoms he adds, *Lib.* περὶ παθῶν, "a Colour "ſomewhat bilious, and bilious Spit, with a Refrigeration of "the external Parts, and a vehement Heat of the internal." And a little after he adds, "This Diſeaſe ariſes from a Com- "motion of Bile ſettled in the Body." He gives much the ſame Deſcription in his ſecond and third Books of Diſeaſes, and in his Book of *critical Days*; from all which it appears, that a ſort of igneous and burning Heat, with a vehement and unquenchable Thirſt, are the diſtinguiſhing Properties of this Fever, as *Galen* alſo writes in many Places, particularly in his ſecond and third Comments on the third Book of the *Epidemics*, and in his fourth Comment on the Book of *Regimen in acute Diſeaſes*. The Author of the *Definitiones medicæ*, much to the ſame Purpoſe, ſays, "A Cauſus is attended with a great "Inflammation, and a Reſtleſſneſs of the Body, together with "a Dryneſs and Blackneſs of the Tongue, and a Deſire of "cold Water."

There are two Species of a *Cauſus* mentioned by *Hippocrates*, one genuine, the other ſpurious, as *Galen* hints, *Com.* 4. *R. V. I. A.* "I find," ſays he, "that when the Patient labours "under a burning Heat, and unquenchable Thirſt, Phyſi- "cians call it a burning *Cauſus*. And, if this be the Caſe, "then are we to call the Diſeaſe, when the Heat is not burn- "ing, and the Thirſt but moderate, ſimply *Cauſus*, tho' it "be not, in a perfect and exquiſite Degree, a *Cauſus*; but, "being only half that Diſtemper, may, for the ſake of Com- "pendiouſneſs in Learning, be called a *ſpurious Cauſus*. And "as we uſually give ſuch Appellations to tertian Fevers, ſo we "may accuſtom ourſelves to ſpeak of two Kinds of the *Cauſus* "*Fever*, as there are of *tertian Fevers*, one perfect and genu- "ine, the other ſpurious, which is attended with ſome of the "genuine Symptoms, but not all." *Hippocrates*, *Lib.* 1. *Epid.* expreſly reckons a *Cauſus* among the Kinds of continual Fevers.

Frederic Hoffman, *in his* Medicina Rat. Syſt. *gives the following Account of this Species of Fever.*

Among the Moderns, all thoſe Fevers, whether of the acute or continued Kind, which begin with a ſhivering Coldneſs, and are afterwards accompanied with a violent Heat, Thirſt, Uneaſineſs, and Quickneſs of the Pulſe, are call'd burning Fevers. *Hippocrates* alſo, the great Founder of the Healing Art, deduces the Origin of all Fevers, from the Bile more or leſs vitiated or exalted. Nor does he make any mention of ſanguine Fevers, or Synochas, but thro' the Whole of his Works calls almoſt all Fevers, whether continued or inflammatory, whether ſimple or complex, whether putrid or malignant, as alſo Synochas, by the common Name of burning Fevers. But that there is a very conſiderable Difference between theſe Fevers, is ſufficiently obvious from an accurate Attention to the Approach of their ſeveral Symptoms, their various Terminations, and the different Methods of Cure requiſite in each.

A burning Fever, therefore, by the *Greeks* call'd καῦσος, is, properly and ſtrictly ſpeaking, that Species of Fever which is accompanied with a burning and intenſe Heat of the whole Body, and an inſatiable Thirſt, whilſt at the ſame time the Patient's Tongue is parched, furrow'd, and black. All the Antients ſpecify theſe two Accidents as the moſt diſtinct and infallible pathognomic Signs of a Cauſus; for which very Rea- ſon they have alſo call'd it a hot and a burning Fever. Thus *Hippocrates*, in his Book *De Affectionibus*, gives us the follow- ing Account of this Diſorder: "The Heat," ſays he, "is "very intenſe, the Thirſt inſatiable, the Tongue rough and "black, the Colour ſomewhat bilious, and the Spit bilious." But *Aretæus*, a faithful and exact Relater of the Hiſtories of Diſeaſes, in the fourth Chapter of his ſecond Book *Acut.* gives us a fuller Deſcription of this Diſorder in the following Words: "The Heat, in all the Parts of the Body, is highly intenſe and "penetrating; but more particularly the Breath appears, as "it were, to be heated by a Fire. The Air is eagerly in- "ſpired by the Patient, he is exceſſively deſirous of Cold, his "Tongue is parched, his Lips and Skin rough and dry, his "Extremities cold, and his Urine highly bilious. He is alſo "incapable of Sleep, and his Pulſe is frequent, ſmall and "weak. His Eyes are clear, ſhining, and reddiſh, and his "Face is of a preternatural Colour. As the Diſeaſe increaſes, "all theſe Symptoms become greater and more violent. The "Pulſe becomes very ſmall and frequent, the Heat intolerably "intenſe and burning. The Patient is ſeized with a Deli- "rium, and knows nobody. His Thirſt is increaſed, and he "is fond of handling all cold Objects, ſuch as the Walls, the "Bed-clothes, the Floor, and Water. The Backs of his "Hands are cold, but his Palms very hot, and his Nails livid. "His Reſpiration alſo is frequent, and a dewy Sweat breaks "forth about his Forehead and Neck." But as the accurate *Lommius*, in his *Obſervationes Medicinales*, is more full and cir- cumſtantiate in enumerating the Symptoms and Prognoſtics of this Diſorder, we ſhall here tranſlate what he ſays on this Sub- ject. A Cauſus, ſays he, is known by a burning Heat of the Body, which is more violent internally than externally. The Patient is ſometimes afflicted with an obſtinate Watching, and ſometimes ſeiz'd with a profound Sleep. His Tongue is dry, foul, rough, blackiſh, and a bitter Taſte is perceiv'd. He breathes with the greateſt Difficulty; his Stomach begins to be rack'd with a pungent Pain; his Appetite is loſt; his Thirſt becomes violent; and the Heat about his Præcordia intenſe. Some Patients have their Bodies ſoluble, and others are coſtive. The Perſons labouring under this Diſorder are reſtleſs, bear it with Impatience, and are frequently ſeiz'd with Deli- riums. This Species of Fever, as it is highly violent, ſo it ge- nerally terminates ſoon; for when, from the Beginning, it is accompanied with good Signs, it generally terminates on the fourth Day; nor does it continue longer with any than the ſeventh. It terminates either with a Vomiting, a Flux, an univerſal Diaphoreſis, or an Hæmorrhage of the Noſe. As this Diſorder is ſeldom incident to old Men, ſo it proves highly pre- judicial to them, when they are ſeiz'd with it. Young Perſons are more frequently ſubject to it, and generally eſcape better. A Cauſus or burning Fever is frequently chang'd into an Inflam- mation of the Lungs; and when this happens, the Death of the Patient is not far off. Both in this Diſorder, and in other con- tinued Fevers, great Danger is indicated when a Jaundice appears before the ſeventh Day, or when the Patient ſhivers before the Concoction of the Matter. But the Danger is ſtill greater, when the Strength is much impair'd; when, after the Shivering, the Patient does not become warm; when he is afflicted with a continual Watching, or a conſtant Drow- ſineſs; when he becomes delirious; when his Voice is inter- cepted; when he becomes deaf, or when he is ſeiz'd with a great Pain of the Neck. Theſe Symptoms are more particularly dangerous in Patients who are growing delirious.

The Danger is alſo great when the Patient, endeavouring to take any thing in his Hands, trembles; when his Thirſt is in- ſatiable, when his Body is highly ſqualid, or when his Tongue being blackiſh, and his whole Mouth dry, he has no Thirſt; when his Mouth is preternaturally ill-ſmell'd; when a Hiccough happens, eſpecially after Purging, or after an immoderate Effu- ſion of Blood. In Children the Danger is indicated to be great, when no Excrements are diſcharged, when the Patient ſleeps none, but often changes Colour, and weeps without Interrup- tion; for Convulſions are ſubſequent to theſe Symptoms. When, in Conjunction with an intenſe Pain of the Head, the Præcordia are drawn inwards, and an Effuſion of Blood from the Noſe does not happen; or when this Diſorder is either not accompanied with, or, if accompanied with, not removed by bilious Stools, Gripes, nor a Pain in the Hips or Knees; for, in either Caſe, the Patient is very ſubject to a Delirium; when acute Pains in the Viſcera are attended with Convulſions; when the Præcordia are pain'd, or the Patient is in a profound Sleep; when a burning Heat, or a gnawing Pain, in the Sto- mach are attended with bilious Stools; where a total Retention of the Excrements is accompanied with a continual Pain of the Head; all theſe are dangerous Symptoms. When the Urine alſo appears like Water, as it generally does under a Delirium; if ſuch Urine continues to be diſcharged for a conſiderable time together, it portends Death.

The Danger is equally great, when the Urine is red, thick, turbid, and fetid; when it is evacuated at ſhort Intervals, and in ſmall Quantities; when it is diſcharged with Difficulty; when it appears concocted unſeaſonably, or is evacuated contra- ry to the Patient's Inclination; when the Patient does not per- ceive the Violence of the Diſorder, in conſequence of his being delirious: When, upon the firſt Approach of the Fever, a pro- fuſe Sweat breaks out; when the Patient begins to grow deli- rious; or when any Part of the Body becomes paralytic; and, laſtly, when the Paroxyſm is violently increaſed on the third Day.

We now come to ſpecify thoſe Prognoſtics, which, in a Cau- ſus, indicate certain and unavoidable Death, which we know will ſoon be the Fate of the Patient, if the Diſeaſe is violent, and the Strength greatly impair'd; and more eſpecially if, at this time, a Delirium or a Rigor happen; if the delirious Pa- tient ſpeaks none at all, provided he is on no other account de- prived of the Uſe of his Speech; if, being very weak, his Eyebrows, his Eyes, or his Noſtrils, are diſtorted; if, at this Juncture, the Patient neither ſees nor hears; or if, when his Speech is loſt, he lies with his Eyes winking, without a Hæ- morrhage from the Noſe, or a Vomiting happening, in order to carry off the Diſorder. The Danger is alſo the greater, if the Patient breathes with the utmoſt Difficulty. The Fate of the Patient is equally deplorable, if the Tears trickle from his Eyes; if they are ſunk, prominent, or darken'd; if they roll about in an indeterminate manner; if they are dull or diſtorted; if their Whites become preternaturally large, and their Blacks ſmall; or if their Blacks are hid under the ſuperior Eyelids, and the Whites appear red, and pale or black Veins are diſco- ver'd in them; when a Subſtance, like a Spider's Web, covers the entire Eyes; or when the natural Mucus remains in the Extre- mities of their Angles; if, during Sleep, the Eyelids are not en- tirely cloſed; or when they are exceſſively pale, unleſs the Paleneſs

Paleneſs is produced by a Flux; or when one of the Eyes is leſs than the other. To theſe we may add, that the Danger is unavoidable when one of the Ears is ſeiz'd with an acute Pain, which Symptom generally carries the Patient off within ſeven Days, eſpecially if the Patient is young. But old Patients, becauſe their Pain and Fever are not ſo intenſe, are generally thought to be in a ſafer State.

If, in conſequence of the Fever, there is a Grinding of the Teeth; if they appear livid, black, and extremely dry; and if at the ſame time, in the Beginning of the Diſeaſe, the Tongue is firſt dry, then rough, and afterwards black and foul; if the Patient lies with his Mouth gaping, and ſleeps continually; or if he ſeems as if he would be ſuddenly ſuffocated; if he can neither drink nor ſwallow his Saliva, tho' at the ſame time there is no Tubercle in his Fauces; if he turns his Neck with great Difficulty, or if it is ſo diſtorted, as to render his Deglutition uneaſy; if his Breath is cold, and his Pulſe obſcure, thick, and interrupted; if his Thirſt, which was before great, is remov'd, whilſt, at the ſame time, his Fever is equally violent, and his Tongue equally dry and black; if a Vomiting of Blood happens, or a Vomiting of various fetid Subſtances of different Colours; if his Fingers pick the Flocks of the Bed-clothes, or pull involuntarily the Borders thereof, or catch at ſome Object on the adjacent Walls; if the Extremities of his Fingers and his Nails are livid or blackiſh, tho' their growing blackiſh is no deadly Sign, provided the Patient's Strength is able eaſily to bear the Diſeaſe, and if other apparent Signs of Recovery enſue, for then the Patient's Health is reſtor'd, but the black and corrupted Parts fall off. It is alſo a fatal Sign when the Abdomen becomes tumid, eſpecially after the Exhibition of a Purgative; or when the Belly, being diſtended with Flatulencies, cannot diſcharge them; when, in the Beginning of the Fever, yellow Bile is diſcharg'd; when the Excrements are liquid, and at the ſame time black or pale, or pinguious or fetid; when the Patient is entirely coſtive, and ſeiz'd with a ſudden Palpitation of the Heart, and a Hiccup; when the Urine begins to be intercepted, or to be diſcharg'd black, thick, or fetid; or when the Urine, which was before good, ſuddenly exhibits bad Signs; or when, thro' the whole Courſe of the Diſeaſe, the Urine remains like that of Perſons in Health; when Blood is diſcharg'd inſtead of Urine; or when the Bladder is pain'd or hard. It is an equally fatal Sign, when, in the Beginning of the Diſeaſe, the Extremities become cold, and cannot again be render'd warm; when, at the ſame time, that the Extremities are cold, the internal Parts of the Body are ſcorched with an intenſe Heat, or when the Patient is inſatiably dry; when the febrile Heat ceaſes all on a ſudden, and without a manifeſt Cauſe; when Sweats and Deliquiums happen, at the ſame time that the Strength is much impair'd; when the Patient lies on his Back, contracts his Knees, and ſlips towards the Foot of the Bed; when he uncovers and ſpreads his Arms and Legs, at the ſame time that they are not preternaturally hot; when the Pain lodg'd in the inferior Parts of the Body ſuddenly ceaſes, in conſequence of its being transferr'd to the Viſcera; when any Ulcer, under which the Patient labour'd before the Fever, or an Ulcer ariſing during the Fever, becomes dry and livid; when there is an Eruption of Puſtules all over the Body, if at the ſame time a purulent Abſceſs does not appear; when, upon the Appearance of an Abſceſs near the Ear, it does not come to Maturity, no Hæmorrhage happening from the Noſe, nor thick Urine being diſcharg'd in large Quantities; when a cold Sweat ariſes, and the Patient is ſeverely afflicted on the fourth and ſeventh Days; when, on the eleventh Day, he perceives no Criſis; or when, on the critical Days, he becomes cold without Sweats enſuing; when a Rigor happens, and often returns, and at the ſame time the Diſorder is not alleviated by that means. The Patient never fails to die, when the Temples become ſunk, the Noſtrils ſharp, the Eyes hollow, the Ears cold, languid, and the Extremities hanging a little down; when the Skin about the Forehead is hard and tenſe; when the Countenance of the Patient is pale like a Corpſe, or black, or manifeſtly alter'd by the Diſorder.

But to return to the judicious *Hoffman*, from whom the former Part of this Article is taken: Theſe burning Fevers are widely different from other Fevers of the continued Kind; for in a Synocha, whether ſimple, complex, or cacochymical, the Burning is not ſo intenſe, nor the Thirſt ſo inſatiable, but the Heat is milder, and accompanied with a kind of Moiſture. Synochas are principally incident to plethoric Perſons, thoſe of a lax Habit, and ſuch as live delicately, eſpecially in the Spring, and in temperate Climates. But a Cauſus principally attacks lean Perſons, thoſe of delicate or bilious Conſtitutions, and generally rages in hot dry Weather long continued, eſpecially in hot Climates. Beſides, in a burning Fever, contrary to what happens in other continued Fevers, the Countenance becomes yellow, and the Patient is either ſeiz'd with a Vomiting, or an Inclination to it, and a Loathing of Food. A high-colour'd Urine, deeply ting'd with Bile, is diſcharg'd, and fetid bilious Excrements are evacuated in large Quantities. Burning Fevers, and ſuch as ariſe from an Acrimony, or too large a Quantity of Bile, have this peculiar to themſelves, different from other continued inflammatory, ſanguine, and malignant Fevers, that, on the odd Days, and about the third Day, they are augmented, but are ſomewhat leſs intenſe on the even Days; which is alſo to be obſerv'd in the continued Tertians, thoſe of the choleric Kind, as alſo in thoſe which the Antients call'd Tritæophyæ, which, on the third Day, are exaſperated without any periodical Shivering or cold Fit, like that which happens in the Hemitritæa, or Semitertian. Add to this, that the Fevers, accompanied with a Redundance either of pure or impure Blood, are generally terminated on the fourth Day by a Diaphoreſis, or a large Hæmorrhage, accompanied with a Redneſs of the Face; whereas burning Fevers terminate about the ſeventh Day, after a Shivering, which proves critical, either by a Diaphoreſis, or ſymptomatical by a fatal Inflammation of the Stomach, Duodenum, and Parts to which the biliary Ducts reach. And, laſtly, with reſpect to the Method of Cure, there is a Difference; for the ardent Fevers are greatly mitigated by Draughts of cold Liquor, which does not happen in other continued and inflammatory Fevers; much leſs in thoſe of the malignant and putrid Kind. Veneſection is highly neceſſary in thoſe Fevers which ariſe from Blood ſtagnating in the large Veſſels, as alſo in inflammatory Fevers, eſpecially ſuch as ſeize thoſe Parts and Viſcera which moſt abound with Blood. But in genuine and intenſe burning Fevers, this Evacuation is ſo far from being neceſſary, that it is rather hurtful.

Theſe true and violent burning Fevers formerly were, and ſtill are, moſt frequent in *Aſia*, *Greece*, *Egypt*, and *Italy*: For this Reaſon the great Founders of Medicine, *Hippocrates*, *Galen*, and *Aretæus*, have copiouſly and accurately laid down the Prognoſtics and Method of Cure proper in this Diſorder. But in our temperate Climate they rarely occur; and when they do, they are owing to a too liberal Uſe of ſtrong Wine, hot Summers, an obſtructed Perſpiration, or an intenſe and violent Exerciſe, either of the Body or Mind. In our Climates ſanguineous burning Fevers, or bilious Synochas, and choleric Fevers, are more frequent.

What we commonly call bilious Synochas, are ſuch as attack the Patient without any conſiderable previous Horror and Rigor, but with an intenſe Heat, Thirſt, Watching, Uneaſineſs, and Reſtleſſneſs, in Patients of ſanguineo-choleric Habits, and ſuch as abound with a hot and bilious Blood; and theſe Fevers either terminate in a ſalutary manner, or prove mortal, on the odd or critical Days, after a previous Rigor. They terminate in a ſalutary manner either by a Diaphoreſis, or, for the moſt part, by an Hæmorrhage from the Noſe; for theſe are the Species of burning Fevers, concerning which *Hippocrates*, *Lib.* 1. *Epid. Com.* 2. obſerv'd, that all thoſe recover'd, who had either had an Hæmorrhage from the Noſe, or any other Part; whereas thoſe died who had no ſuch Evacuation. But when theſe Fevers prove fatal, they either terminate in an Inflammation of the more noble Parts, ſuch as the Membranes of the Brain, the Lungs, the Stomach, and Inteſtines; or in a mortal Syncope, in conſequence of the Blood being collected, ſtagnating, and becoming grumous, in the Right Ventricle of the Heart.

Another Species of a complete burning Fever incident to our Countrymen, is what we call the bilious Fever, which ſeizes the Patient with an intenſe Heat, Thirſt, Uneaſineſs, a Vomiting, or continual Inclination to vomit, bilious Stools in large Quantities, a Coldneſs of the Extremities, an internal Heat, and a Cardialgia. But this Species of Fever is juſtly diſtinguiſh'd into that of the more and leſs acute Kind; in the former, the Symptoms are far more violent. The Stools, and Matter diſcharg'd by Vomit, are bilious, and in large Quantities; the Patient is ſeiz'd with a Cardialgia, attended with a Syncope, and generally this Diſorder proves mortal before the ſeventh Day, by a violent Inflammation of the Stomach and Duodenum, the Signs of which are a violent and fix'd burning Heat about the Præcordia, a Coldneſs of the Extremities, Reſtleſſneſs, and Uneaſineſs, a Hiccup, and a copious Eructation of the Bile and Saliva, a yellow Colour of the Countenance, a cadaverous Face, commonly known by the Epithet *Hippocratic*. Some of theſe Fevers are not ſo acute, but longer protracted, and ſometimes remitting, or appearing evidently intermittent; they are every Day, or every third Day, exaſperated with Vomitings, Uneaſineſs, and cold Fits, for which Reaſon they may be juſtly call'd quotidian, or continued Tertian Fevers. Theſe, unleſs ſpeedily remov'd by proper Medicines, readily degenerate into ſlow Fevers, and excite long Diſorders of the Stomach, heavy Pains, Eructations, and Inflations, in conſequence of the deeper or more ſuperficial Corroſion of the Stomach by the pungent bilious Juices.

As to the Cauſes and Generation of theſe Fevers, that Species which is highly burning, and in which the Patient is ſeized with a violent and intenſe Heat, a Dryneſs of the Tongue, and an inſatiable Thirſt, in which the Parts, both internal and external, are parch'd and dry'd, has no other Cauſe, than a quick Commotion and Agitation of the Blood and Humours, in conſequence of the ſmaller Veſſels of the fibrous and vaſcular Compages of the Body being partly obſtructed, and partly

ſpaſmodically

ſpaſmodically conſtricted: By the reciprocal Attrition of the Solids with the Fluids, the inteſtine Motion of the ſulphureous Parts is alſo increas'd, from which ariſes an inflammatory Heat, which diſſipates and waſtes the Fluids, whilſt, at the ſame time, it parches and burns the Solids. But in Perſons of a plethoric Habit, and ſuch as are full of Juices, in conſequence of the Softneſs and Laxity of the Fibres, the Heat is milder and leſs intenſe, the Fever leſs burning, the Dryneſs of the Skin and Fauces not ſo violent, nor the Thirſt ſo inſatiable. In that Species of burning Fever which we call'd bilious, there is a quicker Motion of the Fluids, not only on account of the Redundance of the ſalino-ſulphureous Parts in the Juices, and ſome of the ſmall Veſſels being rendered narrow and obſtructed, but alſo the large Quantity of bilious Juice, ſecreted in the Liver, and carried into the Duodenum and Stomach, by its Acrimony and Pungency, irritates, corrodes, and inflames the nervous Coats: From this ariſe the Symptoms peculiar to this Fever, ſuch as a Heat, Uneaſineſs, a Cardialgia, a Nauſea, a Retching to vomit, together with violent Diſcharges of bilious Matter by the Mouth and Anus.

All Things, therefore, which heat the Blood, and generate ſulphureous Particles in it, or which hinder or retard its free Circulation thro' the ſmaller Veſſels, contribute to the Production of burning Fevers: Hence thoſe are more ſubject to them than others, who are of a bilious and firm Habit, who indulge themſelves in the Uſe of ſpirituous Liquors, who are frequently under the Influence of exorbitant Paſſions, eſpecially that of Anger, or who uſe too violent Exerciſe. Hence alſo the Reaſon is to be deduc'd, why in hot Climates, and the Southern Parts of the World, intenſe burning Fevers happen; as alſo, why, in our own Country, after long-continued Heats in a dry Summer, ſucceeded by a cold Autumn, bilious Fevers, bilious Diarrheas, Dyſenteries, double and continued Tertians, not only frequently happen, but rage epidemically. But an obſtructed Perſpiration, and the violent Sallies of Anger, principally contribute to the immediate Production of this Fever, in thoſe who have a natural Diſpoſition and Tendency towards it; for when the Juices abound with hot ſulphureous Particles, and when the Diſſipation of theſe, thro' the ſmall exhaling Veſſels, is intercepted, either by a denſe and cold Air, or by imprudently expoſing one's ſelf to the Cold, they remain in the Habit, raiſe an inteſtine Motion of the Fluids, and excite a Fever. The Effect of violent Anger on the Body is ſuch, that it induces an intenſe Motion, and a rigid ſpaſmodic Stricture, not only in the whole nervous and vaſcular Syſtems, but alſo acts in a particular manner upon the nervous biliary Ducts, and, by greatly increaſing their periſtaltic Motion, expreſſes the bilious Juice from the Whole of theſe Ducts, and forces it copiouſly and impetuouſly into the Cavity of the Duodenum; and, whilſt it ſtagnates in this winding Duct, it produces an Effervеſcence, by being mix'd with the ſalival Juice, and acid Crudities; and by that means acquires a pungent and almoſt cauſtic Quality, as is obvious from its green æruginous Colour, reſembling that produc'd by a Mixture of Bile with ſome acid corroſive Spirit, ſuch as Oil of Vitriol, and Aqua-fortis.

In the Method of Cure, we are carefully to diſtinguiſh between the various Species of burning Fevers, and to have a due Regard to the Conſtitution of the Patient; for when a violent burning Fever ſeizes a Patient of a bilious lean Habit, and not very full of Blood and Juices, Veneſection is improper. Nor is it to be us'd in bilious Fevers, either of the acute Kind, or ſuch as appear intermittent, and are accompanied with numerous Vomitings and Stools, an Uneaſineſs of the Præcordia, and a Coldneſs of the Extremities. But when a Plethora is join'd to that burning Fever which is frequent among our Country-men, and which the Antients properly called a bilious or putrid Synocha, a ſeaſonable Veneſection, adapted to the Strength and Condition of the Patient, and the Diſtention of the Veſſels, is highly neceſſary; for when a due Evacuation of Blood is made, the Violence of the Fever, and its ſeveral Symptoms, is not only much abated, but alſo a ſpeedy and favourable Termination is to be expected. On the contrary, Experience teaches us, that Women in a particular manner, and ſuch as abound with Blood, are in conſiderable Danger, if Veneſection has been omitted in the Beginning of the Diſeaſe; for then Nature herſelf attempts the Diſcharge of the ſuperfluous Blood, eſpecially from the Noſtrils, which, if it does not happen at a proper and critical Time, does not produce the deſir'd Effect, ſince a Stagnation of the Blood in the Veſſels of the Brain enſues, and induces a highly dangerous Phrenitis of the Membranes of the Brain.

After Veneſection, we are carefully to endeavour to remove the intenſe Heat of the Body, together with the inſatiable Thirſt and Dryneſs of the Fauces, by ſuch Medicines as fix and correct the violent Agitation of the ſulphureous Particles, relax the ſpaſmodic Conſtriction of the Fibres, dilute the Humours ſtagnating in the ſmall Veſſels, render them capable of a free Circulation, and remove Obſtructions, that an equable and free Circulation of the Fluids, thro' the proper Parts and Veſſels, may be promoted. For this Intention the Antients unanimouſly recommended drinking cold Water. *Hippocrates*, in his Book *de Affect. Sect.* 2. in burning Fevers, orders the frequent Exhibition of cold Draughts by little and little. And *Aretæus*, in *Lib.* 2. *Cap.* 4. *Acut.* has the following Words: "If the Patient labours under a bilious Vomiting, a Tenſity, "a Loathing of Food, Uneaſineſs, and Loſs of Strength, then "two or three Glaſſes of cold Water are to be exhibited, in "order to render the Stomach ſtrong; for cold Water eaſily "becomes warm in the Stomach." *Galen* alſo, in *Meth. Medend. Lib.* 9. *Cap.* 5. beſides Veneſection, highly commends cold Draughts, adding this for a Reaſon, "Becauſe "they extinguiſh the Fever, and render Nature ſtrong and "vigorous, in order to expel, by the Anus, and by the cutaneous Pores, whatever is faulty and peccant in the Habit." *Celſus* is of the ſame Opinion; for, in *Lib.* 3. *Cap.* 7. he uſes the following Words: "If a burning Fever is not at its greateſt Height before the fourth Day, and is attended with an "inſatiable Thirſt, cold Water is to be exhibited copiouſly, "and in as large Quantities as the Patient deſires. After this, "the Patient is to be cover'd with many Bed-clothes, and laid "in a proper Poſture for Reſt, and generally after a long-continued Thirſt and Watching, after drinking much Water, "and an Alleviation of the Heat, a ſound Sleep ſeizes the "Patient, by which a copious Diaphoreſis is promoted, and "preſent Relief afforded." But he ſubjoins theſe Cautions: "But in thoſe only in whom, beſides the Heat, there are no "Pains, no Swelling of the Præcordia, no Obſtructions, either of the Lungs or Fauces, no Ulcer, no Faintings, and "no Flux, the Exhibition of cold Water is proper. But a "Patient, who is afflicted with a gentle Cough under this Species of Fever, ought neither to drink liberally, nor uſe "Draughts of cold Water." *Proſper Alpinus*, in *Med. Meth. Lib.* 2. tells us, "That in violent continent Fevers, "all the *Egyptian* Phyſicians uſed to exhibit large Draughts of "cold Water, becauſe that Liquor concentrates the natural "Heat to ſuch a degree, that the Thirſt and Heat forthwith "ceaſe; by which means the whole Body is corroborated, and "the Water is digeſted: For the moſt part, the Uſe of cold "Water in theſe Caſes excites profuſe Sweats, ſometimes bilious Vomitings, a plentiful Diſcharge of Humours by Stool, "and a copious Evacuation of Urine. It is ſurpriſing, continues he, that ſuch a Medicine ſhould prove effectual againſt "theſe Fevers; for they generally terminate by the Evacuations excited by cold Water." The ſame Author, *de Med. Egypt. Lib.* 4. *C.* 15. informs us, that this was not only the Practice of the *Egyptian* Phyſicians, but that it was accounted a Specific. "Some, ſays he, in Synochas and burning Fevers, "reckon a large Quantity of the Water of Angaril, which "is a Species of Cucumber, exhibited for many Days alone, "a Specific. Others, in the Height of the Diſorder, exhibit "large Draughts of cold Water, after which, they cover the "Patient with many Bed-clothes, in order to procure a Diaphoreſis, by which means I underſtand a great many have "been cured."

Both Reaſon and Experience concur to ſhew us, that the high Opinion the Antients entertained concerning the Efficacy of cold Water in burning Fevers, was not altogether without a Foundation; for unleſs the Stomach and other internal Parts are inflam'd, and when there is no Anxiety, with a Coldneſs of the Extremities, nor a Contraction of the Pulſe, and a Defect of Blood, Draughts of good cool Water, tho' not intenſely cold, exhibited in large Quantities, but not all at once, are of ſingular Service; for the cold Liquor corrects and obtunds the too violent Motion of the ſulphureous and ethereal Particles in the Blood, braces up the relax'd Fibres, and reſtores a due Degree of contractile Force and Elaſticity, to ſuch as are too violently diſtended. Nor are any bad Conſequences to be dreaded from the cold Water, becauſe, by entering the Body ſucceſſively, it becomes tepid by the internal Heat. This Tepidity, join'd with the Moiſture, is ſingularly beneficial in relaxing the ſpaſmodically conſtricted Fibres, and rendering the Fluids, ſtagnating in the capillary Veſſels, fit for a due Circulation, by which means a Diaphoreſis, a plentiful Diſcharge of Urine, and Evacuations by Stool are promoted. But ſince, in the Northern Climates, ſuch pure and light Water is hard to be found, the Water uſed for this Purpoſe muſt be corrected by boiling, or an Admixture of proper Ingredients. *Hippocrates*, in burning Fevers, recommends a Decoction of Water and Barley. And *Aretæus*, in a bilious Fever, recommends a Mixture of Milk and Water. The cold Draughts found moſt beneficial for Patients in our Climate, are principally Juleps, prepar'd of Spring-water, Lemon-juice, and Sugar; as alſo Ptiſans of the Shavings of Hartſhorn, Scorzonera-root, and Syrup of the Juice of Lemons, or Julap of Roſes and Spirit of Vitriol. Water alſo, boil'd with a Piece of Bread in it, is an excellent Drink for this Purpoſe. To this Claſs of Liquors we may alſo refer ſweet Whey, or that which is acidulated with Lemon-juice, as alſo the temperate Mineral Springs, ſuch as the *Selteran*, *Antonian*, and *Wildungenſian* Springs.

This Exhibition of cold Water, thus ſtrenuouſly recommended by Hoffman, *is no new Practice. It is treated of at large in* Lommius's *Treatiſe on Fevers.*

For obtunding and correcting the cauſtic Acrimony of the bilious Juices, ſtagnating in the Stomach and Duodenum, eſpecially in bilious Fevers, the moſt effectual Medicines of the compound Kind are the *Pulvis Marchionis*, and particularly the abſorbent Powders, with which are conveniently mixed the more light earthy Subſtances, Crabs-eyes, Mother of Pearl, prepared Shells, calcin'd Horns and Bones, and, according to *Langius* and *Crato*, *Muſcovy* Glaſs. Nitre is alſo of ſingular Efficacy for extinguiſhing the Heat, and checking the inteſtine Motion; for which Reaſon it may be very advantageouſly mix'd with theſe Powders. But theſe correcting Powders muſt be diluted with a ſufficient Quantity of a proper Liquor, and be exhibited frequently, and at proper Intervals. Nor are diluting and attenuating Medicines leſs beneficial, ſuch as Emulſions of Almonds, and the Four cold Seeds, eſpecially thoſe of the Gourd, with Waters diſtilled from Flowers of a paregoric Quality, ſuch as thoſe of Elder, Roſes, Bugloſs, Cowſlips, Limes, Lily of the Valley, as alſo black Cherry-water. This Intention is alſo anſwer'd by Jellies of the Shavings of Hartſhorn, Milk mix'd with Water, Oil of ſweet Almonds, ſweet Whey, as alſo Broth, prepared of Fowls bruiſed and boiled in a cloſe Veſſel. Theſe Medicines are highly beneficial for removing the Inflammation of the nervous and membranous Parts, which generally proves fatal in theſe Diſeaſes: But they muſt be exhibited in a due Order, at proper Times, and in juſt Doſes; in a Word, the following Cautions muſt be obſerved with reſpect to their Uſe.

Practical Cautions *and* Observations.

As in the Cure of all acute Fevers, ſo more eſpecially in thoſe of the burning and inflammatory Kind, the beſt and ſafeſt Method is, thro' the whole Stages of the Diſeaſe, to proceed calmly and gently, and carefully to abſtain from every thing both in Diet and Medicine, which may contribute to increaſe the Diſeaſe, or retard its Cure. *Celſus*, in the ſeventh Chapter of his third Book, gives us an excellent Caution with reſpect to this Particular, in the following Words: "The "Patient, ſays he, is to be laid in a ſufficiently large Room, "that he may breathe a free and open Air: Nor is he to be "loaded with a large Quantity of Clothes, but only to be "cover'd with ſuch as are light. The Leaves of the Vine, "dipt in cold Water, may alſo be laid over his Stomach, in "order to prevent his being rack'd with an immoderate Thirſt;" for a moderate and equal Heat does more in theſe Fevers for the Correction, Reſolution, and Evacuation of the morbific Matter, than any other Medicine whatever. But nothing is more prejudicial, than to increaſe the Heat by the Warmth of the Room, or an Abſtinence from Drink, ſince, by this means, the Strength is impaired, the due Secretion of the peccant Humours from the vital Juices retarded, and the Moiſture neceſſary for the free Circulation of the Blood and Humours, and for relaxing and opening the obſtructed or conſtricted capillary Veſſels, conſumed. For this Reaſon, the frequent drinking of warm Infuſions in burning Fevers, is ſo far from proving beneficial, that they often prove hurtful. But ſtill more Injury is done by ſuch Medicines as heat the Blood, throw it into a Commotion, and excite an actual Diaphoreſis. For this Reaſon, *Celſus* juſtly commends a large Room, and the Acceſs of a pure Air; for, as the ſubtile, ethereal, and elaſtic Subſtance in the Air, is the genuine Support of the elaſtic, vital, and ſyſtaltic Force of the Veſſels, and of the Strength of the Parts, ſo the Air, when tainted with many moiſt and corrupted Effluvia, and conſequently depriv'd of its Elaſticity, is prejudicial to Perſons in a ſound State of Health, and much more to ſuch as are indiſpos'd. Nor do I think, that any other Reaſon needs be aſſign'd, why ſo many of the Vulgar die of acute Fevers, whoſe Conſtitutions are otherwiſe able to overcome the Shocks of the Diſtemper, than that they lie in little, low, and often overheated Apartments, in which, eſpecially when there is a Number of Patients, the Air they breathe is ſickly, and impregnated with noxious Exhalations.

But as Nature herſelf is the beſt Phyſician in continued Fevers, her Motions are carefully to be adverted to. Theſe are principally exerted by the Rigor which proceeds from the ſpinal Marrow, with a Senſe of Cold and Shivering, and happens at ſtated times, eſpecially on the odd Days, the Half of the fourth Day, the ſeventh, the eleventh, and the fourteenth; for this Rigor is only a ſpaſmodic Affection of all the nervous Syſtem, by which the Blood and Humours are driven, with a certain Violence, from the Surface of the Body towards the internal Parts, the Heart, the Brain, and the larger Veſſels; for which Reaſon the Extremities are cold, but the internal Parts are too much filled and diſtended with Blood. Hence the Pulſe is contracted, there is an Uneaſineſs about the Breaſt, and the Face, together with the Veſſels of the Head, is ſwelled. But if, after this Rigor, the Humours driven inwards are, by an equal Force, and an enlarged Syſtole of the Heart and Arteries, again driven towards the Surface of the Body, the Force of the Diſeaſe, and the morbific Cauſe, are often at once carried off and removed, either by a copious and univerſal Diaphoreſis, or by a Diſcharge from the Noſtrils. Thus a Rigor which is ſalutary, is juſtly, for that Reaſon, called critical; and, after it happens, the Pulſe is equable and ſoft, the Circulation of the Blood carried on in a due manner, the Strength recruited, and the Patient rendered capable of enjoying his natural Reſt. But when the ſyſtaltic Force of the Heart and Arteries is not ſo ſtrong, as again to drive out the Blood, the Rigor is ſymptomatic, and of the bad Kind; for then the Body neither grows warm again, nor the Pulſe equal; nor is there a Diſcharge of Blood from the Noſtrils, nor an univerſal Diaphoreſis, but only a partial and cold one about the Head and Neck; nor are the Body and Mind recruited, nor does the Patient become capable of his natural Reſt. The Blood rather remains pent up internally in the ſmall Veſſels, and in the Brain occaſions a Phrenitis and Convulſions about the Heart and Lungs, a violent Uneaſineſs of the Præcordia, a Difficulty of Breathing, and a Fainting, which is generally ſucceeded by Death on the ninth Day. Sometimes alſo theſe Rigors happen on the critical Days; but theſe are in like manner ſymptomatical, and prognoſticate an unlucky Termination. Theſe Motions, therefore, of Nature, as they are productive either of Death or Health, ought to be carefully attended to by the Phyſician; for on this depends, not only the whole Art of forming right Prognoſtics, and exhibiting Medicines ſeaſonably, but alſo the Whole of Practice. This excellent Ground-work of obſerving the Motions of Nature was always kept in View by *Hippocrates*, and carefully inculcated by his faithful Interpreters *Hieronymus Mercurialis* and *Duretus*. But very few of the Moderns ſeem to be acquainted with it.

When Nature thus reſolves to exert extraordinary Efforts, the Phyſician is to wait and direct nothing; The Patient is alſo entirely to abſtain from Aliments, and the Body is only to be preſerv'd in an equable and moderate Warmth. But if the Force of Nature alone is not ſufficient for expelling the Blood, and promoting the Secretions, ſhe is ſkilfully to be aſſiſted internally, either by temperate Analeptics and Diaphoretics, or externally by Medicines of a deriving and diſcutient Quality; for the happy and ſeaſonable Time of acting and exhibiting Medicines is never of more Importance, than in dangerous and acute Diſorders.

When, after a Rigor, a Head-ach proceeding from a Plethora happens, with a beginning Commotion of Mind, and when a ſmall Quantity of Blood drops from the Noſtrils, I uſe an Epithem prepared of Vinegar and Roſe-water, Camphire diſſolv'd in Spirit of Roſes, Nitre, and Oil of Rhodium, applied cold, not only to the Temples, but rather to the whole Head ſhav'd. This Medicine produces the happieſt Effects by refrigerating, diſcuſſing, and reſiſting Inflammation. This ſame Epithem is of ſingular Service for alleviating the Anxiety, removing the Uneaſineſs, and facilitating the Reſpiration, if it is laid over the Præcordia with a Linen Cloth, conſiſting of three Folds. But the moſt immediate Relief for a Phrenitis is to be expected from opening the Veins of the Noſtrils, whether by a Scarificator, or the Intruſion of the Point of a Straw, taking care to render the Legs and Thighs at the ſame time warm by Friction, and exhibiting internally a diſcutient, diaphoretic, and analeptic Mixture, with diſtil'd Vinegar, Waters of Cinnamon, Roſes, Carduus Benedictus, and the Mixtura Simplex, Cinnabar, Crabs-eyes, and the Bezoardicum Minerale.

In order to allay the Thirſt, and moiſten the parched Tongue and Fauces, I have obſerved no Medicine more efficacious, than half a Dram of the beſt Nitre diſſolv'd in a Pint of ſweet Whey; for this drunk frequently cold, and in ſmall Draughts, ſurpriſingly allays the preternatural Heat. The Mouth alſo and Fauces are now-and-then to be waſh'd with Water, in which a ſufficient Quantity of Nitre, and the Rob of Mulberries has been diſſolv'd. This may alſo be exhibited as a Gargariſm. But I can never approve of Injections by a Syringe, becauſe, by their violent Attrition, they generally increaſe the Pain and Inflammation. Beſides, in order to remove any Inflammation which threatens a Quinſey, this Linctus, gently ſwallow'd, is of ſingular Service.

Take of Conſerve of Roſes, one Ounce; of the beſt Nitre, fifteen Grains; and of Camphire, three Grains. Diſſolve all in one Dram of the Oil of ſweet Almonds.

Tho' the Exhibition of Purgatives, during burning Fevers, is proved to be highly dangerous, both from Reaſon and Experience, yet 'tis proper the Patient's Body ſhould be always ſoluble under the Diſeaſe itſelf; therefore this Intention is beſt and moſt properly anſwer'd by Suppoſitories and Clyſters, prepar'd only of Milk, Honey, and a little Nitre. But when a Criſis and due Concoction are form'd, which may be diſcovered from the Sediment of the Urine, it is expedient to render the Body ſoluble by the milder Laxatives, ſuch as Preparations

tions of Manna, Tamarinds, Rhubarb, Raiſins, and Tartar, that the peccant Juices in the *Primæ Viæ*, generated by the Diſeaſe itſelf, may be evacuated, leſt they ſhould lay a new and freſh Foundation for the like Diſorder.

As Hoffman *gives his Opinion againſt Purging, in the Sorts of Fevers here mentioned, I have not ſuppreſs'd it, in order to favour what I have ſaid concerning purging in Fevers, under the Article* CATHARSIS, *to which I muſt refer the Reader.*

The drinking cold Water, a Practice ſo highly extol'd by the Antients, is of ſingular and uncommon Efficacy in this Diſeaſe, and therefore deſerves the greateſt Attention and Regard of the Phyſician. But as we have already directed, when and in what Caſes it is to be us'd, we ſhall only here obſerve, that it is never to be exhibited in large Draughts at one time, but ſucceſſively and frequently; never in the Beginning of the Diſeaſe, but ſome Days after its firſt Attack; never in the Time of the Paroxyſm, or whilſt the Rigor laſts, or the Pulſe is ſmall and intermittent; in a Word, never till the Plethora is firſt remov'd: But it may be ſafely us'd when the Extremities are hot, and the Pulſe equal, quick, and large.

If the Fever is bilious, acute, and highly dangerous, by reaſon of the bilious and corroſive Juices preying upon the nervous Coats of the Stomach and Inteſtines, ſome ſpeedy and efficacious Remedy is neceſſary. In this Caſe, it is adviſeable to exhibit the abſorbent and correcting Powders frequently, and in larger Doſes than uſual, in Conjunction with diluting and lenitive Liquors. For anſwering this Intention, I always recommend the following, as a Medicine of approv'd Virtue.

> Take of the Powders of Crabs-eyes, Mother of Pearl, uncalcin'd Hartſhorn, *Muſcovy*-glaſs, or calcin'd Talc-ſtone, of each one Dram; and of Nitre, one Scruple; of which the Patient is, every Hour, to take one Dram, in two Ounces of an Emulſion of Almonds, to which two Drams of the Oil of ſweet Almonds have been added.

But for checking the violent bilious Evacuations, my Anodyne Mineral Liquor is of ſingular Efficacy, eſpecially if it is impregnated with a few Drops of the Oil of Mace, and exhibited in any fluid Vehicle, or only in cold Water; for, becauſe it ſtops the too quick ſyſtaltic or periſtaltic Motion of the biliary Ducts, a ſmaller Quantity of the bilious Juice is by that means thrown into the Duodenum, and, conſequently, the too copious Diſcharge of it is ſtopt.

I myſelf, ſays *Hoffman*, have known ſeveral Inſtances of a Cholera Morbus and Dyſentery ſpeedily remov'd by theſe Medicines, exhibited ſeaſonably, and in proper Doſes. *Frederic. Hoffman. Medicin. Rational. Syſtemat.* See FEBRIS.

CAUTERISATIO. Cauteriſing.

CAUTERIUM, καυτὴρ, καυτήριον, from καίω, to burn. A Cautery either actual or potential. See CAUSTICA.

CAVUS. Hollow. Many Parts of the Body are call'd by the Name of *Cava*, as is explain'd under the Article COILA, which ſee.

CAYMANES. The *Weſt Indian* Crocodile, or Alligator. See CROCODILUS.

CEANOTHOS. A Name for the *Carduus Vinearum repens*. See CARDUUS.

CEASMA, κίασμα, from κιάζω, to ſplit, or divide. A Fiſſure, or Fragment. *Heſychius.*

CEBI *Gallinæ*. The broil'd Liver of a Hen. *Caſtellus* from *Paulus Bagellardus de Morbis Puerorum.*

CEBIPIRA *Braſilienſibus*. Marcgr. *Cebipira Guacu*, and *Cebipira Miri*. Piſon. Call'd alſo *Arbor Braſilienſis Floribus ſpecioſis ſpicatis, Pericarpio ſicco*. Of the Bark, which is bitter and aſtringent, Baths and Fomentations are prepar'd, which are eſteem'd excellent againſt Diſeaſes ariſing from Cold, Tumors of the Feet and Belly, and thoſe Pains of the Limbs which the *Portugueſe* call *Curimentos*.

As it is aſtringent, and ſomewhat acrimonious, it is good in the Itch, Ring-worm, and cutaneous Diſorders of the like Kind.

CEBUS. A Species of Monkey. *Caſtellus.*

CECIS, κηκίς. A Gall of the Oak. See QUERCUS.

CECRYPHALOS, κεκρύφαλος, and κεκρύφαλον. Properly a Net, in which the Women bound up their Hair, as it occurs in *Hippocrates*. It alſo ſignifies that Stomach, in ruminating Animals, which lies next before the Omaſum.

CEDMATA, κήδματα. Inveterate Defluxions of Humours on the Joints, eſpecially that at the Hip, where the Os Femoris is articulated into the Acetabulum. Theſe are frequently mention'd by *Hippocrates*. Sometimes alſo Defluxions on the genital Parts are call'd by this Name.

CEDRELÆUM. Oil of Cedar, as *Pliny* ſays, made of the Fruit of the Cedar, *malis Cedri*. *Bellonius* obſerves, that there is a Diſtinction betwixt the Cedrelæon and the Oleum Cedrinum. See CEDRIA.

CEDRELATE.

This Name, according to *Bellonius*, is derived from ἐλάτη, the Fir-tree, and κέδρος, the Cedar. Among Botaniſts it ſignifies the great Cedar, a Tree of ſo immenſe a Bulk, as to exceed not only all the reſiniferous and coniferous Trees, but alſo all the other Trees in the World.

CEDRIA.

This is ſometimes call'd the Pitch, and ſometimes the Reſin, of the Cedar, flowing from the great Cedar; ſo that, properly ſpeaking, it is nothing but the crude Tears of the Cedar. Some affirm, that this Subſtance is different from the *Cedrium*, or Oil of Cedar, which is of a more liquid and oleous Conſiſtence: But, by Authors, it is promiſcuouſly call'd *Cedria*, *Cedrium*, and κεδρέλαιον, κεδρεία, κεδρία, κέδριον, according to *Gerræus*, in *Definit.* *Pliny*, in the fifth Chapter of his twenty-fourth Book, informs us, that the great Cedar yields a Pitch call'd *Cedria*; and, according to *Bellonius*, *Galen* gives various Names to this Subſtance, calling it ſometimes the Reſin, ſometimes the Tears, ſometimes the Pitch, of the Tree, and ſometimes Cedria; for he calls that which flows immediately from the *Cedar-tree*, *Reſin*, or *crude Tears*, in order to diſtinguiſh it from that which is boil'd and prepar'd. According to *Salmaſius*, the *Arabians* call the Oil of Cedar *Ketran*, or *Alketran*; and we, by a Corruption of that Word, commonly give the Name of *Cedrinum* to that Species of Pitch which is us'd for Ships. The *Greeks* call'd this Subſtance ζώπισσον, and ἀπόχυμα; and it is often mention'd by the Farriers, and other medicinal Writers among the *Greeks*: It was Pitch mix'd with Wax, in order to be laid on Ships, and differ'd much from the Cedria, which is the *Ketran* of the *Arabians*. Many of the *Greeks* confound the κεδρέλαιον and the κεδρεία· but, in the Opinion of others, theſe are different Subſtances. The κεδρεία is the Pitch of the Cedar-tree, whereas the κεδρέλαιον is an Oil obtain'd from the Pitch, which ſwims above it in boiling, and is collected with Wool. *Dioſcorides*, in his Deſcription of the Cedar-tree, plainly makes this Diſtinction. What, in the Pitch of the Cedar-tree, was call'd κεδρέλαιον, was, in other kinds of Pitch, call'd πισέλαιον. This was, as it were, the Serum of the Pitch, which, in boiling, floated on its Surface, and was received in clean Wool, ſpread upon the common Maſs. The Name πισέλαιον is alſo applicable to the Cedrelæum, inaſmuch as this Oil is obtain'd from the Pitch of the Cedar-tree. And *Pliny* informs us, that the Piſſelæon is made of the Juice of the Cedar-tree, or the κεδρεία. *Dioſcorides*, in the eighty-ninth Chapter of his firſt Book, ſpeaks of the Cedria in the following manner: "That Cedria is beſt which is thick, pellucid, and "of a nauſeous Smell, which, when pour'd out, does not "ſpread, but runs into Drops, and which has a Power of pre"ſerving dead Bodies, and corrupting ſuch as are alive; for "which Reaſon it is by ſome call'd *the Life of the Dead*. In "conſequence of its remarkably heating and drying Quality, "it alſo corrupts Cloths and Skins. It is of ſingular Service, "as an Ingredient, in Collyriums, and Preparations for the "Eyes; for, when the Eyes are anointed therewith, it ren"ders the Sight clear, and removes Films and Specks. It "kills the Worms of the Ears, when dropt into them with "Vinegar. It removes a Noiſe and Ringing of the Ears, when "pour'd into them, in Conjunction with a Decoction of Hyſſop. "When put into hollow Teeth, it breaks them, and alleviates the "Pain. It produces the ſame Effect when the Mouth is "waſh'd with a Mixture of it and Vinegar. If the Genitals "of Men are anointed with it before Venereal Intercourſe, it "prevents Conception. In Quinſeys, the Parts affected are to "be anointed with it; and it is of Service in Inflammations of "the Tonſils. It deſtroys Nits and Lice, if the Parts are "anointed with it. It affords Relief in the Bites of the Ser"pent call'd Ceraſtes, if it is laid on the Part affected, in Con"junction with Salt. When exhibited in Raiſin-wine, it is of "Service to Patients who have drank the Poiſon of the Sea"hare. It proves beneficial in an Elephantiaſis, when either "us'd internally as a Linctus, or externally by way of Oint"ment. It deterges Ulcers of the Lungs; and, if a Cyathus "of it is taken, thoroughly cures them. Given by way of "Clyſter, it kills Aſcarides and other Worms, and expels the "Fœtus. The Oil is ſeparated from the Cedria whilſt it is "boiling, by ſpreading Fleeces of Wool above the Steam of it, "as in the Pitch; and its Virtues are the ſame in all reſpects. "It has this peculiar to it, that it cures the Scab of Quadrupeds, "Dogs and Oxen, if the Parts affected are ſtrongly anointed "with it. It alſo kills the Tykes lodg'd in their Fleſh; and "cicatrizes the Wounds they have received by being clip'd." The Reaſon why *Dioſcorides* affirm'd, that it corrupts Skins, was, according to *Bellonius*, that it was formerly kept in the Skins of Animals, whereas in the Eaſtern Nations it is now kept in Bottles. *Pliny* comments, in the following manner, upon the Virtues of the Cedria, laid down by *Dioſcorides*: "It "corrupts Garments, and kills Inſects; for which Reaſon I "think it improper to uſe it in Quinſeys; as alſo in Diſorders "ariſing from Crudities, which ſome, in conſequence of its "Taſte, have adviſed. In Tooth-achs, I ſhould alſo be afraid "to waſh the Mouth with it and Vinegar; or to drop it into "the Ears, in order to remove a Dulneſs of Hearing, or kill "the Worms lodg'd in them. It is a fabulous Report, that it "prevents

" prevents Conception, or procures Abortion, if the Genitals " are anointed with it. I ſhould not ſcruple to uſe it, by way " of Ointment, in a Phthiriaſis and ſcurfy Diſorders. It is alſo " order'd to be drank, in Raiſin-wine, againſt the Poiſon of " the Sea-hare; but it is much more properly uſed, as an Oint- " ment, in the Elephantiaſis." If we compare this Paſſage of *Pliny* with what he ſays in the eleventh Chapter of his ſixteenth Book, it appears, that *Pliny* advanc'd this not properly concerning the Cedria, which he calls Pitch, but concerning the Juice of the Cedar-tree, which he calls *Cedrium*, than which the former is thicker. In the mean time, whoever conſiders that, in the former Paſſage, *Pliny* aſcribes ſome of the Things which *Dioſcorides* wrote concerning the Cedria alone, to the Cedria, and others of them to the Juice of the Cedar-tree, will be ready to ſuſpect, that, in the Days of *Pliny*, the ſame Thing was ſignify'd by the Names Cedria and Cedrium; or that this Author confounded the Cedria with the Cedrium, which, *Dioſcorides* ſaid, was a Fluid, flowing like Water in a Pipe, whereas the Cedria was a thicker Liquor. Beſides, *Bauhine* is juſtly ſurpris'd, that *Pliny* did not find Fault with the Juice of the Cedar-tree in Ulcers of the Lungs, as he did in Quinſeys and Crudities, ſince, according to *Galen*, the Cedria not only irritates Ulcers, and excites Phlegmons, but is alſo of a ſeptic Quality.

Hippocrates, in his Treatiſe *De Morb. Muliebr. Lib.* 1. for promoting the Conception of Women, orders the Uſe of a Peſſary, prepar'd of about ſix Drams of Cedria, mix'd with four Drams of the Fat of Beef. According to *Proſper Martianus*, in his Annotations on *Hippocrates*, we have no Reaſon to wonder, that *Hippocrates* ſhould recommend the Cedria for promoting Conception in Women, tho', according to *Dioſcorides*, it prevents it, if the Genitals of Men are anointed with it; for, as much as the Conſtitution of a Woman differs from that of a Man, ſo much may the Effects of one and the ſame Medicine in a Woman, differ from thoſe it produces on a Man, becauſe the Conſtitution of a Woman is cold and moiſt, whereas that of a Man is rather hot and dry. For this Reaſon it is that the Barrenneſs of Women frequently ariſes from Coldneſs and Humidity, whereas the Vigour and Capacity of Men depend upon contrary Qualities. This Opinion not only prevails among the Vulgar, but was alſo receiv'd by *Hippocrates*, who, when the monthly Evacuations were duly made, and the Mouth of the Uterus in its natural Situation, always with an Intention to promote the Conception of Women, preſcrib'd Medicines compoſed of Simples of a heating and drying Nature, which would prove highly prejudicial to Men. *Hippocrates*, in his Book *De Sterilitat.* has an Eye to this Diverſity of Conſtitutions, when he adviſes a Woman, who has Intercourſe with a Man with a View to Conception, to abſtain from Food, but orders the Man to be nouriſh'd with proper Aliments. Becauſe the Cedria is of a highly heating Quality, it may remove Sterility, by correcting the Coldneſs of the Uterus, when it remains in the Pudenda of Women, whereas the anointing the Man's Genitals with it may ſo overheat and dry the ſeminal Matter, in its Emiſſion, as to render Conception impoſſible. If the Uterus is exulcerated by Child-birth, or an Inflammation, he orders us to deterge the exulcerated Part by an Injection of Butter, the Oil of Cedar, and a little Honey. This ſame Remedy he alſo preſcribes in Ulcers of the Pudenda, and inveterate Ulcers of the Uterus. In order to make the Injection, he takes the Fat of a Gooſe and Reſin, to which, when melted, he adds a ſmall Quantity of the Oleum Cedrinum and Honey. But, in order to expel the dead Fœtus, he orders Galbanum, wrapt up in a Linen Cloth, and dipt in the Oleum Cedrinum, to be uſed by way of Peſſary. *Celſus*, in the eighteenth Chapter of his fifth Book, gives us the *Malagma* of *Numenius* for the Gout, and other Indurations of the Joints, in which Cedria is alſo an Ingredient. *Scribonius Largus*, in his Work *De Compoſitione Medicamentorum*, gives us the Form of a Medicine of the Conſiſtence of Honey, and compoſed of Vinegar, Alum, and Cedria, for rubbing the Teeth in the Tooth-ach. What the Cedria is, and how it is produc'd, are Points warmly diſputed by different Authors; but thoſe of the greateſt Note are agreed, that it is a native Reſin, obtain'd from the *Cedrus Major*, which is the Cedrus Magna, or *Libani conifera*. See the Article LARIX ORIENTALIS. Some ſubſtitute, in the room of the Cedria, the Gum of the Juniper-tree, others the Oil of Juniper, others Piſſelæon, the Tears of the Fir, Ladanum, and the Juice of the Birch. See AMBRA.

CEDRINUM *(Vinum)*, κέδρινος οἶνος. Cedar-wine.

Cedrinum, Juniperinum, Cupreſſinum, Laurinum, Pineum, Abiegnum, all theſe ſorts of Wines are prepared after the ſame manner, which is as follows:

They take thin Pieces of the Wood, newly cut from the Tree while the Fruit was upon it, and expoſe them to the Sun, or lay them in a Bath, or by a Fire, in order to obtain their Juice by Exſudation. A Pint of this Juice they mix with ſix Pints of Wine, and let it ſtand for two Months. They then pour it into another Veſſel; and, after expoſing it for ſome time to the Sun, ſet it aſide for Uſe. Obſerve that all factitious Wines muſt have their Veſſels quite full, otherwiſe they will grow ſour; and that medicated Wines are not good for Perſons in Health.

All theſe Wines are heating, diuretic, and gently aſtringent; but the Laurinum, or Bay-tree Wine, is remarkably heating.

Cedar-wine is alſo prepar'd of the Fruit of the greater Cedar, by mixing half a Pound of the bruis'd Berries with ſix Pints of Muſt. This is to ſtand in the Sun forty Days, and then to be ſtrain'd off, and put into Veſſels. *Dioſcorides*, *Lib.* 5. *Cap.* 45.

CEDRIS. The Fruit of the great Cedar. *Dioſcorides* ſays they are heating, and prejudicial to the Stomach; but are good in Coughs, Convulſions, Contuſions, and Stranguries: Taken with bruis'd Pepper, they provoke the Menſes. *Dioſcorides*, *Lib.* 2. *Cap.* 105.

CEDRITES, κεδρίτης. *Cedrites* is thus prepar'd:

They take the Pitch or Roſin which diſtils from the great Cedar, and waſh it in fair Water; and then put one Cyathus (one Twelfth of a Pint) into each Ceranium, (a Meaſure containing nine Gallons) filling it up with Muſt.

This ſort of Wine alſo heats, attenuates, is good for an old Cough, not attended with a Fever, for Pains of the Breaſt and Sides, the Gripes, Ulcers of the Belly and Inteſtines, an Empyema, the Dropſy, and Hyſterics. It is effectual alſo againſt Worms, and in Rigors. It cures the Bites of venomous Creatures, kills Serpents, and eaſes Pains in the Ears, if inſtil'd into them. *Dioſcorides*, *Lib.* 5. *Cap.* 47.

CEDRO. The Citron-tree.

CEDROMELA. The Fruit of the Citron-tree.

CEDRONELLA. Baum. See MELISSA.

CEDRUS. The Cedar.

The Characters are;

The Leaves are ſquamous, like thoſe of the Cypreſs; the Flowers amentaceous, conſiſting of many minute Petals, furniſh'd with many Apices; the Fruit is a Berry, which grows remote from the Flower on the ſame Plant, which is full of angulated Stones, containing an oblong Seed. *Boerhaave Index alter.*

Boerhaave mentions two Species of Cedar;

1. *Cedrus folio Cypreſſi; major; fructu flaveſcente*, C. B. P. 487. *Cedrus, Lycia, retuſa Bellonio dicta.* J. B. 1. 300. *Oxycedrus, Lycia.* Dod. p. 853. *Juniperus, major, Dioſcoridis.* Cluſ. H. 38. *Thuyæ genus quartum.* Lugd. 61. *Sabina, baccifera.* Lob. Ic. 220. 2. H.

This is a Shrub, rarely ſurpaſſing the Length of a Man in Height, with a crooked uneven Trunk, ſending off many Branches, and cover'd with a rough Bark. Its Leaves are fleſhy, and four of them are mutually connected in a continu'd Series, like thoſe of the Cypreſs. Its Flowers are yellow, like thoſe of the common Juniper; but ſituated on the Extremities of the Leaves, as in the Cypreſs and Thuia, or Arbor Vitæ. Theſe Flowers are ſucceeded by a round Fruit as large as a Myrtle-berry, and which is firſt green, and then of a purple Colour. It becomes ſomewhat ſoft as it ripens, and has a Taſte and Smell reſembling that of the Juniper-berry. It has three, four, or more, oblong and ſtriated Seeds, which contain a whitiſh kind of Medulla, whoſe Smell reſembles that of Roſin. It flowers in the Spring; and, like the Juniper, bears its Fruit a great while before it arrives at Maturity. This Shrub firſt ariſes from a Seed; and, whilſt it is yet tender, its Leaves are entirely diſſimilar, and reſemble thoſe of the Juniper, only they are ſomewhat ſhorter and ſofter: But, when it is three or four Years old, its Leaves become round, and begin to reſemble thoſe of the Cypreſs; ſo that the inferior Branches are ſometimes obſerv'd to carry pungent and pointed Leaves, whereas thoſe on the ſuperior Branches are obtuſe and round. Unleſs this Metamorphoſis is diligently adverted to, we may be eaſily impoſed upon, and induc'd to believe, that the young Shrub is a Plant of a different Species from that which is old and full-grown. It grows on the Coaſts of the *Tuſcan* Sea, in the maritime Parts of *Languedoc*, and in great Abundance about *Marſeilles* and *Avignon*; it is alſo produc'd in *Greece*, and delights in cold and ſhady Places.

It is ſaid to be of a heating and diuretic Quality, like common Juniper; and 'tis commonly reported, that the Steam of it, when kindled, baniſhes Serpents. According to *Dioſcorides*, the Berries are moderately heating, aſtringent, and beneficial to the Stomach. When exhibited in Draughts of proper Liquors, they are highly efficacious againſt Diſorders of the Breaſt, Coughs, Inflations, Gripes, and the Wounds inflicted by Serpents. They provoke Urine, and for that Reaſon are proper for Patients afflicted with Ruptures, Convulſions, and hyſteric Fits. The Leaves contain a certain Degree of Acrimony, for which Reaſon either they themſelves, or their Juice, may properly be drank in Wine againſt the Bites of Vipers; or the Part affected may be anointed with the ſame Preparation. The

Country-

Country-people of *Provence*, in *France*, apply the Leaves bruis'd to Carbuncles, in order to put a Stop to their Increaſe: They alſo uſe the Tops of the Trees, if we may believe *Garidel*, for Ropes and Slings to their Waggons and Carts. From the Berries, or the recent Wood, boil'd in Muſt, is prepar'd the *Vinum Cedrinum*, or Cedar-wine, according to *Pliny*, in the ſixteenth Chapter of his fourteenth Book. *Dale* informs us, that he ſaw an Author who expreſly affirm'd, that, in *Carolina*, this Tree yielded a Gum ſo like the true Olibanum, that when he accidentally mix'd ſome Particles of it with Olibanum brought from *Europe*, they ſo much reſembled other each, that they could neither be ſeparated nor diſtinguiſh'd. Hence he concludes, that this is the Tree which produces the Olibanum.

2. Cedrus; folio Cypreſſi; media; majoribus baccis. *C. B. P.* 487. *Cedrus, Phœnicea, altera Plinii & Theophraſti.* Lob. Ic. 221. *Thuya, Maſſilienſium.* Lugd. 59. *Juniperus ex Goâ.* H. L. *Cedrus ex Goâ, vulgô. Sabina, Goënſis.* Raii H. 1916. *Juniperus, Caroliniana, Thuyæ ramulis fuſis & compreſſis, odoratior.* Plukn. Phyt. T. 40. F. 9. H.

Boerhaave makes the great Cedar of *Libanus* to be a Species of the *Larix*. It is thus diſtinguiſh'd by Botanic Authors:

CEDRUS, Offic. Chab. 71. *Cedrus Libani*, Ger. 1161. THE GREAT CEDAR-TREE OF LIBANUS, Emac. 1352. *Cedrus conifera foliis Laricis*, C. B. Pin. 490. Raii Hiſt. 2. 1404. *Cedrus conifera*, Jonſ. Dendr. 315. *Cedrus magna, ſive Libani conifera*, J. B. 1. 277. *Cedrus magna conifera Libani*, Park. Theat. 1532. *Larix Orientalis, fructu rotundo, obtuſo*, Tourn. Inſt. 586. Elem. Bot. 458. Boerh. Ind. A. 2. 180. CEDAR OF LIBANUS. *Dale*.

What we find mention'd in Scripture of the lofty Cedars, can be no ways applicable to the Stature of this Tree; ſince, from the Experience we have of thoſe now growing in *England*, as alſo from the Teſtimony of ſeveral Travellers, who have viſited thoſe few remaining Trees on Mount *Libanus*, they are not inclin'd to grow lofty; but, on the contrary, extend their Branches very far: To which the Alluſion made by the Pſalmiſt agrees very well, when he is deſcribing the flouriſhing State of a People, and ſays, *They ſhall ſpread their Branches like the Cedar-tree*.

Rouwolf, in his Travels, ſays, there were not, at that Time, (*i. e. Anno* 1574.) upon Mount *Libanus* more than 26 Trees remaining, twenty-four of which ſtood in a Circle; and the other two, which ſtood at a ſmall Diſtance, had their Branches almoſt conſumed with Age: Nor could he find any younger Trees coming up to ſucceed them, tho' he look'd about diligently for ſome. Theſe Trees (he ſays) were growing at the Foot of a ſmall Hill, on the Top of the Mountains, and amongſt the Snow. Theſe, having very large Branches, commonly bend the Tree to one Side; but are extended to a great Length, and in ſo delicate and pleaſant Order, as if they were trim'd, and made even, with great Diligence; by which they are eaſily diſtinguiſh'd, at a great Diſtance, from Fir-trees. The Leaves (continues he) are very like to thoſe of the Larch-tree, growing cloſe together in little Bunches, upon ſmall brown Shoots.

Maundrel, in his Travels, ſays, there were but ſixteen large Trees remaining, ſome of which were of a prodigious Bulk; but that there were many more young Trees of a ſmaller Size: He meaſured one of the largeſt, and found it to be twelve Yards ſix Inches in Circumference, and yet ſound, and thirty-ſeven Yards in the Spread of its Boughs. At about five or ſix Yards from the Ground it was divided into five Limbs, each of which was equal to a great Tree. What *Maundrel* hath related, was confirm'd to me by a worthy Gentleman of my Acquaintance, who was there in the Year 1720. with this Difference only, in the Dimenſions of the Branches of the largeſt Tree, which, he aſſured me, he meaſured, and found to be twenty-two Yards Diameter. Now, whether Mr. *Maundrel* meant thirty-ſeven Yards in Circumference of the ſpreading Branches, or the Diameter of them, cannot be determined by his Expreſſion; yet neither of them well agree with my Friend's Account.

Monſieur *Le Bruyn* reckons about thirty-five or thirty-ſix Trees remaining upon Mount *Libanus*, when he was there; and would perſuade us, it was not eaſy to reckon their Number (as is reported of our *Stonehenge* on *Saliſbury* Plain). He alſo ſays, their Cones ſome of them grow dependent; which is abundantly confuted by the above-mention'd Travellers, as alſo from our own Experience: For all the Cones grow upon the upper Part of the Branches, and ſtand erect, having a ſtrong woody central Style, by which it is firmly annex'd to the Branch, ſo as, with Difficulty, to be taken off; which central Style remains upon the Branches after the Cone is fallen to Pieces, ſo that they never drop off whole, as the Pines do.

The Wood of this famous Tree is accounted Proof againſt all Putrefaction of Animal Bodies: The Saw-duſt of it is thought to be one of the Secrets uſed by thoſe Mountebanks who pretend to have the embalming Myſtery. This Wood is alſo ſaid to yield an Oil, which is famous for preſerving Books and Writings; and the Wood is thought, by my Lord *Bacon*, to continue above a thouſand Years ſound. It is alſo recorded, that, in the Temple of *Apollo* at *Utica*, there was found Timber of near two thouſand Years old. And the Statue of the Goddeſs, in the famous *Epheſian* Temple, was ſaid to be of this Material alſo; as was moſt of the Timber-work of that glorious Structure. *Miller's Dictionary.*

CEDUE. The Air. *Rulandus.*

CEDURINI. A Word made uſe of by *Paracelſus* in his Treatiſe *de Vita longa*; but he does not explain the Meaning of it; nor do I know, that any body has found it out.

CEIRIÆ, κηρίαι. Flat Worms. *Galen.*

CELASTRUS. The Staff-tree. See ALATERNUS.

CELATUS *Aer* is Air ſtagnating in Wells, or cloſe Buildings, neither warm'd by the Sun, nor agitated by the Wind.

CELE, κήλη. A Hernia, or Rupture of any Kind.

CELERY.

Under the Article APIUM we have obſerved, that ſome Authors were of Opinion, that the Celeri, or Seleri, by the *Engliſh* call'd *Celery*, was only the *Apium Paluſtre*, improved by Culture. But others, with greater Juſtice, affirm, that the former is entirely different from the latter; ſince there are various Species of the Celeri not only diſtinct from the *Apium Paluſtre*, but different from each other. *Ray* is of Opinion, that the Celery ariſing in the *Engliſh* Gardens, from the Seeds imported from *France* and *Italy*, in a few Years degenerates into the *Apium Paluſtre*, on account of the Coldneſs and Inclemency of the Air; ſo that they who would have it genuine, muſt, when this Change happens, have recourſe to theſe Countries for freſh Seeds. This Plant is poſſeſs'd of the ſame Virtues with the *Apium of the Shops* (which ſee). Thoſe who are fond of Venereal Intercourſes, love Brandy diſtil'd from the Seeds of the Celery. The Root, which is externally white, like a Turnep, and the interior Part of the Stalk, when well waſh'd, and cut into Slices, are uſed as a Salad; and thought an uncommon Delicacy in the Winter, and latter End of the Autumn. The Manner of preparing them is with Oil and Pepper, and many add Salt and Vinegar. The Root is alſo boil'd with Fleſh and Fiſh, in order to render them more delicious. Some are alſo fond of the Seeds preſerved with Sugar.

CELIFOLI. The ſame as COELIFOLIUM, which ſee.

CELIS, κηλίς. A Spot, or any Mark, upon the Skin.

CELLA. A Cell. In Anatomy, a great many ſmall Cavities of the Body are call'd Cells.

Cells, in Botany, are thoſe Partitions or hollow Places in the Huſks or Pods of Plants, in which the Seed is contain'd.

CELLULA. A ſmall Cell.

CELLULOSA MEMBRANA. The Cellular Membrane, call'd alſo *Membrana Adipoſa*. This Membrane is of a vaſcular Contexture, and forms innumerable Cells, communicating with each other, in which the Fat is lodged. Theſe Cells are capable of a prodigious Diſtention, by a very ſmall diſtending Force. In a Conſumption they are ſo much waſted, that the leaſt Traces of them are not perceptible. When, in an Emphyſema, they are diſtended with Air, they ſwell to an enormous Bulk; as alſo in an Anaſarca, when fill'd with Water. This Membrane inveſts all the moveable Parts of the Body, and, by its Interpoſition betwixt the internal Part of the Skin and external Surface of the Muſcles, renders the Skin moveable, whilſt the Muſcles are at Reſt. Hence where the Muſcles, which are moſt in Motion, are ſituated, there this Membrane is found to be naturally thickeſt, and moſt replete with Fat; as is viſible on the Breaſt, Abdomen, Back, Loins, Buttocks, Thighs, Legs, Shoulders, Arms, Temples, and Neck. But in thoſe Parts where the Muſcles are very ſmall, or their Action inconſiderable, it is furniſh'd with ſo little Fat, that moſt Anatomiſts have deny'd, that in thoſe Places it is to be found. Thus, in the Head, Eyelids, Face, and Scrotum, they affirm, that there is no ſuch thing; but, however, erroneouſly; for in theſe Parts it really exiſts, but is leſs, in Proportion, as the *Elevator Palpebræ ſuperioris*, and *Corrugator Frontis*, is leſs than the *Glutæi*. But as this Membrane ſeparates the Muſcles from the Skin, ſo it lies betwixt the Muſcles, and ſeparates every individual Muſcle of the Body from every other Muſcle, that they may move upon each other without Difficulty: It forms alſo Vaginæ for the Tendons of the Muſcles, that they may readily move backwards and forwards, without any Hindrance. It farther accompanies the Heads and Tendons of the Muſcles to their Origins from, and Inſertions into, the Bones; where it is expanded upon the external Perioſteum, Bones, and Ligaments of the Joints, which it involves, and inſinuates itſelf to the Viſcera under the Meninges, Pleura, and Peritonæum. Beſides the Involucrum, or Covering, which the Cellular Membrane gives to each Muſcle, as above-mention'd, every individual muſcular Fibre is cloth'd with a Production thereof; by the Intervention of which every Fibre is

 ſeparated,

ſeparated, and diſtinct from every other Fibre. This Membrane, therefore, on account of its incredible Expanſion, and the Communication of its Cells with each other, carries on an Intercourſe between the Parts of the Body the moſt remote from each other; betwixt the Skin, for Example, and the Marrow of the Bones; for, as it reaches from the Skin to the external Perioſteum, and as the Matter which forms the Marrow is convey'd to the Bone, and a Portion of it reconvey'd back again, by the Veſſels of the Perioſteum, the Way is obvious how theſe remote Parts may communicate. *Boerhaave* ſays, he is convinced of this Structure, and theſe Uſes, of the Membrana Celluloſa, by inconteſtable Experiments; and that the Knowledge of it is indiſpenſably neceſſary, both for underſtanding and curing an Inflammation, Suppuration, Gangrene, Scirrhus, Cancer, Atheroma, Steatoma, Meliceris, Sphacelus, and Dropſy.

Boerhaave thinks, that this Membrane is the Part principally affected in the Venereal Diſeaſe.

Cheſelden ſays, that the Cells of this Membrane communicate, throughout the whole Body, ſo much, that, from any one Part, the Whole may be fill'd with Air. I have ſeen two Caſes, ſays he, where the Wind-pipe being cut, and the external Wounds being cloſely ſtitch'd by injudicious Surgeons, the Air, which eſcaped at the Wound of the Wind-pipe, getting into the Cells of the Membrana Adipoſa, blew up the upper Part of the Body like a Bladder. The like Accident I have ſeen from a broken Rib, where, I ſuppoſe, the End of the Rib had prick'd the Lungs: All theſe Perſons died. In theſe Cells the Water is contain'd in an Anaſarca, which, from its Weight, firſt fills the depending Parts, as the Air, in the former Caſes, did the upper Parts; and, when theſe Cells are very full, the Water frequently paſſes from them into the Abdomen; and, after tapping, tho' the Limbs were ever ſo full, they will almoſt empty themſelves in one Night's time. This Membrane is the uſual Seat of Impoſtumations and Boyls, in both which Nature, uninterrupted, always corrodes a Hole in the Skin; from whence we may learn, that the beſt Way of opening any Impoſtumation is by a Hole, and that too as near the time of its breaking naturally as may be, that Nature may make the utmoſt Advantage of the Diſcharge. There is ſometimes a large kind Boyl or Carbuncle in this Membrane, which firſt makes a large Slough, and a Number of ſmall Holes thro' the Skin, which in time mortifies, and caſts off; but the longer the Slough is ſuffer'd to remain, the more it diſcharges, and with the more Advantage to the Patient; at the latter End of which Caſe the Matter has a bloody Tincture, and a bilious Smell, exactly like what comes from Ulcers in the Liver; and both theſe Caſes are attended with ſweet Urine, as in a Diabetes. *Cheſelden.*

CELSA, in *Paracelſus*, imports a certain Flatus or Vapour, confined within the Integuments, and ſeeking a Paſſage thro' them. He means, I ſuppoſe, the ſame which the Vulgar calls the Beating of the Life-blood.

CELSUS. A celebrated medicinal Author, in great Eſteem both for the Elegance of his Style, and his Doctrine. *See the Preface.*

CELTIS. The *Nettle-tree.*

The Characters are,

The Flower is ſhaped like a Roſe, polypetalous, and furniſh'd with many ſhort Stamina: The Ovary, which is fork'd, becomes a round Berry, full of a roundiſh Seed. *Boerhaave's Index alter Plantarum, Vol. 2.*

Boerhaave takes notice of three Species of this Plant,

1. CELTIS, Offic. *Celtis, Lotus Arbor*, Mont. Ind. 39. *Celtis fructu nigricante*, Tourn. Inſt. 612. Elem. Bot. 485. Boerh. Ind. 2. 231. *Lotus Arbor*, Ger. 1308. Emac. 1493. Park. Theat. 1522. Raii Hiſt. 2. 1483. *Lotus fructu Ceraſi*, C. B. Pin. 447. *Lotus Arbor fructu Ceraſi*, J. B. 1. 229. Chab. 16. *Lotus domeſtica*, Jonſ. Dendr. 90. THE NETTLE-TREE.

It grows in *France* and *Italy*. The Fruit, which is uſed in Medicine, is aſtringent, and binds the Belly; but has leaſt of theſe Qualities when ripe. The Decoction thereof is good for a Dyſentery, and for Women labouring under an immoderate Flux of the Menſes. *Dale.*

2. Celtis; fructu nigricante; folio variegato. *H.*

3. Celtis; Africana; procera; fructu flavo. *H. Boerhaave's Index alter Plantarum, Vol. 2.*

CEMBRO, *ſive Pinus cui Oſſicula fragili Putamine.* J. B. *Pinus ſylveſtris montana tertia.* C. B. *Pinus ſylveſtris altera fructifera, Tæda Arbor forte.* Park. *Pinus ſylveſtris ſecunda.* Ger.

This is a Species of Pine, which, *Ray* informs us, grows in the Country of the *Griſons*, where the Inhabitants eat its Fruit. I find no particular Virtues aſcrib'd to it.

CEMENTATIO, or COEMENTATIO. See CALX, and COEMENTUM.

CEMENTERIUM. An Aludel. *Rulandus.*

CEMENTUM. See COEMENTUM.

CENCHRAMIS, κεγχραμὶς. A Grain or Seed of the Fig. When *Hippocrates*, in his Treatiſe of the *Diſeaſes of Women*, directs Figs to be uſed for a Peſſary, he orders them to be boil'd till the Seeds drop out.

CENCHRIAS, κεγχεὶας. A Serpent, call'd alſo *Ammodytes*, of which *Ætius* gives the enſuing Account: This Animal is a Cubit in Length, at moſt, being never repreſented larger by Deſcription nor Delineation. It is of a ſandy Colour, mark'd with black Spots over it: Its Tail is very hard, and fork'd at the Top; and ſome give it the Name *Cenchrias*, from the Hardneſs of its Tail, which, in that reſpect, reſembles *Cenchros*, κέγχρος, Millet. It has wider Jaws than the Viper; and, tho' it be like it in many other reſpects, may be moſt eaſily diſtinguiſh'd by the Colour, for the Viper is yellowiſh.

The Bite of this Serpent is generally follow'd by ſpeedy Death: If the Patient ſurvives a while, Blood flows from the Wound, and the Place ſwells; in a little time after, Sanies is diſcharged, which is follow'd by a Heavineſs of the Head, and a Lipothymy, and Death, in the Space of three Days, where the Symptoms are the moſt favourable; tho' ſome have ſurviv'd to the ſeventh Day. The Bite of the Female is the moſt ſpeedily mortal.

The Method of Cure is, firſt, by common Remedies, as by Cupping, and Scarifying all round the Place, Conſtriction of the Parts above the Bite, and making Inciſions in the Wound. Peculiar Medicines are Mint, drank in Hydromel; Caſtor, Caſia, and the Juice of Mugwort, taken in Water: The Patient is alſo to take Theriaca; and the ſame is to be apply'd to the Wound. Drawing Plaiſters are alſo to be uſed; and afterwards Cataplaſms proper for Nomæ, or ſpreading Ulcers. *Aetius, Tetrab. 4. Serm. 1. Cap. 25.*

The Bite of the Cenchrias is like that of the Viper, and is ſucceeded by a Tumor like an hydropical one; after which the Fleſh putrefies, and falls off, the Patient is ſeiz'd with a Lethargy, and falls into a profound Sleep. *Eraſiſtratus* ſays, that the Liver, Bladder, and Colon, are affected; for, in Diſſections, theſe Parts are found to be corrupted.

Outward Applications, proper for the Bite of this Serpent, are the Seeds of Lettuce, Linſeed, bruiſed Savory, wild Rue, with Mother of Thyme, and Haſta Regia, or King's-ſpear, bruiſed together. The Patient muſt immediately take two Drams of the Root of Centaury, or of Birthwort, in a Quarter of a Pint of Wine: Naſturtium alſo, and Gentian, are proper in the like Caſe. *P. Ægineta, Lib. 5. Cap. 16.*

CENCHRITES, or ACONTIAS, is a Serpent, two Cubits in Length, of a tapering Figure, of a green Colour, eſpecially about the Belly, ſo as to reſemble Millet; whence it is, by ſome, call'd *Cenchrias* (*ſee the preceding Word*); and, they ſay, it is more robuſt than uſual when Millet is in Flower. When it prepares to bite, it ſtretches itſelf out, and throws itſelf like a Dart upon the Object where it aim'd to do a Miſchief, and inflicts a Wound after this manner.

The Bite of this Serpent is ſucceeded by all the Symptoms conſequent upon the Bite of the Viper, and even worſe; ſuch as the Putrefaction and Falling-off of the Fleſh, and a more deplorable Death. The Remedies, in this Caſe, are the ſame as thoſe preſcrib'd againſt the Bite of the Viper. *Aetius, Tetrab. 4. Serm. 1. Cap. 27.*

The ſame medicinal Virtues are attributed to the Fleſh of theſe Serpents, as to that of the Viper.

CENCHROS, κέγχρος. Millet. See MILIUM. The Seeds of Millet are ſometimes, in *Hippocrates*, called κεγχρεῖδες.

Hence κεγχρειδὲες ἱδρῶτες, Miliary Sweats, or Sweats which break out in Drops as large as the Seeds of Millet. And τεγχύσματα κεγχρώδεα, Miliary Aſperities, or Miliary Eruptions, which *Hippocrates*, in the Beginning of his ſecond Book of *Epidemics*, deſcribes as attending a certain epidemical Fever, with theſe Circumſtances, that they did not cauſe much Itching, that they appear'd upon Women only, and that all who had them recover'd.

Sir *David Hamilton* has wrote a Treatiſe expreſly upon the Miliary Fever, an Account of which Diſorder ſee under the Article MILIARIS *Febris.*

CENEANGIA, κενεαγγεὶη, from κενὸς, empty, and ἄγγος, a Veſſel. Any Inanition of the Veſſels. It is uſed to expreſs Abſtinence, or Faſting, with a View of emptying the Veſſels.

CENEBRIA, κενεβρὶα. An Epithet for Fleſh, importing the Fleſh of Animals which die of themſelves, Carrion.

CENEONES, κενεῶνες, from κενὸς, empty. The Flanks; the Space on each Side, betwixt the ſpurious Ribs and the Os Ileum.

CENIFICATUM, or CINIFICATUM. Calcin'd. *Rulandus.*

CENIGDAM. See CENIPLAM.

CENIOTEMIUM. A purging Remedy, effectual in Venereal Diſorders, which *Paracelſus* mentions, without ſaying what it is. It is ſuppoſed to be ſome mercurial Preparation.

CENIPLAM, *Cenigdam, Cenigotam*, or *Cenipolam*, *Rulandus* ſays, this is a Name for a chirurgical Inſtrument, with which the Cranium is open'd in an Epilepſy.

CENOSIS,

CENOSIS, κένωσις, from κενὸς, empty. Evacuation. In *Hippocrates*, κένωσις muſt be diſtinguiſh'd from κάθαρσις, the former importing a general Evacuation of all the different Sorts of Humours together, by any means whatever; the latter, an Evacuation of ſome particular Humour, when offenſive with reſpect to its Quality.

CENTAURIUM *majus*. The greater Centaury.

The Characters are;

It has a perennial Root; the Leaves are not prickly, but ſerrated on the Edges; the Flower-cup is ſquamous, and void of Prickles; and the Flower of a large and beautiful Size. *Boerhaave Index alter.*

Boerhaave mentions nine different Sorts of this Plant.

1. Centaurium; majus; Orientale; erectum; glaſti folio; flore luteo. *T. Cor.* 32. *Commel. Rar.* 39. *Ic. & Deſcr.*

2. *Rhaponticum falſum*, Offic. *Rhaponticum folio Helenii incano*, C. B. 117. *Rhaponticum Enulæ folio latiore*, Park. 156. *Rha Capitatum Lobelii*, Ger. 316. Emac. 393. *Centaurium majus*, *Rha Capitatum folio Enulæ ſubtus incano & hirſuto*, J. B. 3. 41. Raii Hiſt. 1. 331. Chab. 345, Hiſt. Oxon. 3. 132. *Centaurium majus folio Helenii incano*, El. Bot. 355. Tourn. Inſt. 449. Boerh. Ind. A. 143. RAPONTIC.

This is cultivated in ſome Botanic Gardens; the Root is thick, oblong, and denſe; brown externally, and when cut tranſverſly, of a yellowiſh Colour internally. It is of a bitteriſh and ſomewhat acrid Taſte, ſubaſtringent, and of a pretty grateful Smell. *Dale.*

3. Centaurium; majus; folio Helenii, anguſtiore. *T.* 449.

4. Centaurium; majus; Alpinum, luteum. *C. B. P.* 117. *Prodr.* 56. *M. H.* 3. 132.

5. Centaurium; folio Cinaræ. *Corn.* 72.

6. *Centaurium majus*, Offic. Chab. 344. *Centaurium magnum*, Ger. 436. Emac. 546. Raii Hiſt. 1. 329. *Centaurium majus vulgare*, Park. 469. *Centaurium majus folio in lacinias plures diviſo*, C. B. Pin. 117. Tourn. Inſt. 449. Boerh. Ind. A. 144. *Centaurium majus juglandis folio*, J. B. 3. 38. Hiſt. Oxon. 3. 131. GREAT CENTAURY. *Dale.*

The great *Centaury* has a large Root, of a reddiſh Colour on the Outſide, running deep into the Ground: From which ariſe many large long Leaves, green above, whitiſh and hoary underneath, deeply cut into ſeveral Sections, which are ſerrated about the Edges; tho' ſometimes they are whole, and not cut in at all, but only ſerrated. The Stalks grow to be five or ſix Feet high, thick, and divided into ſeveral Branches, on which grow ſmaller and more divided Leaves; at the End of them come forth large round ſcaly Heads, out of which ariſe a Cluſter of fiſtular purpliſh Flowers, which afterwards turn into Down, incloſing ſhining longiſh Seed.

It grows in ſome of the mountainous Parts of *Italy*, and flowers in *July*.

The Root, which is the only Part uſed, is drying and binding, and good for all kinds of Fluxes; ſtops Bleeding either at the Noſe or Mouth, or any other Part; and is of great Uſe to heal Wounds, taking its Name, ſays *Pliny*, from the Centaur *Chiron*, who cured himſelf of a Wound he receiv'd by one of the Arrows of *Hercules*, by the Uſe of this Plant. It is very rarely uſed. *Miller's Bot. Off.*

The Root is long, ſtrait, and thick; of a reddiſh-brown Colour externally, but of a lighter-red internally; of a ſweetiſh and ſubacrid Taſte. It has the Reputation of opening Obſtructions in the Liver, and corroborating that Part. It is alſo uſed in Hernias.

7. Centaurium; majus; flore exalbido. *Ind.* 54.

8. Centaurium; majus; alterum; laciniatum; purpuraſcens flore. *H. R. Par.*

9. Centaurium majus; folio molli, acuto laciniato, flore aureo magno; calice ſpinoſo. *Boerhaave's Index alter Plantarum.*

Dale mentions another Species of the CENTAURIUM MAJUS, which is the

Rhaponticum, J. B. 2. 989. Chab. 310. *Rhaponticum ficcatum*, Ger. 317. Emac. 395. *Rhaponticum genuinum*, Park. 155.

It is not much unlike the *Rhaponticum falſum*, either in Appearance, or Virtues.

CENTAURIUM MINUS, The leſſer Centaury.

The Characters are;

The Leaves are conjugated; the Flower-cup long, tubulous, pentagonal, quinquefid, with ſharp-pointed Segments; the Flowers monopetalous, pentapetaloidal, Funnel-ſhaped, perforated at the hinder Part, furniſhed with five Stamina, and diſpoſed almoſt in the Shape of an Umbella; the Fruit is generally oval, cylindrical, or conical, producing a long Tube, when ripe, cleaving into two Parts, divided into two diſtinct Cells, which are full of numerous little Seeds. *Boerhaave's Index alter.*

Boerhaave takes Notice of four Sorts of the leſſer Centaury.

1. CENTAURIUM MINUS, Offic. C. B. Pin. 278. SMALL PURPLE CENTAURY, Raii Hiſt. 2. 1092, Synop. 3. 286, Chab. 447. Boerh. Ind. A. 223. Tourn. Inſt. 122. Elem. Bot. 102. Dill. Cat. Giſſ. 127. Buxb. 60. *Centaurium minus vulgare*, THE ORDINARY SMALL CENTORY, Park. Theat. 272. Merc. Bot. 1. 28. Phyt. Brit. 25. *Centaurium minus flore purpureo*, J. B. 3. 353. *Centaurium minus rubrum*, Hiſt. Oxon. 2. 566. *Centaurium parvum*, Ger. 437. Emac. 547. Mer. Pin. 24. CENTAURY. *Dale.*

The common ſmall *Centaury* ſeldom grows to be above a Foot high, full of ſquare Stalks, having two oblong round-pointed Leaves, ſet on without Foot-ſtalks at each Joint. The Flowers grow Umbel-faſhion, many together, on the Tops of the Branches, conſiſting of a ſimple Leaf apiece, cut into five Petala, laid open like a Star, with ſeveral ſmall yellow Stamina in the Middle, ſtanding in a long hollow Calyx; they are of a beautiful red Colour. The Seed is very ſmall, included in a ſlender Seed-veſſel. The Root is ſmall and ſticky, periſhing every Year.

It grows in Fields, and dry Paſture-grounds; and flowers in *June* and *July*.

Centaury is of a very bitter Taſte, and of an aperitive cleanſing Faculty, opens Obſtructions of the Liver and Spleen, provokes Urine and the Menſes, helps the Jaundice and intermitting Fevers, ſtrengthens the Stomach, and deſtroys Worms; outwardly it is uſed in Fomentations, againſt Swellings and Inflammations.

Officinal Preparations are only an Extract. *Miller's Bot. Off.*

The Leaves and the Flowers are intolerably bitter; and, for all that, they give a conſiderably Tincture of red to blue Paper; which makes us conjecture, that the Salt of this Plant is not very different from that which is natural in the Earth, which is very bitter. We have the ſame Reaſon to believe, that the Salt of the ſmall *Centaury* is mixed with a conſiderable Quantity of Sulphur and Earth; but in ſuch a manner, that the Sal Ammoniac is more diſengaged in it, than the other Principles. The Salt which is found in the Aloes, in the Jeſuit's-bark, and Ipecacuanha, is much of the ſame Nature; for theſe Subſtances, which are very bitter, give a red Colour to the Solution of Tourneſole; that is, the Aloes, a beautiful red, and the two others a gridelin: Thus it is no Wonder, that the ſmall *Centaury* ſhould be febrifugous, laxative, and aperitive; that it ſhould kill Worms, and re-eſtabliſh the Functions of the Primæ Viæ. They infuſe a Handful of the Tops of this Plant in a Glaſs of White-wine; but as the Infuſion is very bitter, it is better to make the Extract of *Centaury*, and give a Dram of it; or mix it with as much Powder of Jeſuit's-bark, chiefly for intermitting Fevers, when there are Obſtructions in the Bowels; for in theſe Caſes the Patients are cured without any Return. The Infuſion or the Decoction of the ſmall *Centaury* is vulnerary, deterſive, and very reſolvent, if applied externally. *Martyn's Tournefort.*

2. Centaurium; minus; flore albo. *H. Eyſt. Vern.* 0. 5. *F.* 8. *Fig.* 3. *C. B. P.* 278. *J. B.* 3. 353. *H. R. Par.*

3. Centaurium; minus; caryophylloides; Africanum; ſempervirens. *Par. Pat. Prod.* 321.

4. Centaurium; luteum; perfoliatum. *C. B. P.* 278. *J. B.* 3. 355. *M. H.* 3. 565. *Boerhaave's Index alter Plantarum.*

CENTIMORBIA. A Name of the NUMMULARIA, which ſee.

CENTINERVIA. Plantain. See PLANTAGO.

CENTINODIA. A Name for the POLYGONUM, which ſee.

CENTRATIO. A Term employ'd by *Paracelſus*, to expreſs the degenerating of a ſaline Principle, and contracting a corroſive and exulcerating Quality. Hence *Centrum Salis* is ſaid to be the Principle, or Cauſe of Ulcers. *Caſtellus.*

CENTRION, κέντριον, from κεντέω, to prick. An Epithet for a Plaiſter in *Galen*, calculated againſt Stitches in the Side.

CENTRUM. The Centre, in the chymical Language, imports the principal Reſidence, Foundation, or Source of any thing: And alſo that Part of a Medicine in which its greateſt Virtues reſide.

CENTUM CELLIS, in *Rhodius's* Notes to *Scribonius Largus*, ſignifies the Town now call'd *Civita Vecchia*, formerly famous for excellent Chalybeate Waters.

CENTUNCULUS, the ſame as the ALSINE, which ſee. *Blancard* ſays it is the GNAPHALIUM.

CEPA. The Onion.

The Characters are;

The Root is bulbous, tunicated; or conſiſting of Coats, orbicular; the Leaves fiſtulous; the Stalk fiſtulous, ſwelling into a Belly, which is turbinated on both Sides; the Flowers hexapetalous, and collected into a ſpherical Head or Corymbus; the Style of the Flower becomes a roundiſh Fruit, tricapſular, full of roundiſh Seeds. *Boerh. Index alter P.*

Boerhaave takes notice of ten Sorts of Onions,

1, *Cepa*, Offic. *Cepa vulgaris*, C. B. Pin. 71. Elem. Bot. 304. Raii Hiſt. 2, 1116. Hiſt. Oxon. 2. 383. *Cepa alba & rubra*, Ger. 134, Emac. 169. Park. Parad. 512. *Cepa vulgaris*

garis floribus & tunicis candidis & purpuraſcentibus, Tourn. Inſt. 382. Boerh. Ind. A. 2. 144. Rupp. Flor. Jen. 123. Buxb. 62. *Cepa rubra & alba, rotunda & longa*, J. B. 2. 547. *Cepa vel Cæpe*, Chab. 200. ONIONS. *Dale.*

This is a well-known Root, having a large round flat Body, cover'd with a thin reddiſh Skin, and compos'd of ſeveral Coats one over another, with a Bunch of ſmall Fibres at the Bottom; the Stalk grows to be about two Feet high, with a few green hollow fiſtular Leaves, and at the Top a kind of round Umbel, of numerous ſmall ſix-leav'd Flowers, ſucceeded by three ſquare black Seeds. The whole Plant is of a ſtrong, and, to many, an offenſive Smell, making the Eyes water upon peeling or cutting. It is cultivated in Gardens; the Root only is uſed.

Onions are of great Uſe in the Kitchen, being not only put into Sauces, and Pottages, but eaten as Food. They are ſomewhat windy, but otherwiſe very wholſome for thoſe who abound with cold and moiſt Humours, and are helpful againſt Coughs and Diſeaſes of the Breaſt; beaten into a Cataplaſm with a little Salt, they are a very good Remedy to fetch out the Fire in Burns or Scalds, when the Skin is not off. *Miller's Bot. Off.*

We are convinc'd by Experience, that Onions, eſpecially when externally apply'd, are poſſeſs'd of very ſingular medicinal Virtues; for nothing is of greater Efficacy in ſoftening hard Tumors, and maturating venereal Buboes, than roaſted Onions, eſpecially when apply'd in Conjunction with Figs. They alſo afford a ſpeedy Relief, if applied to the Pubes of Children labouring under a total Suppreſſion of Urine. There is alſo in all the various Species of Garlicks and Onions, a certain ſubtile cauſtic Salt, of a highly penetrating and bliſtering Quality, which, when applied immediately to the nervous Parts, excites violent Pains, and ſometimes an Inflammation. According to *Caſpar Hoffman*, in the fifth Book of his *Inſtitut. Med.* the Juice of Onions, entering Wounds, prevents their Conſolidation; and taints Knives and Inſtruments, as it were, with a gentle Poiſon; which deſerves to be adverted to, that we may guard againſt the Conſequences. But Onions are daily uſed internally, without producing any bad Effects. *Hoffman de Præſtantia Remed. Domeſtic.*

2. Cepa; vulgaris; floribus & tunicis candidis. *C. B. P.* 71. *M. H.* 2. 383. THE WHITE SPANISH ONION.

3. Cepa; oblonga. *C. B. P.* 71. *Dod. p.* 687. *M. H.* 2. 383. THE STRASBURGH ONION.

4. Cepa radicis tunicâ buxeâ. *K.*

5. *Cepa aſcalonica*, Offic. *Cepa aſcalonica*, Matth. 1, 556. Hiſt. Oxon. 2. 383. Tourn. Inſt. 382. Elem. Bot. 304. Boerh. Ind. A. 2. 144. Rupp. Flor. Jen. 123. *Cepa aſcalonica ſive fiſſilis*, J. B. 2. 551. Chab. 200. *Cepa ſterilis*, C. B. Pin. 72. *Cepa aſcalonica ſive aſcalonitides*, Park. Parad. 513. *Aſcalonitides*, SCALLIONS, Ger. Emac. 170. BARREN ONIONS, ESCHALOTS.

The Root of this is employ'd for culinary Uſes. It is eſteem'd heating, drying, inciding, aperient, provocative. It excites an Appetite, and deſtroys Worms in the Inteſtines. *Dale.*

6. SCHOENOPRASSUM, Offic. Ger. 139. Emac. 176. Park. Theat. 870. *Porrum ſectivum juncifolium*, C. B. P. 72. *Prorum juncifolium*, Offic. Comm. Plant. Uſual. 65. *Porrum ſectivum & Schœnopraſſum quorundam*, J. B. 2. 553. Raii Hiſt. 2. 1117. Chab. 200. *Cepa ſectilis*, Rupp. Flor. Jen. 123. *Cepa ſectilis juncifolia perennis*, Hiſt. Oxon. 2. 383. Tourn. Inſt. 382. Elem. Bot. 304. Boerh. Ind. A. 2. 144. CIVES or CHIVES.

It agrees in Virtues with Onions.

7. Cepa; fiſſilis; Matthioli. *Lugd.* 1539. *C. B. Pin.* 72. CIBOULE.

8. Cepa; ſylveſtris; tenuifolia; prolifera & florifera. See ALLIUM SYLVESTRE.

9. Cepa; Luſitanica; foliis capillaceis; minima; flore purpuraſcente. *T.* 385.

10. Cepa; Alpina; paluſtris; tenuifolia. *T.* 385. *Boerhaave's Index alter Plantarum.*

CEPÆA. Baſe Orpine. See SEDUM.

CEPASTRUM. *Dale* includes under this Title the *Allium ſylveſtre*, Crow-garlick. See ALLIUM. The *Cepa Aſcalonica*, Eſchalots, and the *Schœnopraſſum*, Chives. See CEPA. Theſe, he ſays, agree with the *Cepa*, with reſpect to their fiſtulous Leaves, and ſtrong Smell; but diſagree as to their Roots, which are proliferous; and their Stalks, which are not bellied like thoſe of the *Cepa*.

CEPHALÆA, κεφαλαία. A ſort of Head-ach. See CEPHALALGIA.

CEPHALALGIA, κεφαλαλγία, from κεφαλὴ, the Head, and ἄλγος, Pain. A Head-ach.

CEPHALÆA, κεφαλαία, and *Cephalalgia*, are Affections of the Head, which differ in Degree; for a *Cephalæa* is an inveterate and obſtinate *Cephalalgia*, according to *Aretæus*, *Lib.* 1. *Cap.* 2. *de Cauſ. & Sign. Chron. Morb.* where he ſays, "A "ſudden Pain of the Head, from any tranſient (παροδικὸν) "Cauſe, tho' it may laſt for ſeveral Days, is call'd a *Cepha-* "*lalgia*; but if the Pain be grown inveterate, and accuſtom'd "to make long and frequent Returns, and becomes more and "more violent, and difficult to cure, we call it a *Cephalæa*."

The Author of the *Definitiones Medicæ* ſays, "A Cephalæa "is an Affection of the Head, cauſing an intolerable Pain at "certain Periods of Time, attended with a Ringing in the "Ears, and Redneſs of the Eyes, a Diſtention of the Veins "in the Forehead, and a red Colour in the Face."

As Diſſections of Perſons who have died of ſevere Head-achs, which have been related by Authors, are too numerous to be inſerted in this Place, we ſhall here abridge ſome of the moſt curious and important Obſervations relating to *Cephalalgias*, collected by the celebrated *Bonetus*; taking care, at the ſame time, not to omit any Circumſtance of Moment, nor to paſs over any Phenomenon which has the leaſt Tendency either to inform the Judgment, or direct the Practice, of the Surgeon and Phyſician.

OBSERVATION I.

A certain Merchant, about forty Years of Age, of a melancholic Habit, and deeply involved in the Cares of the World, was, during the Dog-days, ſeiz'd with a violent Pain of his Head, which ſome time after oblig'd him to keep his Bed.

I, being call'd, order'd Veneſection in the Arms, the Application of Leeches to the Veſſels of his Noſtrils, Forehead, and Temples, as alſo to thoſe behind his Ears; I likewiſe preſcrib'd the Application of Cupping-glaſſes, with Scarification, to his Back: But, notwithſtanding theſe Precautions, he dy'd on the fourth Day, without the Appearance of any freſh Symptom. If any Surgeon, ſkill'd in Arteriotomy, had been preſent, I ſhould have alſo order'd that Operation.

Upon opening the Cranium, the Veſſels of the Meninges and Brain were found ſomewhat livid, and ſo turgid with Blood, that the Cranium ſcarce ſeem'd capable of containing the Brain. In the anterior Part of the Brain, near the Forehead, there was found a ſmall Abſceſs, about the Bulk of a Nut, full of Serum, and yielding to the gentleſt Touch.

OBSERVATION II.

A certain Lady of Diſtinction, who had for ſeveral Years been ſubject to ſpaſmodic Diſorders, began at laſt to complain of a violent Pain, and Senſe of Weight, in her Head; and happening, about the Beginning of the Night, to awake out of a ſound Sleep, ſhe was ſeiz'd with a convulſive Fit, which ſuddenly degenerated into a fatal Apoplexy.

Upon laying open her Cranium, the Veſſels of the Meninges and Brain were diſtended, and turgid with Blood; whereas in diſſecting the other Parts of her Body, ſcaree any Blood at all was diſcharg'd. Upon removing the Dura Mater, thro' the Pia Mater, which is ſlender and pellucid, was diſcover'd a limpid Water, filling the Corrugations and Sinuſes of the Brain, and, as it were, overflowing its whole Subſtance. The Plexus Choroides had been ſo long immers'd in this Water, that it appear'd diſcolour'd, half corrupted, and, as it were, boil'd. *Willis Pathol. Cerebri, Cap.* 10.

OBSERVATION III.

A certain Man, after complaining for two Years of a Pain in his Head, at laſt fell a Victim to his Diſorder.

Upon opening his Cranium, the Dura Mater was found eat out into Holes in ſeveral Places, eſpecially in the Bregma, under the Sagittal Suture, where it is join'd with the Coronal. Thro' theſe Holes there flow'd a black, and almoſt concreted Blood, with which alſo the Veſſels diſtributed on the external Surface of the Dura Mater, and thoſe running thro' the Pia Mater, were diſtended. The Subſtance of the Cerebellum was become entirely flaccid, and much ſofter than the Brain itſelf. *P. Pavvius, Obſervat. Anat.* 8.

OBSERVATION IV.

A certain Lady apply'd to the Phyſicians for the Cure of a Fluor Albus. A few Days after this Application ſhe was ſeiz'd with a violent Pain of the Side, accompany'd with a Fever. The Phyſicians agreed, that ſhe labour'd under a Pleuriſy and Peripneumony, and accordingly preſcrib'd for her. The celebrated *Duretus*, who was one of thoſe who attended her, predicted that if a Pain and Itching of the Head ſucceeded, the Death of the Patient would be unavoidable, becauſe, in that Caſe, the Matter producing the Peripneumony would be tranſfer'd to the Head. Next Day the Symptoms he mention'd appear'd, and the Patient dy'd a few Hours after.

Her Body was open'd, in order to diſcover whether this Prediction was juſt, and whether there had been a Tranſlation of the Humour from the Pleura to the Head. Accordingly, upon laying open her Cranium, we found all the Parts within the Pia Mater and Brain ſtuffed with Pus. *Ambroiſe Paré, Lib.* 24. *Cap.* 68.

OBSERVATION

Observation V.

A certain Man, afflicted with a long-continu'd Head-ach and Watchings, was at laſt ſeiz'd with a ſlight Delirium, and dy'd of a Convulſion.

Upon opening his Cranium there was an Abſceſs found, full of a fetid and corrupt Pus. *Sebaſtianus Naſius. Meth. Med. Part.* 2. *Quæſt.* 16.

Observation VI.

Willis, in his *Anatomy of the Brain*, *Cap.* 9. informs us, that he had frequent Opportunities of opening the Heads of thoſe who, during their Lives, had been much ſubject to Head-achs. In theſe Subjects, hard by the longitudinal Sinus, where the Seat of the Pain was, the Pia Mater was found growing to the Dura Mater for a conſiderable Space, often for two Fingers Breadth. By this Coalition a rough and unequal Tumor is rais'd, in which the Mouths of the Veſſels are entirely obſtructed, ſo that the Blood, tho' in a violent Effervеſcence, can have no Acceſs to the adjacent Sinus.

Observation VII.

A certain Monk had labour'd under a Head-ach for ten Years, and every Year us'd above three Pounds of *Philonium* for alleviating the Pain: But his Diſorder aroſe from Venereal Abſceſſes, Tophs, and a Caries of the Bone; for, upon applying the Trepan, his Head was found full of Phlegm, and the Cranium corrupted, ſoon after which he dy'd.

An Inſtance ſomewhat analogous to this we find in the *Prælectiones Practicæ* of *Hercules Saxonia*.

A certain Woman, afflicted with a ſcald Head, was at laſt, by the Uſe of certain Lotions, freed from her Diſorder; upon which ſhe was ſeiz'd with a Head-ach, and a continu'd Fever. I, being call'd to her, told her, that I was not in the leaſt ſurpris'd at her Fate. But as her Symptoms neither yielded to the Methods of Derivation, Revulſion, nor Evacuation, ſhe dy'd thirty Days after.

Upon opening the Cranium, the entire Half of the Brain, on the Right Side, was found entirely putrid, and ſtuffed with a yellowiſh Ichor, which reſembled Urine.

Observation VIII.

A certain Perſon, by the Blow of a Horſe's Foot, receiv'd a Wound in the Head, which ſcarce reach'd the Cranium: Immediately after, he complain'd of an intenſe Pain of his Head and Neck. Upon opening the Cranium, we found Half of the Brain putrify'd. In the lateral and middle Ventricles we found a large Quantity both of Pus and Water, ting'd of a reddiſh Colour. The Dura Mater was, however, entire, and apparently unaffected.

Observation IX.

A certain rakiſh Fellow, after labouring for a great while under the Lues Venerea, and its ſeveral concomitant Symptoms, was at laſt afflicted with a moſt cruel and racking Head-ach, which, notwithſtanding all the Methods uſed for his Recovery, afflicted him ſo violently, both in the Night and Day-time, but eſpecially during the former, that he made ſeveral Attempts to lay violent Hands on himſelf. His vital and animal Powers at laſt failing, in conſequence of the intenſe Pain, he dy'd.

Upon laying open his Cranium, and freeing it from the Dura and Pia Mater, nothing of the Brain was found in the whole Cavity of the Cranium, but only a certain mucous Subſtance, and an indigeſted Phlegm, which ſcarce fill'd a fourth Part of the Cavity of the Cranium.

Observation X.

A certain Woman was, for twenty-five Years, rack'd with an intolerable Head-ach, which, when ſhe began to chew her Aliments, or expoſed herſelf to an inclement Air, was ſo increas'd, eſpecially in the Right Side, that Torrents of Tears burſt from her Eyes, and, by her Cries, ſhe diſturb'd not only the Family in which ſhe liv'd, but alſo the Neighbourhood. In vain did ſhe implore the Aſſiſtance of ſeveral Phyſicians, for the Removal of her Diſorder. Death, however, at laſt put an End to her Miſery.

Upon opening her Cranium we found, firſt, under the Pia Mater, a large Quantity of limpid Water; ſecondly, the Ventricles of the Brain fill'd with a ſimilar Liquor; thirdly, in the pineal Glands ſeveral ſmall and rough Concretions of Sand, ſome of which, in conſequence of their Bulk, deſerved the Name of Stones; fourthly, the carotid Arteries ſo indurated, that externally they ſeem'd to have acquir'd a ſtony Texture; but upon opening them we found, that a callous ſtony Subſtance adher'd to their Sides. Thro' the Middle of theſe Arteries there was ſtill left a kind of Paſſage for the Blood. *Regner de Graaf*, in *Miſcel. Curioſ. Ann.* 1670.

Observation XI.

A certain young Man was afflicted with a long-continu'd Head-ach, of ſo obſtinate a Kind, that it would not yield to the Force of any Remedies. After his Death ſcarce were the ſmalleſt Traces of Sutures to be obſerv'd in his Cranium, the Bones of which appear'd, as it were, to be one continu'd Subſtance. This Circumſtance was univerſally concluded to be the Cauſe of his Diſorder, ſince, in conſequence of the Obliteration of the Sutures, there was no Paſſage left for theſe thick Steams and Vapours which prov'd the Cauſe of his Pain. *Columb. Anat. Lib.* 1. *Cap.* 5.

Observation XII.

A certain Lady of Diſtinction, who had long labour'd under a pungent Head-ach, which reſembled the Pricking of Needles or Darts in the Part affected, and which was ſometimes more, and ſometimes leſs violent, at laſt fell a Sacrifice to her Diſorder.

Upon opening her Cranium there was found, under the Dura Mater, near the torcular Herophili, a certain indurated ſtony Matter, reſembling a ſmall rocky Protuberance, unequal, rough, with many Points, variegated, as it were, with Appearances like Cats Claws, the Images of Shell-fiſhes, and ſeveral other Figures, and adhering ſtrongly to the Dura Mater. Between the Inequalities of this Protuberance ſmall Veins were diſtributed, which moiſten'd this Subſtance. Above the Pia Mater there was a certain mucous Humour found. *Cattierus, Obſerv. Medic.* 15.

The *Cephalæa* frequently proceeds from Refrigeration, or Cold, or, on the contrary, from the Heat of the Sun's Rays, or from long want of Sleep; and Women are more ſubject to this Diſorder than Men, becauſe they are ſo much employ'd about the Care of their Hair. The Patient labouring under this Diſeaſe is affected with a violent Pain of the whole Head, or of one Half thereof, which is uſually call'd *Hemicrania*, or only of the Temples, which kind of Pain they call *Cretaphos* (from κρόταφος, a Temple). The Pain extends itſelf alſo to the Roots of the Eyes, the hinder Part of the Head, and the Neck, as far as the Spine of the Back, in ſuch a manner, that, when the Patient attempts to ſit down, he is ſeiz'd with a Vertigo and Dimneſs of Sight, a Sickneſs at the Stomach, and Vomiting of Bile. Under an Exacerbation of this Diſorder the Eyes become red and prominent, and the Eyelids cloſed to avoid the Light; Tears flow, there is a Loathing of all Food, a Dulneſs of Sight, a Ringing in the Ears, and a Thickneſs of Hearing, long and frequent Watchings, Tooth-ach, and, at the Beginning of the Paroxyſm, a Diſtillation of a few Drops of Blood from the Noſe, not at all relieving the Patient.

In this Caſe, if the Pain affect the whole Head, the Patient is to lie on his Back; if only Half of the Head be affected, he muſt lie on that Side; for the Pain is, in ſome meaſure, mitigated by the kindly Warmth, and gentle Compreſſion, of the Bed. If the Diſeaſe increaſes, there follows an Alteration of the Countenance for the worſe, a Lowneſs of the Pulſe, and a Dulneſs of all the Senſes.

In ſome Subjects this Diſeaſe is acute, and attends a Fever; in which Circumſtance the Heads of our Sects have beſtow'd a proper Name upon the Pain, and call'd it *Cephalalgia*. In others it comes within the Liſt of chronical Diſtempers, is without a Fever, and returns at certain Periods of Time upon the Patients, who are only afflicted with a Pain of the Head, which Diſorder the Antients call'd *Cephalæa*.

Some place the Seat of this Diſeaſe in the Membrane of the Brain, others in the Pericranium; ſome make the Skin of the Head, others the Muſcles of the Temples and Cheeks, call'd *Siagones*, to be the Parts affected: But we place the Diſorder ſometimes in only ſome of theſe Parts, according to the Extent of the Pain; ſometimes in all of them, in proportion to the Influence of the Cauſes which bring on the regular Return of the Diſeaſe. Again, as the Remiſſions or Mitigations are more or leſs perfect, ſo are the Intervals longer or ſhorter, and the Reliques of the Diſtemper more or leſs, againſt the Return of the Fit. Regard is alſo to be had to the Paroxyſm in the Time of the Fit; alſo to the Variety of Exacerbations, which are ſometimes continu'd, ſometimes return at Intervals of one or two Days, or thoſe which we call typical, periodical, and hemitritaical Periods, according to their reſpective Times. *Cœlius Aurelianus, Morb. Chronic. Lib.* 1. *Cap.* 1.

The Head-ach is a very painful Senſation in the nervous Membranes of the Head, proceeding from various Cauſes, and frequently attended with a Variety of troubleſome Symptoms, according to its different Degree and Situation.

This Pain affects different Parts of the Head, for which no other Reaſon can be aſſign'd, than that the Cranium, both internally and externally, is furniſh'd with diſtinct nervous Membranes. On the external Surface of the Cranium occurs that fine, but ſufficiently ſtrong, and exquiſitely ſenſible, Membrane which immediately ſurrounds it, and which, in its anterior, intermediate, and poſterior Parts, receives many ſmall Arteries from the external Carotid, and ſmall Ramifications of Nerves from the Vertebræ of the Neck, and the Seventh Pair of the Brain. But the Pericranium coheres with the Muſcles contiguous to the Cranium, and, by means of the Sutures, with

the exterior Lamina of the Dura Mater. In this Membrane, that is, the Pericranium, we place the moſt common and frequent Seat of an Head-ach, which is, among other Circumſtances, demonſtrated to be true, by the external Application of Medicines calculated to alleviate Pain; as alſo by Scarifications, Setons, Cauteries, and Veſicatories. Nor muſt we here exclude the common Integuments or Skin, eſpecially its internal Part, which is contiguous to the Pericranium, from which it may be ſeparated, and thro' which are diſtributed ſeveral Blood-veſſels. This is the principal Seat of that Species of Pain which is dull, heavy, and accompany'd with a Senſation of Preſſure; whereas that which is more acute has its Seat in the Pericranium.

Nor is the interior Membrane, which ſurrounds the Brain, and is call'd the Dura Mater, exempted from Pain. This Membrane is form'd of highly tendinous and nervous Fibres, conſiſts of two Laminæ, receives Ramifications from the Fifth and Seventh Pairs of Nerves, and is furniſh'd with three ſmall Arteries, the firſt of which ariſes from the internal Carotid, and is diſtributed to the anterior Part of the Dura Mater; the ſecond ariſes from the external Carotid, enters the Cranium by a Perforation proper to itſelf, and goes to the middle Part of the Dura Mater; and the third ariſes from the external Branch of the internal Vertebral Artery, enters the Cranium by the Perforation for the internal Jugular Vein, and is diſtributed to the poſterior Part of the Dura Mater. Here the Seat of the Pain is leſs frequent, but much more dangerous; for if the Blood ſhould ſtagnate long in the Veſſels of this Membrane, or, by its Quantity or Acrimony, prejudice their moving Force, it generally brings on ſome violent Diſorder of the Head, ſuch as a Phrenitis and Convulſions in acute Diſeaſes, eſpecially if the Pain is attended with Pulſation; and, in chronical Diſorders, it lays a Foundation for Palſies, Hemiplegies, and lethargic Indiſpoſitions.

The other ſlender Membranes which immediately ſurround the Brain, ſuch as the Pia Mater, and the Arachnoides, which rather appears to be the external Membrane of the Pia Mater, forming a cellular Interſtice, thro' which the Veſſels penetrate, do not, in my Opinion, ſeem to be the Seat of any Pain or uneaſy Senſation, becauſe they are deſtitute of tenſe, nervous, and elaſtic Fibres, and have no conſpicuous Ramifications of Nerves in them. Laſtly, that fine and exquiſitely ſenſible Membrane, which ariſes from the Tunica Pituitaria, and covers the Sinus of the Os Frontis, is frequently the Seat of the moſt acute and intenſe Pain.

Pains of the Head are widely different from each other, according to the Parts in which they are ſeated, as alſo according to their Degrees and Durations; for this Reaſon Authors have aſſign'd different Names to different Species of Head-achs. If the Pain is ſlight, and affects only a Part of the Head, it is call'd *Cephalalgia*; but if it is more intenſe and durable, and affects the whole Head, it is call'd *Cephalæa*, which *Galen* beautifully deſcribes in the following Words: "A Cephalæa," ſays he, "is a laſting Pain of the whole Head, which is with "Difficulty remov'd, and which, by the ſlighteſt Accidents, "is ſo increas'd, that the Patient can neither endure any Noiſe, "any loud Voice, the Splendor of the Light, or any Motion, "but ſeeks Retirement from Noiſe, and a dark Chamber, on "account of the intenſe Pain: For ſome imagine, that they "are beaten with a Mallet, others that their Heads are contus'd "and diſtended, and in ſome few the Pain reaches to the Roots "of the Eyes; ſo that, in this Species of Pain, we have no "Reaſon to doubt but the whole Membrane of the Head is "ſeverely affected."

It often happens, that the Pain affects only one Side of the Head, whilſt the other remains ſound and unaffected, which Species of the Diſorder is by the *Greeks* call'd *Hemicrania*. Sometimes it alſo happens, that the Pain is fix'd in the Crown of the Head, and confin'd within a certain Space, ſcarce exceeding the Largeneſs of a Gooſberry, or an Imperial, which is a Coin much about the Bulk of our Half-guinea. This Species of the Diſorder is peculiarly incident to Women, eſpecially ſuch as are hyſteric, and is diſtinguiſh'd by the Name of *Clavus*. Sometimes a highly acute Pain ſeizes the Forehead, and Parts about the Eyebrows. Sometimes it is lodg'd only in the Sinciput, and at other times in the Occiput. Sometimes it affects the Crown of the Head near the vertical Suture, and at other times it rather affects the Temples. Nor is the Pain, or uneaſy Senſation, always one and the ſame; for one Species of it is acute, another pungent, and another lancinating: One reſembles that of a Contuſion, another is accompany'd with a Senſe of Weight and Preſſure. Some Pains are of the conſtrictory, and others of the violently hot and inflammatory Kind; whereas others are accompany'd with a Senſation of Cold, ſuch as that which principally ſeizes Women in the Crown of the Head, and occaſions their complaining of a Piece of cold Ice, as it were, being apply'd to it.

In general, the Cauſe of every Pain of the Head is to be deduced from an Interruption of the free and equable progreſſive and circular Motion of the Blood thro' the Blood-veſſels, diſtributed thro' the Integuments of the Head, the Pericranium, and Dura Mater. No Phyſician has more exactly, or in a more mechanical manner, deſcrib'd the Cauſe and Origin of Pains of the Head, than *Hippocrates*, who, in the thirteenth Section of his Book *de Flatibus*, beautifully delivers his Sentiments in the following Words. "As the Motion of the Blood, "ſays he, in the Head, is perform'd thro' very narrow Paſ"ſages, the Redundance and Confinement of this Fluid ex"cite Pain; for as the Blood is naturally hot, when it is im"pel'd by any Force, it cannot quickly paſs thro' this nar"row Chanel, ſince it meets with many Hindrances and "Obſtructions, for which Reaſon there is a Pulſation about "the Temples." This Paſſage ſeems to inſinuate, that *Hippocrates* was not an entire Stranger to the progreſſive Motion of the Blood from the Arteries to the Veins; for he calls the Obſtacles, which hinder the free Conveyance of the Blood, *Obſtructions*, which are produc'd by a want of a due Impulſe in the Vaſa revehentia, by which means the Motion of the Blood becomes ſlower and more languid. This ſeems alſo to be confirm'd by the Diſſections of thoſe who have died of violent and ſevere Cephalæas; for, according to *Bonetus*, *Wepfer*, *Pechlinus*, and others, in Subjects of this Kind, the Sinuſes of the Brain, as alſo the internal and external jugular Veins, have been found ſtuffed with a thick and mucous Blood, and ſometimes with ſpurious polypous Concretions, which I myſelf, ſays *Hoffman*, have alſo often obſerv'd in thoſe who died of the Epilepſy; for if a larger Quantity of Blood is convey'd to the Head, than the Veins are able to carry back with the ſame Degree of Celerity, the arterial Veſſels, eſpecially thoſe of the capillary and ſmaller Kind, are violently diſtended by the Congeſtion of the Blood, and the Membranes of the Brain are render'd remarkably tenſe, by which means the Pain, and uneaſy Senſation, are excited.

It is alſo to be obſerv'd, that various Species of Pains are produc'd, according to the different States and Conditions of the Blood, whether the Fault conſiſts in its Redundance, its thick and glutinous Quality, or in its being impregnated with an highly acrid Serum; for when it ruſhes too impetuouſly, and in too large a Quantity upon the Membranes, which principally happens in plethoric Patients, young Perſons, and in Caſes, where accuſtom'd Diſcharges of Blood from the Noſe are ſuppreſs'd, a Pain generally ſeizes the whole Head, which then becomes hot, red, and tumid. The Veſſels ſwell, and their Pulſation becomes ſtrong, eſpecially about the Neck and Temples; the Noſtrils become parch'd and dry, a violent Heat ſeizes the Fauces, and the Patient is tormented with Thirſt. The Antients ſaid, that this Species of Diſorder was produc'd by a hot Cauſe.

When the Blood, collected in the Veſſels of the Head, abounds with a large Quantity of effete Serum, either from an Obſtruction or Suppreſſion of a Coryza, or Running at the Noſe, a Pain ariſes, eſpecially in the Forehead, of the heavy and dull Kind, attended with a Senſation of Preſſure; and ſometimes the Patient's Head becomes, as it were, ſo weighty and heavy, that he can ſcarce lift it up. It frequently happens, that in the Integuments of the Head, eſpecially on the Crown, there ariſe Tumors, in which the Finger leaves an Impreſſion, whilſt the Patient's Pulſe, in the mean time, is languid, and his Complexion livid. This Species of Diſorder was long ago obſerv'd by *Celſus*, in the ſecond Chapter of his fourth Book, where the following Words occur: "Beſides "theſe, there is another Species of Pain which may laſt for "a great while, in which the Humours inflate the Skin, "which becomes tumid, and yields to the Preſſure of the Fin"ger." The Antients affirmed, that this Species of Pain was produced by a cold Cauſe.

A worſe, and more obſtinate Species of Pain, is that which ſeizes thoſe deeply affected with a Lues Venerea, when a ſerous, acrid, and cauſtic Matter is firmly rooted in the Pericranium, and, ſometimes rendering the Cranium itſelf carious, with Difficulty admits of a Cure, and ſcarcely yields to the Force of Medicines. That Species of Pain is generally of the ſame Kind which ariſes from a ſaline-cauſtic Matter driven to the Habit, and afterwards endeavouring to return to the Surface of the Body, as in the Courſe of my Practice I have often obſerved in arthritic Pains, Gouts, Itches, Eryſipelas of the Head, and Gutta Roſacea. In the Small-pox and Meaſles, before the peccant Matter is, by the Force of Nature, driven into the Surface of the Body, or, which is ſtill worſe, when this Matter is repelled, there often ariſes, in Children, a violent Pain of the Head, accompanied with a Fever, a Delirium, and an Epilepſy; in which Caſe, when a ſmall Quantity of cauſtic Matter creates the Pain, the Symptoms are rather to be accounted for from a preternatural Stricture of the Membranes, than from their Diſtention, which is rather produced by a Redundance of Serum and Blood.

There often ariſes in the Head a Pain ſo fixed, ſo laſting, ſo intolerable, ſo acute and intenſe, as to diſturb the animal and rational Powers, to deprive the Patient of Sleep, to hinder Digeſtion, to create a Nauſea and Loathing of Food, and often

to bring on the moſt violent Diſorders of the Head and Nerves, ſuch as a Vertigo, Dimneſs of Sight, Cataracts, Blindneſs, Ringing of the Ears, Convulſions, and Epilepſies. This violent and intenſe Pain, by drawing the other nervous Parts of the Body into Conſent, excites alſo Vomitings, Coſtiveneſs, and a Coldneſs of the Extremities. It alſo makes the Patient's Countenance reſemble that of a dying Perſon. Theſe Circumſtances we find more adverted to by the Antients; for *Celſus*, in the ſecond Chapter of his fourth Book, uſes the following Words: "The Marks of a Cephalæa are a ſtrong "Horror, a paralytic State of the Nerves, Dimneſs of Sight, "Alienation of Mind, Vomiting, Loſs of Speech, Coldneſs "of the Body, and Deliquiums."

As for the Cauſe and Origin of a Head-ach, we muſt not forget, that this may be a natural Imbecillity of the nervous Parts of the Head, convey'd from Parents to their Children; for the weaker any Part is, or the more it is depriv'd of its due Tone and Elaſticity, the more eaſily and readily it receives and retains any foreign Humour; and hence ariſes a Stagnation of the Fluids, and a Diſorder of the nervous Parts. I have often known a hereditary Head-ach convey'd to Children by Parents of weak Heads. I have alſo ſeen Inſtances, in which long Griefs, unſeaſonable Venery, intenſe Lucubrations and Application of Mind, too frequent Veneſection, and immoderate Hæmorrhages, have ſo weaken'd the Head, that, not only violent Pains, but alſo other terrible Diſorders of the Head have enſued.

Nor ought we to exclude, from the Number of the remote Cauſes productice of this Pain, Cold, which, as it is prejudicial to all the nervous Parts when afflicted with Pain, and hinders a free Tranſpiration thro' the cutaneous Pores, ſo it proves in a particular manner hurtful, when admitted to the bare Head, or when the Head is not ſufficiently guarded againſt the nocturnal Cold; or when the Head, becoming warm by long Speaking, violent Exerciſe, the Influence of the Sun, Paſſion, or large Quantities of ſpirituous and intoxicating Liquors, is ſuddenly expos'd to the Cold in rainy Weather, and more eſpecially in the Night-time.

We muſt alſo advert to this, that a Cephalalgia is often no more than the concomitant Symptom of a Diſeaſe. Thus it frequently accompanies continued and intermittent Fevers, and more eſpecially thoſe of the quartan Kind. No Caſe occurs more frequently in Practice, than a violent Pain in the Head, when the Menſes are either juſt about to make an Eruption, or are diſcharg'd immoderately; for in this Caſe, the ſpaſmodic Strictures of the lower Belly exert their Influences on the Head. Thoſe who have the Misfortune of a bad Digeſtion, or labour under what we call the hypochondriac Paſſion, are frequently afflicted with Head-achs: for when the *Primæ Viæ* are encumber'd with a Load of peccant Humours, and when the Spaſms and Flatulencies ariſing thence, convey too large a Quantity of Humours to the Head, the preternatural Congeſtion of theſe Humours produces Diſtentions of the Veſſels, by which the nervous Coats are hurt, and Pain created. It is alſo certain, that a Hemicrania is frequently produc'd by a Fault of the Stomach, whilſt, in conſequence of a bad Digeſtion, many Crudities are generated, which, mixing with the Chyle, are convey'd thro' the thoracic Duct to the Heart, and being thence convey'd to the Head, before their Evacuation thro' proper Emunctories, they excite periodical Pains, which generally ſeize the Patient when the Digeſtion is finiſh'd: Or undigeſted Humours, contain'd in the Stomach, may immediately affect the Nerves thereof, and cauſe a Head-ach.

We alſo obſerve, that Children are pretty ſubject to Head-achs, not only becauſe at this Age a leſs exact Regimen is obſerv'd, and the Stomach is generally loaded with Sweat-meats, unripe Fruits, Cheeſe-cakes, and Aliments prepar'd of Milk; but alſo becauſe Worms, to the Generation of which Children are much diſpos'd, lay a Foundation for this Diſorder, whilſt the putrid and corrupt Humours, convey'd to the Head along with the Chyle, deprive the moving and elaſtic Membranes of their natural Tone and Strength. It muſt alſo be obſerv'd, that this Pain does not continually, and without Interruption, afflict the Patient, but has ſometimes its lucid Intervals, in which, to the great Comfort of the Patient, it remits, or entirely ceaſes, but returns again at certain ſtated Hours, Days, Months, and even Years. This is a certain Indication, that the Cauſe of the Diſorder is lodg'd in the more remote Parts, eſpecially in the Stomach and Viſcera of the Abdomen; by any Fault of which, when the free Circulation of the Blood thro' the whole Body, but more eſpecially thro' the Head, is obſtructed, a Head-ach is excited. This Phenomenon I have principally obſerv'd, in Men who either are, or have formerly been, ſubject to hæmorrhoidal Diſcharges, or who are diſpos'd to hypochondriacal Diſorders.

A Cephalalgia is not always free from Danger; for if the Cauſe of the Pain is ſituated within the Cranium, and lodg'd in the Membranes of the Brain, and if the Pain is intenſe, continued, accompanied with a Fever, and deſtructive of the Patient's Sleep, a Phrenitis frequently enſues. But if a Head-ach ariſes ſuddenly in hypochondriac Patients, and ſuch as are diſpos'd to Melancholy, eſpecially after the Sallies of ſome violent Paſſion, deprives the Patient at once of his Sleep and his Appetite, and is accompany'd with a Dulneſs of Hearing, and an internal Pulſation of the Veſſels without a Fever, Madneſs generally follows. When a ſudden and highly acute Pain of the Head is follow'd by a ringing Noiſe of the Ears, a Difficulty of Walking, a Weakneſs of the Knees, a Slowneſs and Interruption of Speech, it is a Sign of an approaching Apoplexy or Hemiplegy, which, however, more ſeverely afflicts the oppoſite Side, than than which is paralytic, ſince the latter is no longer ſuſceptible of Pain. Nor are we to forget, that frequent Head-achs in young Perſons prognoſticate future arthritic Diſorders, or Gouts.

Curatory Indications.

As the Cauſes of this Diſorder are various, they ought to be carefully diſtinguiſh'd and inquir'd into, becauſe, in removing them, the whole Method of Cure in a great meaſure conſiſts. But, in general, the Intentions of Cure in this Diſorder are theſe following.

Firſt, if the Blood and Humours are impetuouſly convey'd to the Head, and remain there, they are partly to be deriv'd to the more ignoble Parts, and partly to be diſcuſs'd by proper Remedies.

Secondly, The ſpaſmodic Strictures of the Membranes of the Head, generally produc'd by an acrid cauſtic Matter, are to be relaxed, that the Fluids, whoſe progreſſive Motion thro' the Membranes was by their means hindered, may now circulate with the greater Freedom.

Thirdly, The material Cauſe of the Diſorder, which is peccant with reſpect to its Quality, is to be corrected, and gently evacuated thro' proper Emunctories. And,

Laſtly, In order to prevent a Relapſe, the whole Head and nervous Syſtem are to be corroborated by proper Remedies, and more eſpecially by a well-choſen Diet and Regimen.

If the Cauſe of the Pain is too large a Quantity of Blood violently propelled to the Head by the Spaſms of the lower Parts, no Remedy affords a more inſtantaneous Relief than Veneſection, which ought to be inſtituted as near the Part affected as is poſſible, in order to make the more effectual Derivation, under the Tongue for Inſtance, in the Forehead, or in the external jugular Veins, or by the Application of Leaches behind the Ears; but with this Caution, that if the Body is plethoric, or too turgid with Blood, a Vein is to be previouſly opened at the Ancles, and the next, or the ſecond Day after, a Vein is to be breath'd about the Head. I alſo think it adviſeable, before this Step is taken, to evacuate the Contents of the Inteſtines; which is commodiouſly, and to the great Relief of the Patient, effected by the common Family Clyſters, or by Infuſions of Manna and Rhubarb, with an Addition of ſome aperient Salt, ſuch as Cream of Tartar, or the Sedlitz Salt.

In order to check the too violent Orgaſm, and tumultuous Commotion of the redundant and effervеſcent Blood, it is proper to exhibit a gently diaphoretic and correcting Mixture, prepar'd of the Waters of Lime-flowers, Lilies of the Valley, Elder, black Cherries, with an Addition of a proper Quantity of diaphoretic Antimony, purify'd Nitre, calcin'd Hartſhorn, Cinnabar, and Syrup of white Poppies. Externally a diſcuſient and correcting Epithem is to be apply'd, with a double Linen Cloth, to the Forehead and Head. The Epithem, for this Intention, may be prepar'd in the following manner.

Take of the Vinegars of Roſes and Rue, each an Ounce and a half; of the Spirit of Roſes, two Drams, in which ſix Grains of Camphire have been diſſolv'd; of purified Nitre, two Scruples; of the Oil of Rhodium, fifteen Drops.

Or the following Emulſion may be uſed with conſiderable Succeſs.

Take of the Kernels of Peaches, and of bitter Almonds, each half an Ounce; of white Poppy-ſeeds, two Drams; of the Waters of Roſes, Elder-flowers, and black Cherries, each two Ounces: Make into an Emulſion, to which add of Nitre half a Dram, of Camphire five Grains, diſſolv'd in Oil of ſweet Almonds. Mix all together.

But another, and quite different Method of Cure is neceſſary, if a Pain, which generally continues for a conſiderable time, and is accompanied with a Torpor and Senſe of Weight, is produc'd by a Quantity of viſcid and peccant Serum ſtagnating within or without the Veſſels of the Membranes of the Brain, in which Caſe neither Veneſections, nor the milder Laxatives, are ſufficiently efficacious; ſo that it is proper to exhibit ſome more efficacious Medicines, which have at once a Power

Power of diſſolving the thick and glutinous Humours, and expelling the Contents of the Inteſtines. Both theſe Intentions are excellently anſwer'd by the following Pills.

Take of pure Gum Ammoniac, Sagapenum, the beſt Myrrh, roſated Aloes, Extract of black Hellebore, Reſin of Jalap, Mercurius Dulcis, and prepar'd Cinnabar, each half a Dram; of the Extract of Saffron, of the Powder of Caſtor, and of the Salt of Amber, each fifteen Grains: Make up into a Maſs; out of every Scruple of which make twelve Pills, ſix of which may be taken at Night, and the other ſix next Morning.

The Patient is at this time to abſtain from all Aliments, except weak Broths. When three Days are expir'd, the ſame Remedy may be repeated. When the peccant Serum is, by means of theſe Pills, ſufficiently evacuated, we are to have recourſe to ſuch Medicines as corroborate the Veſſels, reſtore the Tone, and are, at the ſame time, diuretic. For anſwering theſe Intentions I have often, ſays *Hoffman*, uſed with ſingular Succeſs the following Mixture.

Take of the acrid Tincture of Antimony, four Parts; of the Eſſence of Amber, of the Spiritus Bezoardicus Buſſii, or of Spirit of Tartar, and my Anodyne Mineral Liquor, each two Parts: Mix all together.

A Doſe of this Mixture may be exhibited twice or thrice a Day, for a Week or longer, as the State of the Patient ſhall require; for I have obſerv'd, that ſuch Medicines as, by corroborating the languid Fibres, reſtore and rouſe their moving and elaſtic Force, and at the ſame time promote a Diſcharge of Urine, are of ſingular Service in that Species of Cephalalgia, which ariſes from an Extravaſation of Serum between the Cranium and its Integuments, or even in the Brain itſelf. Beſides theſe Medicines, I, in this Species of Head-ach, with *Celſus*, recommend Labour and Exerciſe ſufficient to promote a Diaphoreſis, and ſtrong Friction, together with ſuch Aliments and Liquors as provoke Urine.

If by theſe means the Pain is not remov'd, we muſt have recourſe to external Applications, among which, Veſicatories are of the higheſt and moſt conſiderable Service, becauſe they procure an Elimination of the peccant ſtagnating Humour. For this Purpoſe I generally uſe Melilot Plaiſter, with every Ounce of which a Dram of Cantharides is mix'd, adding at the ſame time a few Grains of Camphire. The Breadth of a Dollar, or Crown-piece, of this Plaiſter, may be applied to the Nape of the Neck, and continued at Pleaſure, taking care to renew it at proper Intervals: By this means, a remarkable Quantity of ſerous Humour is evacuated without incommoding the Patient. But in a violent Pain of the Head, and in Caſes where, in conſequence of the Serum ſtagnating under the Integuments of the Cranium, there is a Tumor, which is not only viſible, but alſo painful upon being touch'd, *Wepfer*, after ſhaving the Head, apply'd a Veſicatory to the Whole of it; the Effect of which was, that, without raiſing Bliſters, a large Quantity of viſcid Serum was evacuated, which Kind of Remedy we find uſed with Succeſs by *Riverius* in an obſtinate Head-ach.

It ſometimes happens, that only a particular Place is ſeized with an unuſually intenſe Pain, ariſing from a peccant Matter ſecurely and deeply rooted in the Membranes, in which Caſe *Cheſneau*, a celebrated *French* Phyſician, in his Obſervations, highly extols the Uſe of the *Rananculus pratenſis*, as a Veſicatory. He informs us concerning this Plant, that its Leaves reſemble thoſe of the Anemone, and that, when chewed, it bites the Tongue very ſeverely. He orders its Leaves, when bruis'd, to be apply'd to the Part affected, which is, at the ſame time, to be cover'd with a perforated Plaiſter. This Herb ſeems to produce nearly the ſame Effect with the Moxa, which, in this Species of Head-ach, is highly eſteem'd by the moſt ſkilful Phyſicians. But in Caſes of this Nature, I myſelf, ſays *Hoffman*, have with great Succeſs, after having ſhaved the Part affected, apply'd to it the dry volatile Salt of Sal Ammoniac, mix'd with an equal Quantity of the Flower of Muſtard, becauſe the peccant Humour, in conſequence of its being deeply ſeated, requires proportionably ſtronger Diſcutients.

But when the Head-ach ariſes from a prepoſterous Suppreſſion of a Coryza, or a Mucus retained in the Cavities and Sinuſes of the Noſtrils, it is proper frequently to apply to the Noſtrils the Sal Anglicanum, which is the dry volatile Salt of Sal Ammoniac, exalted with ſome cephalic Oil, ſuch as that of Lavender or Marjoram; or to ſnuff up the Noſtrils, as an Errhine, a gently ſternutative Powder, prepar'd of Marjoram, Betony, the true Marum, Flowers of Benjamin, and Powder of Cloves.

But when a long-continued and intolerable Head-ach is produc'd by a corrupted and deprav'd State of the Serum and Blood, as happens in the Lues Venerea and Scurvy, it is neceſſary to attack the Cauſe of the Diſorder, by Medicines adapted to the reſpective Cures of theſe Diſeaſes. This Intention is principally anſwered by Decoctions of the Woods, with crude Antimony, if the corrupted Humours are previouſly diſcharged by Stool, by means of the above ſpecify'd Pills. Abſtinence, alſo, for a Day or two, is of ſingular Service in this Caſe, as alſo Exerciſe ſufficient to promote a Diaphoreſis. It is alſo ſerviceable in this obſtinate Diſorder, which ariſes from an impure Serum, to provoke Sweat by ſome proper Medicine, which Intention is excellently anſwered by the following Powder.

Take of native Cinnabar, of Ceruſs of Antimony, or Bezoardicum Minerale, of the volatile Salt of Vipers, or of Hartſhorn, and of pure Nitre, each ten Grains; and of Camphire, half a Grain, for a Doſe; drinking after it a Draught of any Decoction, proper for purifying the Blood.

A Hemicrania, eſpecially of the periodical Kind, has its Cauſe generally conceal'd in the Primæ Viæ; when, for Inſtance, the Stomach and Duodenum are ſtuffed with a Load of peccant Humours, theſe muſt be evacuated by mild and gentle Emetics. It is alſo ſometimes highly neceſſary to render the Body ſoluble, and diſcharge the peccant Matter by Stool, that a Derivation of the noxious Humours may be made from the Head. After this, ſtomachic Elixirs, and ſuch Medicines as reſtore and ſtrengthen the Tone of the Stomach and Inteſtines, are to be exhibited. But if the Head-ach ariſes from an immoderate Diſcharge of the Menſes, or Hæmorrhoids, we are prudently to uſe ſuch Medicines, as are adapted to reduce theſe ſalutary Evacuations to their due and natural State.

Cautions *and* Clinical Obsevations.

Having thus given Directions for the Cure of a Cephalalgia, it is not unneceſſary to ſubjoin ſome Cautions and Obſervations relating to the ſame Subject. When the Pain, eſpecially in the Sinciput and Frontal Sinuſes, is ſo highly acute and intenſe as conſiderably to impair the Strength, and endanger the Life, of the Patient, the Removal of the Cauſe of the Diſeaſe is by no means to be firſt attempted; but ſome Relief is rather previouſly to be afforded, becauſe, when the Patient's Strength is gone, the Efforts of the Phyſician are of no Uſe. The Pain is ſometimes ſo exceſſively intenſe, as to bring on more terrible Symptoms; ſuch as continual Watchings, Faintings, Fevers, Inflammations, and Alienation of Mind. In this Caſe both internal and external Medicines are, with all Expedition, to be preſcrib'd, for the Alleviation of the Pain. Among the internal Medicines, I generally prefer, to all others, the *Pilulæ Wildeganſii*, mix'd with native Cinnabar; as alſo the *Pilulæ Starkei:* But the Body is always to be render'd ſoluble, by a Clyſter, before the Uſe of Anodynes. Among external Applications, I find none more ſafe and efficacious than a thick Liniment, prepared of the following Ingredients in this manner:

Take of the expreſs'd Oil of Nutmegs, half an Ounce; of the Reſin of Storax, and of the Reſin of the Bark of Caſcarilla, each one Dram; of the Extract of Saffron, and *Peruvian* Balſam, each half a Dram; and of the Oil of *Rhodium*, twelve Drops: Mix up into a thick Liniment, which is to be laid upon a ſmall Piece of Leather, as large as an Imperial, which is about the Size of a Half-guinea, and applied to the Temples.

When the Violence of the Pain is abated by the internal Exhibition, and the external Application, of Anodynes, it is proper to give a gentle Cathartic; after which the Phyſician is to have recourſe to other Medicines, adapted, by their Nature and Qualities, to remove the Cauſe of the Diſorder, whatever it may happen to be. When a highly acute, and ſcarce tolerable Pain, remains fix'd for a long time in the Cavities of the Noſtrils, and the bony Sinuſes of the Head, which Species of Pain is produced by a ſmall Quantity of extravaſated Blood or Humours, lodged under the Membrane which covers theſe Sinuſes, it is not only proper to alleviate the Violence of the Pain by the above-mention'd Medicines, but we muſt alſo endeavour to leſſen the Impulſe of the Blood, by the Violence of which the Pain is increaſed. This Intention may be commodiouſly anſwer'd by Scarification of the Noſtrils, a Practice uſed by the *Egyptian* Phyſicians; or, if we intend a more ſpeedy and compendious Method of Relief, we may thruſt a ſtrong Straw ſuddenly and forcibly up the Noſtrils, till a Hæmorrhage enſues.

But if the corroſive and acrid Humour, extravaſated under the Membrane of the Pericranium, begins to render the Bone carious, then, after all other Remedies are tried to no Purpoſe, we muſt have recourſe to Inciſion; which, in this Caſe, as well as in a Paronychia, ariſing almoſt from a like Cauſe, affords a very ſingular and ſurpriſing Relief. But if the Caries has reach'd to the Diploe, and the internal Lamina of the Cranium, the only

only Relief is to be expected from the Operation of the Trepan.

We muſt obſerve, in general, that, in the Cure of all Head-achs, from whatever Cauſe they may proceed, we are to begin with the Injection of a Clyſter, and Veneſection, if a Plethora requires it; but the Body is always to be render'd ſoluble before this laſt Step is taken. After this, we are to have recourſe to other proper Remedies, both of the internal and external Kind. When the Plethora is removed, it is often proper, for the ſake of a more effectual Derivation of the peccant Matter from the Part affected, to open the Frontal Vein; in performing which Operation the celebrated *Heurnius*, *in Notis ad Aph.* 68. *Hippocratis*, *Sect.* 5. gives us a Caution worthy of our Attention, which is, before the Operation, to apply a Ligature about the Neck, that the Vein may become turgid; which is afterwards to be cut obliquely, taking care not to wound the Pericranium.

It is confirm'd, by the Teſtimonies of the moſt ſkilful Phyſicians, that Arteriotomy in the Temples has often afforded the moſt inſtantaneous and efficacious Relief, when all other Methods have been uſed in vain. Nor would I detract from the Excellence and Advantages of this Method, tho' I never preſcrib'd it. I am, however, of Opinion, that, by opening the external Jugular Vein, the obſtructed Circulation of the Blood in the Head is more effectually reſtored, and the ſtagnating extravaſated Humours, on which the Pain depends, more commodiouſly removed and eliminated; ſince by this means the arterial Blood is, with a greater Degree of Celerity, convey'd into the evacuated Vein. When Phyſicians adviſe the opening of the Temporal Vein, this Operation is moſt ſafely and commodiouſly perform'd by the Ear, near the Articulation of the Jaw-bone.

In all Head-achs, where the Patient's Strength will not admit of Veneſection, and where the Quantity of the Blood is too ſmall, Foot-baths of the temperate Kind, which are always beneficial in this Diſorder, may be uſed with Succeſs, in order to derive the Blood and Humours to the inferior Parts. Pretty ſtrong Frictions of the Feet and Legs, with Cloths, are not to be diſapproved of: Neither, in this Caſe, do Subſtances which render the Parts red and inflamed, ſuch as Shavings of Horſe-radiſh, mix'd with Salt, and applied to the Feet, want their proper Uſe.

Epithems actually cold are, in this Caſe, to be applied with the greateſt Care and Circumſpection; for I myſelf, ſays *Hoffman*, know Inſtances of Patients, who in Fevers, eſpecially of the exanthematous Kind, Small-pox, Meaſles, and Purple Fever, when Nature happily endeavours to throw off the peccant Matter in the Form of Exhalations thro' the cutaneous Pores, have by the Application of cold Epithems, in order to remove Head-achs, had a perpetual Blindneſs brought on; as alſo Cataracts, and Inflammations of the Eyes. Nor, in removing this Pain, is it always proper to uſe a Variety of Topics; the Application of which is ſometimes more dangerous, and requires more Skill and Judgment in the Phyſician, than the Uſe of internal Medicines. Nor, in this Caſe, are all Medicines equally proper for all Patients indiſcriminately; ſince one is able to bear what may prove highly prejudicial to another.

Under the Paroxyſm itſelf, I have found the Pain conſiderably alleviated by a few Drops of my anodyne Liquor, dropt upon Sugar, reduced to a Powder, and exhibited frequently. In the Intervals of the Paroxyſms, in order to corroborate the Head, or to prevent the Return of the Diſorder, I can, from Experience, recommend my *Balſamum Analepticum Vitale*, either applied to the Temples, and Crown of the Head, or moderately ſnuffed up the Noſe; or a few Drops of it, dropt upon Sugar, may be taken in any proper Infuſion by way of Tea.

When too great an Effervеſcence, or a preternaturally accelerated and tumultuous Motion of the Blood, is the Cauſe of the Head-ach, Purgatives and Evacuants are by no means to be uſed; but rather Medicines of a refrigerating and correcting Quality, with which Intention I generally recommend the drinking cold Water alone, and Preparations of Nitre. And, certainly, the Caution of *Hippocrates*, with reſpect to this Matter, is of the utmoſt Importance; for, in his Book *de Ratione Victus in Acutis*, he adviſes us, "to purge none of thoſe who "are afflicted with Head-achs, in conſequence of too violent "Exerciſe, Running, Travelling, Hunting, or any other ſe-"vere Labour." *Hippocrates*, in this Paſſage, intends to inform us, that, when the Head-ach ariſes from a hot and fervid State of the Blood, Purgatives are by no means to be uſed.

It frequently happens, that a Cephalæa attends an hypochondriac Melancholy, in Conjunction with a depraved Digeſtion, Leanneſs of the Body, Depreſſion of the Spirits, and a vitiated Colour of the Complexion; in which Caſe, Veneſection, Baths of good Water, proper Exerciſe, a prudent Uſe of medicinal Waters, Broths, eſpecially thoſe prepared with the Juice of Succory, Goats Whey, chalybeated, or impregnated with the Juice of Succory, are, of all other Things, the moſt effectual.

As in all other Diſorders of the Head, ſo alſo in Head-achs, the following Regimen is recommended by *Hieronymus Mercurialis*, *in Conſultat. Tom.* 1. *Conſult.* 107. the Whole of which, as an excellent Method of Prevention, we ſhall here tranſlate: "The Inclemency of the Air, ſays he, to which the Patient "has not been accuſtom'd, is to be avoided as much as poſſi-"ble; or guarded againſt by proper Garments, and warm "Rooms. The Patient is to ſleep moderately, and never till "two Hours after Meals. He is to ſleep always with his Head "raiſed high. He is to exerciſe his Body and his Mind equal-"ly, and by turns, leſt the one ſhould outdo the other either "in Labour or Reſt. He is not to allow an Exceſs of Care, "Thoughtfulneſs, or Study, to dull and flatten the natural "Heat of his Conſtitution. He muſt keep his Body as ſolu-"ble as poſſible, if it is not already ſo; for nothing has a "more immediate Tendency to affect the Head, and lay a "Foundation for vertiginous Diſorders, than the Fœces long "retain'd, and pent up in the Inteſtines. Debauches and "Surfeits are highly prejudicial to him, which he muſt there-"fore avoid; and abſtain from the daily Uſe of ſtrong and "generous Wines. He muſt alſo abſtain from thick, pin-"guious, and flatulent Aliments, ſuch as Pulſes and Pot-"herbs, Fiſh, and Diſhes prepar'd with Spices, like thoſe uſed "by the *Germans*, leſt his Diſorder ſhould be daily increaſed." *Hoffman Medicina Rationalis Symptomat. Vol.* 2.

As many Species of Head-achs are ſymptomatical, we muſt refer their Cure to thoſe of the Diſtempers which they accompany. But it muſt be remark'd, in general, that Head-achs are greatly relieved by Pains in the Feet, ariſing ſpontaneouſly: This has given a Hint to Phyſicians to try the Effect of Pain in theſe Parts, procur'd artificially, by ſtimulating Applications; which has been found, by Experience, to anſwer very well the Intention. From a Parity of Reaſoning, promoting a Diſcharge of Blood from the Hæmorrhoidal Veins has been experienced, and found of great Service.

A particular Method of Cure, for that Species of Head-ach proceeding from a Collection of Matter contain'd in the *Antrum Maxillæ ſuperioris*, is recommended, I think, by *Cowper*. It conſiſts in drawing one of the *Dentes Molares*, the Bottom of whoſe Socket is only ſeparated from this Cavity by a thin bony Lamina, which is readily perforated; and by this means a Drain is made for the Matter, which, when confin'd, cauſes the Head-ach.

This Species of Head-ach is frequently attended with a Tumor on one Side of the Face, upon the *Antrum*, which ſubſides after the Operation, of which I have ſeen Inſtances.

Relative to this, *Drake* gives the two following remarkable Caſes.

A young Gentleman became my Patient, who had labour'd under an Apoſtemation in the Antrum Maxillæ ſuperioris, between four and five Years: I had ſeen him about a Twelvemonth ſince, when I told him where the Seat of his Diſeaſe was, and the way I would take to cure him, which he unluckily neglected. And notwithſtanding the Arguments uſed by an ingenious and learned Phyſician, as well as againſt his own Inclinations, he was at that time prevail'd with to defer drawing his Tooth, (which I propoſed to him) till Time, with the Increaſe of his Malady, and a late Inſtance of Succeſs I had in the like Caſe, on a Perſon of the firſt Rank in Senſe as well as Quality, had convinc'd him of the Neceſſity of doing it: By this time the Matter had of itſelf made way by the fartheſt Dens Molaris of the Left Side, inſomuch that, before the Tooth was drawn, I paſs'd a Probe by the Side of it into the Antrum. The Day after the Tooth or Stump (for the greateſt Part of it was moulder'd away) was taken out, an ordinary Spoonful, at leaſt, of the worſt colour'd and ſcented Pus flow'd at the Socket, on holding his Head back: I then ſyring'd it with a proper Injection, which was continued daily; and, in three Days, he told me, he had very little Uſe for his Handkerchief, which he uſed to change five or ſix times in a Day, for three or four Years before. On viſiting him, the ſeventh Day, he told me, to his Admiration, he was not only freed of the Flux at his Noſe, and violent Pains in his Head, particularly in his Eyes, but reſtor'd (as he expreſs'd it) to a perfect Tranquillity of Health.

An elderly Gentleman, who, for a long time, labour'd under a Diſcharge of a great Quantity of fetid Matter from his Noſe, after I had told him how he might be relieved, was by others laugh'd out of the Project, (as they call it) till, at length, the Thing itſelf convinced him of the Truth of what I told him. When he conſulted me again, which was ſeveral Months after I firſt ſaw him, he then ſent for a Tooth-drawer to take out the Tooth I ſhould direct: Tho' the Operator attempted it with proper Dexterity, not only the Tooth, which appear'd ſound, (but was not ſo) on which he applied his Inſtrument, but the next Tooth alſo, with their Alveoli or Sockets, came away all together. This frighten'd the Tooth-drawer; but I ſhew'd him it was none of his Fault, but that the corroſive Matter, which had been ſo long ſuffer'd to lie on the Bone, had rotted it. In doing this, the Patient did not complain of

Pain, and was relieved of the Diſcharge at his Noſe (the Matter finding a ready Paſſage at the Breach); but was afterwards purſued with extravagant Pains in his Face, and that Side of his Head; and, at length, after ſome Months, fell into convulſive Diſorders, and died.

On opening his Head, I found the upper Part of the Antrum carious, and Part of that Bone moulder'd away; but the Caries did not ſtop there, a Sinus being made thro' the Tract of the Foramen Lacerum; the oppoſite Part of the Os Sphenoides was alſo perforated, and the Dura Mater laid bare, and not perforated; but, on the contrary, it was inflamed, and very much thicken'd, on that Side the Head. I found an Apoſtemation in the cortical Subſtance of the fore Part of the hinder Lobe of the Brain of the ſame Side, tho' cover'd with the Pia Mater, in which was about an Ounce of fetid Matter. *Drake's Anatomy, Vol.* 2.

CEPHALARTICA. Remedies which purge the Head. *Blancard.*

CEPHALE, κεφαλή. The Head. See CAPUT.

CEPHALICUS, κεφαλικός. Cephalic. Appertaining to the Head. Thus the Vein mark'd M. in *Tab.* 6. *Fig.* 1. is call'd the cephalic Vein, becauſe Bleeding in that Vein was ſuppoſed to relieve the Head.

Thus, alſo, Remedies for Diſorders of the Head are peculiarly ſtyl'd *Cephalica*, Cephalics. Under this Denomination are comprehended all thoſe Medicines which have a particular Relation to the Brain; ſo that cephalic Remedies, in general, are ſuch as promote the Secretion and Diſtribution of the Spirits. This Intention is anſwer'd by all ſuch Subſtances as procure a free Circulation of the Humours thro' the Veſſels of the Brain: Hence Cephalics are different, according to the Diverſity of Cauſes which may happen to obſtruct or hinder the Circulation of the Humours in the Brain. If the Cauſe is of the cold and mucous Kind, the Cephalics to be preſcrib'd muſt be of a heating, ſtimulating, fragrant, and aromatic Quality. If, on the contrary, the Diſorder ariſes from an Exceſs of Heat in the Body, the Cephalics to be exhibited muſt be of a cooling and refrigerating Nature. Thus Correctors, univerſal Evacuants, and other Medicines, deſerve to be dignified with the Epithet *Ciphalic*, when they have a Tendency to weaken or remove the Cauſe which produces any particular Diſorder of the Head. Since, therefore, different Diſorders of the Head draw their Origins from oppoſite Cauſes, thoſe muſt certainly be in a palpable Error, who only give the Title of Cephalics to heating and volatile Subſtances, which have often been found to prove hurtful in Diſorders of the Head. The various cephalic Remedies are, therefore, to be taken from the general Titles or Claſſes of Medicines oppoſite to the morbific Cauſe. Cephalic Medicines are either internal, when, for Inſtance, they are exhibited by the Mouth, in order to produce their Effects by the general Circulation of the Fluids; or by way of Clyſters, which often produce the moſt happy Conſequences, by making a Revulſion from the ſuperior and more noble Parts; or they are ſuch as are applied externally to the Head, to which Claſs belong Errhines, proper Liquors for waſhing the Head, medicated Caps, and other Remedies commonly call'd Topics; the Materials of which are alſo uſed againſt the Diſorders of other Parts of the Body. With reſpect to cephalic Topics in general, we muſt obſerve, that the Head is leſs capable of bearing moiſt than dry Applications; becauſe the former, by diſtending or relaxing the Veſſels, produce Congeſtions of Humours, which prove hurtful and prejudicial to the Brain. Nor do moiſt Preparations, applied to the Head, ever anſwer any valuable Purpoſe, except in thoſe Caſes alone where the Diſorder ariſes from an Exceſs of Heat and Dryneſs, or from an inflammatory Diſpoſition in the Head; for, in this Caſe, agreeably to the antiphlogiſtic Method, moiſtening Fomentations and Epithems, applied to the Head, Neck, and Throat, generally produce happy Effects; ſince, by this means, the Water, inſinuating itſelf into the Pores of theſe Parts, renders them more pervious, ſo that the Blood paſſes more freely thro' them, and conſequently preſſes leſs forcibly on the Brain; and, becauſe the external Carotid Artery is diſtributed to all the Parts of the Head, the Blood is directed to ſome other Quarter, in conſequence of the Relaxation of theſe very Parts. Decoctions, then, of the Flowers of Marſhmallows, Mullein, and other Emollients, or moderately warm Oxymel, or Water and Elder-vinegar, are proper, for Inſtance, in Deliriums, according to *Boerhaave*, *Aph.* 702. in Comas, *Aph.* 706. in obſtinate Watchings, *Aph.* 709. in a Phrenitis, *Aph.* 781. in an inflammatory Quinſey, *Aph.* 809. and in a Hydrophobia, *Aph.* 1143. *N.* 5. In Wounds of the Head and Pericranium, we muſt not, according to *Hoffman*, in his *Annotat. ad Poter.* 17. uſe oleous or pinguious Subſtances and Ointments; becauſe, by obſtructing the Pores, they bring on violent Inflammations. But, in their room, we muſt ſubſtitute either dry Subſtances, ſuch as the Powders of *Florentine* Orris, Maſtich, or Amber, or Honey, with an Admixture of a ſmall Quantity of *Peruvian* Balſam. In other Diſorders of the Head, ſuch as Pains ariſing from a cold Cauſe, medicated Bags, ſtuffed with heating Ingredients, ſuch as Sage, Marjoram, Frankincenſe, and Salt, are generally uſed with Succeſs. The Patient's Head is alſo to be waſhed with a Lixivium, in which Ingredients of a heating Quality have been boil'd, ſince theſe are highly proper for attenuating the obſtructing Matter, and corroborating the Brain.

Sennertus, in his *Inſtitutiones Medicinæ*, informs us, "That, "tho' Liquors for waſhing the Head are by ſome abſolutely con"demn'd and rejected, yet they are not altogether uſeleſs, "ſince they open the Pores of the Skin, that the Fumes pent "up in the ſmall obſtructed Veſſels may be exhal'd. But they "muſt not be us'd when the Patient labours immediately under "a Catarrh, or a Head-ach; for they are more properly, and "with greater Succeſs, apply'd in the Intervals of theſe Diſor"ders. As for the Method of uſing them, the Head muſt be "waſh'd either in the Morning, or an Hour before Supper; "and, when it is ſufficiently waſh'd, it muſt be dry'd with "moderately warm Linen Cloths. Waſhing of the Feet is "alſo proper, not only with a View to remove the ſordid Matter "collected about them, but alſo to derive the Humours from "the Head." *Campegius*, in his *Campus Elyſius Galliæ*, gives us the following Cautions with reſpect to the Uſe of heating medicated Bags: "Let them," ſays he, "be apply'd "after a conſiderable, but gentle Evacuation, and at the "Height, or in the Decline, but not in the Beginning or In"creaſe of the Diſeaſe, nor before a gentle Evacuation is made, "leſt, by their hot and attracting Influences, they ſhould draw "the Humours to the Head, and, by that means, do more "Harm than Good." *Cheyne*, in his Treatiſe *De Infirmorum Sanitate tuenda*, tells us, that the greateſt Advantages accrue to the Eyes, Ears, and whole Head, from ſhaving it frequently, and bathing it daily in cold Water, mixed with a few Drops of Lavender or Hungary Water. The Benefit, ſays he, ariſing from this Method, abſtracting from the Pleaſure it affords, are only known and reliſh'd by ſuch as have experienc'd them. To rub the Head, after it is ſhav'd, proves an inſtantaneous Cure for a Cephalalgia, a Stuffing of the Head, and a Weakneſs of the Eyes, ariſing from a weak and relax'd State of the nervous Fibres: And as, by every freſh Evacuation of the Humours, their Quantity is not only leſſen'd, but alſo their recrementitious Parts deriv'd thither; ſo the more frequently the Head is ſhav'd, the larger Quantity of Humours is diſcharg'd, ſo that the frequent Shaving of the Head and Beard is like a perpetual Fontanel or Veſicatory. From frequently waſhing the Skin of the Head with Soap and Water, and then ſhaving it, ariſes another conſiderable Advantage, which is, cleanſing the Mouths of the cutaneous Pores from the Scurf and Scales which block them up; by which means a free Diſcharge is procur'd to the perſpirable Matter, which, when retain'd, proves highly prejudicial to the Head and Brain. Then, by plunging the Head in cold Water, and carefully waſhing it, the Scales of the Cuticula are cloſely brac'd up, and hinder'd from gaping in an unſeemly manner, and ſo that too large a Quantity of the perſpirable Matter ſhould be diſcharg'd, and that they may the better reſiſt the Influence of the external Cold, by which means Perſons of an infirm State of Health ſuffer very conſiderably; for which Reaſon I would adviſe all valetudinary Perſons to ſhave every Day, or every other Day, or, at leaſt, as often as they conveniently can, and then to waſh their Heads with cold Water. *Celſus*, in the fourth Chapter of his firſt Book, gives the following Directions with reſpect to the Management of the Head: "The Perſon," ſays he, "who has a weak Head, provided "his Digeſtion is good, ought gently to rub it with his Hands "in the Morning, never, if poſſible, to keep it cover'd, nor "to ſhave it cloſe to the Skin. It is alſo proper he ſhould ſhun "the Influences of the Moon, eſpecially before her Conjunction with the Sun. He muſt alſo take care not to go "abroad immediately after Meals. If he has Hair, he muſt "daily comb it, and walk much, but neither in the Houſe, "nor in the Sun. He muſt alſo, in a particular Manner, ſhun "the Heat of the Sun after Meals, or the Uſe of Wine. He "muſt rather anoint than bathe; and when he does anoint, it "muſt never be before a violent Fire, where there is an Eruption of Flame, but ſometimes before a gentle Fire, where "the Coals are live and clear. If he intends to uſe a Bagnio, "he muſt firſt ſweat a little, cover'd with Cloths, in the *Tepidarium*, where he muſt alſo be anointed; thence he muſt go "into the Sweating-room. When he has ſweated, he muſt not "go into the Bathing-ciſtern, but pour large Quantities of "Water, firſt moderately warm, and then cold, upon his "Head and whole Body; but he muſt pour it longer upon his "Head than upon the other Parts of his Body. Then he muſt "rub his Head for ſome time, and, laſt of all, wipe himſelf, "and anoint. *Nothing is ſo beneficial to the Head as cold "Water:* He, therefore, who has an infirm Head, ought, "during the Summer, daily to plunge it in a pretty large "Veſſel of Water; and tho' he ſhould anoint without bathing, "or cannot endure the Influence of the Cold over his whole "Body, yet he ought always to pour cold Water upon his "Head. When he has not an Inclination to have the Water "touch any other Parts of his Body, he muſt bend his Head "downwards,

" downwards, that it may not reach his Neck, and that the " Eyes and other Parts of the Face may partake of the common " Benefit; he is every now-and-then to apply it to these Parts " with his Hands as it runs down. He must necessarily use a " spare Diet, and such as is of easy Digestion; and, if his " Head is prejudic'd by fasting, he may also eat in the Middle " of the Day; but, if he sustains no Injury by fasting, it is " more adviseable to eat only once a Day. For his ordinary " Drink, 'tis more proper he should use mild diluted Wine " than Water. It is also proper, that, when his Head begins " to ake violently, he should have a Place proper for Repose, " to betake himself to. Wine or Water, us'd continually by " themselves, are not proper for him, since they only prove " Medicinal when us'd alternately. He must neither write, " read, nor dispute, after Supper, at which time profound Me- " ditation is also hurtful: But, of all other Circumstances, " Vomiting is most prejudicial to one in this State." From what has been said we see, that there are two principal Classes of Cephalics; and these are Medicines either of the refrigerating or cooling, or of the warming and heating Kind. For since, as *Riverius* justly observes, the Brain is sometimes attack'd with cold, and sometimes with hot Disorders, the Medicines calculated for its Relief must also be of two Kinds, in order to remove the several Indispositions to which it is subject. " Heating " Medicines," says the now-quoted Author, " not only heat " and dry the Brain, but also incide and attenuate the Phlegm " contain'd in it; whereas those of a refrigerating Quality " partly correct the hot Intemperature of the Brain, and partly " inspissate the acrid saline Phlegm, and other serous Humours, " which produce violent Defluxions." To these two Classes of refrigerant and heating Medicines we may refer what *Hoffman*, in his *Annotat. ad Peter.* proposes in the following Words: " Two Kinds of Medicines are principally proper in Disorders " of the Head, which arise either from an irregular and desul- " tory Motion of the Spirits, or from Obstructions of the " Nerves and Vessels of the Brain. Of the former Kind are " Anodynes, which, by their grateful Exhalations, stop the " tumultuous and disorderly Motions of the Spirits; such as the " Flowers of the Cowslip, of the Lime, of Piony, of the " *Egyptian* Thorn, of Elder, of Roses, of Violets, of the " wild Poppy, and of Lilies of the Valley; as also odorous " and scented Substances, such as Musk, Castor, Amber, and " Saffron. To the latter Class belong such Substances as con- " tain a subtile oleous Salt, of which Kind are all oleous Sub- " stances, and volatile Spirits obtain'd from Animals; as also " Marjoram, Rue, Lavender, Valerian, white Aloes Wood, " garden and wild Rosemary, Cardamoms, Cubebs, Mother " of Thyme, Basil, Amber, Ambergrise, and *Peruvian* Balsam: " All which, boil'd with Water or Wine, or infus'd in any " proper Menstruum, prove excellent Medicines for Disorders " of the Head." But such Substances as relax the too much constricted Vessels, (in consequence of which Constriction a brisker Motion of the Humours, and a greater Heat in the Body, are procur'd) retard the accelerated Motion of all the Humours. As to what we call cephalic Specifics, which, by a peculiar Virtue, act upon the Head, and remove its Disorders, without influencing any other Parts of the Body, and are consequently indiscriminately proper in all Indispositions of the Head, from whatever Cause they may arise, we must, in this Affair, be cautious in passing our Judgment, since some maintain, that there are really such Medicines, whilst others deny the Fact, and engage the opposite Party with Experience, the most conclusive of all Arguments. *Wedelius*, in his *Centuriæ Exercitationum Medicarum*, *Cent.* 1. *Dec.* 7. informs us, that Hyssop was the cephalic Specific of *Hippocrates*, as appears from his Book *De Morbo Sacro*, compar'd with what he has said concerning Hyssop. But this Plant can only be proper in one Species of Epilepsy; when, for Instance, it is produc'd by a Redundance of Phlegm, concerning which Species *Hippocrates* treats in that Work. In this Case, indeed, heating and drying Medicines are proper: Hyssop then is a Plant of this Kind; and *Wedelius* himself informs us, that it abounds with a volatile oleous Salt. *Hippocrates* also, in his Work *De Diæta*, *Lib.* 2. informs us, that Hyssop is hot, and evacuates Phlegm. *Forestus*, *Obs. Med. Lib.* 9. *Obs.* 52. acquaints us with a very singular, and, I believe, inexplicable, cephalic Virtue in Vervain, which he obsery'd in a Patient, who, for several Nights, had been afflicted with a violent and universal Pain of his Head, every Hair of which dropt with Sweat; for after all other Medicines, generally thought most efficacious, had been us'd in vain, the Patient, whilst fast asleep, was miraculously cur'd, by hanging a Piece of green Vervain bruis'd about his Neck: But the Author informs us, that the Vervain must not be remov'd, till, becoming dry, it falls away of its own accord.

CEPHALINE, *κεφαλίνη*. That Part of the Tongue which is next the Root, and nearest the Fauces. *Gorræus.*

CEPHALOIDES, *κεφαλοειδὴς*. Shap'd like a Head, or having a Head. It is apply'd to those Plants which are call'd capitated.

CEPHALONOSOS, *κεφαλονόσος*, from *κεφαλὴ*, the Head, and *νόσος*, a Disease. The Term is apply'd to a malignant epidemical Fever, frequent in *Hungary*, thence call'd *Febris Hungarica.*

CEPHALO-PHARYNGÆUS. A Muscle of the Pharynx. See PHARYNX.

CEPHALOPONIA, *κεφαλοπονία*, from *κεφαλὴ*, the Head, and *πόνος*, Pain. A Head-ach.

CEPHALOS, *κέφαλος*. A Fish, call'd also Mugil. A Mullet. See MUGIL.

CEPHALOTOS, *κεφαλωτὸς*. Capitated. See CAPITATÆ.

CEPHALOTROTOS, from *κεφαλὴ*, the Head, and *τιτρώσκω*, to wound. Wounded in the Head.

CEPINI. Vinegar. *Rulandus.*

CEPULA, *κέπουλα*. Large Myrobalans. *Nic. Myrepsus*, *Sect.* 9. *C.* 83.

CERA, *κηρός*. Bees-wax.

The best Wax is yellowish, somewhat pinguious, well scented, and smelling something like Honey, pure, and produc'd in *Creta* or *Pontus*. The next in Value is what is white, and of a naturally fat Substance.

All Wax is heating, mollifying, and moderately incarning. It is mix'd in forbile Liquors, as a Remedy for a Dysentery; and ten Bits, of the Size of a Grain of Millet, swallow'd, prevent the Curdling of Milk in the Breasts of Nurses. *Dioscorides*, *Lib.* 2. *Cap.* 105.

Certain Balsams appear, in a very small Quantity, upon the Surface of the Leaves of some Plants, where they are inspissated by the Heat of the Sun, as seems manifestly to appear in Rosemary: There are also often found in other Plants certain very minute Globules, rising from the open seminal Tufts in the main Part of the Flower. These can scarce be collected by any human Means; but I have sometimes found, upon frequently cohobating Spirit of Wine upon Rosemary-leaves, an unexpected and ungrateful Taste or Smell of Wax, fouling the Spirit, which before was good; and upon viewing these Leaves with a Microscope, I thought I discover'd little waxy Risings of the Surface; and, upon handling them considerably, I evidently found Wax gradually sticking to my Fingers. Wax, therefore, appears to be a certain Species of Turpentine, which the fat Juices of Plants, when heated by the Sun, sweat out upon the Surface, or produce within the Cavities of the flowery Tufts. This the Bees collect, roll up into little Balls, and carry between their hind Feet to their Hives, where it is wrought into the Cells of their Combs; and from hence, after the Honey is separated from the drossy Parts, it is procur'd for human Uses. It is generally yellow, and not ungrateful either in Taste or Smell. It becomes hard, and almost brittle, in the Cold, but grows soft, and dissolves, with Heat.

Process upon BEES-WAX.

Half fill a Glass Retort with fine Wax, cut into Pieces small enough to enter the wide Mouth thereof; then pour clean Sand upon it, so as to fill the Retort; which is now to be gently warm'd till the Wax melts, and sufficiently imbibes and mixes among the Sand: Set the Retort in a Sand-furnace, apply a Receiver, and distil with a gradual Fire. There usually first comes over a little tartish Water, of a disagreeable fetid Odour, along with a little Spirit. When, with the gentle Heat of 214 Degrees, nothing more ascends, change the Receiver, and raise the Fire, by which means there will gradually arise a thin Oil, of a whitish Colour, and concrete, like Butter, in the Receiver. When this ceases, apply a violent Fire of Suppression, upon which the whole Body of the Wax will soon come over into the Receiver, and there appear in a solid Form, like Butter; having lost the hard brittle Nature of Wax, and melting oily. So much Sand should be here mix'd with the Wax as to prevent its explosive Swelling, as would otherwise happen in the Boiling.

REMARKS.

It is hence manifest, that the whole Body of Wax is volatile, with a certain Degree of Fire; in which respect, therefore, this Substance agrees with Camphire, though Camphire be much more volatile. Hence we see also, that Wax, which is wholly inflammable, may exist in a hard, and almost brittle Form, when dissolv'd in hot Water, then forc'd thro' a Linen Strainer, and poured into shallow metalline Moulds, so as to form little Cakes, these being exposed to the open Air and Sun, and frequently sprinkled with pure Water, the Wax is thus blanch'd or whiten'd; and tho' it now also wholly consumes in Flame, yet it is almost as brittle as Glass, so as to seem a very different thing from Oil. Inflammable vegetable Oils, therefore, may exist under the various Forms of Oils, Balsam, Rosin, Pitch, dry Tears, Wax, and Butter. And hence we see the Fire can make true liquid Oils from Bodies which appear'd not to be

Oils

Oils before; as we evidently ſee in the Diſtillation of Colophony and Wax: And this Converſion of Wax into Butter is durable; for it does not return to hard Wax again in a very long time, but conſtantly remains a ſoft Butter, even in the greateſt Cold. I have kept this Butter of Wax above twenty Years, in a Glaſs cylindrical Veſſel, whoſe wide Mouth was only looſely covered with Paper; yet, in all this time, it did not return into Wax; whereas the moſt liquid Oil of Turpentine ſoon grows thick; ſo that the different Effects of Fire upon the bare oily Parts of Plants are ſurpriſing: Conſequently no certain Rules can hence be laid down for the Action of Fire upon Oils. Camphire, which is a pure inflammable Oil, becomes Camphire again, and not a liquid Oil, after being raiſed by the Fire. The Butter of Wax, thus prepar'd, affords an extremely ſoft anodyne Unguent, agreeable to the Nerves, highly emollient, and relaxing; and, when rub'd upon the Parts, proves ſerviceable in Contractions of the Limbs, and ſucceſsfully preſerves the Skin from Roughneſs, Dryneſs, and Cracking, in the Cold, or the Winter: It alſo proves excellent in the ſharp Pains of the Hæmorrhoids. *Boerhaave's Chymiſtry.*

The BUTTER *of* WAX *turned into a liquid Oil, upon repeated Diſtillation by the Retort.*

Melt the Butter of Wax, over a gentle Fire, to a liquid Oil; then pour it thro' a Funnel, firſt well heated, into a Glaſs Retort, alſo well heated beforehand, ſo as to half-fill the Retort, with Care to prevent any of the Butter from ſticking to the Neck thereof, becauſe in that Caſe the groſs Matter would fall into the Receiver, which ſhould here be avoided. Set the Retort in a Sand-furnace; lute on a clean Receiver, and diſtil cautiouſly, managing the Fire, ſo that one Drop may follow another, at the Diſtance of ſix Seconds; when nothing more comes over with this Degree of Heat, raiſe the Fire, and diſtil as before, and continue in this manner increaſing the Fire with the ſame Caution, ſo long as any Butter remains in the Retort; and by this means all the Butter will come over, ſcarce leaving any Fœces behind; and a thickiſh Oil, not much diminiſhed in Quantity, be found inſtead of Butter in the Receiver. If this Oil of Wax be again diſtilled in like manner, it always becomes more liquid, ſoft, tranſparent, and thin, ſo as at length to reſemble a ſubtile limpid Oil: And the oftener the Diſtillation is repeated, the more mild and gentle, yet the more penetrating, the Oil becomes.

REMARKS.

Hence it appears, that the Action of the Fire more and more attenuates certain oily Bodies of Plants; yet without rendering them acrimonious, but, on the contrary, always milder, tho' at the ſame time more penetrating; for this laſt Oil of Wax is an incomparable Remedy for the Diſeaſes of the nervous Papillæ in the external Skin, and has ſcarce its Equal in curing fiſſur'd Lips in the Winter, fiſſur'd Nipples in the Women who give Suck, and in the cracking of the Skin of the Hands and Fingers, being ſometimes gently anointed thereon. It is alſo ſerviceable in diſcuſſing cold Tumors ariſing on the Face or Fingers in the Winter; and curing contracted Tendons, and the Rigidity of the Limbs thence ariſing, being uſed along with Baths, Fomentations, and Motion; for it has a ſingular Virtue in thus reſtoring Flexibility to the Parts. Being frequently rubbed upon the Abdomen, it prevents Coſtiveneſs; and is therefore excellent in effectually curing the Diſeaſes of Children. *Boerhaave's Chymiſtry, Vol.* 2.

From this Account of Bees-wax it is evident, that it is not ſo improper an Ingredient in the *Lucatellus*'s Balſam, as ſome believe.

CERÆÆ, κηραῖαι. The Cornua of the Uterus. *Ruffus Epheſius, C.* 31.

CERAGO. The Aliment of Bees. *Caſtellus.*

CERAMICE, or CERAMITIS, κεραμικὴ, or κεραμῖτις, join'd with γῆ, Earth, ſignifies Potters Clay. *Hippocrates*, in his Book *De internis Affectionibus*, orders, in an Eryſipelas of the Lungs, this Earth to be apply'd cold, by way of Cataplaſm, to the Body. It is not very clear, whether he means the whole Body, or the Region of the Lungs only. He alſo takes notice of this Earth in his firſt Book *De Morbis*; and in his third Book *De Morbis*, he mentions it as a refrigerating Topic for the Head-ach.

CERAMIUM, κεράμιον. A *Greek* Meaſure, the ſame which the *Latins* call'd *Amphora*. It contains about nine Gallons.

CERAMOS, κέραμος. A Tile.

CERANITES, κερανίτης. The Name of a Paſtil or Troche, mention'd by *Galen.*

CERANTHEMUS, κηράνθεμος, or κηράνθεμον. Bee-glue, or Bee-bread. See PROPOLIS, and AMBRA.

CERARE. To incorporate, or mix. *Rulandus.*

CERAS, κέρας. A Horn. See CORNU.

CERASIATUM. The Name of a purging Medicine in *Libavius*, ſo call'd becauſe the Juice of Cherries is one Ingredient therein.

CERASION, κεράσιον. A Cherry. See CERASUS.

CERASIOS. A Name given by *Meſue* to two Ointments, which he calls the greater and the leſs. *Caſtellus.*

CERASMA, κέρασμα, from κεράννυμι, to mix. A Mixture of cold and warm Water, when the warm is pour'd into the cold. *Caſtellus* from *Galen.*

CERASTES, κεράστης, κεραστῆς, from κέρας, a Horn, is a Serpent, a Cubit in Length, or two Cubits when longeſt, of a ſandy Colour in the Body, and near the Tail void of Scales. At the Head it has two Eminences like Horns, and the Parts about the Belly are cover'd with Scales orderly diſpoſed, which, as the Serpent creeps along, make a ruſtling Noiſe like Hiſſing; this Animal never creeps directly, but obliquely.

The Bite of this Serpent cauſes a Tumor like the Head of a Nail, and an Efflux of Sanies of the Colour of Wine, or blackiſh, eſpecially from the Margin, as it uſually happens in Wounds from Blows or Sugillations.

The ſame Symptoms which are conſequent from the Bite of the Viper affect thoſe who are bit by this Serpent, but to a more vehement Degree, tho' the Patient generally ſurvives to the ninth Day. The Remedies are the ſame, as thoſe preſcribed againſt the Bite of the Viper. *Aetius, Tetrab.* 4. *Serm.* 1. *C.* 28.

Lemery ſeems to have copy'd *Aetius* in his Account of this Serpent: And adds, that it is prepared for Medicinal Uſes like the Viper; that it contains a great deal of volatile Salt and Oil; and that it is ſudorific, reſiſts Poiſons, purifies the Blood, and is good in the Small-pox, Plague, Leproſy, and Itch.

CERASUS. The Cherry-tree; ſo call'd from *Ceraſus*, a City of *Pontus*, from whence they were imported to *Rome* by *Lucullus*, and thence propagated into *Britain*, as *Pliny* informs us.

The Characters are;

The Leaves are conſiderably large, and ſhining; the Calyx, or Flower-cup, is very hollow, conſiſts of one Leaf, is crowned with a quinquefid Crown, expanded, when come to Maturity, retorted; the Flower is like a Roſe, pentapetalous, the Petals growing out of the Spaces between the Segments of the Calyx; it is alſo furniſhed with no fewer than thirty Stamina. The Ovary, which has a long Tube in the very Bottom of the Calyx, becomes a pulpous, roundiſh, or Heart-ſhaped Fruit, ſurrounding a ſtony Shell of a round Figure, which incloſes a Kernel of the ſame Shape; the Fruit has a very long Pedicle. *Boerhaave Index alter, Vol.* 2.

Dioſcorides repreſents Cherries in general, as keeping the Belly open when eaten freſh, but as binding when dry. The Gum of the Cherry-tree, he ſays, taken in Wine and Water, cures a chronical Cough, improves the Complexion, ſharpens Viſion, and excites an Appetite, *L.* 1. *C.* 157.

Boerhaave, in his Work before quoted, informs us, that the Induſtry of the Gardeners has multiply'd the Species of Cherries to above forty-four. But the Cherries principally taken notice of in Medicine are the following.

Ceraſus rubra, Offic. *Ceraſus*, Mont. Ind. 39. *Ceraſus vulgaris*, Ger. 1319. THE COMMON ENGLISH CHERRY-TREE, Emac. 1502. *Ceraſus Anglica*, Park. Theat. 1517. *Ceraſus ſativa*, Jonſ. Dendr. 92. *Ceraſa ſativa rotunda, rubra & acida, quæ noſtris Ceraſa ſativa*, C. B. Pin. 449. Raii Hiſt. 2. 1537. *Ceraſus ſativa fructu rotundo rubro & acido*, Tourn. Inſt. 625. Elem. Bot. 496. *Ceraſus acida rubella*, J. B. 1. THE RED CHERRY-TREE. *Dale.*

This Tree grows hardly ſo high as the black Cherry-tree, ſpreading its Branches more abroad; the Flowers and Leaves are much alike, but the Fruit is much larger, of a red Colour, and a ſharper Taſte.

Theſe are reckon'd more cooling than the black, quenching Thirſt, are grateful to the Stomach, and whet the Appetite; they are ſeldom uſed in Phyſic. The Gum is accounted Lithontriptic, and good for the Stone and Gravel, *&c. Miller's Bot. Off.*

They are cooling, drying, and aſtringent, and corroborate the Heart and Stomach; hence they are uſeful in allaying feveriſh Heats and Thirſt; the Kernels are good to break the Stone. *Dale* from *Schroder.*

Theſe Cherries are eſteem'd a very ſalutary and agreeable Fruit. The Juice of them, when perfectly ripe, is ſaponaceous, and highly reſolvent; and if taken in large Quantities, and theſe frequently repeated, eſpecially when boil'd or bak'd, it is capable of curing many obſtinate chronical Diſtempers, and taking away the obſtructing Matter by a ſalutary *Diarrhœa.*

Ceraſus acida nigricantia, Ind. Med. 32. *Ceraſus fructu acido ſerotino, ſucci ſanguinei*, Tourn. Inſt. 625. Rupp. Flor. Jen.

Jen. 167. *Ceraſus fructu acido ſucci ſanguinei*, Elem. Bot. 497. *Ceraſa acidiſſima ſanguineo ſucco*, C. B. Pin. 450. *Ceraſa acida nigricantia ſolidiora tardius maturaſcentia*, J. B. 1. 221. Raii Hiſt. 2. 1538. THE MORELLO-CHERRY.

The Fruit preſerved, and the Rob of the inſpiſſated Juice, are uſed, and agree in Virtues with the red Cherry. *Dale.*

Ceraſus nigra, Offic. Ger. 1323. THE COMMON BLACK CHERRY-TREE, Emac. 1505. Park. Parad. 571. Mer. Pin. 25. Phyt. Brit. 25. *Ceraſus major ac ſylveſtris, fructu ſubdulci, nigro colore inficiente*, C. B. Pin. 450. BLACK CHERRY-TREE. MAZZARDS, Raii Hiſt. 2. 1538. Dill. Cat. Giſſ. 45. Buxb. 62. Tourn. Inſt. 620. Elem. Bot. 497. *Ceraſus ſylveſtris fructu nigro*, J. B. 1. 220. Raii Synop. 3. 463. THE BLACK CHERRY-TREE.

This grows to be a pretty tall Tree, whoſe Branches are cover'd with roundiſh ſharp-pointed Leaves, ſerrated about the Edges. The Bloſſoms or Flowers precede the Leaves, growing ſeveral together upon long Foot-ſtalks, of ſingle white Leaves, cut into fine Parts, with ſeveral Stamina in the Middle ſet upon the Rudiments of the Fruit, which grows to be roundiſh, leſs than the red Cherry, having a hard Stone in the Middle, cover'd with a pleaſant Pulp, yielding a purple Juice. This Tree grows wild in ſeveral Parts of *England*; and is likewiſe planted in Gardens for the Fruit. It flowers in *April*; the Fruit being ripe in *July*.

Black Cherries are accounted cordial and cephalic, and uſeful in all Diſeaſes of the Head and Nerves, as Epilepſies, Convulſions, Palſies, and the like. They are commended by ſome for the Stone, Gravel, and Stoppage of Urine.

Officinal Preparations are only the diſtil'd Water, which is of more Uſe in the modern Practice than any other ſimple Water whatever. *Miller's Bot. Off.*

See AQUA.

The Stones of black Cherries with their Kernels bak'd, and powder'd, are ſaid to be extremely diuretic.

It is alſo ſaid, that the Kernels of theſe yield by Diſtillation an Oil equally poiſonous with that of the Laurel. Hence the black Cherry-water has, contrary to all Experience ſo far as I can learn, got into ſome Diſrepute.

Padus, Offic. *Padus Theophraſti*, Dill. Cat. Giſſ. 66. *Padus Germanica folio deciduo*, Rupp. Flor. Jen. 108. Buxb. 149. *Ceraſus Avium*, Merc. Bot. 2. 18. Phyt. Brit. 25. *Ceraſus Avium nigra & racemoſa*, Ger. 1322. Emac. 1504. Mer. Pin. 24. Raii Hiſt. 2. 1549. Synop. 3. 463. *Ceraſus racemoſa ſylveſtris fructu non eduli*, C. B. P. 451. Tourn. Inſt. 626. Elem. Bot. 497. Boerh. Ind. A. 2. 244. *Ceraſus racemoſa ſylveſtris*, Jonſ. Dendr. 93. *Ceraſus avium racemoſa*, Park. Theat. 1517. BIRDS CHERRY.

It grows in rocky and mountainous Places, and the Fruit is uſed to hang about the Necks of Children, as a Cure for the Epilepſy. *Dale.*

Mahaleb, Offic. *Macaleb Geſneri*, Ger. 1211. CORAL PRIVET, Emac. 1397. *Machaleb Germanicum*, THE ROCK WILD CHERRY OF AUSTRIA, Park. Theat. 1519. *Ceraſus ſylveſtris*, Ind. Med. 32. *Ceraſus ſylveſtris, Mahaleb*, Mont. Ind. 39. *Ceraſus ſylveſtris amara Mahaleb putata*, J. B. 1. 227. Raii Hiſt. 2. 1549. Tourn. Inſt. 627. Elem. Bot. 497. *Ceraſus ſylveſtris amara, Arabum Mahaleb putata*, Chab. 16. *Ceraſo affinis*, C. P. Pin. 451. Jonſ. Dendr. 93. ROCK CHERRY.

It grows in rocky Mountains, and the Kernels are uſed, which are of a heating and emollient Quality. *Dale.*

CERATIA, κεράτια. The Carob-tree. See CAROBA.

CERATIO. The ſmearing any thing over with Wax. But in the chymical Language it implies the reducing any Subſtance to ſuch a State, as to be ſuſceptible of a Fuſion like that of Wax, whether the Body to be thus alter'd is naturally too hard and coherent to admit of ſuch a Fuſion, or whether it is too volatile to bear it; or it is a Mollification of a hard and not fuſible Subſtance, ſo as to make it capable of Liquefaction. In the Alchemical Senſe it imports the fixing of Mercury with ſomething which flows like Wax, and detains it.

CERATITES. The Foſſil Unicorn. A Stone in the Shape of a Horn.

CERATITIS, κεραῖτις. *Marcellus Empiricus* ſays this is the Sea-violet. But *Pliny* informs us it is a Name of the *Papaver Corniculatum*, *L.* 20. *C.* 19.

CERATIUM, κεράτιον. The Fruit of the Carob-tree. See CAROBA.

It alſo ſignifies a Carat, a ſort of Weight. See CARATA.

CERATOGLOSSUS. The Name of a Muſcle of the Tongue. It ariſes fleſhy from three different Places. Its firſt Origin is broad and carneous from the Cornu of the Os Hyoides; this is properly the *Ceratogloſſus*. Its ſecond Head comes from Part of the Baſis of this Bone, and is named *Baſiogloſſus*. The third Beginning is derived from the cartilaginous Appendage of the Hyoides, which ſome call *Chondrogloſſus*. Theſe three unite, and their Fibres, running in the ſame Direction, are inſerted broad and thin near the Root of the Tongue laterally.

Its Uſe is to draw the Tongue obliquely to one Side; but if both act at once, the Tongue is pulled directly backwards into the Mouth. *Douglas.*

CERATOIDES, κερατοειδὴς. A Name for the Tunica Cornea of the Eye.

CERATOMALAGMA, κερατομάλαγμα. A Cerate. See CERATUM.

CERATONIA. The Carob-tree. See CARODA.

CERATOPHYLLON. An aquatic Plant, of which two Sorts are taken notice of.

1. *Ceratophyllon lævis, aquis immerſum Hydroceratophyllum, folio lævi, octo cornibus armato*, Act. Ac. R. Sc. Par. 1719. Pag. 20. Vaill. 32.

Obſerved by Dr. *Manningham* and Dr. *Dillenius* in the Ditches, by the Way-ſide, from *Chichester* to *Selſey*. *Syn. Stirp. Brit. Ed.* 3. 135.

2. *Ceratophyllon aſperum, aquis immerſum. Hydroceratophyllum, folio aſpero, quatuor cornibus armato*, Act. Ac. Sc. Par. Ann. 1719. Pag. 20. *Milleſolium aquaticum cornutum* 2. Raii Hiſt. 191. *Equiſetum ſub aqua repens foliis biſurcis*, Flor. Pruſſ. 67. Common in ſtanding Waters. *Martyn's Tournefort.*

I find no Medicinal Virtues attributed to them.

CERATUM. A Cerate. What the Antients call'd a Cerate was ſomewhat thicker in Conſiſtence than their *Acopon*, and Cerelæon, and ſofter than a Plaiſter, according to *Galen*; but *Paulus Ægineta* informs us, that the *Acopon* was of a middle Conſiſtence betwixt the Cerate and Plaiſter. The Cerate was made of Oil and Wax, to which Powders were ſometimes added. The general Rule as to the Proportion was, to put twelve Parts of Wax, four Parts of Oil, and one of Powder, into the Compoſition. But Cerates were ſometimes made without any Wax at all, and of unctuous Ingredients and Powders only.

Amongſt the Moderns Cerates are prepar'd of oily or fat Subſtances, Gums, Reſins, Balſams, and Powders, united together with a proper Proportion of Wax, to which ſometimes Mucilages, and various Sorts of Juices, are added, in ſuch a manner, as that the Compoſition may be more thick than an Ointment, and more ſoft than a Plaiſter. The Rule laid down by Authors is to take eight Parts of Oil, Fat, or Juices, four of Wax, and one or two of Powders. Others order three Ounces of Oil to half an Ounce of Wax, and two or three Drams of Powder. But as in warm Weather Oils and unctuous Subſtances are more fluid than in cold, a proper Allowance is to be made for this. The Method of making a Cerate is, to melt the fuſible Ingredients over the Fire, and then to ſtir in the Powders till the Mixture grows cool. Sometimes a Cerate is made by adding eight Parts of any Ointment to two or three of Wax; and ſometimes by lowering a Plaiſter by the Addition of a ſufficient Quantity of Oil. A Cerate is generally directed to be ſpread on Linen or Leather, and to be apply'd to the Part intended to be reliev'd; and they are uſed for all manner of Intentions, as to relax, mollify, digeſt, cicatrize, contract, *&c.*

Quincy ſays, that a Cerate differs from an Ointment only in obtaining an higher Conſiſtence. There are but two Preſcriptions now given by the College under this Title, the firſt a Cooler, the other a moderate Detergent; but they are ſo readily made, that they are hardly any-where kept.

Ceratum Album: The white Cerate.

Take of the whiteſt Wax, four Ounces; of Oil of ſweet Almonds, five Ounces; of the fineſt Sperma-ceti, one Ounce; of Ceruſs waſhed in Roſe-water, one Ounce and an half; of Camphire, half an Ounce: Make them into a Cerate, S. A.

Ceratum Citrinum: The yellow Cerate.

Take of yellow Reſin, half a Pound; of Sheeps-ſuet, four Ounces; of the beſt Turpentine, two Ounces: Let them be melted by a gentle Fire; then give a little Boil, and ſtrain ſo as to make a Cerate.

There are ſeveral under this Title in the old officinal Diſpenſatories, and eſpecially thoſe of our College; but they are all ſo troubleſome of Compoſition, ſo inelegant, and ſo little uſed, that they are thrown out, and theſe two only added new, which are both eaſy to make, and cleanly to uſe. But the chief Reaſon why this Claſs is ſo much reduced, ſeems to be the Conveniency of providing for all the Intentions they are ſuited for by extemporaneous Preſcriptions, ſo that there is no Occaſion to trouble the Shops with them till they are called for. *Quincy's London Diſpenſatory.*

Turner's Cerate, or *Ceratum e Lapide Calaminari*, is deſcrib'd under the Article CADMIA.

CERAUNIA, *ſive fulminaris Lapis*, Offic. *Ceraunius*, Boet. 480. Worm. 74. Charlt. Foſſ. 30. De Laet. 155. Aldrov. Muſ. Metall. 606. Schw. 372. Kentm. 30. *Ceraunia vel Ceraunias*, Geſn. de Lap. 61. THUNDER-STONES.

This is a Stone of a pyramidal Figure, either black or brown. Authors make this different from the *Lapis Belemnites*. It is principally found in *Germany*.

The Women superſtitiouſly rub their Knees and Breaſts with theſe Stones, in caſe of Tumors or Defluxions on thoſe Parts. It is alſo eſteemed good for the Dropſy and Jaundice. But I don't know that Experience atteſts any of theſe Virtues.

CERAUNO-CHRYSOS. A Name for the *Aurum Fulminaris*. *Johnſon*.

CERBERUS *Triceps* is the *Pulvis Cornachini*. In the chymical Language it imports a triple Mercury, from Salt, Quickſilver, and Vitriol. *Caſtellus* from *Libavius*.

CERCHNALEOS, κερχναλέος. Any thing which cauſes Wheezing or Hoarſeneſs.

CERCHNOS, κέρχνος. A Wheezing, or hoarſe Noiſe made in Reſpiration, on account of ſome Diſorder in the *Larynx*, or *Aſpera Arteria*, or both. The Word is frequently us'd by the *Greek* Medicinal Writers in this Senſe.

CERCIO.

This, according to *Johnſton*, is an *Indian* Bird as large as a Starling, of different Colours, almoſt always ſhaking its Tail. The Inhabitants teach it to talk, and it is more docile than the Parrot; there are no Medicinal Virtues attributed to it. *Lemery des Drogues*.

CERCIS, κερκίς. It ſignifies a Peſtil, an Inſtrument to pound any thing with; or the Bone in the Arm call'd the *Radius*.

CERCOPES, κέρκωπες. Artful Cheats and Impoſtors, a Set of People who are repreſented by *Galen* as much converſant in the Stews in *Rome*. There is a ſort of People among us in low Life, who ſeem to be their Succeſſors; theſe are Retainers to the Brothels, who at once act the Part of Bullies, Pimps, Intendants of Health, and Cullies; and who are attach'd to theſe Scenes of Debauchery, partly by their vicious Inclinations, and partly by the Neceſſity they lie under of eating, which, perhaps, without this ſort of Complaiſance might be attended with ſome Difficulty.

CERCOPITHECUS. A Monkey.

CERCOSIS, κέρκωσις. A Diſeaſe of the Clitoris, which conſiſts in its preternatural Inlargement.

CERDAC. Mercury. *Rulandus*.

CEREA. Ear-wax.

CEREALIA. All Sorts of Corn with which Bread is made, ſo call'd from *Ceres*, who was thought by the Heathens to have taught Mankind the Uſes of Corn.

CEREBELLUM. The poſterior Part of the Brain.

CEREBRUM. The Brain.

The Name of Brain is given to all that Maſs which fills the Cavity of the Cranium, and which is immediately ſurrounded by two Membranes, called *Meninges* by the *Greeks*, and *Matres* by others, becauſe they were commonly of Opinion, that theſe Membranes were the Origin, and, as it were, the Mother of all the other Membranes of the Body.

This general Maſs is divided into three particular Portions; the Cerebrum or Brain, properly ſo called, the Cerebellum, and Medulla Oblongata: To theſe three Parts, contained within the Cranium, a fourth is added, which fills the great Canal of the Spina Dorſi, by the Name of Medulla Spinalis, being a Continuation of the Medulla Oblongata.

The Cerebrum, properly ſo called, is a kind of medullary Maſs, of a moderate Conſiſtence, and of a greyiſh Colour on the outer Surface, filling all the ſuperior Portion of the Cavity of the Cranium, or that Portion which lies above the tranſverſe Septum. The upper Part of the Cerebrum is of an oval Figure, like half an Egg cut lengthwiſe, or rather like two Quarters of an Egg cut lengthwiſe, and parted a little from each other. It is flatter on the lower Part, each lateral Half of which is divided into three Eminences called Lobes, one anterior, one middle, and one poſterior.

The Subſtance of the Cerebrum is of two Kinds, diſtinguiſhed by two different Colours; one Part of which is ſofteſt, being of a greyiſh or aſh Colour; the other, which is more ſolid, being very white. The aſh-coloured Subſtance lies principally on the outer Part of the Cerebrum like a kind of Cortex, from whence it has been named the Cortical Subſtance, or Cineritious. The white Subſtance occupies the inner Part, and is named Subſtantia Medullaris, or ſimply Subſtantia Alba.

The Cerebrum is divided into two lateral Portions, ſeparated by the Falx, or great longitudinal Septum of the Dura Mater. They are generally termed Hemiſpheres, but they are more like Quarters of an oblong Spheroide. Each of theſe Portions is divided into two Extremities, one anterior, and one poſterior, which are termed the Lobes of the Cerebrum, between which there is a large inferior Protuberance, which goes by the ſame Name; ſo that in each Hemiſphere there are three Lobes, one anterior, one middle, and one poſterior.

The anterior Lobes (*Tab.* 12. A A.) lie upon thoſe Parts of the Os Frontis, which contribute to the Formation of the Orbits, and of the frontal Sinuſes, commonly called the anterior Foſſæ of the Baſis Cranii. The poſterior Lobes (*Tab.* 12. B B.) lie on the tranſverſe Septum; and the middle Lobes, in the middle or lateral Foſſæ of the Baſis Cranii.

Each lateral Portion of the Cerebrum has three Sides, one ſuperior, which is convex; one inferior, which is uneven; and one lateral, which is flat, and turned to the Falx. Thro' the whole Surface of theſe three Sides we ſee Inequalities or Windings like the Circumvolutions of the Inteſtines, formed by waving Streaks or Furrows very deep and narrow, into which the Septa or Duplicatures of the Pia Mater inſinuate themſelves, and thereby ſeparate theſe Circumvolutions from each other, which are repreſented *Tab.* 7.

Near the Surface of the Cerebrum, theſe Circumvolutions are at ſome Diſtance from each other, repreſenting ſerpentine Ridges; and in the Interſtices between them the ſuperficial Veins of the Cerebrum are lodged, between the two Laminæ of the Pia Mater, from whence they paſs into the Duplicature of the Dura Mater, and ſo open into the Sinuſes.

Theſe Circumvolutions are fixed through their whole Depth to the Septa or Duplicatures of the Pia Mater, by an infinite Number of very fine vaſcular Filaments, as may be ſeen by pulling the Circumvolutions a little aſunder with the Fingers.

When they are cut tranſverſely, we obſerve, that the medullary Subſtance lies in the Middle of each Circumvolution, ſo that there is the ſame Number of internal medullary Circumvolutions as of external cortical ones; the firſt repreſenting white Laminæ inveſted by others of an aſh Colour; but the cortical Subſtance is, in many Places, thicker than the medullary.

The anterior and middle Lobes of the Cerebrum on each Side are parted by a deep narrow Sulcus, which aſcends obliquely backward, from the Temporal Ala of the Os Sphenoides to near the Middle of the Os Parietale; and the two Sides of this Diviſion have each their particular Ridges and Circumvolutions, which gives a very great Extent to the cortical Subſtance. This Sulcus is termed Fiſſura Magna Sylvii, or ſimply Fiſſura Cerebri.

Having cut off the Falx from the Criſta Galli, and turned it backward; if we ſeparate gently the two lateral Parts, or Hemiſpheres of the Cerebrum, we ſee a longitudinal Portion of a white convex Body, which is named Corpus Calloſum. It is a middle Portion of the medullary Subſtance, which under the inferior Sinus of the Falx, and alſo a little toward each Side, is parted from the Maſs of the Cerebrum, to which it is ſimply contiguous from one End of that Sinus to the other; ſo that at this Place the Edge of the Inſide of this Hemiſphere only lies on the Corpus Calloſum, much in the ſame manner, as the anterior and poſterior Lobes lie on the Dura Mater. Both Extremities of this medullary Body terminate by a ſmall Edge bent tranſverſely downward.

The Surface of the Corpus Calloſum is covered by the Pia Mater, which runs in between the lateral Portions of this Body, and the lower Edge of each Hemiſphere. Along the Middle of its Surface, from one End to the other, there is a kind of Raphe, formed by a particular Intexture of Fibres, which croſs each other; for though theſe Fibres appear to be tranſverſe, yet they are really a little oblique, and thoſe which come from the Right Side, interſect thoſe that come from the Left. This Raphe is made more perceivable, by two ſmall medullary Cords which accompany it on each Side, and adhere cloſely to the tranſverſe Fibres.

The Corpus Calloſum becomes afterwards continuous on each Side with the medullary Subſtance, which, through all the remaining Part of its Extent, is entirely united with the cortical Subſtance, and, together with the Corpus Calloſum, forms a medullary Arch or Vault, of an oblong or oval Figure. To perceive this, the whole cortical Subſtance, together with the medullary Laminæ mix'd with it, muſt be cautiouſly and dexterouſly cut off in the ſame Direction with the Convexity of the Cerebrum. After which, we may obſerve a medullary Convexity, much ſmaller than that which is common to the whole Cerebrum, but of the ſame Form; ſo that it appears like a medullary Nucleus of the Cerebrum, eſpecially when we conſider it together with the medullary Subſtance of the inferior Part or Baſis of the Cerebrum. And from thence M. *Vieuſſens* took Occaſion to name this Nucleus the Centrum Ovale.

Under this Arch are two lateral Cavities, much longer than they are broad, and very ſhallow, ſeparated by a tranſparent medullary Septum, of which hereafter. Theſe Cavities are generally named the anterior ſuperior Ventricles of the Cerebrum, to diſtinguiſh them from too other ſmaller Cavities which are ſituated more backward, as we ſhall ſee preſently; but the Name of lateral or great Ventricles given them by *Steno*, is more proper than either of the other two.

The lateral Ventricles are broad, and rounded at thoſe Extremities, which lie next the tranſparent Septum. They go from before backward, contracting in Breadth, and ſeparating from each other gradually in their Progreſs. Afterwards they bend downwards, and return obliquely from behind forward in a Courſe, like the Turning of a Ram's Horn, and terminate almoſt under their ſuperior Extremities, only a little more backward and outward.

At the Place where they begin to bend, in order to run downward,

downward, and then backward, there is on each Side a particular Elongation, which runs from before backward, and terminates in a triangular pointed Cavity turned a little inward, the two Points reſembling Horns. Theſe Ventricles are everywhere lined with a thin Membrane.

The tranſparent Partition, or Septum Lucidum, as it is commonly called, lies directly under the Raphe or Suture of the Corpus Calloſum, of which it is a Continuation, and a kind of Duplicature. It is made up of two medullary Laminæ, more or leſs ſeparated from each other by a medullary Cavity, ſometimes filled with a ſerous Subſtance. This Cavity, in ſome Subjects, reaches a great Way backwards; and, I am inclin'd to think, communicates with the third Ventricle, of which hereafter.

The Septum Lucidum is united by its lower Part to the anterior Portion of that particular medullary Body, called improperly the Fornix with three Pillars, becauſe of ſome Reſemblance it is thought to bear to the Arches of antient Vaults. It is in Reality nothing but the Corpus Calloſum, the lower Side of which is like a hollow Cieling with three Angles, one anterior, and two poſterior; and three Edges, two lateral, and one poſterior. The lateral Edges are terminated each by a large ſemicylindrical Border, like two Arches, which, uniting at the anterior Angle, form, by their Union, what is called the anterior Pillar of the Fornix; and as they run backward ſeparately toward the two poſterior Angles, they have then the Name of the poſterior Pillars.

The anterior Pillar, being double, is larger than either of the poſterior; and the Marks of this Duplicity always remain. Immediately below the Baſis of this Pillar, we obſerve a large, white, ſhort, medullary Rope, ſtretched tranſverſely between the two Hemiſpheres, and commonly called the anterior Commiſſure of the Cerebrum. It is to this Pillar that the Septum Lucidum adheres; but it has no total Adheſion below, and therefore the two lateral Ventricles communicate with each other. The poſterior Pillars are bent downward, and continued thro' the lowet Portions of the Ventricles all the Way to their Extremities, reſembling a Ram's Horn, which is a Name which has been given to them. They diminiſh gradually in Thickneſs during this Courſe, and at their Outſides they have each a ſmall, thin, flat, collateral Border, to which the Name of Corpora Fimbriata is owing.

The inferior Surface of the triangular Cieling, which lies between the Arches, is full of tranſverſe, prominent, medullary Lines; for which Reaſon the Antients called it Pſalloides and Lyra, comparing it to a ſtringed Inſtrument, ſomething like what is now called a Dulcimer.

The Fornix being cut off and inverted, or quite removed, we ſee, firſt of all, a vaſcular Web, called Plexus Choroides, and ſeveral Eminences more or leſs covered by the Expanſion of that Plexus. There are four Pairs of Eminences which follow each other very regularly, two large, and two ſmall. The firſt two great Eminences are named Corpora Striata; and the ſecond, Thalami Nervorum Opticorum. The four ſmall Eminences are cloſely united together; the anterior being called Nates, and the poſterior, Teſtes; but it would be better to call them ſimply, anterior and poſterior Tubercles. Immediately before theſe Tubercles, there is a ſingle Eminence called Glandula Pinealis.

The Corpora Striata got that Name, becauſe, in ſcraping them with the Knife, we meet with a great Number of white and Aſh-colour'd Lines alternately diſpoſed, which are only the tranſverſe Section of the medullary and cortical Laminæ, mixed together in a vertical Poſition in the Baſis of the Cerebrum, as appears evidently by Inciſions made from above downward. Theſe two Eminences are of a greyiſh Colour on the Surface; oblong, roundiſh, pyriform, and larger on the fore than the back Part, where they are narrow and bent.

They lie in the Bottom of the ſuperior Cavity of the lateral Ventricles, which they reſemble in ſome meaſure in Shape, their anterior Parts being near the Septum Lucidum, from which they ſeparate gradually as they run backward, and diminiſh in Size. They are in reality the convex Bottoms of the Ventricles, and it is at the lower Part of the Interſtice, between the largeſt Portions of them, that we obſerve the great tranſverſe Cord, named the anterior Commiſſure of the Cerebrum, which I mentioned already in deſcribing the anterior Pillar of the Fornix Calloſus. This Cord communicates more particularly with the Bottom of the Corpora Striata, by a Turn toward each Side.

The Thalami Nervorum Opticorum are ſo named, becauſe theſe Nerves ariſe principally from them. They are too large Eminences placed by the Side of each other, between the poſterior Portions or Extremities of the Corpora Striata. Their Figure is ſemiſpheroidal, and a little oval; and they are of a whitiſh Colour on the Surface; but their inner Subſtance is partly greyiſh, and partly white; ſo that, in cutting them, we ſee Streaks of different Colours, like thoſe of the Corpora Striata.

Theſe two Eminences are cloſely joined together, and at their convex Part they are ſo far united, as really to become one Body, the whitiſh outer Subſtance being continued uniformly over them both. This Subſtance is very thin, and falls to Pieces only by the Weight of the lateral Parts of the Brain when taken out of the Cranium. Therefore to learn the Structure of theſe Eminences, they muſt be examined *in Situ*, and even there they muſt be handled very gently.

Immediately within this whitiſh common Subſtance, theſe two Eminences are cloſely contiguous till about the Middle of their Thickneſs; and from thence they ſeparate inſenſibly toward the Bottom, where, by the Space left between them, a particular Canal is formed, named the third Ventricle, one Extremity of which opens forward, the other backward, as we ſhall ſee hereafter. Some Anatomiſts have miſtaken the ſuperficial Connection of theſe Eminences for the Pons Varolii.

At the Bottom, theſe two Eminences are elongated downward toward both Sides, into two thick, round, whitiſh Cords, which ſeparate from each other like Horns, by a large Curvature; and afterwards by a ſmall Curvature, turned forward in an oppoſite Direction to the former, and repreſenting the Tip of an Horn, they approach each other again. The Size of theſe Ropes diminiſhes gradually from their Origin to their anterior Reunion.

The Tubercles are four in Number, two anterior, and two poſterior; adhering together, as if they made but one Body ſituated behind the Union of the Thalami Nervorum Opticorum. They are tranſverſely oblong; the anterior being a little more rounded, and broader or larger from before backward, than the poſterior. Their Surface is white, and their inner Subſtance greyiſh. The Names of Nates and Teſtes given to theſe Tubercles are very impertinent, there being no Reſemblance between them and the Things from whence theſe Names are taken. I ſhould like to call them Quadrigemina; that Term being uſed by Anatomiſts on another like Occaſion, to expreſs four ſmall Muſcles lying near each other, and inſerted round the great Trochanter of the Os Femoris.

Directly under the Place, where the Tubercles of one Side are united to thoſe of the other Side, lies a ſmall middle Canal, which communicates by its anterior Opening with the third Ventricle, which belongs to the Cerebellum, as we ſhall afterwards ſee.

Where the convex Parts of the two anterior Tubercles join theſe poſterior convex Parts of the Thalami Nervorum Opticorum, an Interſtice or Opening is left between theſe four Convexities, which communicates with the third Ventricle, and with the ſmall middle Canal. Inſtead of the ridiculous Name of Anus, which has been given to this Opening, it may be called Foramen Commune Poſterius, to diſtinguiſh it from another which ſhall be mentioned hereafter, by the Name of Foramen Commune Anterius.

The Glandula Pinealis, *Tab.* 12. *Fig.* 2. *f.* is a ſoft greyiſh Body, about the Size of an ordinary Pea, irregularly round, and ſometimes of the Figure of a Pine-apple, ſituated behind the Thalami Nervorum Opticorum, above the Tubercula Quadrigemina. It is fixed like a ſmall Button to the lower Part of the Thalami, by two very white medullary Pedunculi, which at the Gland are very near each other, but ſeparate almoſt tranſverſely toward the Thalami.

It ſeems to be moſtly of a cortical Subſtance, except near the Foot-ſtalks, where it is ſomething medullary. The Foot-ſtalks are ſometimes double, as if they belonged to the two anterior Tubercles. This Body adheres very cloſe to the Plexus Choroides, by which it is covered, as we ſhall ſee hereafter; and it therefore requires ſome Dexterity to ſeparate it from the Glandula, without altering its Situation, or breaking the Pedunculi. This Gland has been often found to contain Gravel. Below the Glandula Pinealis there is a medullary tranſverſe Cord, called the Poſterior Commiſſure of the Hemiſpheres of the Cerebrum.

Between the Baſis of the anterior Pillar of the Fornix, and the anterior Part of the Union of the Optic Thalami, lies a Cavity or Foſſula named Infundibulum. It runs down towards the Baſis of the Cerebrum, contracting gradually, and terminates in a ſtrait Couſſe, by a ſmall membranous Canal, in a ſoftiſh Body, ſituated in the Sella Sphenoidalis, named Glandula Pituitaria. The Infundibulum opens above, immediately before the Optic Thalami, by an oval Hole, named Foramen Commune Anterius, and conſequently communicates with the lateral Ventricles.

At the lower Part of the Thalami Nervorum Opticorum, or Beds of the Optic Nerves, directly under their Union, lies a particular natural Canal, called the third Ventricle of the Cerebrum. I call it a natural Canal, that we may not miſtake for it an accidental Fiſſure, which lies between the Thalami in a Brain, taken out of the Cranium, as I have already ſaid.

This Canal opens forward into the Infundibulum, under the Foramen Commune Anterius, by which it likewiſe communicates with the lateral Ventricles. It opens backwards, under the Foramen Commune Poſterius, between the Thalami and

Tubercula Quadrigemina, oppoſite to the ſmall middle Canal which goes to the Cerebellum.

The Plexus Choroides is a very fine vaſcular Texture, conſiſting of a great Number of arterial and venous Ramifications, partly collected in two looſe Faſciculi, which lie one in each lateral Ventricle, and partly expanded over the neighbouring Parts, and covering in a particular manner the Thalami Nervorum Opticorum, or Beds of the Optic Nerves, Glandula Pinealis, Tubercula Quadrigemina, and the other adjacent Parts, both of the Cerebrum and Cerebellum, to all which it adheres.

In each lateral Portion of this Plexus we obſerve a venous Trunk, the Ramifications of which are ſpread thro' the whole Extent of the two Portions. Near the Glandula Pinealis theſe two Trunks approach each other, and uniting behind that Gland, they open into the Torcular, or fourth Sinus of the Dura Mater. When we blow into one of theſe Trunks toward the Plexus, the Air paſſes into all its Ramifications; and in ſome Subjects theſe two Veins form one Trunk, which opens into the Sinus.

The ventricular or looſe Portions of the Plexus often appear to contain a great Number of Tubercles like Glands, which in the natural State are extremely ſmall, but grow bigger in Diſeaſes. To be able to examine them as we ought, the looſe Portions muſt be made to ſwim in clear Water, and be there carefully expanded; then, by the Help of a Microſcope, we may ſee theſe Tubercles in the natural State, like ſmall Folliculi, or little Bags more or leſs flatted.

Beſides this vaſcular Web or Plexus of the Septum Lucidum; the Sides of the Fornix, of the Eminences, Ventricles, Canals, and Infundibulum, are all covered by a very fine Membrane, in which, by Injections or Inflammations, we diſcover a great Number of very fine Veſſels. This Membrane is in a manner a Continuation of the Plexus, and that ſeems to be a Detachment from the Pia Mater. By the ſame means we likewiſe diſcover an extremely thin Membrane on the Inſides of the Duplicature of the Septum, though in ſome Subjects theſe Sides touch each other.

The pituitary Gland is a ſmall ſpongy Body lodged in the Sella Sphenoidalis, between the ſphenoidal Folds of the Dura Mater. It is of a ſingular kind of Subſtance, which ſeems to be neither medullary nor glandular. On the Outſide it is partly greyiſh, and partly reddiſh, and white within. It is tranſverſely oval or oblong, and on the lower Part, in ſome Subjects, it is divided by a ſmall Notch into two Lobes, like a Kidney-bean. It is covered by the Pia Mater as by a Bag, the Opening of which is the Extremity of the Infundibulum; and it is ſurrounded by the ſmall circular Sinuſes, which communicate with the Sinus Cavernoſi.

Cerebellum.

The Cerebellum is contained under the tranſverſe Septum of the Dura Mater. It is broader laterally, than on the fore or back Sides, flatted on the upper Side, and gently inclined both Ways, anſwerable to the Septum which ſerves it as a kind of Tent or Cieling. On the lower Side it is rounder, and on the back Side it is divided into two Lobes, ſeparated by the occipital Septum of the Dura Mater.

It is made up like the Cerebrum, of two Subſtances, but it has no Circumvolutions on its Surface. Its Sulci are pretty deep, and diſpoſed in ſuch a manner, as to form thin, flat Strata, more or leſs horizontal, between which the internal Lamina of the Pia Mater inſinuates itſelf, by a Number of Septa equal to that of the Strata.

Under the tranſverſe Septum, it is covered by a vaſcular Texture, which communicates with the Plexus Choroides. It has two middle Eminences called Appendices Vermiformes, one anterior and ſuperior, which is turned forward; the other poſterior and inferior, which goes backward. There are likewiſe two lateral Appendices, both turned outward. They are termed Vermiformes, from their Reſemblance to a large Portion of an Earthworm.

Beſides the Diviſion of the Cerebellum into lateral Portions, or into two Lobes, each of the Lobes ſeems to be likewiſe ſubdivided into three Protuberances, one anterior, one middle or lateral, and one poſterior; but they are not in all Subjects equally diſtinguiſhed, either by their Convexity or Limits; but they may always be diſtinguiſhed by the Direction of their Strata, thoſe of the middle and anterior Protuberance being leſs tranſverſe than in the poſterior.

When we ſeparate the two Portions or Lobes, having firſt made a pretty deep Inciſion; we diſcover, firſt of all, the poſterior Portion of the Medulla Oblongata, of which hereafter; and in the poſterior Surface of this Portion, from the Tubercula Quadrigemina, all the Way to the poſterior Notch in the Body of the Cerebellum, and a little below that Notch, we obſerve an oblong Cavity, which terminates backward like the Point of a writing Pen. This Cavity is what is called the fourth Ventricle.

At the Beginning of this Cavity, immediately behind the ſmall common Canal which lies under the Tubercles, we meet with a thin medullary Lamina, which is looked upon as a Valve between that Canal and the fourth Ventricle. A little behind this Lamina, the Cavity grows wider towards both Hands, and then contracts again to its firſt Size. It is lined interiorly by a thin Membrane, and ſeems oftentimes to be diſtinguiſhed into two lateral Parts, by a kind of ſmall Groove, from the Valvular Lamina, to the Point of the Calamus Scriptorius.

This Membrane is a Continuation of that which lines the ſmall Canal, the third Ventricle, Infundibulum, and the two great Ventricles. To be able to ſee the fourth Ventricle in its natural State, in which it is narroweſt, it muſt be laid open while the Cerebellum remains in the Cranium; and, in order to that, the Os Occipitis muſt be ſawed very low down.

On each Side of this Ventricle the medullary Subſtance forms a Trunk, which expands itſelf in form of Laminæ through the cortical Strata. We diſcover theſe medullary Laminæ according to their Breadth, by cutting the Cerebellum in Slices almoſt parallel to the Baſis of the Cerebrum; but if we cut one Lobe of the Cerebellum vertically from above downward, the medullary Subſtance will appear to be diſperſed in Ramifications through the cortical Subſtance. Theſe Ramifications have been named Arbor Vitæ, and the two Trunks from whence theſe different Laminæ ariſe, are called Pedunculi Cerebelli.

We cannot go on with the Deſcription of the other middle Parts of the Baſis of the Cerebellum, before that of the middle Parts of the Baſis of the Cerebrum, becauſe theſe two Kinds of Parts are united, and jointly form the Medulla Oblongata. *Winſlow* ſays, he ſhall only add here, that the Strata of both Subſtances of the Cerebellum are not always of the ſame Extent, in the ſame Portions or Protuberances of each Lobe. This appears merely by viewing the convex or outer Surface of the Cerebellum; for there we ſee, at different Diſtances, ſome cortical Strata ſhorter than others, and likewiſe that the Extremities of the ſhort Strata diminiſh gradually in Thickneſs, till they are quite loſt between two long ones.

If we make a ſmall Hole in the external Lamina of the Pia Mater, over one of the Lobes of the Cerebellum, without touching the inner Lamina, and then blow into the cellular Subſtance, by which theſe two Laminæ are connected, thro' a ſmall Pipe introduc'd into the Hole, the Air will gradually ſwell that Subſtance, and ſeparate the Strata more or leſs equally from each other, through their whole Extent; and we ſhall ſee, at the ſame time, the Diſpoſition of all the membranous Septa, or Duplicatures of the internal Laminæ of the Pia Mater, with the numerous Diſtribution of the fine Blood-veſſels which run upon it, eſpecially after a lucky Injection, or in an inflammatory State of theſe Membranes.

Medulla Oblongata.

The Medulla Oblongata is a medullary Subſtance, ſituated from before backward in the middle Part of the Baſis of the Cerebrum and Cerebellum, without any Diſcontinuation, between the lateral Parts of both theſe Baſes; and, therefore, it may be look'd upon as one middle medullary Baſis, common to both Cerebrum and Cerebellum, by the reciprocal Continuity of their medullary Subſtances, thro' the great Hole in the tranſverſe Septum of the Dura Mater; which common Baſis lies immediately on that Portion of the Dura Mater which lines the Baſis of the Cranium. The Medulla Oblongata is, therefore, juſtly eſteem'd to be a third general Part of the whole Maſs of the Brain, or as the common Production, or united Elongation, of the whole medullary Subſtance of the Cerebrum and Cerebellum.

To prevent, however, falſe Ideas either in viewing ourſelves, or in ſhewing to others, the Medulla Oblongata thus inverted, it is very neceſſary often to call to mind, that all which appears ſuperior in that Situation is inferior in the natural State.

The lower Side of the Medulla Oblongata, in an inverted Situation, preſents to our View ſeveral Parts, which are, in general, either medullary Productions, Trunks of Nerves, or Trunks of Blood-veſſels.

The principal medullary Productions are theſe: The Branches of the Medulla Oblongata, which have likewiſe been nam'd Crura Anteriora, Femora, and Brachia Medullæ Oblongatæ, and Pedunculi Cerebri: The tranſverſe Protuberance, call'd likewiſe Proceſſus Annularis, or Pons Varolii: The ſmall or poſterior Branches, call'd Pedunculi Cerebelli, or Crura Poſteriora Medullæ Oblongatæ: The Extremity or Cauda of the Medulla Oblongata, with two Pair of Tubercles, one of which is nam'd Corpora Olivaria, the other Corpora Pyramidalia: And to all theſe Productions we muſt add a Production of the Infundibulum, and two medullary Papillæ.

The great Branches of the Medulla Oblongata are two very conſiderable medullary Faſciculi, the anterior Extremities of which are ſeparated, and the poſterior united; ſo that, taken both together, they repreſent a *Roman* V. Theſe Faſciculi are flat, much broader before than behind; their Surfaces being compos'd of ſeveral longitudinal and diſtinctly prominent medullary Fibres. Their anterior Extremities ſeem to be loſt at the lower

lower Part of the Corpora Striata; and it is for that Reaſon that they are look'd upon as the Pedunculi of the Cerebrum.

The tranſverſe, annular, or rather ſemiannular Protuberance, is a medullary Production, which ſeems, at firſt Sight, to ſurround the poſterior Extremities of the great Branches; but the medullary Subſtance of this Protuberance is, in reality, intimately mix'd with that of the two former. *Varolius*, an antient *Italian* Author, viewing thoſe Parts in an inverted Situation, compar'd the two Branches to two Rivers, and the Protuberance to a Bridge over them both; and from thence it has the Name of Pons Varolii. Its Surface is tranſverſely ſtreak'd, and it is divided into two lateral Parts, by a very narrow longitudinal Depreſſion, which does not penetrate into its Subſtance.

The ſmall Branches of the Medulla Oblongata are lateral Productions of the tranſverſe Protuberance, which, by their Roots, ſeem to encompaſs that medullary Portion in which the fourth Ventricle, or Calamus Scriptorius, is form'd. They form, in the Lobes of the Cerebellum, on each Side, theſe medullary Expanſions, a vertical Section of which ſhews the white Ramifications commonly call'd Arbor Vitæ; and they may be juſtly enough ſtyled Pedunculi Cerebelli.

The Extremity is no more than the Medulla Oblongata contracted in its Paſſage backward to the anterior Edge of the great Foramen of the Os Occipitis, where it terminates in the Medulla Spinalis; and in this Part of it ſeveral things are to be taken notice of: We ſee, firſt of all, four Eminences, two nam'd Corpora Olivaria, and the other two Corpora Pyramidalia. Immediately afterwards it is divided into two lateral Portions, by two narrow Grooves, one on the upper Side, the other on the lower. They both run into the Subſtance of the Medulla, as between two Cylinders, flatted on that Side by which they are join'd together.

When we ſeparate theſe Ridges with the Fingers, we obſerve a crucial Intertexture of ſeveral ſmall medullary Cords, which go obliquely from the Subſtance of one lateral Portion into the Subſtance of the other. M. *Petit*, Member of the Royal Academy of Sciences, and Doctor of Phyſic, is the Author of this Diſcovery.

The Corpora Olivaria and Pyramidalia are whitiſh Eminences, ſituated longitudinally near each other on the lower Side of the Extremity or Cauda, immediately behind the tranſverſe or annular Protuberances. The Corpora Olivaria are in the Middle, ſo that the Interſtice between them, which is only a kind of ſuperficial Groove, anſwers to the inferior Groove of the following Portion.

The Corpora Pyramidalia are two lateral Eminences depending on the Olivaria. *Willis* gave the Name of Pyramidalia to what I have call'd Olivaria, after the late M. *Du Verney*, in his Treatiſe of the Organ of Hearing. Theſe four Eminences are ſituated on the lower Half of the Medulla; which muſt be remember'd, becauſe, in all Figures and Demonſtrations, theſe Parts are repreſented as ſuperior, which in their natural Situation are inferior. Thus theſe Eminences are under the fourth Ventricle, and under the Pedunculi Cerebelli.

The Tubercula Mamillaria, which are ſituated very near the Production of the Infundibulum, have been taken for Glands, probably becauſe of their greyiſh inner Subſtance, which, however, does not ſeem to be any ways different from that of ſeveral other Eminences of the Medulla Oblongata; and, for that Reaſon, I chooſe rather to call them, from their Figure, Tubercula Mamillaria than Papillæ Medullares.

Theſe Tubercles ſeem to have ſome immediate Relation to the Roots or Baſes of the anterior Pillar of the Fornix; ſo that they might be nam'd, according to *Santorini*, the Bulbs of theſe Roots, tho' they appear to be likewiſe partly a Continuation of other Portions of the cortical and medullary Subſtance, of a particular Texture.

The Beak or Tube of the Infundibulum is a very thin Production from the Sides of that Cavity, and it is ſtrengthen'd by a particular Coat given to it by the Pia Mater. It is bent a little from behind forward, toward the Glandula Pinealis, and afterwards expands again round this Gland.

The Membrana Arachnoides, or external Lamina of the Pia Mater, appears to be very diſtinctly ſeparated from the internal Lamina, in the Interſtices between all theſe Eminences on the lower Side of the Medulla Oblongata, without any viſible cellular Subſtance between them. The internal Lamina adheres much more to the Surface of theſe Interſtices than to that of the Eminences. The external Lamina is, as it were, buoy'd up by the Eminences, and equally ſtretch'd between their moſt prominent Parts, to which it ſticks very cloſe; and, in this reſpect, the Roots, or great Cornua of the optic Nerves, may be reckon'd among theſe Eminences.

We muſt obſerve, in general, concerning the Eminences of the Medulla Oblongata, that thoſe which are medullary on their Outſides or Surfaces, are interiorly either entirely cortical, or partly cortical and partly medullary, or form'd by a ſingular Mixture of theſe two Subſtances, which ſtill remains to be unfolded, as well as many other Particularities obſervable in examining the internal Structure of the Brain.

From this common Portion of the Cerebrum and Cerebellum ariſe almoſt all the Nerves which go out of the Cranium, thro' the different Foramina by which its Baſis is perforated. It likewiſe produces the Medulla Spinalis, which is no more than a common Elongation of the Cerebrum and Cerebellum, and of their different Subſtances; and, therefore, the Medulla Oblongata may juſtly be ſaid to be the firſt Origin or primitive Source of all the Nerves which go out thro' the Spina Dorſi, and conſequently of all the Nerves of the human Body.

Medulla Spinalis.

The Medulla Spinalis is only an Elongation of the Extremity of the Medulla Oblongata; and it has its Name from its being contain'd in the bony Canal of the Spina Dorſi. It is, conſequently, a Continuation, or common Appendix, of the Cerebrum and Cerebellum, as well becauſe of the two Subſtances of which it is compos'd, as becauſe of the Membranes by which it is inveſted.

Under the Article Spina Dorsi there is mention'd a ligamentary Tube, which lines the inner Surface of this bony Canal from the great occipital Foramen to the Os Sacrum, repreſenting a very long flexible Funnel. There are alſo mention'd the yellowiſh, and very elaſtic Ligaments, which lie in the great poſterior Notches of all the Vertebræ, and adhere very cloſely to the above-mention'd ligamentary Tube.

The Dura Mater, after it has lin'd the whole internal Surface of the Cranium, goes out by the great occipital Foramen, and forms a kind of Funnel in its Progreſs downward thro' the bony Canal of the Vertebræ. As it goes out at the occipital Hole, it joins the Beginning of the ligamentary Funnel already mention'd, and adheres very ſtrongly to it. That Portion of the Pericranium, which terminates exteriorly at the Edge of the great Foramen, joins the Funnel likewiſe, which, by all theſe Acceſſions, becomes very ſtrong, and capable of reſiſting the greateſt Violences.

This Adheſion of the Dura Mater to the ligamentary Funnel is gradually diſcontinu'd below the firſt Vertebra; and from thence the Dura Mater forms a ſeparate Tube, which runs down in the bony Canal all the Way to the Os Sacrum, the Capacity of it anſwering to that of the Canal; but it does not adhere cloſely to the Sides, as it does to that of the Cranium. It is ſurrounded by a ſlimy Subſtance, which, near the lower End of the Canal, reſembles Fat.

The ſpinal Marrow is made up of a cortical and medullary Subſtance, as the Cerebrum and Cerebellum; but with this Difference, that the Aſh-colour'd Subſtance lies within the other; and, in a tranſverſe Section of this Medulla, the inner Subſtance appears to be of the Figure of an Horſe-ſhoe, or of the Os Hyoides; the convex Side being turn'd forward, and the Extremities or Cauda backward.

The Body of the Medulla Spinalis runs down all the Way to the firſt Vertebra of the Loins, where it terminates in a Point. The Size of it is proportionable to that of the bony Canal, ſo that it is larger in the Vertebræ of the Neck than in thoſe of the Back. It is a little flatted on the fore and back Sides; ſo that we may diſtinguiſh in it two Sides, one anterior, the other poſterior, and two Edges. It is likewiſe, in a manner, divided into two lateral Halves, by a Groove which runs along the Middle of each Side, being a Continuation of thoſe in the Extremity of the Medulla Oblongata.

Each lateral Portion ſends off from both the fore and back Sides, between the Grooves and the Edges, at different Diſtances, flat Faſciculi of nervous Filaments turned toward the neareſt Edge. The anterior and poſterior Faſciculi, having got a little beyond the Edge of the Medulla, unite in Pairs, and form on each Side a kind of Knots, call'd Ganglions by Anatomiſts, each of which produces a nervous Trunk. Theſe Ganglions are made up of a Mixture of cortical and medullary Subſtances, accompany'd by a great Number of ſmall Blood-veſſels.

The Dura Mater, which inveſts the Medulla, ſends out, on each Side, the ſame Number of Vaginæ as there are Ganglions and nervous Trunks. Theſe Vaginæ are Productions of the external Lamina, the internal Lamina, which is very ſmooth, and poliſh'd on the Inſide, being perforated by two ſmall Holes very near each other, where each Vagina goes off, thro' which Holes the Extremities of each anterior and poſterior Faſciculus are tranſmitted; and, immediately after their Paſſage through the internal Lamina, they unite.

The triangular Spaces left between the two anterior and poſterior Faſciculi, and Edge of the Medulla, are fill'd from one Extremity to the other by an indented Ligament, very thin and ſhining, having the ſame Number of Indentations as there are Pairs of Faſciculi. It is fix'd, at different Diſtances, to the Edge of the Medulla, from whence it ſends Filaments to the internal Lamina of the Dura Mater, by which the anterior Faſciculi are diſtinguiſh'd from the poſterior.

The Membrana Arachnoides is here very diſtinct from the internal Lamina of the Pia Mater, ſo that by blowing through a Hole made in the Arachnoides it will ſwell from one End to the other, like a tranſparent Gut. The internal Lamina, call'd in this Place ſimply the Pia Mater, adheres very cloſely to the Medulla Spinalis, and ſends many Productions and Septa thro' its Subſtance. When we blow thro' a Hole made in the Pia Mater, thro' the Subſtance of one lateral Portion of the Medulla, the Air penetrates thro' the Whole, and the Pia Mater, which covers the other lateral Portion, is ſeparated from it.

The Membrana Arachnoides adheres more cloſely to the Pia Mater at the lower than at the upper Part, being, in a manner, ſuſpended by the indented Ligament, which runs along both Edges of the Medulla, and is fix'd by a Filament to the internal Lamina of the Dura Mater, in each Interſtice between the nervous Faſciculi, as has been already ſaid. It alſo gives off Elongations, in the ſame manner as the Dura Mater, to each nervous Trunk or Rope, as we ſhall ſee hereafter.

The NERVES *of both* MEDULLÆ, *from their Origin to their going out of the* CRANIUM.

The Nerves ariſe either from the Medulla Oblongata or Spinalis; they go out in Faſciculi diſpos'd in Pairs; ten Pairs are reckon'd to belong to the Medulla Oblongata, of which nine go out thro' the Foramina of the Cranium, and the tenth ariſes from the Extremity of this Medulla, as it paſſes through the great occipital Hole; and, laſtly, about thirty Pairs are reckon'd to belong to the Medulla Spinalis, of which ſeven paſs thro' the lateral Notches of the Vertebræ Cervicis, twelve thro' thoſe of the Back, five thro' thoſe of the Loins, and five or ſix thro' the anterior Holes of the Os Sacrum, and one at the Sides of the Os Coccygis.

My Deſign is here principally to mention ſome particular Obſervations about the Nerves, while they remain within the Cranium, the reſt of their Courſe thro' the whole Body is ſufficiently deſcrib'd under the Article NERVUS; and it would not be amiſs, if the Reader firſt of all reviews that Article, before he peruſes this.

The firſt Pair of Nerves that ariſe from the Medulla Oblongata are the Olfactory, *Tab.* 7. *a. a.* antiently call'd Proceſſus Mamillares. They are two very flat and ſoft medullary Ropes, each ariſing firſt by medullary Fibres from the Outſide of the lower Part of the Corpora Striata, between the anterior and middle Lobe, on each Side of the Cerebrum, and afterwards by another Filament more internally, and by a third which is more poſterior, and very long. They run under the anterior Lobes of the Cerebrum, being lodg'd in two ſuperficial Grooves in the Baſis of theſe Lobes, and lying immediately on the Dura Mater, from the Clinoide Apophyſes to the Os Ethmoides.

They are firſt of all conſiderably incurvated from without inwards, or towards each other; and, having reach'd near the back Side of the Os Ethmoides, they run for a ſmall Space parallel to, and at ſome Diſtance from, each other; backward they are very thin, but they gradually increaſe in Bulk, in their Courſe forward toward each Side of the Criſta of the Ethmoidal Bone, where they terminate in elongated Papillæ, the Subſtance of which appears to be ſofter and leſs white than that of the Ropes.

Theſe Papillæ lie on the two Sides of the Lamina Cribroſa, and ſend down a nervous Filament into each Hole of that Lamina. At the ſame Place the Dura Mater ſends off the ſame Number of Vaginæ, which inveſt and accompany the nervous Filaments, and their Ramifications on the internal Parts of the Noſe.

The ſecond Pair, or optic Nerves, *Tab.* 7. *b. b.* ariſe from the Eminences call'd Thalami Nervorum Opticorum. The internal Carotids run upon the Outſides of theſe Nerves, immediately after their Union, and before they paſs thro' the Foramina Optica.

Beſides their Origin from the Optic Thalami, theſe Nerves have likewiſe a kind of Communication with the Tubercula Quadrigemina Anteriora by very fine Filaments, one Extremity of which is loſt in the Tubercles, the other in the Roots of the great Arches or Bodies of the optic Nerves. The internal Structure of theſe Nerves ſeems to change at their Entrance into the optic Holes, as we ſhall ſee in another Place.

The Union of theſe Nerves, by the ſmall Curvatures of their Cornua, is very difficult to be unfolded in human Bodies. This Union is commonly found to be very cloſe, but, in ſome Subjects, it ſeems to be no more than a ſtrong Adheſion; in others, to be partly made by an Interſection, or Croſſing of Fibres. They have been found quite ſeparate; and, in other Subjects, one of them has been obſerv'd to be very much alter'd, both in Size and Colour, thro' its whole Paſſage, the other remaining in its natural State.

The third Pair, call'd Nervi Motores Oculi Communes, Oculares Communes, and Oculo-muſculares, *Tab.* 7. *c. c.* ariſe from the Union of the anterior Edge of the great tranſverſe Protuberance, with the two great Branches of the Medulla Oblongata. They pierce the Dura Mater behind the lateral Parts of the poſterior Apophyſis of the Sella Sphenoidalis, and paſs afterwards, each in the neighbouring Sinus Cavernoſi, by the Side of the carotid Artery, and all the Way to the broad Portion of the ſuperior orbitary Fiſſure, where they divide in the manner ſpecify'd under the Article NERVUS.

The fourth Pair, call'd Nervi Trochleares, Muſculares Obliqui Superiores, and moſt commonly Pathetici, *Tab.* 7. *d. d.* are very ſmall and tender, and, in Proportion, very long. They ariſe each behind the Tubercula Quadrigemina, and from the lateral Part of the valviform Expanſion, at the Entry of the fourth Ventricle. From thence they take their Courſe forward, all the Way to the Edge of the anterior Extremities of the tranſverſe Sinus, where, on each Side, they enter the Duplicature of the Dura Mater, and, advancing into the Sinus Cavernoſi, they accompany the third Pair to the ſuperior orbitary Fiſſure.

The fifth Pair, call'd Nervi Innominati, or Trigemini, *Tab.* 7. *f. f.* are at firſt large Trunks, ariſing chiefly from the lateral and poſterior Parts of the great tranſverſe Protuberance, and a little from the Corpora Olivaria and Pyramidalia. They run down obliquely forward on the Extremity of the upper or anterior Side of the Apophyſis Petroſa, very near the Side of the Sella Sphenoidalis, where they enter the Duplicature of the Dura Mater and Sinus Cavernoſi.

At their Entry into the Sinus they form a kind of flat irregular Ganglion, from which ſome Filaments are ſent off to the Dura Mater; and, immediately afterward, each of them is divided into three great Branches, one ſuperior or anterior, one middle, and one inferior or poſterior. The firſt Branch, which may be term'd Ocularis or Ophthalmicus, accompanies the Nerves of the third and fourth Pairs to the ſuperior orbitary Fiſſure. The ſecond, call'd Maxillaris Superior, goes out by the ſuperior Maxillary Hole; and the third, nam'd Maxillaris Inferior, by the inferior maxillary Hole. As the great Trunk of this Nerve runs down, it perforates the Membrana Arachnoides, which, at this Place, forms a kind of Cieling.

The ſixth Pair, nam'd Motores Oculorum Externi, Oculares or Ophthalmici Externi, and Oculo-muſculares Externi, *Tab.* 7. *g. g.* are ſmall Nerves, but ſtill not ſo ſmall as the fourth Pair; and I have ſometimes found them double. They ariſe partly from the oblong inferior Eminences immediately behind the tranſverſe Protuberance, and partly from this Protuberance; and, paſſing immediately under it, they pierce the Dura Mater behind the occipital Symphyſis of the Sphenoidal Bone.

They run on each Side of the Duplicature of the Dura Mater to the cavernous Sinus; and, having enter'd that Sinus, each of them accompanies the firſt Branch of the fifth Pair to the ſuperior orbitary Fiſſure. In this Courſe they communicate with the firſt Branch juſt mention'd, and are increaſed on the fore Part by a Filament or two, which ariſe from the great ſympathetic Nerve, and run up with the Carotid.

The ſeventh Pair, nam'd Auditorii, *Tab.* 7. *h. h.* ariſe from the lateral and poſterior Part of the tranſverſe Protuberance, near the Pedunculi of the Cerebellum, by two Cords, one ſmall and ſolid, the other large and ſoft, which, from thence, is call'd Portio Mollis, and the firſt Portio Dura, or, as I have nam'd it, Nervus Sympatheticus Minimus. The two Nerves on each Side accompany each other very cloſely all the Way to the internal Foramen Auditorium.

The eighth Pair, named Par Vagum, Nervi Vagi, or Sympathetici Medii, *Tab.* 7. *i, i, i, i,* ariſe from the poſterior Extremities of the large Branches or Crura of the Medulla Oblongata, from the tranſverſe Protuberance, and from the anterior Part of the inferior oblong Eminences behind the tranſverſe Protuberances, by numerous Filaments, which all together make a broad Band on each Side, which runs toward the Foramen Lacerum, where it pierces the Dura Mater, and goes out thro' the anterior Part of that Hole; having been firſt joined by a nervous Portion, that runs up from the Medulla Spinalis thro' the great Occipital Foramen, by the Name of Nervus Acceſſorius Octavi Paris, or Nervus Spinalis. This additional Nerve goes out with that of the eighth Pair, thro' the Foramen Lacerum, lying behind it; but diſtinguiſh'd from it by a membranous Septum.

The ninth Pair, call'd Nervi Hypogloſſi Externi, Hypogloſſi Majores, and commonly Guſtatorii, ariſe each from the lateral Part of the Extremity of the Medulla Oblongata, between the oblong inferior Eminences, by ſeveral Filaments, which, uniting together, form commonly two ſmall Ropes on each Side, which pierce the Dura Mater ſeparately; and, preſently afterwards, form one Rope, which goes out of the Cranium thro' the anterior Condyloide Hole.

The tenth Pair, call'd Nervi Suboccipitales, ariſe under the ninth Pair, chiefly from the anterior, and a little from the lateral Part of the Extremity of the Medulla Oblongata, oppoſite to the poſterior Part of the Condyloide Apophyſis of the Occipital Bone, by a ſingle Plane, or Faſciculus of ſmall Filaments, which pierce the Dura Mater directly from within outward, at the ſame Place where the Vertebral Arteries perforate it from without inwards.

The

The Nerves form'd by the lateral Union of the anterior and poſterior Filaments of the Medulla Spinalis go out of the bony Canal of the Spina Dorſi, toward each Side, thro' the intervertebral Holes, thro' the anterior Holes of the Os Sacrum, and the lateral Notches of the Os Coccygis; and from thence they have the general Name of Nervi Vertebrales. They are divided in the ſame manner as the Vertebræ, into ſeven Pair of Cervical Nerves, twelve Pair of Dorſal, five Pair of Lumbar, and five or ſix Pair of Nervi Sacri.

As the Spinal Marrow, which furniſhes all theſe Nerves, ſeldom goes lower than the firſt or ſecond Vertebræ of the Loins, the Situation of the Faſciculi of nervous Filaments muſt be different from that of the Holes thro' which they paſs; and ſeveral of theſe Faſciculi, both anterior and poſterior, muſt be longer than the reſt. This we find, from Experience, to be the Caſe in the following manner.

The Faſciculi of nervous Filaments of the Medulla Spinalis, which produce the Cervical Nerves, run more or leſs tranſverſely toward each Side, from their Origin to their Paſſage thro' the intervertebral Holes. The Faſciculi, which form the Dorſal Nerves, run a little obliquely downward, from their Origin to the intervertebral Holes; and thoſe which form the Lumbar Nerves, run down more and more longitudinally, from the Medulla to the Holes by which they go out.

Therefore the Cervical Faſciculi are very ſhort in the Spinal Canal; the Dorſal Faſciculi are longer; and the Faſciculi, from the Loins and Os Sacrum, very long. It muſt likewiſe be obſerved, that the Faſciculi of the four loweſt Pairs of the Cervical Nerves, and firſt Pair of the Dorſal Nerves, are broader, and more compounded, than the following; becauſe the Brachial Nerves are a Continuation of theſe. The Filaments belonging to the Lumbar Nerves, and thoſe of the Os Sacrum, are likewiſe very broad, and made up of numerous Filaments, as being the Roots of the large Nerves which go to the lower Extremities. The Dorſal Filaments are very ſmall.

The Cervical and Lumbar Faſciculi are not only broader, and made up of more Filaments, than the Dorſal, but alſo ſituated much cloſer to each other; the Lumbar Faſciculi being ſtill more ſo than the Cervical; whereas in the Dorſal a conſiderable Interſtice is left between the Faſciculi.

Theſe Lumbar Faſciculi, from their Origin to the Extremity of the Os Sacrum, form, thro' the whole Canal of the Lumbar Vertebræ, and of the Os Sacrum, a large Bundle of nervous Ropes, call'd by Anatomiſts, Cauda Equina, becauſe of ſome Reſemblance which it bears to a Horſe's Tail, eſpecially when taken out of the Canal, and extended in clear Water.

Tho' the Medulla Spinalis ends at the firſt Vertebra of the Loins, the Vagina of the Dura Mater, by which it is inveſted, is continued thro' the reſt of the bony Canal, all the Way to the Extremity of the Os Sacrum, and involves the great Bundle, or Cauda Equina; the Cords of which pierce it on each Side, nearly oppoſite to the Places where they paſs thro' the intervertebral Holes, and the anterior Holes of the Os Sacrum.

This Vagina of the Dura Mater being ſeparated from the Canal of the Vertebræ, and the lateral Elongations, which ſerve for particular Vaginæ to the Cords, being cut off, it preſently ſhrinks up, and contracts in the ſame manner as all the other elaſtic Parts of the human Body: For Inſtance, as an Artery does, when cut tranſverſely, ſoon after Death. Therefore its true Length muſt be taken while it is *in Situ*, and likewiſe the true Situation of the lateral Elongations.

From all this a Concluſion may be drawn of great Importance, not only in anatomical and philoſophical Inquiries, but alſo for underſtanding local Diſeaſes, Wounds, *&c.* which is, that, when we have Occaſion to conſider any particular Nerves near the Vertebræ of the Back or Loins, or near the Os Sacrum, we muſt remember, that, in the Spina Dorſi, the Origin of theſe Nerves is not even with their Paſſage out of the Spine, but proportionably higher. If, for Inſtance, we inquire about any of the loweſt Nervi Sacri near the Os Coccygis, we muſt not ſtop at the Extremity of the Os Sacrum; but trace its Origin as high as the laſt Vertebra of the Back, or firſt of the Loins.

The Membrana Arachnoides accompanies the original Faſciculi, ſeparately, to their Paſſage thro' the lateral Elongations of the Dura Mater, forming a kind of Duplicature, Breaks, or Diſcontinuations, between the Cords which run in the Vagina of the Dura Mater. The internal Lamina of the Pia Mater, or the Pia Mater ſimply, as it is here reckon'd, adheres very cloſely both to the Faſciculi, and Filaments of which they are compoſed.

Among the original Productions of the Nerves of the Medulla Spinalis, we ought ſtill to reckon the Formation of the Nervi Acceſſorii of the eighth Pair, or of thoſe that I call Sympathetici Medii. They ariſe from the lateral Parts of this Medulla by ſeveral Filaments, about the third and fourth Vertebræ of the Neck, and ſometimes lower. And, ſays *Winſlow*, if my Memory does not fail me, I once traced them to the Middle of the Back. They run up on each Side, between the anterior and poſterior Ranks of the nervous Faſciculi, increaſing gradually in Size, by the Acceſſion of new Filaments from the poſterior Faſciculi.

Having reach'd above the firſt Vertebra of the Neck, they have a kind of Adheſion or Communication with the neighbouring Ganglions of the Nervi Suboccipitales, or thoſe of the tenth Pair. Above this Adheſion they receive two Filaments each, from the back Side of the Medulla; and afterwards continue their Courſe towards the great Occipital Foramen. As they enter the Cranium, they communicate with the Nerves of the ninth and tenth Pairs; and at the Foramen Lacerum they join thoſe of the eighth Pair, with which they return out of the Cranium.

In the poſterior Part of the Medulla Spinalis, near its lower Extremity, there is in ſome Subjects a longitudinal Depreſſion, in which ſeveral tranſverſe Fibres are ſituated; which tho' *Winſlow* has not examined any further, he thought it proper to mention this Obſervation, as he ſays he found it in his Anatomical Common-place Book.

Blood-veſſels *of the* Brain *and* Medulla Spinalis.

The Arteries which ſupply the Cerebrum, Cerebellum, and Medulla Oblongata, come partly from the Carotids, which enter the Cranium thro' the Canals in the Apophyſes Petroſæ of the Temporal Bones, and partly from the Vertebrals, which enter by the great Occipital Foramen, and ſend off the Arteriæ Spinalis into the Canal of the Spine for the Medulla lodg'd there.

All theſe Arteries are divided into ſeveral Branches, which ſend out a great Number of Ramifications, diſtributed thro' both Subſtances of the Brain, and thro' the whole Extent of the Pia Mater. The Dura Mater, both of the Cerebrum and Cerebellum, has Arteries peculiar to it.

The internal Carotid, on each Side, enters the Cranium by the great Canalis Petroſus, in an angular and winding Courſe. The inner Surface of this Canal is lined by a Production common to the Dura Mater, and inferior Pericranium; to which the Artery adheres only by a looſe filamentary Subſtance, in which the plexiform Filaments run, which belong to the great ſympathetic Nerve, commonly call'd the Intercoſtal.

Having paſs'd thro' the bony Canal, it immediately bends upward, towards a Notch in the ſphenoidal Bone, and thro' the Notch it enters the Cranium. Immediately after this, it penetrates the Cavernous Sinus on the Side of the Sella Sphenoidalis, where having form'd a third Curvature, it goes out from it, from below, upwards, and is bent a fourth time round the anterior Cliniode Apophyſis, from before backward. By this Courſe, it is in a manner bath'd in the Blood of the Cavernous Sinus, together with the third, fourth, fifth, and ſixth Pairs of Nerves.

After this fourth Curvature, the internal Carotid having now reach'd the Side of the Infundibulum, and conſequently being very near its Fellow, theſe two Arteries communicate ſometimes by a very ſhort tranſverſe arterial Production. At this Place each of them divides into two principal Branches, one anterior, the other poſterior; and ſometimes into three, in which Caſe there is a middle Branch between the two former.

The anterior Branch runs firſt of all forward under the Baſis of the Cerebrum, ſeparating a little from the ſame Branch of the other Carotid. They approach each other again under the Interſtice between the two olfactory Nerves, communicating by a very ſhort Anaſtomoſis, and ſending ſmall Twigs to that Pair of Nerves. They afterwards ſeparate, being each divided into two or three Branches.

The firſt Ramification of the anterior Branch goes to the anterior Lobe of the Cerebrum. The ſecond, which is ſometimes double, is inverted on the Corpus Calloſum, to which it gives Ramifications, as alſo to the Falx of the Dura Mater and middle Lobe of the Cerebrum. The third, which is ſometimes a diſtinct Branch, ſometimes only an additional Branch to the ſecond, goes to the poſterior Lobe of the Cerebrum. This third Branch is ſometimes ſo conſiderable, as to deſerve to be reckon'd the middle Branch of the three principal ones.

The poſterior Branch communicates firſt of all with the vertebral Artery of the ſame Side, and then is divided into ſeveral Branches on the ſuperficial Circumvolutions of the Cerebrum, and between theſe Circumvolutions all the Way to their Bottom. The anterior, and middle Branches when there are three, diſtributes the ſame Kind of Ramifications to the Circumvolutions and to their Interſtices.

All theſe different Ramifications are in the Duplicature of the Pia Mater, from which they receive a Kind of additional Coats, and the Capillaries being diſtributed upon it in a reticular manner, afterwards penetrate the cortical and medullary Subſtance, in which laſt they terminate inſenſibly.

The vertebral Arteries enter thro' the great occipital Foramen, having firſt pierc'd on each Side the Elongations of the Dura Mater, at the ſame Place where the Suboccipital Nerves, or thoſe of the tenth Pair, pierce it, as they go out; the Arteries in this Place lying above the Nerves.

At

At their Entry into the Cranium, they ſend each ſeveral Ramifications to the Cauda of the Medulla Oblongata, and to the Corpora Olivaria and Pyramidalia, which Ramifications are diſtributed on the Sides of the fourth Ventricle, produce the Plexus Choroides, are ſpread on the whole Surface of the Cerebellum, inſinuate themſelves between the Strata, always inveſted by the Duplicature of the Pia Mater, and are at length loſt in both Subſtances of the Cerebellum.

Afterwards the two vertebral Arteries turn toward each other, for the moſt part immediately under the poſterior Edge of the tranſverſe or ſemiannular Protuberance of the Medulla Oblongata, where they unite, and form one common Trunk. This Trunk paſſes directly from behind forward, under the Middle of the great Protuberance, and partly in the middle Groove of the convex Surface of that Protuberance, at the anterior Edge of which it terminates.

In its Paſſage thro' the Groove, this Trunk ſends off ſeveral ſmall Branches on each Side, which ſurround tranſverſely the lateral Portions of the Protuberances, being partly lodg'd in the ſmall lateral Grooves of theſe Portions. Theſe lateral Branches are afterwards diſtributed to the neighbouring Parts of the Cerebrum, Cerebellum, and Medulla Oblongata.

This common or middle Trunk of the vertebral Arteries, having reach'd the Edge of the great Protuberance, is divided again into two ſmall Branches, each of which ſoon communicates with the Trunk of the internal Carotid on the ſame Side. Inſtead of this Bifurcation, the two laſt or moſt anterior lateral Branches, ſend each ſometimes a ſmall Branch forward, which form the Anaſtomoſes with the internal Carotids.

The principal Arteries of the ſpinal Marrow, call'd commonly Arteriæ Spinales, are two in Number, one anterior and one poſterior, lodg'd in the Grooves, by which the Medulla is divided into lateral Portions on both Sides. They ariſe from the vertebral Arteries, a little above the great occipital Foramen, where theſe Arteries ſend each a ſmall Branch downward as ſoon as they enter the Cranium; and having got under the Extremity of the Medulla Oblongata, they ſend off two other Branches backward.

The firſt two Branches, uniting ſoon after their Origin, form the Arteria Spinalis Anterior, which runs down within the Canal of the Vertebræ, along the anterior Groove of the Medulla. The other two ſmall Branches are inverted on the Sides of the Medulla Oblongata, and from thence running backward, they unite much in the ſame manner with the firſt two, and form the Arteria Spinalis Poſterior, which runs down along the poſterior Groove of the Medulla Spinalis.

The two ſpinal Arteries, in their Courſe downward along the Medulla, ſend off on each Side lateral Ramifications, by which they frequently communicate with each other; and likewiſe with the vertebral Arteries of the Neck, with the Intercoſtals; and ſometimes they are in a manner ſplit for a little Way, and then unite again.

The Veins of the Cerebrum and Cerebellum may in general be look'd upon as Branches, not only of the longitudinal Sinus of the Dura Mater, and of the two great lateral Sinuſes, but alſo of all the inferior Sinuſes of that Membrane; in all which Sinuſes the Veins terminate by different Trunks. Their principal Ramifications accompany all the cortical Circumvolutions of the Cerebrum, and Directions of the Strata of the Cerebellum, running always in the Duplicature of the Pia Mater. The Veins of the Plexus Choroides, in general, are of the Number of thoſe already mention'd.

The Veins of the Medulla Spinalis are Branches partly of the ſuperior Extremities of the two vertebral Veins, partly of the two venal Ropes, termed Sinus Venoſi, which run down both Ways laterally on the anterior convex Side of the Production of the Dura Mater, and form, at different Diſtances, reciprocal Communications, by ſemiannular Arches, as by ſo many ſubordinate Sinuſes. The two longitudinal Sinuſes communicate likewiſe in their Paſſage with the vertebral Veins, in the ſame manner as the neighbouring Arteries.

Uſes of the Brain, and of its Appendages in general.

We are obliged to the great *Malpighi* for the firſt and beſt Inſtructions concerning the Manner of examining the Structure of the Brain, eſpecially that of the two Subſtances of which it is made up, and for putting us in a Condition to be able to conjecture ſomething about its Uſes. The Experiments and Obſervations of that illuſtrious and faithful Searcher into Nature, having been repeated by ſeveral excellent Philoſophers, and confirm'd by comparative Anatomy, leave us no room to doubt, but that the Brain is a ſecretory Organ, or, as it is called by Anatomiſts, a Gland.

It is to no Purpoſe to diſpute about Words, when we are agreed as to the Things themſelves. Anatomiſts have, for many Years paſt, underſtood by the Word *Gland* an Organ fitted to ſeparate ſome particular Fluid from the Maſs of Blood, as univerſally as they mean by the Word *Muſcle* all Sorts of fleſhy Fibres capable of Contraction; and this laſt Term might be cavil'd at, and rejected, as juſtly as the other.

The whole Matter of Secretion muſt be own'd to be very obſcure; but it is to be hoped, that the Brain and Liver will ſome time or other lead us ſo far into the Knowledge of it, as, at leaſt, to be able to diſtinguiſh Truth from Falſhood.

The greyiſh or aſh Colour of the cortical Subſtance is not the Effect of a particular Mixture of Red and White; at leaſt, we have no Experiment to prove it. The Blood, indeed, gives this Subſtance a ſlight rediſh Caſt; but the aſh Colour, which ſeems to be the Characteriſtic of the Structure of theſe ſecretory Organs, is not owing to that.

We learn from M. *Ruyſch*'s Anatomical Injections, that the cortical Subſtance is principally compoſed of Veſſels; that, by making theſe Veſſels ſwim in a clear pellucid Liquor, their Extremities repreſent an infinite Number of fine Bruſhes, or vaſcular Tufts; and that his Injection fills even the ſmalleſt Filaments of theſe Tufts. He tells us likewiſe, that in theſe laſt Filaments the Structure is alter'd; and that, by the Mechaniſm of this Change, the Functions attributed to Glands may be perform'd.

But ſtill theſe Injections and Preparations do not unravel the Myſtery, neither is the Exiſtence of theſe Pencils or Tufts ſufficiently demonſtrated; for they are only the laſt Extremities of the ſmall Arteries macerated in Water, or ſome other Liquor, after being injected, and then artfully ſeparated from the other eſſential Parts of the Organ.

In the firſt Place, they are ſeparated from the venous Extremities, which muſt anſwer to theſe Tufts, in what manner ſoever that be brought about. Secondly, they are ſeparated from the membranous Filaments of the Pia Mater, which, in the natural State, tie theſe arterial Extremities to each other, and give them a different Diſpoſition from that of Tufts or Pencils. Thirdly, by this Preparation the arterial Extremities are ſeparated from their Connections with the medullary Subſtance; which both Experiments and comparative Anatomy ſhew to be fibrous.

It is no ways ſurpriſing, that theſe Capillary Extremities, thus ſtript, ſhould float looſely and freely, when moved in a Fluid, and that they ſhould put on the Appearance of Pencils or Tufts, being, in this State, only the truncated Extremities of ſmall Veſſels. When we conſider theſe Circumſtances attentively, we find ourſelves obliged to return to the ſmall glandular Bodies and Folliculi of *Malpighi:* And, at the ſame time, we muſt acknowledge, that *Ruyſch*'s fine Injections have diſcover'd theſe minute Bodies to be of a vaſcular Texture, the Structure of which we are ſtill ignorant of.

In a Word, *Malpighi* has diſcover'd the glandular Tubercles and Folliculi, without deſtroying their natural Connections. *Ruyſch* has diſcover'd a conſiderable Part of their Structure, by deſtroying their Connections. We are, therefore, very much beholden to both theſe illuſtrious Anatomiſts; and it is only by joining their Obſervations to each other, that we can ever be able to form an Idea of the ſecretory Organs, which will anſwer all the Phenomena concerning the different Secretions in the human Body.

The infinite Number of theſe ſmall ſecretory Cluſters ſtrain or filtre the Maſs of Blood, carried to them by the numerous Ramifications already mention'd, and ſeparate from it an exceſſively fine Fluid; the remaining Blood being convey'd back, by the ſame Number of venous Extremities, into the Sinuſes of the Dura Mater; and from thence into the Jugular and Vertebral Veins.

This ſubtile Fluid, commonly call'd Animal Spirits, Nervous Juice, or Liquor of the Nerves, is continually forced into the Medullary Fibres of the white Portion of the Cerebrum, Cerebellum, Medulla Oblongata, and Medulla Spinalis; and, by the Intervention of theſe Fibres, ſupplies and fills the Nerves, which are a Continuation of them.

All the nervous Ropes, as they paſs thro' the Foramina of the Cranium and Vertebræ, are accompanied by particular Elongations of the Pia and Dura Mater. Thoſe of the Dura Mater ſerve them for Vaginæ, in their Paſſage thro' the bony Openings. Thoſe of the Pia Mater not only accompany and inveſt each nervous Rope, but alſo form internal Septa between all the Filaments, of which each Rope conſiſts. It is known, from many Experiments, that the Nerves are the primitive or original Organs of all Muſcular Motion, and of all Animal Senſation; and that theſe two Functions depend in general on the Brain; but we are ignorant of the Nature of this Dependence, and of the particular Uſes of the medullary Fibres, of the nervous Fluid, and of the membranous Productions which accompany the Nerves.

Neither is there any thing certain in what has been ſaid concerning the Deſign, or particular Uſes, of the ſuperficial Conformation of the Cerebrum and Cerebellum; or of the different Configuration of their Turnings, Circumvolutions, Eminences, Depreſſions, Expanſions, and various Folds. It may be affirm'd, in general, that, by this Structure, the Extent of the ſecretory Organ of the nervous Fluid is increaſed very conſiderably,

derably, and the particular Functions of each nervous Rope diſtinguiſh'd; and likewiſe their general and reciprocal Correſpondence, both in regard to the Exquiſiteneſs of the Organs of Senſation, and the Activity of the Organs of Motion.

The Falx of the Dura Mater hinders one Portion of the Cerebrum from preſſing on the other, when we lie on one Side. The tranſverſe Septum ſerves for a Tent to the Cerebellum, and defends it from a mortal Compreſſion, which it muſt otherwiſe be liable to from the Cerebrum, eſpecially when we walk or jump.

The Septum, and Productions of the Pia Mater, connect and ſtrengthen all the Circumvolutions, Diviſions, and Ridges of the Cerebrum and Cerebellum, and ſuſtain, in a general and almoſt incomprehenſible manner, all the Branches and Ramifications of the Blood-veſſels, all the medullary Filaments, and all the Elongations and Ropes that depend on theſe.

A Diſſertation on the Anatomy of the Brain, by M. Steno, *read in the Aſſembly held at M.* Thevenot's *Houſe, in the Year* 1668.

Gentlemen,

Inſtead of promiſing, that I ſhall ſatisfy your Curioſity in what relates to the Anatomy of the Brain, I begin, by publicly and frankly owning, that I know nothing of the Matter. I wiſh I were the only Perſon under a Neceſſity of talking in this manner, becauſe I might, in time, become acquainted with what others know; and it would be a great Bleſſing to Mankind, if this moſt delicate Part, which is liable to ſo many dangerous Diſeaſes, were as well underſtood as the Generality of Anatomiſts and Philoſophers imagine it to be. In this, few imitate the Sincerity of *Sylvius*, who never talks poſitively concerning the Brain, tho' he has been at more Pains about it, than any Man that I know. The Number of thoſe who think every thing eaſy is infinitely the greateſt, and they give us the Hiſtory of the Brain, and Diſpoſition of its Parts, with the ſame Confidence and Aſſurance, as if they had been preſent at the Formation of this ſurpriſing Machine, and had been let into all the Deſigns of the Great Architect. Though the Number of theſe poſitive Gentlemen be very great, and though I cannot pretend to anſwer for the Sentiments of all the reſt, I am nevertheleſs very much convinc'd, that they who ſearch for ſolid Knowledge, will find nothing ſatisfactory in all that has been written about the Brain. It is very certain, that it is the principal Organ of the Soul, and the Inſtrument by which it works very wonderful Effects. The Soul, which imagines it can penetrate into every thing without it, and that nothing in the World can ſet Bounds to its Knowledge, is nevertheleſs utterly at a Loſs to deſcribe its own Habitation, and is no-where more to ſeek than at Home. We need only view a Diſſection of that large Maſs, the Brain, to have Ground to lament our Ignorance. On the very Surface you ſee Varieties which deſerve your Admiration; but when you would look into its inner Subſtance, you are utterly in the dark, being able to ſay nothing more, than that there are two Subſtances, one greyiſh, the other white, which laſt is continuous with the Nerves diſtributed all over the Body; that the greyiſh Subſtance ſerves in ſome Places for a Cortex to the White, and that in other Places it ſeparates the white Filaments from each other.

If we are aſked what theſe Subſtances are, in what manner the Nerves are joined in the white Subſtance, or how far their Extremities penetrate into it; all we can do is to own our Ignorance, except we are reſolv'd to increaſe the Number of thoſe who prefer the Applauſe of the Public to Sincerity and Truth. For, to ſay that the white Subſtance is only an uniform Body like Wax, without any Art concealed in it, would be to think too meanly of this great Maſter-piece of Nature. We are ſure, that where-ever there are Fibres in the Body, they always obſerve a certain regular Order, more or leſs complex, in proportion to the Functions for which they are appointed. If this Subſtance is every-where fibrous, as it appears in many Places to be, you muſt own, that theſe Fibres are diſpoſed in the moſt artful manner, ſince all the Diverſity of our Senſations and Motions depends upon them. We admire the Contrivance of the Fibres of every Muſcle, and ought ſtill more to admire their Diſpoſition in the Brain, where an infinite Number of them, contained in a very ſmall Space, each execute their particular Offices without Confuſion or Diſorder.

The Ventricles or Cavities of the Brain are no leſs unknown than its Subſtance. They who place the animal Spirits there, think they are as much in the right, as they who make them the Receptacles of the Excrements; but they are both equally puzzled, when they are deſired to explain the Origin of theſe Spirits and Excrements. Theſe may come from the Veſſels found in theſe Cavities, as well as from the Subſtance of the Brain; and it is equally difficult to determine how they get out.

Among thoſe who place the animal Spirits in the Ventricles, ſome make them paſs from the anterior to the poſterior Ventricles, there to meet with the Entrances into the Nerves, while others affirm, that theſe Entrances are in the anterior Ventricles. Some imagine, that the Excrements of the Brain are contained in the Ventricles, becauſe they think they ſee ſomething like Excrements there; but they own, that there is as ready a Paſſage for them from the Brain down to the Medulla, as into the Infundibulum; and ſuppoſing they go into the Infundibulum, they may be carried from thence into the Sinuſes of the Dura Mater; and there is ſome Reaſon to believe, that they may have an immediate Paſſage into the Eyes, Nares, and Mouth.

We are ſtill more uncertain about what relates to the Animal Spirits. Are they Blood, or a particular Subſtance ſeparated from the Chyle by the Glands of the Meſentery? Or may they not be derived from a lymphatic Serum? Some compare them to Spirit of Wine, and it may be doubted whether they are not the Matter of Light. Our common Diſſections cannot clear up any of theſe Difficulties.

The true Manner of diſſecting the Brain is as little known as its Subſtance. I need not mention the Method of cutting it into Slices, becauſe it is owned by every body, that nothing can be learned that way. The ſecond Method of unfolding all the Plicæ is ſomething more artful; but it only ſhews us the outer Surface of what we want to know, and even that very imperfectly.

The third Method of unfolding the Plicæ, and ſeparating the two Subſtances, goes no farther than the Surface of the Medulla. Theſe three Methods have been differently combined; and they may be ſtill more diverſify'd, according as they are executed longitudinally, tranſverſely, or in any other manner.

As for my own Part, it is my Opinion, that the true Method of diſſecting would be to trace the nervous Filaments through the Subſtance of the Brain, to ſee which Way they paſs, and where they end; but this Method is accompany'd with ſo many Difficulties, that I know not whether we may hope ever to ſee it executed without a particular manner of preparing. The Subſtance of the Brain is ſo ſoft, and the Fibres ſo tender, that they can hardly be touch'd without breaking. Since, therefore, Anatomy has not hitherto arriv'd to that Degree of Perfection, as to make the true Diſſection of the Brain, let us, without flattering ourſelves any longer, freely acknowledge our Ignorance, that we may not firſt deceive ourſelves, and others afterwards, by promiſing to ſhew them the true Structure of this Organ.

I ſhould tire your Patience inſtead of entertaining you, were I to mention particularly all the Diſputes that have aroſe about the Brain: Books are but too full of them; and therefore I ſhall only relate the principal Miſtakes which ſtill ſubſiſt amongſt Anatomiſts, and which may be corrected by Anatomy; and they may be reduced to theſe Heads. Some pretend to ſhew Parts in the Brain as ſeparate, which are only a Continuation of the ſame Subſtance; and others would perſuade us, that theſe Parts touch each other without any Connection, though they are viſibly joined together by Filaments or Veſſels. Some ſituate the Parts in the manner which is moſt agreeable to the Syſtems they have framed, without conſidering that they are quite otherwiſe ſituated by Nature. They ſhew you the Pia Mater, for Inſtance, in Places where it never was; and do not ſee the Dura Mater in Places where it is viſible; and in caſe of Need, they will make the very Subſtance of the Brain paſs for a Membrane.

I have too good an Opinion of Men of Learning in general, to believe that they do this with a Deſign to deceive others; but the Principles which they have eſtabliſhed, and the Method of Diſſection to which they have accuſtomed themſelves, oblige them to it. All Anatomiſts would demonſtrate the Parts the ſame way, if they made uſe of the ſame Method; and therefore we ought not to be ſurpris'd, if their Syſtems are very ill founded.

The Antients were ſo far prepoſſeſs'd about the Ventricles, as to take the Anterior for the Seat of common Senſation, the Poſterior for the Seat of Memory, that the Judgment, which they ſaid was lodg'd in the Middle, might more eaſily reflect on the Ideas, which came from either Ventricle. I would only aſk thoſe who are ſtill of the ſame Opinion, to give us the Reaſon why we ſhould believe them; for there is nothing ſatisfactory in all that has been hitherto ſaid in favour of it; and as that fine arched Cavity of the third Ventricle, where they placed the Throne of Judgment, does not ſo much as exiſt, we may eaſily ſee what Judgment is to be pronounced on the reſt of this Syſtem.

Willis is the Author of a very ſingular Hypotheſis. He lodges common Senſation in the Corpora Striata, the Imagination in the Corpus Calloſum, and the Memory in the cortical Subſtance: But without being at Pains to enter into the Detail of his whole Hypotheſis, we need only make the following Remarks upon it. He deſcribes the Corpus Striatum, as having two Sorts of Striæ, one aſcending, the other deſcending; and yet, if you ſeparate the Cortical from the white Subſtance, you will perceive, that theſe Striæ are all of the ſame Nature,

that is, that they are part of the Subſtance of the Corpus Calloſum, which runs toward the Medulla Spinalis, parted into different Lamellæ by the Intervention of the Aſh-colour'd Subſtance.

How can he then be ſure, that theſe three Operations are perform'd in the three Bodies which he pitches upon? Who is able to tell us, whether the nervous Fibres begin in the Corpora Striata, or if they paſs through the Corpus Calloſum all the Way to the cortical Subſtance? We know ſo little of the true Structure of the Corpus Calloſum, that a Man of a tolerable Genius may ſay about it whatever he pleaſes.

M. *Deſcartes* knew too well how imperfect an Hiſtory we have of the human Body, to attempt an Expoſition of its true Structure; and accordingly, in his *Tractatus de Homine*, his Deſign is only to explain a Machine capable of performing all the Functions done by Man. Some of his Friends have indeed expreſs'd themſelves on this Subject differently from him; but it is evident from the Beginning of that Work, that he intended no more than what I have ſaid; and in this Senſe, it may juſtly be ſaid, that M. *Deſcartes* has gone beyond all the other Philoſophers. He is the only Perſon who has explain'd mechanically all the human Actions, and eſpecially thoſe of the Brain. The other Philoſophers deſcribe to us the human Body itſelf. M. *Deſcartes* ſpeaks only of a Machine, but in ſuch a manner, as to convince us of the Inſufficiency of all that had been ſaid before him, and to teach us a Method of inquiring into the Uſes of the Parts with the ſame Evidence, with which he demonſtrates the Parts of his Machine call'd a Man, which none had done before.

We muſt not therefore condemn M. *Deſcartes*, though his Syſtem of the Brain ſhould not be found altogether agreeable to Experience. His excellent Genius, which ſhines no-where more than in his *Tractatus de Homine*, caſts a Veil over the Miſtakes of his Hypotheſes, eſpecially, ſince even *Veſalius* himſelf, and other Anatomiſts of the firſt Rank, are not altogether free from ſuch Miſtakes. And ſince we can forgive theſe great Men their Errors, who paſs'd the greateſt Part of their Lives in diſſecting, why ſhould not *Deſcartes* meet with the ſame Indulgence, who has happily employ'd his Time in other Speculations?

The Reſpect which I and all the World owe to ſuch ſuperior Geniuſes, would have inclined me to continue only to admire this Treatiſe, as containing the Deſcription of a fine Machine invented by the Author, if I had not met with ſeveral Perſons who would make us believe, that it is a faithful Relation of the moſt ſecret Springs of the real human Body. Since theſe Perſons are not convinced by *Sylvius*'s repeated Demonſtrations, that M. *Deſcartes*'s Deſcriptions do not agree with what appears in diſſecting the human Body, I find myſelf oblig'd to point out ſome Parts of his Syſtem, without relating the Whole; in which they may ſee, if they have a Mind to be inſtructed, the vaſt Difference there is between *Deſcartes*'s imaginary Machine, and the real Machine of the human Body.

The Glandula Pinealis has lately been the Subject of the greateſt Diſputes touching the Anatomy of the Brain; but before I enter upon that Matter, or endeavour to determine the Place where it lies, I muſt firſt give *Deſcartes*'s own Opinion in his own Words, contain'd in the following Paſſages.

" The Surface of the Glandula Pinealis has a Relation to " the inner Surface of the Brain.

" In the Concavity of the Brain, the Pores are directly op- " poſite to thoſe of the ſmall Gland.

" The Spirits run from all Sides of the Gland into the " Concavities of the Brain.

" The Gland may perform its Functions, though it be in- " clined ſometimes to one Side, and ſometimes to the other.

" The ſmall Tubes on the Surface of the Concavities are " always turned to the Gland, and may eaſily be turned to- " ward the different Points of this Gland."

From all theſe Paſſages, it is certain, that he believed the Glandula Pinealis to lie entirely in the Cavities of the Brain. And though in ſome other Places he ſays, that it is ſituated at the Entry of theſe Cavities, yet we are not to think, that this is contrary to what he advances in the Paſſages here quoted; for as it is but a very ſmall Body, it may lie either at the Entry, or in any other Place of the Cavities, and yet ſtill be within them, which he declares to be his Opinion, in many other Places.

We are now to examine, whether this Opinion be not contrary to Experience. It is very certain, that the Baſis of this Gland reaches immediately from the Paſſage of the third Ventricle to the fourth; but the poſterior Part, that is, one Half of the Gland, may evidently be perceiv'd to be altogether without the Cavities, by only removing the Cerebellum, and one or both of the Tubercles of the third Pair, with Dexterity and Care; upon which the poſterior Part of the Gland will be brought into View, and yet no Paſſage will appear, by which the Air, or any other Fluid, can paſs into the Ventricles.

To prove that the anterior Part of the Gland is not in the lateral Cavities, we need only look upon them, after they have been opened either in *Sylvius*'s Way, or in that of the Antients; for the Subſtance of the Brain will always be found to lie between theſe lateral Cavities and the Gland. The ſame Thing may be demonſtrated without cutting the Subſtance of the Brain, by ſeparating from its Baſis the Part which contains theſe Cavities; for the Gland will then appear to be ſo far out of the Cavities, that it can have no manner of Relation to them, being hindered by the Inſertions by which this Part is fix'd to the Baſis. The Antients knew very well, that the Fornix is not continuous with the Baſis of the Brain, but that it forms a third Cavity on its under Side, and by forcing in Air through the Fiſſure, between the Tubercles of the ſecond Pair, we raiſe the Fornix, and thus by breaking the Filaments, which connect it to the Baſis, a large Cavity is form'd; from whence ſome have imagined, that when the Spirits ſwell the Cavities, the Fornix riſes, and that all Sides of the Surface of the Gland are turned toward the Cavities.

I ſay ſome have imagined this, becauſe though the Fornix be rais'd in the manner already ſaid, only the anterior Surface of the Gland can be turned toward the lateral Cavities; but no Preparation whatever can turn the poſterior Surface toward the poſterior Ventricles. But if the Brain has ſuffer'd no Violence, either in opening the Cranium, forcing in Air, or by any other Method, the Cavity of this third Ventricle will be found very narrow at the Middle, and to contain nothing but the great Vein which forms the fourth Sinus, and the glandular Bodies, which accompany this Vein.

I own that behind this Fiſſure, and immediately below its poſterior Opening, there is a Cavity lined on the fore and lateral Parts, by that Part of the Plexus Choroides which runs up toward the fourth Sinus, and at the back Part, clos'd by the Glandula Pinealis, the anterior Portion of which is perfectly continuous; and when the Fornix is remov'd, this Cavity remains entire under the firſt, in the Shape of a Kind of inverted Horn.

What *Deſcartes* ſays, that the Glandula Pinealis may perform its Functions, though it inclines ſometimes to one Side, ſometimes to another, Experience ſhews to be groundleſs; becauſe it is ſo hedged in between all the Parts of the Brain, and ſo fix'd to them on all Sides, that it cannot be mov'd in the leaſt without Violence, and without breaking the Fibres by which it is connected. It is eaſy to ſhew likewiſe, that M. *Deſcartes* has not repreſented it in its true Situation, which is neither perpendicular, as he repreſents it, nor inclined forward, as other very great Anatomiſts believe; but its Point is always turned toward the Cerebellum, and makes nearly half a right Angle with the Baſis.

The ſuppoſed Connection of this Gland with the Brain, by means of Arteries, is likewiſe groundleſs; for the whole Baſis of the Gland adheres to the Brain, or rather the Subſtance of the Gland is continuous with that of the Brain, tho' the contrary be affirm'd by *Deſcartes*.

The Hypotheſis of Arteries meeting round the Gland, and from thence running up to the great Euripus, as it is call'd, is of great Moment in *Deſcartes*'s Syſtem, becauſe the Separation and Motion of the Spirits depend upon it. But, if we can believe our Eyes, this is no more than a Collection of Veins from the Corpus Calloſum, from the interior Subſtance of the Brain, from the Plexus Choroides, from different Places of the Baſis of the Brain, and from the Gland itſelf; the Office of which Veins is to carry back the Blood from the Brain to the Heart, and not to bring it from the Heart to the Brain. Some have thought, that M. *Deſcartes* deſign'd to carry the Nerves to the Gland; but he never had any ſuch Intention.

Such of M. *Deſcartes*'s Friends who look upon his Man only as a Machine, will be ſo good as to believe, that I do not here ſpeak againſt his Machine, the Contrivance of which I have always admired; but as for thoſe who pretend to demonſtrate, that M. *Deſcartes*'s Man is made like other Men, Anatomical Obſervations may eaſily convince them, that this is a fruitleſs Attempt. And if they ſhould plead the ſame Experience on their Side, we may readily anſwer, that there is nothing more common than not to perceive the Miſtakes we commit in diſſecting the Brain, as will evidently appear in the Sequel of this Diſſertation.

Diſſections or Preparations being liable to ſo many Miſtakes, and Anatomiſts having hitherto too readily form'd Syſtems, and moulded theſe ſoft Parts in the manner that was moſt agreeable to each, we cannot be ſurpriſed to find ſo little Exactneſs in their Figures. But this Want of Accuracy in the Figures is not owing to bad Diſſections only: The Ignorance of Drawers has contributed very much, and the Difficulty of expreſſing the ſeveral Eminences and Depreſſions of the Parts, and of underſtanding what the Anatomiſts principally inſiſt upon, furniſhes them with a never-failing Excuſe. The beſt Figures of the Brain are thoſe of *Willis*; but even theſe contain a great Number of egregious Miſtakes, and they want many Things to perfect them. In the third Figure he repreſents the

Superior

ſuperior or Pineal Gland like a round Ball; and conſequently, according to this Figure, the Apex of that Gland cannot be ſaid to be turn'd either forward or backward. Beſides, we ſee here nothing of the Subſtance of the Brain on the fore Side of the Gland, and which goes from one Side to the other; all which the Figure would make us believe to be annihilated. Behind the Gland a Space appears on the Baſis of the Brain, between the two Tubercles of the third Pair, which, in the natural State, has a quite different Appearance. The thin Expanſion of the white Subſtance of the Cerebrum, which is continued to the Middle of the Cerebellum, where it is very thick, is quite wanting; as alſo the Origin of the Nervi Pathetici, which go out from this Expanſion. He likewiſe repreſents the ſecond Pair of Tubercles as diſtinct, which commonly adhere to each other. The under Side of the Fornix appears to be uniform, which is, nevertheleſs, of an uneven, and very elegant, Structure. When we cut the Corpus Striatum tranſverſely, we ſee Radii very different from what they are exhibited in *Willis*'s eighth Figure. The white Radii appear there to be continuous with the fore Part of the Corpus Striatum, which nevertheleſs is of an Aſh-colour'd Subſtance, and, as it runs in between the white Radii, does not appear, in that Method of Diſſecting, to adhere to any other Body whatever.

In the third Figure the Infundibulum has no Reſemblance to Nature. The Nervi Motores Oculorum are ſtrait, and not oblique as they ought to be; neither do we ſee the true Origin of the Filaments of which theſe Nerves are compos'd, from the Baſis of the Brain. The Pons Varolii might have been better and more diſtinctly expreſs'd; and the anterior Roots of the Fornix are not ſeparated as in the ſeventh and eighth *Figures*, but touch each other at the upper Parts, and form an acute Angle. The Line mark'd G. G. G. in the ſeventh *Figure*, appears to be a continu'd Line, tho' the Part between the Roots of the Fornix, which is repreſented, has no Connection with the Extremities; and, in the ſame *Figure*, the Glandula Pinealis is connected to the Subſtance of the Brain by two Funiculi. I need ſay nothing of the *Figures* of *Veſalius*, *Caſſerius*, &c. for ſince theſe, which are the lateſt and beſt, are ſo very imperfect, we may eaſily imagine how little Regard is to be paid to the others.

I have ſeen but three Figures of *Varolius*, which expreſs, in a wretched Manner, the beſt Obſervations that ever have been publiſh'd on the Brain. I don't know whether the Figures of the firſt Edition at *Padua* in 1573. may not be better than thoſe which I have ſeen publiſh'd at *Franckfort* in 1591. and again in *Bauhinus*'s Anatomy. Among *Bartholinus*'s Figures there are three, which repreſent the Brain diſſected after *Sylvius*'s Method; but the Author himſelf owns, that they are faulty. But, to paſs over many other Miſtakes in all theſe Figures, there is not one amongſt them which repreſents truly the Situation of the Glandula Pinealis, the Duct of the third Ventricle, the Plexus Choroides, the Ramifications of the Veins contain'd in the lateral Cavities, the Diſtribution of the Arteries, the Concourſe of the Veins which form the fourth Sinus, or the numerous glandular Bodies lodg'd there.

From all this you ſee how the Brain has been hitherto diſſected, how little Knowledge has been gain'd from theſe Methods of Diſſection, and how falſely the Figures repreſent the Parts which they are deſign'd for. It is eaſy to conclude from hence, how little Regard is to be paid to the Syſtems built on theſe bad Foundations, in framing of which the Authors, by an unaccountable ſort of Misfortune common to this with all other Arts, have employ'd obſcure Terms, Metaphors, and Compariſons, all of them ſo ill choſen as to be equally puzzling to thoſe who have made ſome Progreſs in this Science, and thoſe who begin to learn it. Beſides, the greateſt Number of theſe Terms are ſo low, and ſo unworthy of the moſt noble Part of the Body of Man, that I am at a Loſs whether I ought moſt to wonder at the bad Turn of Thought of thoſe who firſt made uſe of them, or at the Indolence of their Succeſſors, who continue ſtill to retain them. What Neceſſity could there be to employ the Words Nates, Teſtes, Anus, Vulva, and Penis, which, in their common Signification, have no Relation at all to the Parts expreſs'd by them in the Anatomy of the Brain? And, accordingly, what one Author calls Nates, another calls Teſtes, *&c.*

The third Ventricle is a very equivocal Term. The Antients underſtood by this Word a Cavity under the Fornix, which they believ'd to be ſeparated from the Baſis of the Brain; and they have repreſented it with three Legs, that it might ſupport the Brain which lies upon it. *Sylvius* calls the third Ventricle a Canal found in the Subſtance of the Baſis of the Brain, between the Infundibulum and the Paſſage which goes under the two poſterior Pairs of the Tubercles of the Brain, towards the fourth Ventricle. Some Anatomiſts, having ſeparated the Bodies of this ſecond Pair of Tubercles, take the Space between them, which is owing to their manner of Diſſection, for the third Ventricle, which is, conſequently, ſometimes the Fiſſure above, and ſometimes the Canal below; and ſome will have it to be the Space between the Fiſſure and Canal, which is likewiſe owing to the Rupture of the Parts. We have, therefore, three third Ventricles, the ſecond of which alone is the true one; the firſt and third ariſing entirely from the Methods of preparing the Parts. To theſe a fourth third Ventricle might be added, if the ſmall Fiſſure under the Fornix could be look'd upon as a Paſſage between the two anterior Ventricles and the fourth; but it is ſo ſmall, and ſo full of the Veſſels and Glands of the Plexus Choroides, that I doubt very much whether there can be any Communication that Way between the anterior and poſterior Ventricles, eſpecially ſince *Sylvius*'s third Ventricle is ſufficient for that Purpoſe, and likewiſe anſwers the Deſign ſo perfectly well, that whatever goes from the lateral to the poſterior Ventricle, muſt firſt of all fill the Infundibulum and this Canal.

Two Glands are reckon'd to belong to the Brain; tho' we know not if either of them reſembles Glands in any thing more than in Figure; and even that, when well examin'd, will be found to be different from what it is in the reſt. The ſuperior or Pineal Gland is not like a Pine-apple, either in Brutes or in Man; and it is not known whether the inferior or pituitary Gland acts in any reſpect on the Pituita.

The Plexus Choroides repreſents a vaſcular Texture, in which the Veins are ſeen very diſtinct from the Arteries, and the Diſtribution of each may be traced ſeparately. The Name of Fornix gives the Idea of an arched or vaulted Part, which, however, is not to be found but when look'd for in a proper Manner. The Corpus Calloſum, in the common Signification, means the white Subſtance of the Brain, which comes into View when the two lateral Parts are ſeparated; but as it entirely reſembles the reſt of the Subſtance of the Brain, there can be no Reaſon for giving a particular Name to one Part of this Subſtance.

There are but two Ways of coming at the Knowledge of a Machine; either to be taught the whole Contrivance of the Maker, or to take it quite to Pieces by itſelf, and as it ſtands in relation to the reſt. Theſe are the only true Ways of learning the Contrivance of any Machine; but the Generality of Inquirers have thought, that they had better gueſs at it, than be at any Pains to examine it thoroughly. They have ſatisfy'd themſelves with obſerving its Motions, and on theſe Obſervations they have built Syſtems which they believ'd to be true, becauſe, by their Help, they imagin'd they could explain all the Effects in different Manners; and that the Senſes alone are capable of informing us whether our Ideas be conformable to Nature. As the Brain is a Machine, we muſt not flatter ourſelves, that we can diſcover the Contrivance of it by any other means than we made uſe of for knowing other Machines; and we have no Way left but to take it to Pieces, and to conſider what every Part of it is capable of in a ſeparated and in an united State. In this Search we may truly ſay, that few Anatomiſts have diſcover'd any great Degree of Curioſity. Chymiſtry has, in all Ages, found both private Men and Princes ready to erect Laboratories; but few have purſued Anatomy with equal Ardour. This Neglect is not owing to Princes, among whom many have had Curioſity enough for ſuch an important Part of Knowledge, to build magnificent Theatres, which they have often honour'd with their Preſence: But the Diſſectors, being always willing to appear complete Maſters of this Science, never had the Sincerity to own, that any thing ſtill remain'd to be known; and, to conceal their Ignorance, have contented themſelves with demonſtrating what was to be found in the Writings of the Antients.

Anatomiſts might have Reaſon to blame me, if I did not ſhew, by a farther Explanation, that they are not ſo much in the wrong as I ſeem to inſinuate, by ſaying, that they do not apply themſelves ſufficiently to anatomical Inquiries. They that ſtudy Anatomy are generally either Phyſicians or Surgeons, who, being both oblig'd to viſit their Patients, have too little Time left for Study, after they have attain'd to a tolerable Degree of Reputation. But they ought not to undertake the Cure of a Body, the Make of which they do not know, that is, they ought not to endeavour to rectify a Machine, till they are previouſly acquainted with its Nature. Others, who do not viſit ſick Perſons, but have no other Buſineſs but that of teaching Anatomy in public Schools, do not look upon themſelves as more oblig'd to purſue anatomical Inquiries than the practiſing Phyſicians and Surgeons. The Deſign of their Profeſſion is to teach to thoſe who are to practiſe Phyſick and Surgery, the Deſcriptions left us by the Antients of the Structure of the human Body; and when they have clearly demonſtrated all that is contain'd in the Works of the Antients, and their Hearers have as diſtinctly underſtood them, they both imagine, that they have done their Duty. The Bounds of thoſe different Profeſſions of Teaching and Practiſing have been ſo very ill ſettled, that the true Knowledge of the human Machine, though the moſt neceſſary Branch, is neglected, as belonging neither to the Anatomiſt, Phyſician, nor Surgeon.

To make the neceſſary Inquiries for the Diſcovery of Truth, a Man's whole Time muſt be taken up; and Profeſſors of Anatomy, who are oblig'd to make public Demonſtrations, which employ

employ a great deal of Time and Labour, cannot be proper for this Study, for the Reaſons already given, and for the following, which are no leſs evident.

Firſt, There is ſo much Time and Application required to examine each Part as it ought, that every thing elſe muſt be laid aſide, and we muſt mind nothing but that. Phyſicians and Surgeons cannot comply with this becauſe of their Practice, nor Profeſſors becauſe of their public Demonſtrations. Whole Years may ſometimes be neceſſary to diſcover what may afterwards be demonſtrated to others in the Space of an Hour. I do not queſtion but that *Pecquet* was a great while in carrying the Chyle from the Meſentery to the Subclavian Vein; and perhaps I ſhould not be believ'd, were I to mention what Difficulties I found before I could ſhew the true Inſertion of *Pecquet*'s Duct, of which *Bilſius* had given us a Figure; whereas, at preſent, they may be both prepar'd and demonſtrated in half an Hour.

Secondly, Though Anatomiſts open a thouſand Bodies in the Schools, it is by mere Accident, if they diſcover any thing new. They are oblig'd to demonſtrate the Parts as deſcrib'd by the Antients, and, in doing this, it is neceſſary they ſhould follow a certain Method; whereas Inquiries admit of no ſettled Method, but muſt be purſu'd in every manner that can be thought of. In the Schools every thing muſt be remov'd that lies in the way of the Part which they want to ſhew; but, in particular Searches, no Part muſt be cut off till we have firſt examin'd it; and if any ſuch thing were attempted in public Diſſections, the Demonſtrator would be look'd upon as ignorant, and the Spectators would be often in the right to complain of Loſs of Time, becauſe he would not always be ſure to find what he propoſed to ſhew them. It is evident from theſe Conſiderations, that Profeſſors have not hitherto been oblig'd to make Inquiries in Anatomy, and even that it is impoſſible for them to do it, were they ever ſo willing; ſo that it is not their Fault, that greater Progreſs has not been made in that Science.

Anatomy in general has, we ſee, been manag'd hitherto with very little Succeſs; and the Inquiries into the Brain have ſucceeded leſs than any others, becauſe they have not been made with that Care and Diligence which the Difficulty of the Subject requires. Let us now conſider the true Method, and examine if any Perſon has hitherto found it.

Bilſius apply'd himſelf to Anatomy, without having ſtudy'd the Writings of the Antients; and I make no Queſtion but that he would have made a greater Progreſs, if, after having learn'd all that is good in theſe Writings, he had employ'd his Time and Application in making new Diſcoveries. We muſt own, that the Works of our Predeceſſors contain very fine Experiments, which we might ſtill have been ignorant of, if they had not handed them down; and they have ſometimes told us Truths, which their Succeſſors, for want of ſufficient Application, have not been able to ſee. It muſt, however, be own'd, that all that both Antients and Moderns have told us about the Brain is ſo uncertain, that the Books which contain the Anatomy of this Organ may be ſaid to be chiefly a Collection of Doubts, Diſputes, and Controverſies; but ſtill a great Advantage may be made of their Labour, and even of their Miſtakes. I here ſpeak of the Authors who have diſſected; for as for thoſe who only copy the Works of others, the beſt that can be ſaid of them is, that it may ſometimes be proper to read their Books by way of Diverſion. But they would have deſerv'd a great deal more Commendation, and been more uſeful to thoſe who diſſect, if they had given us only an exact Relation of all that Anatomiſts have wrote about the Brain; if they had explain'd, according to the Laws of a true Analyſis, all the different Ways of accounting for the animal Actions mechanically; or if they had made an exact Liſt of all the Propoſitions found in theſe Writings, diſtinguiſhing thoſe which are founded on Facts and Experience, from thoſe which contain Reaſonings and Concluſions drawn from the former. None of theſe Methods have hitherto been purſu'd by the Compilers, and, therefore, we muſt confine ourſelves to the original Authors.

The firſt thing to be conſider'd is the Hiſtory of the Parts; and in this we ought preciſely to determine what is true and certain, that we may be able to diſtinguiſh that from what is falſe and uncertain. Neither is it ſufficient, that we ourſelves are ſatisfy'd about any thing; the Evidence of our Demonſtrations ought to be ſo clear as to oblige every body elſe to aſſent to them; for otherwiſe the Number of Diſputes would rather increaſe than diminiſh. Every Anatomiſt, who diſſects the Brain, demonſtrates from Experience what he advances. This ſoft and pliable Subſtance ſo readily yields to every Motion of his Hand, that the Parts are imperceptibly form'd in the ſame manner as he had conceiv'd them before Diſſection; while the Spectator, who often ſees two contrary Experiments made on the ſame Part, is either puzzled very much to know which he ought to embrace, or oblig'd to reject both to make himſelf eaſy. Therefore, to prevent this Inconvenience, it is abſolutely neceſſary to carry Diſſections the Length of a convincing Certainty, which, though very difficult, is very far from being impoſſible. For I would not have you imagine, from what I have ſaid, that I believe there is nothing certain in Anatomy, or that all who follow that Study make the Parts appear as they have a mind, without any Danger of being diſcover'd: You may, indeed, juſtly doubt if Parts, which are ſhewn you ſeparated, were ever united; but it would be impoſſible to ſhew them united together, if they were not naturally ſo. To clear up any Doubt that might ariſe on this Subject, and to be certain whether the Parts which are ſhewn you were naturally join'd, or not, you need only examine them in their natural State, without uſing any kind of Violence, but allow thoſe whom you have a mind to convince, to do all that is in their Power to ſhew, that they are united. We may come at the ſame Degree of Certainty in other Circumſtances, and particularly when we inquire into the Situation of Parts, provided we touch nothing without having firſt examin'd it, and ſet down every Moment what we touch. In order to this, we muſt not only be very attentive to the Part which we examine, but alſo reflect on all that we did before we reach'd it, to ſee if theſe Operations may have chang'd it from its natural State in any reſpect: For, by often handling more exterior Parts, we may eaſily affect thoſe which lie within them; and when theſe come in Sight, we are ſubject to imagine, that they are naturally ſuch as they then appear, without conſidering how far we may have alter'd their Situation and Connection with other Parts. The moſt famous anatomical Diſpute, which this Age has produc'd, may ſerve for an Example of what I ſay. They who deny the Continuation of the Glandula Pinealis with the Subſtance of the Brain, and the Adheſion of the Fornix to the Baſis of the Brain, would not talk ſo poſitively concerning a Matter of Fact, if they did not believe it to be prov'd by inconteſtable Experiments and Obſervations. But, in making theſe Experiments, they muſt neceſſarily have forgot the Changes which happen in ſeparating the exterior Parts, and that they deſtroy all the Connections by which the Dura Mater adheres to the Cranium; and I have often obſerv'd, that, in raiſing the ſuperior Part of the Cranium, the Middle of the Dura Mater continu'd ſtill to adhere to it, even after I had open'd it ſufficiently to thruſt in three Fingers between the ſeparated Parts of the Cranium. Now, how can the Dura Mater be thus raiſed without making the interior Parts, to which it is fix'd, ſuffer Violence? The Glandula Pinealis adheres to the fourth Sinus, which is connected with the Falx, ſo that the Dura Mater cannot be rais'd at that Place without affecting the Gland. This Falx receives likewiſe all the Veins which paſs between the Fornix and the Baſis of the Brain, and by which theſe two Parts are connected. There is a pretty ſtrong Connection between the upper Part of the Brain and the Dura Mater; and, when that Membrane is rais'd, the Brain muſt follow it; and the fourth Sinus, being carry'd upward, breaks the Connection between the Fornix and the Baſis. I have many times been deceiv'd about this, when I firſt began to diſſect the Brain; and I us'd to wonder why theſe Connections were not always ſenſible: But obſerving afterwards, in Horſes, Sheep, Cats, *&c.* where that Part of the Dura Mater which ſeparates the Cerebrum from the Cerebellum is offify'd, that I deſtroy'd a great many of the inner Parts in extracting this Bone, I began to perceive the Cauſe of this Miſtake, and that it was not an eaſy Matter to ſeparate the Cranium as it ought. The common Way is to divide the Cranium by a circular Section, to remove the upper Segment; but if this Segment were again divided by a Section perpendicular to the former, it would be much more eaſily remov'd without doing any Violence to the Brain; for Sciſſars, Saws, and Forceps, cannot be handled without ſhaking and diſordering the Parts. A ſmall circular Saw might be contriv'd, which would not ſhake the Parts very much, eſpecially if it were turn'd upon a proper Axis, plac'd between two pointed Pillars. This Saw might likewiſe be employ'd for ſeveral other Purpoſes in ſeparating the Cranium; but if any Liquor could be diſcover'd to diſſolve or ſoften the Bones in a ſmall Space of Time, this would be by far the beſt Way of ſeparating the Cranium.

It is not ſufficient to be continually attentive; we muſt likewiſe make uſe of different Methods of Diſſection, which are ſo many different Proofs of the Truth of our Operations, in order to ſatisfy ourſelves, and to convince others.

This will appear a very ſtrange Doctrine to thoſe who believe, that there are ſtated Laws for the Diſſection of every Part, and that the anatomical Adminiſtrations, taught us by the Antients, ought to be inviolably obſerv'd, without any Change or Addition. I own, that the Antients might have given us unalterable Rules for the Diſſection of each Part, had they been ſufficiently acquainted with them themſelves; but as they certainly knew leſs about many Parts than we do, they were, at leaſt, as unfit as we are to preſcribe Rules, which can never be fix'd or conſtant till more Diſcoveries have been made. It will here be objected, that ſome Method muſt be follow'd in diſſecting the Parts already known. This I readily grant, and alſo, that the Method of the Antients is to be made uſe of till a better is found out; but I would not have that Method look'd upon as perfect and unalterable. The principal Reaſon why a great many Anatomiſts

tomiſts have remain'd in their Miſtakes, and why they have gone no greater a Length than the Antients in Diſſection, is, becauſe they believe, that every thing has been already taken notice of, and that there is nothing left for the Moderns to do; and as they have look'd upon the antient Laws as inviolable Rules in Diſſection, they ſpent their whole Lives in demonſtrating the ſame Parts in the ſame Manner; whereas Anatomy ought to be confin'd by no Rules, every new Diſſection requiring a different Method. The Advantage of proceeding in this manner is, that if we miſs of new Diſcoveries, we are, at leaſt, put in a Condition to find out any Miſtakes which may have happen'd in former Diſſections, eſpecially in controverted Points, in which the Spectators ought to have the Liberty of preſcribing the Rules of Diſſection.

This Method of Diſſection makes, indeed, but a very ſmall Shew, and a Man cannot well diſplay his Learning at the ſame time that he acknowledges his Ignorance; but, as for my own Part, I much rather chuſe to own what I do not know, than to impoſe upon my Readers antient Opinions, which will, ſome time or other, be demonſtrated to be falſe. We have ſeen great Anatomiſts expos'd to this Mortification; and we ſtill ſee many who believe, that more Regard will be paid to their Stiffneſs and Poſitiveneſs in Opinion, than to ocular Demonſtration. I wiſh theſe Gentlemen much Joy of their Self-conceit, while I endeavour to follow the Laws of Philoſophy, by which we are taught to ſearch after Truth in ſo cautious a manner, as never to believe we have found it, till it brings Demonſtration along with it.

I cannot prove to you the Neceſſity of often changing the Methods of Diſſection better than by the two following Examples. It is a confirm'd Experiment, that, by blowing into the Beginning of the Fiſſure under the Fornix, the Fornix is ſeparated from the Baſis, and a conſiderable Cavity left between them; and the ſame thing happens when we ſeparate the Cranium with Violence, as I have already ſaid. This is ſo evident, that both the Diſſector and the Spectators are fully convinc'd of it; but if any Perſon ſhould ſtill be in Doubt, there is no other Way to clear it up but to endeavour to demonſtrate this Cavity in another manner: For, if it be natural, we muſt always find it the ſame, in whatever manner we look for it; but if, by any other Method, we find, that it is wanting, and that the Parts between which it ought to lie are connected together, without leaving any void Space between them, you ought, from that Moment, to be convinc'd of the Falſity of the former Demonſtration, and that it was the Force of the Air to which the Appearance of a Cavity was owing.

If the Brain is diſſected according to the Method of *Varolius* or *Willis*, after having taken it out of the Cranium, you will commonly ſee the ſecond Pair of Tubercles ſeparated at the Middle of that white Subſtance which lies before the Glandula Pinealis, and which is very often broken. When we make the Diſſection, leaving the Brain in the Cranium, we ſee both the Tubercles and the white Subſtance entire; and then we ſee plainly, that the Cauſe of the firſt Miſtake was owing to the Weight of the lateral Parts, which break thoſe in the Middle.

Having made a true and exact Plan of the Parts of the Brain, having obſerv'd the Miſtakes, and the Cauſes of the Miſtakes, and having ſettled the true Method of demonſtrating theſe Parts, with all the neceſſary Precautions, the next Step is to expreſs, by good Figures, all that we have diſcover'd; for we had better be without Figures than not have them true and faithful. When we cannot have recourſe to the Originals, the Repreſentation ſerves to keep us in mind of them; and many Perſons never have an Opportunity of ſeeing the Parts in any other Way, their Averſion to Blood hindering them from ſatisfying their Curioſity by examining dead Bodies; and, therefore, if the Figures are not true, they give falſe Ideas to thoſe who would learn Anatomy by their Help, and puzzle others, who make uſe of them only to refreſh their Memory.

We ought, therefore, to leave nothing undone to procure exact Figures, in order to which a good Drawer is as neceſſary as a good Anatomiſt. We muſt likewiſe apply ourſelves very particularly to ſee in what manner we ought to diſſect and diſpoſe the Parts, ſo as to exhibit all that is to be ſeen in the Brain, there being Difficulties peculiar to this Organ. The other Parts require only a Preparation to complete the Figures we deſign; whereas the Brain, never ſo well prepar'd, ſubſides before the Figure can be taken; and we muſt have ſeveral freſh Subjects, before one Figure can be finiſh'd. To this, perhaps, it is owing, that no anatomical Figures are ſo imperfect as thoſe of the Brain.

I have hitherto ſaid nothing of the Uſes of the Parts, nor of the animal Actions, as they are call'd, becauſe it is impoſſible to explain the Movements of a Machine, till we know the Contrivance of its Parts. A reaſonable Man muſt, in his own Mind, laugh at thoſe poſitive Anatomiſts, who, having made a long Harangue about the Uſe of Parts, the Structure of which is altogether unknown to them, give this as the only Reaſon of all they advance, that God and Nature do nothing in vain. They deceive themſelves in the Application of this general Maxim; and the Part which they raſhly judge to have been made by God for one End, is afterwards diſcover'd to have been made for another. We had, therefore, much better own our Ignorance, be more reſerv'd in our Deciſions, and not undertake, upon ſuch ſlight Conjectures, to explain Matters which are, in their own Nature, ſo difficult.

All that I have hitherto mention'd is but a very ſmall Part of what ought to be done, in order to acquire the Knowledge of the Brain. We ought, moreover, to examine the Heads of all Animals, and in all the different States of each Animal. In the Fœtus of Animals we ſee how the Brain is gradually form'd; and what could not be ſeen in a ſound healthy Brain, may, perhaps, be diſcover'd in one that is diſeas'd.

In living Animals we ought to conſider every thing that may cauſe the leaſt Alteration in the Actions of the Brain, whether the Cauſes be external, as from Liquors, Wounds, or Medicines; or internal, as a great Number of Diſeaſes reckon'd up by Phyſicians. There is likewiſe this Advantage attending the Diſſection of the Brains of Animals, that we may manage them as we pleaſe. We may learn to trepan, or to perform any other Chirurgical Operation, upon them; we may examine whether the Brain has any Motion in theſe Operations, and whether the Application of any Medicines to the Dura Mater, or to the Subſtance or Ventricles of the Brain, may not produce ſome particular Effects.

We might likewiſe make different Trials without opening the Cranium, by applying Medicines externally, by mixing them with the Food, and by Injections into the Veſſels, in order to diſcover what diſturbs the animal Actions, and what is moſt proper to reſtore them when diſordered.

The Brain is different in different Animals; and this is another Reaſon why we ſhould examine them all. The Brains of Birds and Fiſhes are not at all like that of Man; and even in Animals where there is the greateſt Likeneſs to the human Brain, I have always found a very great Variety. Whatever this Difference be, it may always afford us ſome new Light, and teach us what it is abſolutely neceſſary we ſhould know. In ſome Animals the Fibres are more eaſily ſeen than in Men; and the Parts which in the human Brain are mixed and joined together, are ſometimes diſtinct and ſeparate in Animals; and we often meet with the Subſtance more or leſs ſolid, and the Size and Situation different.

I need not inſiſt any longer on this Subject, becauſe I believe we are all convinced, that we are indebted to the Diſſection of Animals for almoſt all the new Diſcoveries of this Age; and that there are many Parts which would never have been found in the human Brain, if they had not firſt been obſerved in Animals.

What I have hitherto ſaid concerning the Inſufficiency of all the Syſtems of the Brain, concerning the want of a true Method in diſſecting it, concerning the infinite Number of Inquiries that ought to be made about it in Man, and in Brutes, in all their different States, concerning the Barrenneſs of all the Writers on this Subject, and concerning the Precautions that muſt be uſed in handling theſe tender Parts, ought certainly to undeceive thoſe who ſatisfy themſelves with what they find in the Books of the Antients. We muſt always remain in Ignorance, if we ſit down with what the Antients have taught us, and if Men capable of ſuch Inquiries do not contribute their Labour, Induſtry, and Study, in order to arrive at the Knowledge of Truth, which is the principal Aim of all who ſearch for it ſincerely. *Winſlow's Anatomy.*

Before we proceed to conſider the Brain as an Aliment, and as a Medicine, we muſt obſerve, that the Subject of our Diſcourſe is that ſoft whitiſh Subſtance which is contained within the Cranium, and has ſome Reſemblance to Marrow, comprehending under the Term *Brain* both the fore Part call'd by Anatomiſts, in a ſtrict Senſe, *Cerebrum*; and the hinder Part, which goes under the proper Name of *Cerebellum*. One Thing more we would premiſe, as worthy of Obſervation, which is, that by Authors, who trouble not themſelves with anatomical Terms of Art, the Brain, that is, the *Cerebrum* and *Cerebellum* in Conjunction, is called *Cerebellum*, when they ſpeak of the Brains of ſmall Animals, as Birds, or little Pigs.

Athenæus, *Lib.* 2. *Cap.* 24. writes, that the Antients abſtain'd from eating Brains out of a religious Motive, becauſe it was ſituated in the Head, the Seat of almoſt all the Senſes, And *Plutarch*, *Sympoſ.* 8. *Probl.* 9. reckons the Brain among ſuch Things as were neither to be eaten nor taſted at firſt, but which afterwards was eſteem'd a great Delicacy in Food. *Bulenger*, *de Conviviis*, *Lib.* 2. *Cap.* 24. tells us, that the Brains of Birds cleanſed from the Fibres, and drawn out thro' the Neck, were in high Eſteem. And *Apicius*, who was ſo famous for his Proficiency in the Art of gratifying the Appetite, *Lib.* 2. *Cap.* 1. where he treats of making Sauſages, preſcribes boiled Brains for an Ingredient; and in *Lib.* 4. *Cap.* 2. you have an Account of the Brains which were to enter the Compoſition of the ſeveral Diſhes. In our Times the

Brains of ſome Animals, as of Calves, Kids, and Hares, are reckon'd among the greateſt Dainties. But they are not approv'd by Phyſicians, who regard them as a pituitous kind of Food, of groſs and vitiated Juice, difficult of Concoction, noxious to the Stomach, and exciting a Nauſea; but if they are well boiled, they afford abundance of Nutriment. The wiſeſt Way therefore is wholly to abſtain from them, unleſs you have very ſtrong Viſcera, or ſeaſon them with Spices, to promote Concoction. There is a fat and unctuous Humidity in Brains, which gives the Stomach a great deal of Trouble to digeſt it; for which Reaſon the drier the Brain of Animals is found to be, the better it is accounted, as the Brains of Birds, if compar'd with thoſe of other Creatures; and thoſe of Mountain-birds, in Compariſon of thoſe of Water-fowl. They are ſuppoſed to generate good Blood, and by that means to provoke venereal Inclinations. *Vitellius*, that eminent Glutton, had the Brains of Pheaſants and Peacocks ſerved up in his famous, noble, and coſtly Diſh; and *Heliogabalus* diſtributed ſix hundred Heads of Oſtriches to his Gueſts, that they might pick out the Brains, and eat them. The Brains of Hens and Capons are now eaten; and ſome commend the Brain of Sparrows as an Incentive to Venery. *Ludovici Nonnii Diæteticon*, *L.* 2. *C.* 36. *Averrhoes* and *Rhaſis* affirm, that the human Brain is more effectually ſtrengthened and corroborated by eating the Brains of Animals, than by the Uſe of any other Subſtance, becauſe ſimilar things corroborate each other. Hence *Foreſtus*, in his *Obſervat. Med. L.* 9. *Obſ.* 32. *Schol.* orders Patients who have receiv'd Blows on the Head, attended with a Diſcharge of Blood from the Ears and Noſtrils, to eat the Brains of Hens and caſtrated Kids. Various Medicinal Virtues are by different Authors aſcrib'd to the Brains of particular Animals. The Brain, for Inſtance, of a Hare boil'd, triturated, and eaten, is ſaid to be beneficial in the difficult and uneaſy Dentition of Children; and ſome affirm, that, when chew'd, it proves ſerviceable in Tremors. *Dioſcorides* affirms, that the Brain of a Cock, drank in Wine, is an effectual Medicine againſt venomous Bites, and that it checks Eruptions of Blood from the Membranes of the Brain. The Brain of a Camel, according to *Galen*, when dry'd and drank in Vinegar, cures epileptic Patients. The Brain of a Weaſle is ſaid to produce the ſame Effect; and that of Swallows, mixed with Honey, is by ſome ſaid to be an effectual Medicine in Cataracts. The Brain of a Sheep, prepared in the ſame manner, affords a ſurpriſing Relief in the difficult Dentition of Children, according to *Paulus Ægineta*, in the third Chapter of his ſeventh Book. According to *Joſephus Lanzonius*, the Brain of a Cat is claſs'd among Poiſons, becauſe, when eaten, it excites a Vertigo, Stupidity, and ſometimes Madneſs. As to the particular Virtues belonging to the Brains of particular Animals, they are ſpecified under the reſpective Names of the Animals themſelves. But we ſhall here conſider the Medicinal Uſe and Virtues of the human Brain. According, therefore, to *Ettmuller*, the human Brain is an infallible Specific in Apoplexies and Epilepſies. When ſubjected to Diſtillation, it yields a large Quantity of Water and Oil. But becauſe it has an empyreumatic Smell, when diſtil'd by the Retort, it is better firſt to diſtil it in *Balneo Mariæ*, and afterwards to expreſs the Oil from the remaining Maſs. This Oil is an excellent Analeptic; and the Water obtain'd in this manner is by *Bartholetus* highly commended againſt Loſs of Memory; for it is of a highly cephalic and anodyne Quality; for which Reaſon it is an excellent Remedy, when mix'd with Oil, for anointing contracted Tendons and Nerves. This Water will be ſtill ſo much the better, if it is diſtil'd with aromatic and cephalic Flowers. The human Brain, of itſelf, generally yields but a ſmall Quantity of Spirit. But if it is cut into Pieces, and kept till, in conſequence of a commenc'd putrefactory Motion, its Oil is reſolv'd, and if Spirit of Lilies of the Valley be added to it, then ſubjected to Diſtillation, and rectified, it yields an urinous and oleous Spirit, of ſingular Service in Epilepſies, and Loſs of Memory. Hence 'tis obvious, why *Schroder* gives the Title of *Aqua Antepileptica* to that diſtil'd from the human Brain, with the Water of Lilies of the Valley, Lavender, Primroſes, and Malmſey-wine; and why the ſame Author dignifies with the Name of an excellent Antiepileptic, the Oil diſtil'd by a Glaſs Retort in a Sand-heat, from the Subſtance of the Brain, mixed with common Salt. The ſame Author gives the Title of *Aqua Aurea* to a Spirit of the human Brain, prepar'd of the Brain of a ſound and young Man, who dies a violent Death, together with all its Membranes, Arteries, and Veins, as alſo the whole ſpinal Marrow, ſhaken together, with the cephalic Waters of the Lime, Piony, Betony, black Cherries, Lavender, and Lilies of the Valley. It is to ſtand in Infuſion for ſome time, and then to be ſubjected to repeated Diſtillations; and the elixiviated Salt prepar'd of the calcin'd Fœces is to be added to it. Its Doſe for an Epilepſy is, according to *Hartman*, from one Scruple to four. When ſubjected to a chymical Analyſis, the human Brain yields much the ſame Subſtances as are obtain'd from other Parts of Animals, when treated in the ſame manner, which are poſſeſs'd of the ſame Virtues with other volatile urinous Salts. But I leave it to be determin'd by others, whether the Opinion of the antiepileptic Virtues of the Brain is not founded upon Superſtition, becauſe the Spirits are ſaid to be generated in the Brain.

CEREFACTIO ſeems to import the ſame as CERATIO.

CEREFOLIUM. The ſame as CHÆREFOLIUM, Chervil, which ſee.

CEREIBA *Braſilienſibus*, Marcgrav. *Mangue ſeu Mangles prima Species*, Piſon. *Arbor Braſiliana foliis ſalicis, in quibus ſal concreſcit, floribus tetrapetalis*, Raii.

A ſmall Tree, which grows in *Braſil*, like a Willow. What is remarkable in it is, that when the Sun ſhines upon it, a ſort of Salt concretes upon the Leaves, which, during the Night, and in cloudy Weather, diſſolves into a Dew. I find no Medicinal Virtues attributed to it.

CEREIBUNA, *Mangue*, 2 *Species*, Piſon. Another Species of the preceding Plant, not diſtinguiſh'd for any Uſe in Medicine.

CERELÆUM, κηρέλαιον. The ſame as *Ceratum*; but in ſome modern Authors it imports the Oil of Wax, or *Butyrum Ceræ*, deſcrib'd under the Article CERA. *Galen* diſtinguiſhes betwixt the Cerate and the Cerelæum, informing us, that the *Cerelæum* and *Acopon* are the moſt liquid of any Compoſitions of this Kind, and next to theſe the Cerate.

CEREVISIA. Drink made of any ſort of Corn.

CEREUS. The *Torch-thiſtle*.

The Root is perennial, ſmall in reſpect of the Plant, and abounding with Fibrils. The Plant has no Leaves, is thorny, and angulous; its Stalk is either ſtrait or inflected, continuous, or articulated. The Angles of the Alæ are ſet with Thorns, which proceed like Rays from one Centre, reſembling Stars. The innermoſt Part of the Stalk is of a ligneous Subſtance; the outer Part is white, fungous, and cover'd with a coriaceous Membrane. The Calyx is long, ſquamous, and has its upper Part furniſhed with very long Rays, ſurrounding the Summit of the Ovarium. The Flower at the End of the Fruit conſiſts of very numerous Petals, narrow below, and ſpreading above; and is adorn'd with many Stamina, and a beautiful Pointal. The Ovarium at the End of a Pedicle makes the Body of the Calyx, is furniſhed with a very beautiful Tube, and becomes a Fruit like that of the prickly Pear-tree, conſiſting of a ſoft fleſhy Subſtance, cover'd with a hairy viſcid Membrane, and containing a Multitude of Seeds.

Boerhaave mentions thirteen Species of this Plant.

1. Cereus; erectus; altiſſimus; Syrinamenſis. *Par. Bat.* 116. *Spinis fuſcis*, H. R. D.

2. Cereus; erectus; altiſſimus; Syrinamenſis. *Par. Bat.* 116. *Spinis albis*, H. R. D.

3. Cereus; maximus; fructu ſpinoſo, rubro. *Daduſ. Par. Bat.* 113. THE GREATEST TORCH-THISTLE, WITH RED PRICKLY FRUIT.

4. Cereus; erectus; fructu rubro, non ſpinoſo. *Par. Bat.* 114.

5. Cereus; erectus; fructu rubro, non ſpinoſo; lanuginoſus, lanugine flaveſcente. *Par. Bat.* 115. THE UPRIGHT TORCH-THISTLE, WITH YELLOW DOWN AND RED FRUIT WITHOUT SPINES.

6. Cereus; erectus; craſſiſſimus; maximê anguloſus; ſpinis albis, pluribus, longiſſimis, lanugine flavâ. *H. R. D.* THE LARGEST UPRIGHT TORCH-THISTLE, WITH LARGE ANGLES, AND WHITE SPINES, HAVING A YELLOW DOWN ON THE TOP.

7. Cereus; erectus; gracilis; ſpinoſiſſimus; ſpinis flavis; polygonus; lanugine alba palleſcente. THE LESSER UPRIGHT TORCH-THISTLE, WITH MANY ANGLES, AND YELLOW SPINES, WITH A WHITE DOWN ON THE TOP.

8. Cereus; erectus; gracilior; ſpinoſiſſimus; ſpinis albis; polygonus. *H. R. D.* THE LESSER UPRIGHT TORCH-THISTLE, WITH WHITE SPINES.

9. Cereus; erectus; quadrangulus; coſtis alarum inſtar aſſurgentibus. *Ind.* 181. THE FOUR-CORNER'D UPRIGHT TORCH-THISTLE.

10. Cereus; ſcandens; minor; trigonus; articulatus; fructu ſuaviſſimo. *Par. Bat.* 118. THE LESSER TRIANGULAR, CREEPING, JOINTED TORCH-THISTLE, WITH THE SWEETEST FRUIT, COMMONLY CALL'D IN BARBADOS THE TRUE PRICKLY PEAR.

11. Cereus; ſcandens; minor; polygonus; articulatus. *Par. Bat.* 120. THE LESSER CREEPING JOINTED TORCH-THISTLE, WITH MANY ANGLES.

12. Cereus; minimus; articulatus; polygonus; ſpinoſus. *H. R. D.* THE LEAST PRICKLY JOINTED TORCH-THISTLE, WITH MANY ANGLES.

13. Cereus; erectus; polygonus; ſpinoſus; per intervalla compreſſus quaſi in articulos. *H. R. D. Boerhaave's Index alter Plantarum*, *Vol.* 1.

M.

M. *Juſſieu*, in the Memoires of the Royal Academy for 1716. gives a long Account of this Plant.

CERIFICATIO. The ſame as CERATIO.

CERINTHE, *Honeywort*.

The Characters are;

The Leaves are glaucous or green; the Flower monopetalous, Bell-ſhaped, tubulated, multifid, with its Edges ſometimes open, ſometimes cloſed. The Calyx contains a tetragonous Pointal, which becomes a Fruit, conſiſting of two roundiſh Shells, divided into two Seed-veſſels, incloſing for the moſt part an oblong Seed. *Boerhaave*, *Index alter*.

Boerhaave takes notice of eight Species of this Plant.

1. Cerinthe quorundam major, verſicolore flore, *J. B.* 3. 602. *Tourn. Inſt.* 80. *Boerh. Ind. A.* 195. *Cerinthe*, Offic. *Cerinthe major*, Ger. 431. Emac. 538. Raii Hiſt. 1. 506. *Cerinthe major flore luteo & rubro*, THE GREATER YELLOW AND RED HONEYWORT, Park. Theat. 520. *Cerynthe veteribus*, *Cerinthe quorundam*, Chab. 520. *Cerinthe, ſeu Cynogloſſum montanum majus*, C. B. Pin. 258. Hiſt. Oxon. 3. 445. HONEYWORT.

Dale ſays, that nothing certain is related with reſpect to the Virtues of this Plant.

2. Cerinthe; quorumdam; major; flore ex rubro-purpuraſcente, *J. B.* 3. 603. *Cluſ. H.* 168. THE LARGE HONEYWORT, WITH REDDISH PURPLE FLOWERS.

3. Cerinthe; quorumdam; major; ſpinoſo folio; flavo flore. *J. B.* 3. 602. THE LARGER HONEYWORT, WITH PRICKLY LEAVES, AND YELLOW FLOWERS.

4. Cerinthe; quorumdam; minor; flavo flore. *J. B.* 3. 603. *Cluſ. H.* 168. THE LESSER HONEYWORT, WITH YELLOW FLOWERS.

5. Cerinthe; flore verſicolore ex luteo & albo. *a*.

6. Cerinthe; flore verſicolore ex albo & rubro. *a*. HONEYWORT, WITH RED AND WHITE PARTY-COLOUR'D FLOWERS.

7. Cerinthe; flore verſicolore ex albo & purpureo. *a*. HONEYWORT, WITH PURPLE AND WHITE PARTY-COLOUR'D FLOWERS.

8. Cerinthe; folio non maculato, viridi. *C. B. P.* 258. HONEYWORT, WITH DEEP GREEN LEAVES, WITHOUT SPOTS.

CERINTHOIDES.

The Characters are;

The Leaves are glaucous and ſmooth; the Calyx conſiſts of one Leaf, is tubulated, pentagonal, divided into five Lobes; the Flowers are ſmall, tubulous, quinquefid, not ſtellated; the Seeds are ſmooth.

Cerinthoides; argentea; flore pulchre cæruleo. *Bugloſſum marinum incanum, flore cæruleo.* H. L. T. 135. *Cynogloſſum, maritimum, procumbens, lævæ, purpuro-cæruleum.* Flor. 2. 62. *Cynogloſſum, procumbens, glaucophyllum, maritimum, noſtras, floribus purpuro-cæruleis, ſeminibus lævibus*, Plukn. T. 172. Fig. 3. *Cynogloſſum, perenne, maritimum, procumbens, foliis glaucis, brevioribus*, M. H. 3. 450. *Echium marinum*, Phytol. Britann. Raii Synopſ. 120. H. *Boerhaave's Index alter Plantarum*.

CERIO. A Diſeaſe of the Head, call'd *Favus*. See ACHOR.

CERION, κηρίον. Honey-comb. *Hippocrates*, in many Places, recommends a Decoction of Honey-combs with Water, as a proper Drink in Fevers. It alſo ſignifies that Diſorder which the *Latins* call *Favus*. See ACHOR. *Ceria*, or *Cerix*, alſo ſignifies flat Worms bred in the Inteſtines.

CERITUS or CERRITUS, mad, enthuſiaſtic, from the Goddeſs *Ceres*, who was ſuppos'd to affect People in this manner. It may be tranſlated, drunk with Malt Liquor.

CERNUA, ὀρτός. A kind of Fiſh mention'd by *Galen*. It is not certain to what ſort of Fiſh this Name belongs, tho' ſaid by ſome to be the Ruff.

CEROBER. Water. *Rulandus*.

CEROMA, κήρωμα. A Cerate. See CERATUM.

CERONEUM. A Cerate. See *Blancard*.

CEROPISSUS, κηρόπισσος. A Plaiſter made of Pitch and Wax.

Of this ſort of Plaiſter the Antients made their *Dropaces*; it was uſual with them to ſpread a certain Quantity of this Plaiſter on Cloth or Leather, and apply it to ſome Part of the Body, and then take it or pull it off again, and apply it afreſh, frequently renewing the Application and Removal of the ſame, in order to induce a Redneſs on the Part, with an Intent to attract the Humours, or the Juices which ſerve to nouriſh the Part, outward, or to open the Pores. To render this Plaiſter the more efficacious, they ſometimes added to it acrimonious Powders, as of Pellitory of *Spain*, Pepper, Salt, or Sulphur; the Dropax was alſo uſed to make the Hair fall off, or to pull it off from any Part.

CEROTUM. The ſame as CERATUM.

CERRUS. The ſame as *Ægilops*, or Holm-oak. See ÆGILOPS.

CERVARIA. A Name for the SESELI ÆTHIOPICUM, *Blancard*.

CERVICALIS. Belonging to the Neck. The Veins and Arteries of the fore Part of the Neck are diſtinguiſh'd by this Epithet.

CERVICARIA. Throatwort. See CAMPANULA.

CERVICULÆ *Spiritus* is, according to *Rulandus*, the Spirit of the Bone of the Stag's Heart.

CERVIX. The Neck, that Part of the Body which is ſituated betwixt the Head and Breaſt. But it is apply'd figuratively to other Parts. Thus there is the Neck of the Bladder, and the Neck of the Uterus.

The Neck in general is divided into the anterior Part or Throat, and poſterior Part or Nape. The Throat begins by an Eminence, and terminates by a Foſſula. The Nape begins by a Foſſula, which, as it deſcends, is gradually loſt. The Neck contains the *Larynx*, a Part of the *Trachea Arteria*, the *Pharynx*, a Part of the *Oeſophagus*, the *Muſculi Cutanei*, *Sterno-maſtoidæi*, *Sterno-hyoidæi*, *Thyro-hyoidæi*, *Omo-hyoidæi*, *Splenicus*, *Complexus*, the *Muſculi Vertebrales*, which lie upon the firſt ſeven Vertebræ, and a Portion of the *Medulla Spinalis*.

The Arteries which go to the Neck are theſe:
Arteriæ Carotides, in general.
Arteriæ Carotides externæ.
Arteriæ Carotides internæ.
Arteriæ Vertebrales.
Arteriæ Cervicales.

The Veins belonging to the Neck are theſe:
Venæ Jugulares, in general.
Venæ Jugulares externæ.
Venæ Jugulares internæ.
Venæ Cervicales.
Venæ Vertebrales.

The Nerves diſtributed to the Neck are theſe:
Nervi Sympathetici minimi, or the Portio Dura of the Auditory Nerves.
Nervi Sympathetici medii, the Eighth Pair.
Nervi Acceſſorii Octavi Paris.
The Ninth Pair.
Nervi Suboccipitales, or the Tenth Pair.
The Seven Cervical Pairs.
Nervi Sympathetici Maximi.

Winſlow's Anatomy.

With reſpect to the Neck, two Things come under our preſent Conſideration. The firſt is the wry Neck; the ſecond, Wounds in this Part.

There are ſufficient Inſtances of Perſons who have their Neck bent in ſuch a manner, as to make them incline their Head to the Right or Left Side (ſee *Tab.* 42. *Fig.* 12.). This Diſorder is by *Tulpius*, perhaps in Imitation of *Horace's Stes Capite obſtipo*, called *Caput obſtipum*, and is ſince called ſo by others. This remarkable Blemiſh or Defect may be brought with a Child into the World, or it may proceed from other Cauſes; when it is born with the Child, it ſeems hardly poſſible to be cur'd, becauſe the Vertebræ of the Neck are in that Caſe either incurvated by Nature, or elſe, by their long perverted Situation, are by degrees diſtorted ſo much, as to admit very little Hopes of a Cure. And therefore we have the more Reaſon to be ſurpris'd at thoſe extraordinary Cures, which *Tulpius*, *Meekren*, and *Roonhuyſen*, as they themſelves aſſure us, have perform'd upon young Perſons of twelve, ſixteen, eighteen, and even twenty-three Years of Age, who were born with wry Necks, and yet had them, after ſo long a Space of Time, reſtor'd to their juſt and natural Poſition. But when ſuch a Misfortune happens after Nativity, in Puberty, or in adult Age, it then proceeds either from a Burn in the Neck, and too great a Conſtriction of the Skin on either Side, or from a ſpaſmodic and ſtrong Contraction of one of the maſtoide Muſcles, repreſented (*Tab.* 42. *Fig.* 12. A. A.) which, by little and little, becomes dry and indurated; or it may be owing to a preternatural Relaxation of one of thoſe Muſcles, in conſequence of which, it will be extremely difficult to prevent the ſtronger Antagoniſt Muſcle from contracting the Head and Neck to the oppoſite Side; or laſtly, according to the Opinion of *Roonhuyſen*, it may proceed from ſome preternatural Ligament drawing the Head downwards. If, then, this Diſtortion or Wryneſs of the Neck be occaſioned by any or either of theſe Cauſes, it ought by no means to be look'd upon as deſperate, and abſolutely incurable, eſpecially if it be of no long Standing, and in a young Subject.

The Method of Cure is as follows: If the Diſorders be recent, and occaſion'd by corrupt or ſuperfluous Humours, commonly call'd Defluxions or Catarrhs, Heat, and mild Sudorifics, are generally very ſerviceable. If it proceeds from other Cauſes, as particularly the Contraction of a Muſcle, or the Conſtriction

Conſtriction of the Skin by a Burn, we muſt endeavour by the frequent Uſe of Fomentations and Ointments, with emollient Oils and Plaiſters, to mollify and relax by little and little the contracted Parts, while the Head is to be held inclined to the oppoſite Side by a convenient Bandage. *Nuck* and *Solingen* recommend the Uſe of a proper Inſtrument, (*Tab.* 42. *Fig.* 13.) compos'd of a Kind of Steel Arch (B. B.), and a very ſoft Band or Collar (A.). This Collar is to be put about the wry Neck, and a Cord being put through the Ring (C.), the Patient is to be ſuſpended by it ſeveral times in a Day, for a Quarter of an Hour together, or ſo long as he can conveniently bear it. If theſe Remedies prove of little Service, which, as we are aſſur'd by *Tulpius* and *Roonhuyſen*, very frequently happens, or if the Diſorder be grown too inveterate, we muſt proceed to the Operation.

If the Diſorder then be owing to a Conſtriction of the Skin from a Burn, it will be neceſſary to make one, two, or more tranſverſe Inciſions in the contracted Parts of the Skin, taking all due Care to avoid wounding the jugular Vein. Theſe Inciſions are to be fill'd with Lint, in order to dilate the Skin, and treated with ſome digeſtive Ointment, like other Wounds, while Care is to be taken, at every Dreſſing, to draw the bended Head at a juſt Diſtance towards the contrary Side, by a proper Bandage, till the Wounds being fill'd up with new Fleſh, the Skin is prolong'd, and the Head by that means acquires an eaſy and proper Poſition.

If the Wryneſs or Diſtortion of the Neck proceeds from a too great Aſtriction or Contraction of one of the maſtoide Muſcles, or ſome preternatural Ligament, they are to be divided by a tranſverſe Inciſion, with a crooked Knife, in their loweſt Part near the Clavicle or Sternum; but due Care muſt be taken to avoid every conſiderable Vein and Artery, the wounding of which might occaſion a dangerous Hæmorrhage. To ſtop the Effuſion of Blood, the Wound is immediately to be fill'd with Lint, and afterwards, by means of ſome digeſtive Ointment, or Oil of Hypericum, or (Balſam of Copaiva,) which laſt is recommended by *Roonhuyſen*, to be gradually conglutinated with a large Cicatrix. *Tulpius*, *Meekren*, and *Roonhuyſen*, give us Relations of Caſes which occur'd to them, in which, after cutting the preternatural Ligament or Tendon, the inclin'd Head ſtarted back with ſurpriſing Celerity, and with a ſort of Impetus, into its natural Poſition. In the Management of the Cure it ſeems neceſſary, tho' omitted by the forementioned Authors, to uſe a Bandage for holding up the Head, till the Conglutination is perfected, or till the Neck has recover'd its right Situation. They who deſire more particular Obſervations on this Subject, may conſult *Tulpius*, eſpecially *Lib.* 4. *Cap.* 58. *Meekren*, *Cap.* 33. and *Roonhuyſen*, *Obſerv.* 22. and 23. But the more modern *French* Surgeons, which ſeems ſurpriſing, mention not a Word neither of this Diſeaſe, or its Cure. *Heiſter*, *Chirug. Vol.* 2.

The Operation is thus perform'd, according to *Sharp*.

The Operation of cutting the wry Neck is very uncommon, and is never to be practis'd, but when the Diſorder is owing to a Contraction of the maſtoide Muſcle only, as it can anſwer no Purpoſe to ſet that Muſcle free, by dividing it, which is all that is to be done, if the others of the Neck are in the ſame State, and more eſpecially if it has been of long Standing from Infancy, becauſe the Growth of the Vertebræ will have been determined in that Direction, and make it impoſſible to ſet the Head upright.

When the Caſe is fair, the Operation is this. Having laid your Patient on a Table, make a tranſverſe Inciſion thro' the Skin and Fat, ſomewhat broader than the Muſcle, and about one third of its Length from the Clavicle; then paſſing the probed Razor with Care underneath the Muſcle, draw it out, and cut the Muſcle. The great Veſſels of the Neck lie underneath, but I think, when we are aware of their Situation, there is no great Danger of wounding them. After the Inciſion is made, the Wound is to be cram'd with dry Lint, and always dreſs'd ſo as to prevent the Extremities of the Muſcles from reuniting, to which End they are to be ſeparated from each other as much as poſſible, by the Aſſiſtance of a ſupporting Bandage for the Head, during the whole Time of the Cure, which will generally be about a Month. *Sharp's Surgery.*

Wounds *of the* Neck.

Wounds in the Neck are certainly no leſs troubleſome and dangerous, than Wounds in the Breaſt and Abdomen; whence it is ſurpriſing, that there ſhould be found, among the Profeſſors of Surgery, ſome who in their Writings treat not at all, or at leaſt very ſlightly, of Wounds of this Kind.

There is a great Variety of Wounds in the Neck: Some affect only the outward Skin and Fleſh, and are therefore leſs afflictive and dangerous; but the moſt terrible, and indeed incurable, Wounds, are thoſe which are inflicted on ſome of the larger Veins or Arteries, ſuch as the jugular and vertebral Veins, or the Carotides; or where the Aſpera Arteria, Fauces, Medulla Spinalis, the Nerves which deſcend by the Neck, ſuch as the Par Vagum, the Nervi intercoſtales and diaphragmatici, receive a Wound; or where ſeveral of theſe Parts happen to be wounded at the ſame time.

The Nature of a Wound in the Neck, and which are the injur'd Parts, may be diſcover'd by the Eye, or by conſidering the Place where the Wound was inflicted, with the Aſſiſtance of Anatomy, or by obſerving the conſequent Symptoms. From this Diagnoſtic the Prognoſtic will eaſily and naturally follow; for whoever is thoroughly acquainted with the Condition of a Wound, will find no great Difficulty in determining the Event of it. When therefore only the Skin and Fleſh are injur'd, we have no Reaſon to be apprehenſive of any ill Conſequence; but when the Parts of the Neck are Partakers of the Injury, and have a very conſiderable Share in the ſame, there is but too much Reaſon to be concern'd for the Safety of the Patient, becauſe theſe Parts are of abſolute Neceſſity to Life itſelf, tho' even in this Circumſtance, where the Wound is very ſmall, it is ſometimes known to be cured.

Wounds of the Arteries in this Part are ſeldom or never cured; for in this Caſe the Patient uſually bleeds to Death, before a Surgeon can be call'd to his Aſſiſtance; tho', to ſpeak the Truth, the Preſence and Induſtry of the Surgeon are found to be of little or no Service; for it is extremely difficult to ſtop the Effuſion of Blood in this Part, not only on account of the Largeneſs of the Arteries here ſituated, but from the Impoſſibility of making a Ligature upon the wounded Veſſels, ſtrong enough to ſuppreſs the vehement Efflux of the Blood.

A Wound of the external Jugular is not attended with much Danger, if a Surgeon be call'd in time; for not only the Hæmorrhage may be ſtopp'd by a gentle Compreſſion, as appears by the frequent Practice of Blood-letting in this Part, but alſo a Wound made in that Vein cloſes up, and is conglutinated in a kind of ſpontaneous manner. But, on the contrary, Wounds of the internal Jugulars are very dangerous, both on account of their extraordinary Size, which uſually exceeds that of a Finger, and alſo from the Deepneſs of their Situation, which renders it extremely difficult to make Ligatures upon them. And tho' there be ſome Surgeons, who, being perſuaded by the Force of theſe Reaſons, have preſumed to declare all Wounds of the internal Jugulars incurable, I can by no means agree with them, that it is perpetually ſo. On the contrary, I am of Opinion, that where the Wound in theſe Veins is not very large, and a Surgeon is ready at hand, before the Patient is too far exhauſted and debilitated by the Hæmorrhage, it is not impoſſible to ſave Life, and effect a Cure. But after what manner thoſe Kinds of Wounds are to be treated, we ſhall teach below.

Wounds in the Aſpera Arteria are almoſt all pronounced incurable, or abſolutely mortal, by Profeſſors and Writers of Surgery. I am ſo far from intending to contradict them in this their Sentiment, that I ſhall rather endeavour to ſupport it in ſuch Caſes, where the Aſpera Arteria is wholly divided, or is wounded within the Thorax, or, as it uſually happens, when the Carotids and Jugulars are alſo cut through. But, on the other hand, if it be only wounded in the fore Part, and the neighbouring Veſſels before-mentioned remain entire, it will admit in good meaſure of a Cure, as is moſt certainly evident, from Examples within the Compaſs of our own Obſervation, and others every-where to be met with.

The Patient is in a very dangerous Condition when the Oeſophagus is much wounded, or entirely divided, becauſe not only the Paſſage of Aliment is intercepted, but the Part is ſo ſituated, that it can ſcarce be wounded without injuring ſome of the adjacent Nerves and Arteries; and, beſides, the Treatment of ſuch a Wound is commonly very difficult and troubleſome to the Surgeon. But when the Oeſophagus is the only Subject of the Wound, and the Opening but ſmall, a Cure may doubtleſs ſometimes be performed.

All Wounds of the Medulla Spinalis are extremely dangerous, and principally when they are inflicted about the Neck. It is no Wonder, therefore, that we have ſcarce an Inſtance of one recovering from a conſiderable Wound of this Kind. The Reaſon of this will readily appear, if we conſider, that ſeveral Nerves, which are abſolutely neceſſary to the vital Functions, proceed from this Part; that the vertebral Veins and Arteries can hardly avoid being wounded at the ſame time, and that ſuch Wounds are by their Situation render'd almoſt incapable of being rightly treated, by conveying the proper Remedies for ſtopping the Blood, and cleanſing the Part. Nor are Wounds of the larger Nerves of the Neck leſs to be dreaded, becauſe they are ſeldom or never inflicted without depriving the nobler Parts of the Breaſt and Abdomen, to which they are aſſiſtant, of all Senſe and Motion.

The Treatment of Wounds in the Neck differs according to their various Natures. When only the Skin and Fleſh are divided, the Cure is to be manag'd after the ordinary way of treating ſlight Wounds. When the external Jugular is wounded, Application of pretty thick Bolſters, with a Bandage, is generally all that is requir'd; for the ſame Methods, which we uſe after Bleeding in that Vein, are ſufficient.

If the internal jugular Vein happens to receive a Wound, which is known to be but ſlight by the moderate Effuſion of Blood, the Hæmorrhage may eaſily be ſtopt, by filling the Wound with Pledgets of Lint, or the orbicular Fungus, which they call *Crepitus Lupi*, or *Boviſt*, laying over them ſquare Bolſters, and ſecuring the Whole with a Bandage drawn as tight as the Situation of the Part will permit. For as an Hæmorrhage is much more eaſily ſuppreſs'd in a Vein than in an Artery, ſo the principal Part of the Cure in this Caſe conſiſts in the accurate Compreſſion of the wounded Veſſel, which is generally ſucceeded by a ſpeedy Conglutination. Sometimes it happens, that this Dreſſing of the Wound, which we have here directed, has no Effect; in this Caſe the wounded Vein muſt be compreſs'd by an Aſſiſtant with his Finger, or by a new chirurgical Inſtrument, repreſented in *Tab.* 26. *Fig.* 2. or ſome other like it, till the Hæmorrhage be entirely ſtopt; and this Compreſſion muſt ſometimes be continued for a Day or two. The ſame Method is to be obſerv'd for Wounds of the vertebral Veins. The Blood being ſtopt, the Dreſſings are not to be remov'd till the third Day, and then a vulnerary Balſam and Plaiſter may be apply'd to heal the Wound.

When the internal jugular Vein receives a large Wound, the Patient generally dies in a very ſhort time with the Loſs of Blood. But if a Surgeon happens to be preſent, or comes the next Inſtant, I would adviſe him immediately to apply Bolſters to the Place, and to compreſs them with his Finger, and then to enlarge the Wound by Inciſion upwards lengthwiſe, till, by Help of a crooked Needle, he can make a ſtrong Ligature upon it; after which he may fill up the Wound, and treat it after the Manner mentioned in the preceding Paragraph. By this means, tho' the Courſe of the Blood through that Veſſel be entirely cut off, yet the Life of the Patient may be ſaved, as I am ſatisfy'd from a Multitude of Experiments made upon Dogs, who were able to live without any remarkable Inconvenience after the Tying of their internal jugular Vein; it is better therefore to try this doubtful Remedy than none at all.

A Wound in the carotid Artery is attended with yet greater Danger than one in the internal jugular Vein; but, if a Surgeon be at hand when the Wound is receiv'd, I think he ſhould attempt to cure it by the ſame Method as the other. The Cure of this Kind of Wound is more likely to ſucceed in the upper and middle Part of the Artery, than in the lower. But if the Trunk of the Artery be not divided, but only one or two of its Branches near the Head, the Wound is to be fill'd up with Lint, dipt in ſome ſtyptic Liquor, if you have it ready; and upon this you are to lay Bolſters one above another, increaſing in Largeneſs to the uppermoſt, ſecuring all with a tight Bandage, and ordering an Aſſiſtant to compreſs the Part for ſome time with his Hand. By this Method I have ſucceſsfully ſtopt a violent Stream of Blood, almoſt as big as a Finger, flowing from a Branch of the carotid Artery, which I have divided in extirpating very large, tumid, ſcirrhous, parotid, or ſubmaxillary Glands. But in theſe Caſes it is neceſſary to be obſerv'd, that the Dreſſings are not to be remov'd till the third or fourth Day, in order to avoid a new and violent Hæmorrhage, which otherwiſe uſually happens, as I myſelf have experienc'd.

As to the Treatment of Wounds in the Aſpera Arteria, the Surgeon's principal Care, after cleanſing the Wound of the Blood, ſhould be to unite the divided Parts, by means of ſticking Plaiſters, or, where the Wound is large, by making two Sutures with a crooked Needle. This done, he is to dreſs the Part with ſome vulnerary Balſam, ſticking Plaiſters, and Bolſters, and to ſecure all with a firm Bandage, adviſing the Patient to keep his Head always bending forward. By this Method the wounded Part will, very probably, by degrees be conglutinated, eſpecially if the Wound be inflicted by Puncture, or by a cutting Inſtrument. But if a Piece of the fore Part of the Aſpera Arteria be taken off by a Bullet, a Suture then ſeems improper: Wounds of this Kind, as I have learnt by Obſervation, are more readily healed and cured by the Uſe of a digeſtive Ointment, or vulnerary Balſam, the Head being kept bending forward. If the Aſpera Arteria be intirely divided, and the lower Part of it contracts itſelf, and ſinks to ſuch a Depth as that it cannot be laid hold on, and united to the upper Part, the Caſe is deſperate, and Death unavoidable.

When the Oeſophagus is wounded, the greateſt Part of what the Patient eats or drinks comes out at the Wound, which is often ſucceeded by the Hiccough and Vomiting. If the Oeſophagus be entirely divided, the Patient muſt die; but where it is only perforated in ſome Part, the moſt effectual Method is to dreſs the Wound with ſome vulnerary Balſam, and endeavour to unite it by ſticking Plaiſters, adviſing the Patient to a ſtrict Abſtinence for ſome Days, or at leaſt to be very ſparing of Food, and inſtead thereof, preſcribing nouriſhing Clyſters prepar'd of good Broths and Milk. But when the Neceſſities of Nature require Nouriſhment by way of the Mouth, the Wound ſhould immediately be well cleans'd afterwards, leſt ſome Reliques of the Food ſhould adhere to the Place, and putrefy, which might be ſucceeded by bad Symptoms; this done, the Wound is to be bound up again, and treated as before, till it be healed.

If any Part of the Medulla Spinalis happens to be wounded, the ſafeſt Method is to dreſs the Wound with Balſam of Peru, or Eſſence of Myrrh and Amber, or Spirit of Maſtich, or ſome Medicine of the like Nature, mix'd with Honey of Roſes, ſpread upon Lint, and apply'd warm. The Event muſt be left to God, and a good Conſtitution; for ſlight Wounds in theſe Parts are now-and-then healed, but large Wounds bring with them inevitable Death.

Wounds of the large Nerves, belonging to the Neck, are almoſt conſtantly ſucceeded by a ſpeedy Death; but where the Wound is but ſlight, the Cure may probably be beſt accompliſh'd by the ſame Method, as we preſcrib'd for Wounds of the Medulla Spinalis. *Heiſter*, *Chirurg.*

CERUMEN. Ear-wax.

The *Cerumen*, or *Marmorata Aurium* of the *Latins*, and the κυψελὶς, the κυψέλη, and the ὄτων ῥύπος, correſpond to what in *Engliſh* we call the Wax of the Ear, which is that natural Excrement collected in the Meatus Auditorius, and diſcharg'd from the Glands of theſe Parts thro' the Membrane which lines them. It is fluid on its firſt Diſcharge, but by its Continuance it becomes thicker, more ſolid, viſcid, of the Conſiſtence of Clay, and of a bitter Taſte. It is by ſome rank'd in the Claſs of Medicines, eſpecially that Species of it which is obtain'd from the human Ears, and which is us'd both internally and externally. Thus *Paulus Ægineta*, in the third Chapter of his ſeventh Book, informs us, that the Wax of the Ears cures Fiſſures of the Skin about the Roots of the Nails; and *Pliny*, in the fourth Chapter of his twenty-eighth Book, acquaints us, that the Wax of the Ears cures Bites inflicted by Men; and immediately ſubjoins, that it cures the Bites of Scorpions and Serpents, if apply'd immediately to the Part affected. *Helmont* affirms, that it affords great Relief in Punctures of the Nerves. *Ettmuller* ſays, that the ſame Obſervation is confirm'd by the Experience of others; he alſo recommends the Wax of human Ears, as an excellent Vulnerary, either by itſelf, or in Conjunction with Balſam of Sulphur, or Peruvian Balſam, if laid upon Wounds, eſpecially of the recent Kind, made by Puncture in the nervous Parts. He alſo affirms, that, in Conjunction with the expreſs'd Oil of Walnuts, it is an excellent Deterger of Wounds; or,

> Take of the Wax of the Ear, two Ounces; of Sugar of Lead, one Dram: Mix them up into a Liniment, with a ſufficient Quantity of the expreſs'd Oil of Walnuts.

This ſame Author informs us, that this Wax, when boil'd with expreſs'd Oil of Walnuts, is an excellent vulnerary Balſam for the Cure of recent Wounds. And *Agricola*, in his *Chirurgia parva*, tells us, that he has an Ointment which ſoon proves highly effectual, and performs ſurpriſing Cures in Inflammations, Tumors of the Joints, and Suppurations. The Compoſition is this following.

> Take of the Wax of the Ears, three Drams; of the Sugar of Lead, two Drams; and of the expreſs'd Oil of Haſel, a ſufficient Quantity: Mix all together, and if it is wanted of a thicker Conſiſtence, it may be inſpiſſated over the Fire.

Internally half a Dram of the Wax of the Ears, taken in any proper Liquor, is ſaid to be a Specific for the Colic. In the *Eph. N. C. Vol.* 2. we have an Account of an old Printer, who, after having us'd Spectacles for a great while, at laſt acquir'd a clear Sight, and laid them aſide; which happy Change he attributed to his daily anointing the internal *Canthi* of his Eyes, and his Eyelids, with the Wax of the Ears. *Serenus Samonicus* recommends the Wax of Cattles Ears for the Cure of a Furunculus or Boil. The Bitterneſs of the Wax of the Ears, and its being of ſuch a Conſiſtence, as if it was compos'd of Wax and Oil, are Circumſtances which leave us no Reaſon to doubt of its being of a ſaponaceous, abſtergent, and cleanſing Quality, and conſequently of a vulnerary Nature. I ſhall here conclude with the Words of *Pauli*, in his *Diſſertatio de Medicamentis e Corpore humano deſumptis*. Tho', ſays he, this unuſual and nauſeous Medicine were of ſo much Worth and Excellence, that nothing could be objected againſt it; yet there are many Remedies already approved, and more pleaſant in themſelves, by which the Intentions, with which this Medicine is preſcrib'd, may be equally well anſwer'd; for who doubts of the ſalutary Effects produced by Sperma Ceti in the Colic? Or who doubts, that the Balſam of *Peru*, or *Capivi*, are excellent Vulneraries? Not to mention other Things exhibited, with greater Applauſe, by the more cleanly and ſkilful Phyſicians. See AURIS.

CERUSIANA. The Name of a compound Medicine, mention'd and deſcrib'd by *Galen*, in his Treatiſe *de Compoſ. Medicam. S. Loc. L.* 7. *C.* 5.

CERUSSA, ψιμυθιον. *Dioſcorides.*

Ceruſſa & ſandix, Offic. *Ceruſſa*, Aldrov. Muſ. Metall. 164. Worm. 131. Charlt. Foſſ. 54. Matth. 1351. *Plumbum album, quibuſdam.* CERUSE, WHITE LEAD. *Dale.*

It is of a cooling Quality, ſtops Perſpiration, mollifies, fills, and attenuates: It gently repreſſes Excreſcences, and induces a Cicatrix; for which Purpoſes it is made an Ingredient in Cerates, gentle Plaiſters, and Troches; but it is of the Number of thoſe Things which are of a deadly Quality. *Dioſcorides, Lib.* 5. *Cap.* 103.

Its Uſe is only external; being poiſonous, internally exhibited. See PLUMBUM.

CERUSSEA *Urina.* White Urine, which looks as if Ceruſs had been mix'd with it. *Paracelſus* looks upon it to be a Sign of Death, or of conſiderable Obſtructions in the Liver.

CERVUS. The Stag.

The *Cervus* of the *Latins*, and the ἔλαφος of the *Greeks*, import what in *Engliſh* we call the Stag or Hart, the Male of the red Deer. To give a Deſcription of this Animal, is unneceſſary; and, to give its natural Hiſtory, inconſiſtent with our Deſign. We ſhall, therefore, only conſider what Aliments, and what Medicines, are obtain'd from it. The Horns, then, of the Stag or Deer, whilſt as yet young, tender, ſprouting, and not become hard, are reckon'd a Delicacy by ſome Perſons of a particular Taſte. Theſe are prepared in different manners; ſometimes boil'd, for Inſtance, and ſometimes cut down into Pieces, and fry'd in a Frying-pan. *Petrus Caſtellanus*, in his χειροπαγια, *L.* 2. *Cap.* 3. affirms, that a ſurpriſing Efficacy is aſcrib'd to theſe Horns againſt all Kinds of Poiſon; and he himſelf does not deny them an alexipharmic Quality, but thinks they do not deſerve the Name of an Aliment, becauſe they cannot prove more nutritive than any other Cartilage. But, in my Opinion, *Melchior Sebizius*, in his *Manuale*, is in the right, when he pronounces the Man miſtaken, "who "judges this a ſalutary Aliment; for theſe ſprouting Horns are "glutinous, thick, tough, viſcid, and earthy. Their Smell "and Taſte alſo, in ſome meaſure, reſemble thoſe of Fun-"guſes."

The Fleſh of this Animal is accounted nearly like Beef; and, according to *Celſus*, in the eighteenth Chapter of his ſecond Book, it is of a highly nouriſhing Quality. According to *Hippocrates*, in his ſecond Book *de Diæta*, the Fleſh of the Hart is of a drying Quality, does not paſs eaſily off by Stool, but provokes Urine. Elſewhere, in his Work *de Morbo Sacro*, he claſſes the Stag's Fleſh among thoſe which excite violent Diſorders in the Inteſtines. *Pliny*, in the thirty-ſecond Chapter of his eighth Book, informs us, that the Fleſh of the Stag is ſo far from generating Fevers, that it prevents them: For, "ſays he, I know ſome Women of Diſtinction, who, habi-"tuating themſelves to taſte it every Morning, have, by that "means, lived to a great Age, without the Attacks of Fe-"vers. This they think ſo much the more effectual and in-"fallible, if the Animal is kill'd only by one Wound." *Johannes Bruyerinus*, in his Treatiſe *de Re Cibaria, L.* 13. *Cap.* 23. pronounces this Aſſertion of *Pliny*'s a fatal Miſtake; and affirms, that the Fleſh of the Stag is not only very hard, and yields bad Juices, but alſo, that it is of difficult Digeſtion, and generates black Bile; for which Reaſon it renders the Bodies of thoſe who eat it diſpoſed not only to violent Fevers, but alſo to other terrible Diſorders; in conſequence of which, they who are careful of Health will uſe it rarely. *Simeon Sethi* not only affirms, that the Fleſh of Stags yields bad Juices, is of hard Digeſtion, and generates Melancholy; but alſo cautions us to abſtain from it in the Summer, becauſe theſe Animals, at that Time, frequently feed upon Vipers and Serpents, and are conſequently poiſonous, and hurtful to the Conſtitution. But *Melchior Sebizius*, in his Treatiſe *de Alimentorum Facultatibus*, informs us, that this Aſſertion is contrary to Experience; and that their Fleſh is better in the Summer than in the Winter, becauſe, in the former Seaſon, they are better nouriſh'd than in the latter; and that it may be eaten with Safety. It is frequently uſed in the Entertainments of the Nobility, and Perſons of Diſtinction, who delight in Hunting; eſpecially that of the Calves, which is moiſter, ſofter, finer, of a more eaſy Digeſtion, of a more agreeable Taſte, and not at all unwholſome. Next to the Fleſh of theſe, is that of the Animals when they are three Years of Age. The Part of the Deer principally in Uſe, among the more delicate People, is that towards the Back and Loins. The Fleſh of the caſtrated Deer, before the Eruption of the Horns, is the beſt; ſince it is temperate, both with reſpect to Heat and Dryneſs. Some prefer the young Calves, when ſucking, to thoſe which are older. The Fleſh of the Stag is prepared in various manners; for, according to *Sebizius*, in his Treatiſe *de Alimentorum Facultatibus*, it is either boil'd or roaſted, or put into Paſties, or ſtew'd. To uſe the Words of *Caſtellanus*, in his χειροπαγια, I can by no means approve of the Curioſity of ſome Perſons of Diſtinction, who think young Calves of the red Deer, cut out of the Bellies of their Mothers, a Delicacy; for, in my Opinion, they have too much of a diſagreeable Mucor to be eaten, without producing a Loathing; and they abound with a Juice ſo crude, that they cannot be eaſily digeſted, and converted into a ſalutary Aliment. Beſides, the Stag's Fleſh, in the Months of *Auguſt* and *September*, when the Animal is at Rut, is ungrateful, and ſmells ſtrong, like that of Goats, as *Ariſtotle* long ago obſerved. The Fleſh of old Deer is not a laudable Aliment, becauſe it is dry, and of difficult Digeſtion, creates Obſtructions, promotes the Generation of a melancholic Juice, and diſpoſes to Fevers. In weak Conſtitutions it creates Diſorders of the Inteſtines, becauſe it is of difficult Digeſtion. But why *Hippocrates* affirm'd, that the Fleſh of this Animal provokes Urine, is what cannot be accounted for.

If we conſider, that the Food of Deer is only Vegetables and Water, we ſhall readily perceive, that the Fleſh of this Animal cannot be highly alcaleſcent, unleſs render'd ſo by much Exerciſe and Heat. A Stag which is ſhot, therefore, muſt be a leſs alcaleſcent Animal, than one which is hunted. It is remarkable, that the Legiſlator of the *Jews* orders the Throat of a Stag to be cut, that it may bleed ſufficiently; probably with a View to leſſen the Tendency to an alcaline Putrefaction, which the Fleſh of Deer contracts after much Motion.

Many medicinal Preparations are obtain'd from this Animal. Thus, in the Works of the Antients, we read, that almoſt every Part of it is effectual againſt Poiſons; and the Moderns have generally given into the ſame Opinion, except with reſpect to its Tail alone; the Extremity of which, in a particular manner, is accounted poiſonous; and, when eaten, is ſaid to excite the moſt cruel Symptoms, ſuch as intolerable Diſorders of the Præcordia, and frequent Faintings, by which it ſpeedily proves fatal to the Patient, unleſs a Vomiting be quickly excited, and the Theriaca, together with Abſorbents, exhibited. But this Opinion, concerning the poiſonous Nature of the Tail, ſeems to have drawn its Origin from an Error of the Antients, who imagin'd, that the Bile of the Stag was lodg'd in its Tail. *Ettmuller*, in his *Opera Medica*, *T.* 1. thinks the Whole of the Stag is deſervedly accounted alexipharmic and diaphoretic; and that all the Preparations of it are poſſeſs'd of the ſame Qualities. *Muſitanus*, in his *Pyretologia*, affirms the ſame thing, in expreſs Words. Hence *Cardan* aſſerts, that the inſpiſſated Tears of the Stag, when tied to any Part of the Body, prove effectual againſt Poiſons. *Agricola* affirms the ſame concerning the Tooth of the Stag; but others aſcribe this Virtue to the Hoof of one of its Right Feet. According to *Sextus*, a *Platonic* Philoſopher, if a Man is cloath'd with a Stag's Skin, he is Proof againſt Poiſon. It is alſo aſſerted, in the *Theatrum Sympatheticum*, that the Bone of the Stag's Heart, wore about any Perſon, defends him againſt the Bites of venomous Animals. *Baricellus*, in his *Hort. Genial.* declares himſelf of the ſame Opinion. *Ælian* alſo, and *Mizaldus*, affirm, that Serpents never approach the Place where the Fat of the Stag is kept. And *Dioſcorides*, in the ſixty-ninth Chapter of his ſecond Book, informs us, that thoſe who are anointed with the ſame Subſtance have no Reaſon to dread the Bites of Serpents. The ſame Author alſo affirms, in the fifty-ſecond Chapter of the ſame Book, that Serpents are baniſh'd by the Smoak of crude Hartſhorn. In the thirty-ninth Chapter of the laſt-quoted Book, he tells us, that thoſe who are bit by Vipers receive Relief by the Penis of the Stag, triturated and drank in Wine. *Guainerius*, after the Exhibition of Bezoar, and Preparations of the Theriaca, orders the Bites or Stings of venomous Animals to be tightly tied up with a Thong of Hart's Skin; for, ſays he, this Skin is of ſingular Efficacy againſt Poiſons.

Whether the Accounts relating to the Enmity between the Stag and Serpents are juſt or fabulous, or whether the Stag, in conſequence of its Longevity, is poſſeſs'd of any peculiar Virtues for procuring long Life, and preventing Diſeaſes, are Points we ſhall not take upon us to determine; ſince we have not the Sanction of Experience to vouch our Aſſertions in either of the Caſes. Forbearing, therefore, to ſwell the Article with various Conjectures, and the Authorities of the Learned on theſe Subjects, we ſhall only conſider thoſe Parts of the Animal which have any medicinal Uſes aſcrib'd to them; omitting, at the ſame time, their alexipharmic Qualities, of which we have already treated. But, that what follows may be the better underſtood, we muſt obſerve, that the Juices of the Stag, as well as of other Animals, have a Tendency to an alcaline Putrefaction; which is ſtill heighten'd, becauſe, in conſequence of their Swiftneſs, their Bodies are much exerciſed.

As to the medicinal Virtues aſcrib'd to the Tail of this Animal, *Xenophon*, in the fifth Chapter of the nineteenth Book of the *Geoponica*, informs us, that if we anoint the Teſticles and Pudenda of any Animal with the Stag's Tail calcin'd, and triturated with Wine, it quickens the Deſire of Venery in that Animal; which, again, is allay'd by anointing the ſame Parts with Oil: And the ſame Effects are alſo produced in Men, by theſe Methods. *Rieger* is of Opinion, that not only the Tail, but

but alſo any other Part of the Stag, as well as of any other Animal, when not ſo thoroughly calcin'd as to deſtroy the whole Oil, in which Caſe the Aſhes are entirely inſipid, may, by its Acrimony, irritate the Fibres, and procure that Degree of Rigidity requiſite for a due Erection; whilſt, at the ſame time, the Wine, by its ſtimulating Quality, contributes to the Production of the Effect. The Tail of this Animal is not, however, kept in the Shops.

Johnſton, in his *Hiſtoria Naturalis de Quadrupedibus*, informs us, that *Rhaſis* recommends the Brain of the Stag in Pains of the Hips and Sides; as alſo for the Cure of Fractures. In conſequence of its pinguious and unctuous Nature, it may be proper for external Uſe, where the Intention is to mollify the Parts. But, as we have great Plenty of ſuch mollifying Medicines, the Brain of this Animal is not kept in the Shops.

Pliny, in the fourteenth Chapter of his twenty-eighth Book, informs us, that the Runnet of the Calf of the red Deer, boil'd with Lentils and Beets, and uſed as an Aliment, is of ſingular Service in Diſorders of the Inteſtines. It is alſo recommended for ſtopping immoderate Diſcharges of the Menſes, and reſolving coagulated Milk. *Scribonius Largus*, in his Work *de Medicamentorum Compoſitione*, recommends it againſt an Epilepſy. It is not, that we know of, uſed in Medicine at preſent; and, as it is an acrid ſtimulating Subſtance, it can only be properly uſed in Caſes, where, by its reſolvent Quality, it may produce ſome happy Effects.

They who aſcribe medicinal Virtues to the Whole of the Stag, claſs its Heart among the moſt conſiderable and efficacious of the cordial Medicines. But the Preparations from this Part of the Animal are rarely uſed, becauſe other Medicines, of equal Virtues, are more eaſily obtain'd.

The Bone of the Stag's Heart is more highly recommended for medicinal Uſes than the Heart itſelf. This Subſtance, according to *Veſalius*, is nothing but the Tendons of the Muſcles of the Heart, about the Origin of the Aorta, and Pulmonary Vein, which in old Harts degenerate, firſt, into a cartilaginous, and then into a bony Hardneſs. This Bone ſeems properly to be ſituated between the Valves of the Root of the Vena Cava, and the Origin of the Aorta, as it were in the Middle of the Septum. Some affirm, that, in freſh-kill'd Stags, this Subſtance is ſoft and flexible, like a Cartilage; but that, when it is for ſome time expoſed to the Air, it aſſumes the Hardneſs and Texture of a Bone. Theſe Bones ought to be of a beautiful white Colour, and not too large, leſt they ſhould be ſuch as are obtain'd from old Oxen; with Bones of which Kind the genuine Bones of the Stag's Heart are often mix'd. This Bone is recommended againſt Poiſons, and for procuring Longevity. It is reported, that, in conſequence of its alexipharmic Quality, it affords an inſtantaneous Relief to pleuritic Patients, if uſed frequently thro' the whole Courſe of the Diſorder. The Reaſon aſſign'd for this is, that it is impregnated with a pretty large Quantity of volatile Salt, by which it contributes to open the Obſtructions of the ſmall Veſſels in the Pleura. It is generally thought to be appropriated, in a particular manner, to Diſorders of the Heart; for which Reaſon it is made an Ingredient in Medicines of a cordial and comforting Nature. It is generally recommended as a Specific againſt Abortion, when exhibited with Grains of Chermes, and in a proper Vehicle. Half a Dram of it is generally exhibited in Powder. *Hildanus* thinks it better when calcin'd, than when crude. It is externally recommended, as an Amulet, in violent Hæmorrhages; for the ſtopping of which it is alſo put into the Patient's Drink; or the Powder of it is blown into his Noſtrils. But as Bones of this Kind are not only found in Stags, but alſo ſometimes in Oxen, and in old Men, *Ettmuller* thinks the particular Virtues, aſcrib'd to this Bone, ſpurious; and imagines, that they have drawn their Origin from a fooliſh Suppoſition of the Heart's being the Seat of the Principle of Life, and of its being poſſeſs'd of a peculiar Degree of Eminence, above the other Parts, on that account. *Stahl*, in his *Ars Sanandi cum Expectatione*, *Satyra Harveana*, juſtly obſerves, that the Bone of the Stag's Heart does not differ from the other Bones of that Animal, in any other reſpect, than that it is in the ſingular Number: We may, therefore, juſtly affirm, that this Bone is poſſeſs'd of no higher medicinal Virtues than the Bones and Cartilages of other Animals. Hence, when reduced to a Powder, it may, in conſequence of its abſorbent Quality, deſtroy Acidities in the Stomach and Inteſtines; and even for anſwering this Intention, according to *Ludovici*, it is ſo far from ſurpaſſing, that, in many Caſes, it does not come up to Crabs-eyes, or calcin'd Hartſhorn. They who prepare Jellies from this Bone, obtain a Subſtance poſſeſs'd of the ſame Virtues with the Jellies obtain'd from the Bones either of the Hart, or of other Animals. If other Ingredients are added, the Effects of the Jelly are to be judged of from the Natures of theſe Ingredients. The Method of preparing a Jelly from the Bones of the Stag's Heart may be ſeen in *Schroder's Pharmacopœia*. Patients, therefore, only ſuffer on account of the Dearneſs, but not of the Effects, of the Medicine, when the Apothecaries, inſtead of the Bone of the Stag's Heart, uſe the Trachea of an Ox in their Compoſitions, as *Matthiolus ad Dioſcor. L. 2. C. 52.* informs us they uſed to do; or when they ſubſtitute in its room the Bones found in the Hearts of Oxen, as *Hildanus* informs us the Apothecaries, for the moſt part, did; or when, in its ſtead, they uſe a pliant flexible Bone, taken from the Head of a Sheep, as *Amatus*, in *Dioſcor.* informs us was cuſtomary among the *Venetians*.

That the Skin of the Stag is effectual againſt Poiſons, has been already obſerv'd. It is alſo recommended againſt Strangulations of the Uterus. *Joel* affirms, that a Belt, made of the Skin of the Stag, kill'd when copulating with the Female, is found, from Experience, to be poſſeſs'd of ſingular Virtues. When applied to the Loins, it is ſaid infallibly to promote the Expulſion of the Fœtus. *Burrhus*, according to *Ettmuller*, recommends Stockings of it againſt the Gout; and he himſelf order'd a Coat to be made of it for a certain Prince. The Shavings of this Skin, taken off with a Pumice-ſtone, and triturated with Vinegar, are ſaid to be proper for anointing an Eryſipelas. The ſame, when put in Beds, is ſaid to be a Remedy for an involuntary Diſcharge of the Urine. We can ſee no Reaſon for extolling the Effects of this Skin ſo highly; nor can we affirm, that they anſwer the Expectations of the Patients, ſince we are perſuaded, that the Opinion of theſe Virtues originally aroſe from an ill-grounded Notion, that all the Parts of the Stag were of ſingular Service in Medicine, and uſeful for many curative Intentions.

The Penis of the Stag, according to *Ettmuller*, is of ſingular Uſe in Medicine: But the Stag muſt be kill'd in the Time of Coition; for, by this means, it is of the greateſt Efficacy in ſtimulating to Venery, when a Dram of it is exhibited in the Form of a Powder, with a poach'd Egg, and a ſmall Quantity of generous Wine. *Solenander* alſo informs us, that it proves a very powerful Stimulus to Venery. But, if the Stag is kill'd in the Act of Copulation, its Penis is of no Uſe againſt a Dyſentery, but rather proves prejudicial. But if the Stag is kill'd at any other time, its *Penis* is an excellent Remedy againſt Dyſenteries and Pleuriſies, either in the Form of a Powder, or ſhaved down. The Doſe is from half a Dram to a whole Dram, in ſome Water appropriated to Pleuriſies and Dyſenteries, adding a little Laudanum Opiatum; or the Shavings of this Penis muſt be boil'd, and the Decoction given to the Patient; or a Jelly muſt be prepared from them, after the Exhibition of which the Patient is to expect a Sweat. In the abovemention'd Diſorders, when frequently repeated, they are of ſingular Uſe; and are very properly added to Antidyſenteric Electuaries. The Penis of this Animal, according to *Bartholine*, in his *Hiſtoriæ Anatomicæ Cent. 6. Hiſt. 50.* is highly proper againſt Colics, and hyſteric Diſorders. Externally, the Penis, reduced to a Powder, and anointed on the Teſticles, in Conjunction with Wine, proves a ſingular Stimulus to Venery. Others commend the Uſe of it againſt a Difficulty of diſcharging the Urine; as alſo in Diſcharges of bloody Urine, the Plague, and for promoting Deliveries. When exhibited in Wine, it is ſaid to be good againſt the Bites of venomous Animals. According to *Welſchius*, in his *Hecatoſteæ*, *Obſ. 75.* a certain Phyſician happily cured Dyſenteries, and Hæmorrhages, only with a Powder, prepared of the Penis and Teſticles of this Animal; adding either a little common Sugar, or red Sugar-candy, which takes its Colour from the Sanders uſed in its Preparation. I am of Opinion, that the Veracity of ſo great Authors is not to be call'd in Queſtion, provided theſe Accounts are founded on their own Experience, and not on the Reports of others. But Reaſon convinces us, that no other medicinal Virtues are to be expected from the Penis of the Stag, than what are owing to the abſorbent drying Quality of its Powder, or the mucilaginous and gelatinous Nature of its Decoction; ſo that a Suſpicion remains, that the Effects produced are owing to the Subſtances taken in Conjunction with this Penis, ſuch as generous Wine, and poach'd Eggs, Things which greatly ſtimulate to Venery. It is not improbable, that the medicinal Virtues attributed to the Penis of the Stag draw their Origin from the groundleſs Opinion of the Antients, that the Whole of the Stag was uſeful for many medicinal Purpoſes. And as for its proving a Stimulus to Venery, I ſuſpect this Opinion is owing to the ſalacious and hot Diſpoſition of the Animal.

The Tears of the Stag, which are the Sordes collected in the greater or interior Angle of the Eye, reſembling indurated Wax, or rather the indurated Wax of the Ears, and which ſmell ſomewhat rank, like the Sweat of the Animal, are recommended for their drying, corroborating, aſtringent, and diaphoretic Qualities. They are alſo ſaid to be good againſt Poiſons, and contagious Diſeaſes; and to be proper in difficult Labours, and for expelling the dead Fœtus. The Doſe is ſaid to be three or four Grains.

According to *Franciſcus Joel*, half a Scruple of this Subſtance, drank in generous Wine, is proper for expelling all Kinds of Poiſons by Sweat. *Avenzoar*, a celebrated *Arabian* Phyſician,

Phyſician, in his *Abbomeron*, *Lib.* 1. *Tract.* 13. *C.* 6. informs us, that he cured a Jaundice, produced by taking ſome poiſonous Subſtance, by an Exhibition of the Weight of three Grains of Barley of this Subſtance, with five Drams of Gourd-water. When worn by way of Amulet, and frequently applied to the Noſtrils, it is ſaid to be a *Panacea*, or univerſal Medicine. At preſent this Subſtance is not uſed for medicinal Purpoſes; and *Ludovici*, in his *Pharmacopœia*, affirms, that, when exhibited in a large Quantity, its Virtues are not ſo conſiderable, as to render ſo nauſeous a Remedy preferable to other more pleaſant, and more eaſily obtain'd, Medicines. The Fable on which the remarkable Virtues, attributed to the Tears of the Stag, are founded, is, by *Avenzoar*, deliver'd in the following Words: "That Species of Bezoar is more genuine and uſeful than the "others, which, in ſome Parts of the *Eaſt*, is produced near "the Eyes of the Stag, in the following manner. The large "Stags of theſe Countries ſometimes eat Serpents, in order to "ſtrengthen themſelves; and, before they receive any Injury "from them, run to the freſh-water Rivers, into which they "plunge themſelves, till the Water riſes very near their "Mouths. This they are taught by Nature. They do not "drink any of the Water; for, if they did, they would quick-"ly die: However, they continue in it till their Eyes begin "to ſhed Tears, which become viſcid, and coagulated under "their Eyelids; and which, in Proceſs of Time, become as "large as a Cheſnut, or Haſlenut. But, when they perceive "the Poiſon entirely diſcharg'd, they come out of the Water. "Theſe Tears, when indurated like a Stone, fall off by "Friction, are afterwards found by Men, and accounted a "more perfect and uſeful Bezoar than any other." Hence we underſtand the Reaſon, why theſe Tears are by ſome call'd the Stone or Bezoar of the Stag. *Scaliger*, in his *Exercitationes*, relates another Fable; and accounts for the Origin of theſe Tears from the Longevity of the Animal, in theſe Words: "Before, ſays he, a Stag is an hundred Years old, it produces "no Tears; but, when it is arrived at this Age, there is "form'd, at the Canthus of the Eye, a Subſtance, which ad-"heres to the Bones, and which is harder than a Horn. Its "prominent Part is round, remarkably ſhining, of a yellow "Colour, and mark'd with ſmall black Veins. It is ſo ſmooth "as almoſt to eſcape the Touch; and ſhrinks in ſuch a man-"ner, that it almoſt appears to move itſelf. It is a preſent "Remedy againſt Poiſons; and is advantageouſly exhibited, "with a little Wine, to ſuch as are ſeiz'd with the Plague; "and by its means ſuch a Diaphoreſis is excited, that one "would think the whole Body in Danger of being diſſolved." What Kind of Stone the learned Author here deſcribes, we leave others to determine. We ſhall only obſerve, that ſome Men, celebrated for their Learning, have adher'd to one or other of theſe Opinions above-mention'd, concerning the Production of this Stone. But *Scribonius Largus*, in his Treatiſe *de Medicamentorum Compoſitione*, ſeems to be more in the right, when he calls the Tears of the Stag thoſe rank Sordes, found, when the Animal is taken, in that Corner of the Eye which is next to the Face. Theſe Sordes, he informs us, are gather'd by the *Sicilian* Huntſmen, on account of their Virtues againſt the Bites of Serpents. The celebrated *Harderus* has diſcover'd a peculiar Lachrymal Gland in the Stag, which other Animals want. This Gland has no Communication with the *Glandula Innominata*, nor with the common Lachrymal Gland, both of which are found in the Stag. It is ſituated in the inferior Part of the Orbit, and is furniſh'd with a large Number of Veſſels. By an excretory Duct, peculiar to itſelf, it diſcharges the ſecreted Lymph; and this it does in ſo much the greater Quantity, becauſe it is much larger than the *Glandula Innominata*, and the common Lachrymal Gland. He thinks it probable, that the Lymph, thus diſcharged and inſpiſſated, conſtitutes that Subſtance commonly call'd the Tears of the Stag. See the *Acta Eruditorum Lipſiæ*, for the Year 1694. By what has been ſaid, I do not intend to call the Veracity of thoſe Authors into Queſtion, who affirm, that the Tears, either of a Man or a Stag, may ſometimes happen to aſſume a ſtony Conſiſtence; but theſe are uncommon Accidents; whereas we only here ſpeak of the common Tears of the Stag, or thoſe indurated Sordes, which reſemble the Wax of the Ears.

The Marrow of the Stag, or that ſoft and pinguious Subſtance contain'd in the Cavities of the Bones, is by ſome thought preferable to the Marrows of other Animals, for alleviating Pains, and healing malignant Ulcers. *Dioſcorides* informs us, that thoſe who are anointed with it are Proof againſt Poiſons. And *Ovid*, in his *Art of Love*, tells us, that it was formerly uſed as a Paint or Varniſh for the Face. When this Marrow is old, it becomes rancid, acrid, inflammatory, corroſive, and of a cauſtic Quality: But, when recent, it is of a mild and oleous Nature, and conſequently proper for ſoftening indurated Parts, and moiſtening ſuch as are dry. Hence we know when its Uſe is proper, either externally, for anointing any Part affected, or when exhibited by way of Draught; or when injected, by way of Clyſter, in Gripes of the Inteſtines. *Galen*, for provoking the menſtrual Diſcharge, order'd it to be included in a thin and clean Linen Cloth, and put into the Pudenda of Women, with a Thread at it, in order to pull it out; probably becauſe ſuch a Medicine, by its ſoftening Quality, may prove beneficial where the Mouth of the Womb is preternaturally conſtricted, dry, or indurated; ſince by this means, when the Humours are juſt about to be diſcharg'd, the leſs Reſiſtance may be made to them. *Hippocrates*, in his firſt Book *de Morb. Mul.* for this Purpoſe, orders to anoint the Mouth of the Womb with the Marrow of a Gooſe or Stag, triturated with Ointment of Roſes, and Womens Milk. As emollient and lenitive Subſtances are beneficial in Ulcers which are either dry, or abound with a corroſive Acrimony, the Reaſon is obvious why *Hippocrates*, in the laſt-quoted Book, claſſes the Marrow of the Stag among the Medicines proper for Exulcerations of the Mouth of the Womb. From what has been ſaid, we cannot aſſign a Reaſon why thoſe anointed with it ſhould be Proof againſt Poiſons. If, therefore, we are ſo idle as to believe, that the medicinal Virtues of any Subſtance depend upon Fables, we muſt have recourſe to the Enmity between the Stag and Serpents, in order to account for this wonderful Phenomenon. As for its Uſe in adorning the Skin, I am of Opinion, that it is proper, when other medullary or pinguious Subſtances are ſo; that is, when a Dryneſs or Fiſſures of the Skin are to be remov'd. The Preference ſeems to have been given to the Marrow of the Hind, the Female of the Stag, above that of the Male, becauſe Women, when they us'd this Subſtance as a Medicine, were not allow'd to take it from the Male Stag. But this calls rather for the Laughter, than the ſerious Regard, of a rational Creature. The Marrow of this Animal is not kept in many Shops; nor, indeed, are we at any Loſs on this Account, ſince we can more readily have the recent Marrows of other Animals, almoſt daily kill'd everywhere for the Uſe of Kitchens. When us'd as an Aliment, this Marrow is of difficult Digeſtion; and, when eaten plentifully, is highly injurious; but, when it is duly digeſted, it is very nouriſhing.

As for the medicinal Virtues of the *Elaphopila*, or Hairs collected in the Stomach, and ſometimes in the Inteſtines, of the Stag, ſee the Article ÆGAGROPILÆ. We muſt only obſerve, that this Subſtance is form'd of the Hairs which the Animal, in licking itſelf, ſwallows down; and theſe Hairs are render'd compact and firm by the Filaments of the Vegetables the Animal eats, and the Juice contain'd in the Stomach.

The Lungs of the Stag, when us'd as an Aliment, are ſaid to be of eaſy Digeſtion. But, beſides, the Lungs of this Animal, eſpecially when young, are accounted a valuable Medicine in ſome Caſes; for if we may believe *Pliny*, in the twelfth and ſeventeenth Chapters of his twenty-eighth Book, the Lungs and Oeſophagus of this Animal, dry'd in the Smoak, beat with Honey, or daily taken in Wine, are good againſt a Cough and Phthiſis. We can aſſign no other Reaſon for this, than that Stags, eſpecially when young, by their Swiftneſs demonſtrate the Goodneſs of their Lungs. But the other medicinal Virtues, aſcrib'd to the Lungs of this Animal, are no more to be depended on than this, if we may believe *Johnſon*, in his *Hiſtoria Naturalis de Quadrupedibus*.

As to the Blood of the Stag, when dry'd, it is ſaid, that, when infus'd in Clyſters, it cures Ulcers of the Inteſtines, and inveterate Fluxes; and that, when drank in Wine, it is effectual againſt Poiſons. It is alſo commended againſt the Gout and Pleuriſy. The Doſe is from half a Scruple to a Dram. But notwithſtanding the high Encomiums beſtow'd thereon, it is poſſeſs'd of no other medicinal Virtues than the Blood of other Animals.

That the Suet of the Stag baniſhes Serpents from thoſe who are anointed with it, as *Dioſcorides* informs us, ſeems to be founded on the Perſuaſion, that the Stag, and all its Parts, are poſſeſſed of a Quality, whereby they reſiſt Poiſon. This Suet is alſo ſaid to be good for ſoftening Tumors, conglutinating Wounds, curing Chilblains, and alleviating Pains, even thoſe of the Gout. It is alſo ſaid to be good for Hernias, Excoriations of the Perinæum, and Freckles and Exulcerations of the Face. It is a proper Ingredient in Clyſters intended for the Cure of Fluxes and Dyſenteries. The Oil diſtil'd from this Suet is ſaid greatly to alleviate arthritic Pains, if the Part affected is frequently anointed with it every Day. According to *Hoffman*, in his *Clavis Schroder.* when laid upon a Linen Cloth, melted at the Fire, and apply'd to the Gums, it ſurpriſingly alleviates Tooth-achs, and extracts the Worms which create the Pain. According to *Ettmuller*, "The Suet of the Stag is an excellent conſolidating "Medicine in ſuperficial Excoriations. In a Falling-down of the "Anus, let the Part be anointed with it warm, and gently put up. "It is alſo an excellent Medicine for an Intertrigo, or Galling of "the Skin; as alſo for Fiſſures of the Hands and Feet produc'd by "Cold; for it is of a more penetrating and reſolvent Nature than "any other pinguious Subſtances. Dr. *Neſter* put one Drop of "Stags Suet in the Urine of any Patient who was thought to "be dangerouſly ill. If this Drop ſubſided in the Urine, he "pronounc'd the Caſe deſperate; and, if it floated, he pro-

"gnoſticated

" gnoſticated a Recovery." *Hippocrates*, in his Book *De Morb. Mul.* ordered melted Stags Suet, mix'd with Oil of Roſes, to be laid upon Wool, and put into the Pudenda, in child-bed Women, when the Lochia were not diſcharg'd. The ſame Author, in the laſt-quoted Book, recommends this Suet as a proper Ingredient in Peſſaries againſt Exulcerations of the Uterus; and when, in order to provoke the menſtrual Diſcharge, acrid Peſſaries have been us'd, he orders theſe to be laid aſide, and the Suet of the Stag, melted in Wine, to be apply'd. From what has been ſaid we may infer, that in Caſes where ſuch Subſtances as ſoften, moiſten, and correct Acrimony are proper, Stags Suet, when recent and mild, but not when old and rancid, may be advantageouſly us'd, both internally and externally, like any other Subſtances of a mild and oleous Nature.

As for the Ankle-bone of the Stag, or that ſmall ſquare Bone protuberating above the Hoof, the Powder of it is by ſome highly commended againſt Dyſenteries, Colics, and the Stone; but I think they are in the right who aſſert, that it does not differ in Virtues from the other Bones of the Animal.

But the Part of a Stag moſt celebrated in Medicine is the Horns, of which Authors give the following Accounts.

Vinegar, in which crude Hartſhorn has been boil'd, is, by *Dioſcorides*, *Lib.* 2. *Cap.* 63. ſaid to remove the Pain attending Dentition, if the Gums are waſh'd with it. Vinegar alone is a fit Medicine for allaying and removing Pains; but whether it receives any additional Virtues from the Hartſhorn, muſt be aſcertain'd by manifold Experience. *Pliny*, in the thirty-ſecond Chapter of his eighth Book, informs us, that the Smell of kindled Hartſhorn is beneficial to epileptic Patients. The Filings of Hartſhorn are ſometimes us'd in the time of the Plague, in order to correct and purify the Air; but they are ill adapted to that Deſign, becauſe they do not reſiſt the putrefactive Corruption of the Atmoſphere, which is at that time requiſite, but rather ſeem to promote it by their alcaleſcent Nature. Theſe Shavings, reduc'd to a Powder, which is call'd prepar'd Hartſhorn, is, according to *Ettmuller*, highly proper in ſeveral Caſes, eſpecially when an Acid in the Primæ Viæ is to be abſorb'd, and a gentle Diaphoreſis promoted. But its diaphoretic Virtue is only granted by thoſe who believe the whole Stag to be poſſeſs'd of an alexipharmic Quality. From this Perſuaſion the Country-people, when labouring under malignant Fevers, make themſelves a Powder of the Shavings of Hartſhorn, macerated and well ſoak'd in a Lixivium of Marſh-trefoil, prepar'd with its own Water and Salt, and then dry'd. By the Uſe of this Powder the Patients are recover'd, not ſo much by the Virtues of the Hartſhorn as by means of the Lixivium. *Willis*, *de Morbis Caſtr.* informs us, that he compos'd a Powder, for the ſame Purpoſe, of the Shavings of Hartſhorn, with an Admixture of the Roots of Devil's-bit, Swallow-wort, Tormentil, the Leaves of Marſh-trefoil, and Nitre. It is juſtly extol'd for its antiacid Virtue. But the mucilaginous, gelatinous, and tenacious Nature of Hartſhorn, even when reduc'd to a Powder, renders it of difficult Digeſtion by weak Stomachs; and, if it wanted this tenacious Quality, it would be more abſorbent than it really is. That Phyſicians, therefore, might not be reduc'd to a Neceſſity of preſcribing it crude, other Preparations of it are brought into the Shops. Theſe are of two Kinds, obtain'd either with or without Fire. The Preparation by Fire, call'd calcin'd Hartſhorn, is no more than common Hartſhorn, calcin'd till it becomes white, ſpongious, friable, and eaſily reduc'd to a Powder. This is afterwards to be levigated on a Marble, pouring upon it, now-and-then, ſome proper Water, ſuch as that of Roſes; and, when it is dry, it is kept either in the Form of a fine Powder, or in that of Troches. It is alſo ſometimes call'd, by way of Excellence, Hartſhorn prepared. The ſame Subſtance is produc'd when we take the Caput Mortuum, which remains after the Diſtillation of the Spirit, the Oil, and the volatile Salt, and calcine it to a Whiteneſs. With reſpect to this, *Hildanus*, in *Tract. de Gangræna*, accuſes the Negligence, or rather the Ignorance, of ſome Apothecaries, who, inſtead of calcining their Hartſhorn in Crucibles, or other proper Veſſels, burn them among the open Coals. But this Method, as it is more eaſy and commodious to the Apothecaries, ſo 'tis more loathſome and prejudicial to the Patient; for Coals contain a malignant and peſtilential Vapour in them; and the Hartſhorn, whilſt burning among theſe Coals, and whilſt the Aſhes every-where adhere to it, may very eaſily derive ſomething of a malignant Nature from the Coals. *Dioſcorides*, therefore, gave a good Method of calcining Hartſhorn, when he order'd it to be put in a coarſe earthen Veſſel, cover'd up with Clay, put into a Furnace, and burn'd till it becomes white. Calcin'd Hartſhorn is generally recommended againſt Putrefaction, for ſtopping Fluxes and Hæmorrhages, for killing Worms, and exciting a Diaphoreſis. It is alſo recommended for provoking the Menſes, for curing the Jaundice, Spittings of Blood, Ulcers, and Defluxions of the Eyes. It is alſo recommended for Dentifrices, and againſt Pains of the Bladder, in Conjunction with Tragacanth. Some abſolutely reject calcin'd Hartſhorn, affirming that by the Calcination it is reduc'd to a dead Earth, and deſtitute of all medicinal Virtues. *Ettmuller*, in his firſt Volume, tells us, " That it is a pure dead Earth, " which, either as an Alexipharmic or Diaphoretic, produces " no Effect at all, except, perhaps, in a very remote and acci- " dental Manner, by powerfully abſorbing the Acids of the " Primæ Viæ, rendering them inſipid, or changing them, and, " by that means, preventing their Action on the Parts of the " the Body. But in Diarrheas, and a Laxity of the Inteſtines, " by abſorbing the Humidity, it produces good Effects, and " may, therefore, be properly exhibited in acute Diſorders, " attended with Fluxes, Hæmorrhages, Vomitings, and a " Cholera. Where an Acid abounds in the Inteſtines, it is " alſo properly preſcrib'd; for it powerfully abſorbs Acidities, " and various acrid Humours." It is alſo properly exhibited for expelling Worms of the Inteſtines, eſpecially thoſe of Children. Doctor *Michaelis*, for an antidyſenteric Powder, calcin'd, in a Crucible, Hartſhorn with Antimony, both of which were levigated. Hartſhorn calcin'd, with Antimony, was frequently us'd by *Hartman*, in an epidemic Dyſentery; but he adds Gold to it at the ſame time. *Muſitanus*, in his *Pyretologia*, informs us, that calcin'd Hartſhorn is only a dead Calx, and thinks, that if at any time the Exhibition of it promotes a Diaphoreſis, this Effect is owing to the Quality of the Waters with which it is exhibited, ſuch as that of Carduus, for Inſtance, or to the Bed-cloths with which the Patient is cover'd. *Clauderus*, in *Ephem. N. C. D.* 2. *a.* 4. and *Morley*, in *Collect. Leyd.* affirm that calcin'd Hartſhorn is poſſeſs'd of no other Virtues than what it has in common with other abſorbent Subſtances, ſuch as Crabs-eyes and Coral. *Foreſtus*, indeed, in his *Obſervat. Med. Lib.* 6. *Obſ.* 4. *Schol.* aſſerts, that in certain malignant Fevers, epidemically raging, and attended with a Flux, and a large Number of Worms, nothing was ſo beneficial as calcin'd Hartſhorn; but he cautiouſly ſubjoins ſome Claſſes of Abſorbents, which, he ſays, he found as effectual in the Cure of the ſame Diſeaſe. I am of Opinion, that, in the Calcination of the Horns, or other hard Parts of Animals, there is a Burning of the phlogiſtic Part, an Expulſion of the Moiſture, and an Evaporation of the volatile Salt into the Air. Theſe Bodies muſt, by a Deſtruction of the Coheſion of their Parts, become friable, and deſtitute of Water, Oil, and Salt; ſo that I think it obvious, that calcin'd Hartſhorn is not poſſeſs'd of any other Virtue than what may be aſcrib'd to other dry, earthy, and abſorbent Subſtances. Hence *Welſchius*, in his *Curationes Propriæ*, does not, in all Caſes, think the Uſe of this Medicine proper, becauſe, by its drying Quality, it may produce bad Effects. But that it is a mere earthy Body, deſtitute of ſaline and oleous Parts, may appear from this, that the like Subſtance is obtain'd from the Caput Mortuum, when ſubjected to Calcination, after the Diſtillation of the Spirit, the volatile Salt, and the Oil. 'Tis now obvious, that *Hoffman*, in his *Acta Laboratorii Altdorfini*, when he has told us, that *Martin Rulandus* us'd calcin'd Hartſhorn for preparing Decoctions, judges rightly when he adds, " This Method may " be follow'd at preſent, if the Patient deſires an inſipid " Decoction, juſt as the celebrated *Sereta*, in his Treatiſe on " a malignant Camp-fever, order'd one Dram of diapho- " retic Antimony to be mix'd with Spring-water, and " exhibited with a View to quench Thirſt, and extinguiſh " the febrile Heat." From what has been ſaid, we perceive the Reaſon why *Scribonius Largus*, in his Treatiſe *De Medicamentorum Compoſitione*, beſtows ſo large Encomiums on a Medicine compounded of Hartſhorn, cut into Slices, calcin'd in an earthen Veſſel, cloſe ſtopt, to white Aſhes, and then mix'd with white Pepper and Myrrh, not only for removing preſent, but preventing future, Pains of the Colon. For, if the Diſorder is produc'd by a cold Cauſe, a viſcid Mucus, or a redundant Acid, this Medicine by no means appears improper, on account of the Power of abſorbing Acidities, lodg'd in the calcin'd Hartſhorn, and in conſequence of its ſtimulating, reſolvent, and heating Qualities, ariſing from an Addition of the Myrrh and Pepper. But for what Reaſon calcin'd Hartſhorn ſhould be accounted attenuating, as the Antients imagin'd, I can by no means comprehend. That the Antients thought ſo, is obvious from a Paſſage in the firſt Book of *Hippocrates de Morb. Mulier.* where, for ſuch Women as do not conceive on account of the Fatneſs and Thickneſs of the Mouth of the Uterus, he orders the Application of a Medicine compos'd of calcin'd Hartſhorn, and double the Quantity of Barley-meal, mix'd up with Wine. Calcin'd Hartſhorn ſeems to be recommended for a Dentifrice, becauſe it is an earthy rough Subſtance, eſpecially when not reduc'd to too fine a Powder. In conſequence of this, when rub'd on the Teeth, it cleanſes them. It ſeems proper to be exhibited in thoſe kinds of Jaundice where an Obſtruction is form'd in the Duodenum by an acid Matter, which, diſtending it too much, blocks up the common biliary Duct, where it terminates in that Inteſtine. This Species of Diſorder frequently occurs in Children, and is reliev'd by calcin'd Hartſhorn, or any other abſorbent Medicines, eſpecially in Conjunction with reſolvent Salts. Tho' *Franciſcus Fool* affirms, that it is proper in all Hiccoughs indiſcriminately, yet it is of no Efficacy, except when the Diſorder ariſes from an

an acrid vellicating Matter, adhering to the moſt nervous Part of the Stomach, where its ſuperior Orifice communicates with the Diaphragm. Hartſhorn prepar'd without Fire, which is alſo call'd Hartſhorn philoſophically or ſpagirically prepar'd, is made by ſuſpending, by a Thread, Hartſhorn cut in Pieces in the Neck of a Still, from which Brandy, or ſome cordial Water, ſuch as that of the Carduus Benedictus, or of common Carduus, is diſtil'd, that by this means the Hartſhorn may be penetrated, and render'd white and friable, by the aſcending Vapours. When dry'd after this Proceſs, it is either kept in that State, or reduc'd to Troches, with ſome proper Water. This Preparation, by the Steam of the Liquors ſubjected to Diſtillation, is, in the *Collect. Leyd.* call'd a Fumigation of Hartſhorn. This philoſophical Manner of calcining it was caſually found out at *Dreſden* in *Saxony*, probably about the Middle of the laſt Century, by one *Caſpar Pantzerus*, an Apothecary, and a Native of *Pruſſia*, whilſt, in order to digeſt ſome Medicine, he put a Piece of Hartſhorn into the Beak of the Alembic, and, upon taking it out, he found it ſo ſoft as ſcarcely to exceed the Hardneſs of Cheeſe. At preſent it is alſo prepar'd by boiling it in a ſufficient Quantity of common Water, till it becomes ſoft, ſomewhat friable, and till the exterior blackiſh Coat is capable of being ſeparated with a Knife, after which the white Subſtance in the Middle is dry'd, and preſerv'd for Uſe. *Hoffman*, in his *Acta Laboratorii Altdorfenſis*, orders the Water, in which it is boil'd, to be impregnated with ſome alcaline Salt, that it may the ſooner become ſoft. He alſo obſerves, that the Hartſhorn, thus prepar'd, may aſſume a rediſh Colour, if it is boil'd in a cloſe Veſſel in Lime-flower-water. Hartſhorn, thus prepar'd without Fire, is recommended for the ſame Purpoſes with that which is calcin'd; and the former is prefer'd to the latter by ſome, who, thinking it poſſeſſed of greater Virtues, preſcribe it in ſmaller Doſes. When thus prepar'd, it has the ſame drying and abſorbent Qualities, and may be preſcrib'd for the ſame Intentions with the burn'd Hartſhorn; only it is leſs abſorbent, becauſe it ſtill retains ſomewhat of its gelatinous Subſtance. *Schulzius*, in his *Prælect.* tells us, "That many Phyſicians aſcribe little or nothing to this Preparation, ſince it is "deprived of its gelatinous Part, on which its Virtues muſt "neceſſarily depend. But that its gelatinous Subſtance is not entirely deſtroy'd, is experienc'd by thoſe who put the Powder "of it into Waters, which, by that means, ſoon become mucilaginous, and unfit for keeping long. There are alſo ſome "celebrated Phyſicians, who recommend it, as having a temperating, antiſpaſmodic, and, in ſome meaſure, a diaphoretic "Quality, and uſe it very much in theſe ſeveral Intentions. "But, above all others, a certain Phyſician, *Eph. N. C. D.* "2. *a. b.* gave this Medicine alone the higheſt Encomiums, as "an efficacious Cure for malignant Fevers." But it may be juſtly ſuſpected, that the critical Sweat, by which the malignant Fever is carry'd off, may be excited only by drinking the Water of Carduus Benedictus, with which the Hartſhorn is exhibited. Some alſo call that *Hartſhorn philoſophically prepar'd*, which is calcin'd with an Addition of Brick-duſt by way of Cementation: But this is nothing more than Hartſhorn burnt. As for the various Preparations of Hartſhorn in the ſeveral Diſpenſatories, and the Cenſures paſſed upon them, we ſhall not here give them a Place: But it muſt be obſerv'd, that, in all theſe Preparations of the Hartſhorn, it is depriv'd of its volatile Salt, and the abſorbent earthy Powders only remain.

Decoctions of the Shavings of Hartſhorn, in common Water, may prove beneficial, where the Acrimony of the Humours is to be corrected, where dry Parts are to be moiſten'd, and where Thirſt is to be allay'd; but they are more proper in Diſorders ariſing from Acidities, than in ſuch as ariſe from an alcaleſcent State of the Juices. Theſe Decoctions ought to be weak for Perſons of tender Conſtitutions, and ſomewhat ſtronger for thoſe of a more hardy and robuſt Make; for they are of a gelatinous Nature, and not to be digeſted without ſome Difficulty. *Hoffman*, in the twenty-third Chapter of his *Off. Paral.* tells us, "That they who are of Opinion, that Hartſhorn cures "malignant and peſtilential Fevers, either put it in the Patient's Drink, or boil it in Barley-water, which they "take to be diuretic. But," ſays he, "I would willingly "know, whether for this Purpoſe we are to uſe crude or calcin'd Hartſhorn. All uſe that which is calcin'd, except "*Saxonia*, who declares in favour of that which is crude, becauſe it retains the Properties of the Hartſhorn, which, in "Calcination, are deſtroy'd. Some Subſtances we calcine in "order to render them more mild, ſuch as Braſs, and Cadmia; "and others are calcin'd with a View to render them more "acrid, of which Kind is Hartſhorn. They who will not believe, that it aſſumes an acrid Quality, in conſequence of "its Calcination, may be convinced of this Truth by ſprinkling ſome of it in any Wound they have received. That "the Barley-water may, therefore, acquire a drying Quality, "they uſe calcin'd Hartſhorn in the Compoſition. But I am "of Opinion, that the Diſcharge of Urine is not enlarged by "the Hartſhorn, but by the Water, which proves cheriſhing "to the Kidneys, eſpecially when drank in a large Quantity."

As for the various Methods of preparing the Jellies of Hartſhorn, either in the Kitchens or the Shops, it would be too tedious to recount them here. The ſingular Virtues of Subſtances of this Kind are enlarged upon by *Ettmuller*, in the following Words: "The Jelly, extracted by boiling, is no"thing but that Quinteſſence, or nutritive Juice, of the Stag, "by which it is nouriſh'd. It is poſſeſs'd of alexipharmic as "well as antifebrile Virtues, if half an Ounce, or between "ſix Drams and an Ounce, of it is diſſolved in half a Pint or "a Pint of Ale, or of ordinary Drink. It is alſo an excellent "and eaſily prepared Medicine againſt the Heat and Malignity "of Fevers, and other Diſorders; as alſo, for the Expulſion "of any peccant Matter, which may happen to be lodged in "the Body. It is alſo of a temperate analeptic Nature, fit "for correcting the acrid Juices in the Body, allaying the Efferveſcences ariſing thence, and mitigating the natural Heat. "Hence, in continued Fevers, nothing is more uſual than "large Doſes of the Jelly of Hartſhorn, both in alterative and "alexipharmic Juleps, and in the Patient's common Drink: "For this Jelly is nothing but a volatile Salt, concentrated by "a ſpermatic Mucilage. It is either ſimple, for the Uſe of "hectic and phthiſical Patients, for promoting the Eruption of "the Small-pox, purple and petechical Fevers; or it may be "ſprinkled with diſtil'd Vinegar, or acidulated with Lemon-"juice; in which Form it is more proper, in Caſes where "there is a preternatural Heat, and Ebullition of the Maſs of "Blood."

It muſt be carefully obſerved, that the Jelly of Hartſhorn is no more than its Decoction, ſo inſpiſſated, that, when expoſed to the Cold, it aſſumes a Conſiſtence capable of being cut with a Knife; that it is richly impregnated with the Subſtance of which the Horn was originally form'd, and conſequently contains Parts fit for nouriſhing the Perſon who uſes it; as alſo, that it is proper for lubricating the exaſperated and dry Fibres, and for correcting the too fluid State of the Juices. Hence it happens, that, in conſequence of its glutinous Quality, it ſometimes produces deſirable and happy Effects in Diarrhœas and Dyſenteries. But it muſt be obſerved, that it proves uneaſy to weak Stomachs, when exhibited in large Quantities, by its glutinous Quality; for which Reaſon it ought to be exhibited to the Sick in a diluted Form, ſuch as that of the Decoction. Secondly, we muſt obſerve, that, in conſequence of its alcaleſcent Nature, it is proper in Diſeaſes where an acid Acrimony is to be corrected. But as many feveriſh, hectic, and phthiſical Patients ſuffer too much from an alcaleſcent State of the Juices, acidulated Jelly of Hartſhorn may ſo much the more ſafely be exhibited to them: As, on the contrary, Hartſhorn-jelly, with an Addition of Aromatics, is proper in Diſorders ariſing from a peccant Acid. For this Reaſon *Wilſchius*, in his *Curationes propriæ*, for feveriſh Patients, generally preſcrib'd this Jelly, prepared with Lemon-juice. The medicinal Uſes of the Jelly of Hartſhorn may, I think, be determin'd, from what has been ſaid: But, at the ſame time, I am of Opinion, that it is poſſeſs'd of no higher alexipharmic or analeptic Virtues, than what may be juſtly attributed to the Jellies prepared from the Parts of other Animals. Nor, in order to eſtabliſh the alexipharmic and diaphoretic Virtues of this Jelly, would I have recourſe to an urinous Spirit, and a volatile Salt, concentrated in it; for theſe may, by Diſtillation, be obtain'd from the Jelly itſelf, as well as from the crude Hartſhorn. But we cannot hence infer, that any Matter acts on our Bodies by virtue of theſe Subſtances, obtain'd from the Jelly by the Violence of the Fire in the chymical Veſſels. When other Subſtances are added to the Jelly, the Nature and Qualities of theſe are alſo to be regarded, in forming a Judgment of the Effect generally produced. Thus, for Inſtance, it may be affirm'd, concerning the Jelly of Hartſhorn, in which excorticated ſweet Almonds are bruiſed, ſo as to form a kind of Emulſion, that it is highly nutritive, and corrects every Kind of Acrimony, in conſequence of the mild balſamic Oil contain'd in the Almonds, if they are recent, and not old and rancid.

As the Water diſtil'd from Hartſhorn is taken no notice of by the Compilers of our Diſpenſatories, but is a Medicine much uſed by the *French* Phyſicians, we ſhall here give the various Methods of preparing it, directed in ſome of the moſt celebrated Diſpenſatories. In the *Diſpenſatorium Brandenburgicum*, therefore, and the *Pharmac. Pariſ.* it is prepar'd by Diſtillation from the young and tender Horns of the Stag. According to *Ettmuller*, "It is an excellent Medicine againſt "Palpitations of the Heart; and a good Vehicle for exhibiting "to Children, Infants, and Adults, alexipharmic Medicines "in Fevers, and other Diſorders of a malignant Nature. It "is proper for promoting the Eruption of the Small Pox and "Meaſles; as alſo for curing Epilepſies, either by itſelf, or "mix'd with other proper Medicines. This Water is uſed "with Succeſs by Child-bed Women, when ſeiz'd with the "purple Fever; as alſo in immoderate Fluxes of the Lochia, "Dyſenteries, and Scurvy." Others alſo recommend it for promoting the Expulſion of the Fœtus. But it is poſſeſs'd of ſcarce any other Virtues than thoſe of common Water; for theſe

theſe young and tender Horns, as alſo all the other Parts of other Animals, as *Zwelfer* juſtly obſerves, only ſend forth, by way of Sweat, an elementary Water or Moiſture poſſeſs'd of very inconſiderable Virtues; and which, tho' impregnated with an empyreumatic Smell, cannot, from that Circumſtance, be thought to poſſeſs ſo very powerful Qualities. The *Aqua Cornu Cervi e tenellis cum vino*, in the *Diſpenſatorium Brandenburgenſe*, receives, beſides the tender Horns, ſtimulating and alexipharmic Medicines, entire Citrons, Aſtringents, and other Subſtances, which, in Diſtillation, do not yield their Virtues: All theſe are diſtil'd with Wine, and Water of Germander. It is ſaid to be alexipharmic and cordial, which Qualities it more juſtly claims than the preceding Water, not on account of the Hartſhorn, but of the aromatic, ſpirituous, and heating Ingredients. *Schulzius*, in his *Prælectiones*, paſſes his Judgment upon them both in the following Words: "They are ſup-"ported upon a groundleſs and implicit Opinion, the worſt of "Foundations. Some fond Abettors of Antiquity, however, "aſcribe a great deal to Compoſitions of this Kind. As there "is no Neceſſity for envying theſe Men their Noſtrums, they "may be at Liberty to enlarge at Pleaſure the Claſs of "Cordials and Alexipharmics. Of the ſimple Water, a few "Ounces may be exhibited for a Doſe; and of that prepared "with Wine, one Ounce is ſufficient." Both theſe Waters are now in Diſuſe, becauſe better and more judicious, or at leaſt as good, Compoſitions are to be had with more Eaſe. They may, indeed, be uſed as Vehicles for other Medicines, that the Apothecary may have no Reaſon to complain of ſuſtaining a Loſs on account of their being diſcarded. The *Aqua Typhorum Cervi*, in the *Pharmacopœia Argentoratenſis*, is diſtil'd with Wine alone. This Preparation is by ſome commended as an Alexipharmic, and good againſt burning and malignant Fevers. A few Spoonfuls may be given for a Doſe. What riſes in the Alembic ſeems to be ſimple Spirit of Wine, as may be alſo known from its Virtues and Properties. The *Aqua Cornu Cervi Citrata, Waldſchmidii*, in the *Pharmacopœia Argentoratenſis*, is prepared of the Shavings of Hartſhorn, diſtil'd with entire Citrons, and ſome diſtil'd Waters of Vegetables, commonly call'd alexipharmic or ſtimulating, with an Addition of the Water of Sorrel. This Preparation is accounted analeptic, and proper for allaying preternatural Heats. It is alſo ſaid to be alexipharmic. A Spoonful of it may be exhibited at a time; or it may be mix'd with other proper Liquors. From what is before ſaid, 'tis obvious, that whatever Virtues theſe Waters poſſeſs are owing to the Waters uſed in Diſtillation, and not to the Hartſhorn.

I now proceed to the Spirit, Salt, and Oil of Hartſhorn.

Boerhaave, whom I ſhall follow, in order to avoid Repetitions, has given the Method of procuring volatile alcaline Salts from all Animal Subſtances, of which Hartſhorn is the moſt frequently uſed, under one Article. The Example he gives is in the Hoofs of Horſes. But I muſt remark, that by Hartſhorn, in Medicine, the Horns of any Deer are implied, whether the red or fallow.

Take the Parings of Horſes Hoofs, whilſt at Graſs, as they are cut off by the Farrier, and ſteep a ſufficient Quantity thereof in Water, that they may be cleanſed, and afterwards dry'd: Put them into a Glaſs Retort, ſo as to fill it almoſt to the Neck; ſet the Retort in a Sand Furnace; apply a very capacious Receiver, and lute the Juncture with a Paſte of Linſeed-meal; diſtil with ſlow Degrees of Fire. There will firſt come over a limpid aqueous Liquor in dewy Drops: Continue the ſame Heat ſo long as this Liquor diſtils; then pour it out, and keep it apart; apply the Receiver afreſh, and raiſe the Fire, till white Clouds begin to riſe; at which time an unctuous Spirit will come over in oily Veins: Continue this Degree ſo long as it will bring any thing over: There will be now ſome Signs of a ſaline Matter. Increaſe the Fire again, and, along with the unctuous Spirit, there will come over a volatile alcaline Salt, ſhooting up in little Lumps, together with an Oil: Continue this Fire till ſcarce any thing more riſes; then increaſe it to the utmoſt; at length, raiſing a Fire of Suppreſſion, a ſomewhat more fix'd volatile Salt, along with a very thick red Oil, will now come over; at which time the Feces, fuſing, will run into a Maſs, which ſwells and riſes up to the Neck of the Retort. Now let the Operation ceaſe, and take away the Receiver before the Retort is thoroughly cold, otherwiſe the volatile Salt will in a great meaſure go back into the Retort: Keep the Productions in a well-ſtopt Glaſs, for they are exceedingly volatile. The remaining Feces are very ſharp, light, ſpongy, as alſo fetid and bitter; and, if calcin'd in an open Fire, afford a little Quantity of white, inſipid, and conſiderably pure Earth.

If Hartſhorn, which has been kept for many Years, and is now grown exceedingly dry, be broke into large Pieces, and put into an Iron Pot, ſet in a Furnace, and fitted with a large earthen Alembic-head, which works with two Beaks, each fitted to a capacious Receiver, and the Diſtillation be carefully perform'd with Degrees of Fire, nearly all the ſame Matters will be obtain'd; that is, a fat, oily, alcaline Spirit, a volatile Salt, a light Oil, a Salt ſomewhat more fix'd, and a groſs pitchy Oil: There will remain behind a ſolid black Coal, which does not eaſily diſſolve by Fire, but remains brittle; and, when reduced to Powder, and given upon an empty Stomach, it proves an excellent Medicine for deſtroying Worms.

The recent Bones of Animals, clear'd as much as poſſible from their Fat, and treated in the ſame manner, afford the ſame Subſtances; only abounding with more of a highly fetid nauſeous Oil, which infects every thing it touches. Horns, Nails, Hoofs, Hair, and Silk, afford the ſame.

REMARKS.

As a greater or leſs Quantity of Water is drawn from all theſe, even the drieſt Bodies, it ſhews, how intimately Water may adhere to the other Principles of Animals, and be conſolidated therewith into an extremely hard and dry Form, ſo as to remain fix'd for a great Number of Years; and at length be releaſed again by the means of Fire. This principally appears when the fluid Spirit is ſeparated from its volatile Salt and Oil; for, then, a conſiderable Quantity of fetid Water is procur'd: And hence it appears, that the moſt perfectly inodorous Bodies may, by the bare Force of Fire, acquire many Degrees and Kinds of fetid Odours; whilſt each Part, ſeparate from the reſt, has a peculiar Odour, which it tenaciouſly retains for a very long time. And the ſame holds true of the Variety of Taſtes produced from an inſipid Body; for the Water, Spirit, Salt, and Oil, have each their particular Odour. Again, from a ſolid Body we have various Fluids, which concrete together again with the greateſt Difficulty: We have ſeveral alſo, which are volatile from fix'd Bodies; and there remains, from ſo large a Bulk, but little Earth, which is firm and fix'd. And as the ſame Principles are obtain'd both from the Solids and Fluids, tho' always more Earth from the Solids, we hence ſee the common Nature of both, and, therefore, that the Solids are compoſed of the Fluids; but the larger Bones, calcin'd to perfect Whiteneſs, both in their Surface and Subſtance, with a clear and violent Fire, ſtill retain the former Size and Figure; yet, if afterwards expoſed to the Action of the Fire, in a cloſe Veſſel, they afford no Water, Salt, Spirit, or Oil, but remain crumbly; yet ſo as, if dipt into Water or Oil, they again acquire a Tenacity. So, likewiſe, if Horns, Bones, or the like Parts, be ſtrongly boil'd for a long time in Water, with a repeated Change of the Water, and a ſeparate Reſervation of the former Decoctions; and this be continued till the Water comes off pure, after boiling with the Bone; and all theſe Decoctions be inſpiſſated to a thick coagulated Maſs, without burning, ſo as to appear almoſt like Horn in the Cold; then this Maſs, ſo prepared from Hartſhorn, Ivory, Bones, or Fleſh, will, by Diſtillation, afford all the Principles, in the ſame manner as the other Subjects of this Proceſs. But the horny or bony Matter, remaining after this thorough Decoction, affords ſo much the leſs Salt, Oil, and Spirit, the more Jelly was obtain'd by the boiling; from whence it ſeems, that all the ſaline, ſpirituous, and oily Matter proceeded only from the Juices; whilſt the laſt Solid is a mere ſimple Earth, which can ſcarce cohere together; and containing, after having ſuffer'd the utmoſt Violence of the Fire, no fix'd Salt; but always affording, when burnt to Whiteneſs, a kind of Aſhes proper for making the Refiners Teſts. And, when Bones are treated in *Papin's* Digeſter, I have found, by repeating the Operation, that they remain almoſt wholly terreſtrial after boiling. And this has ſhew'd me, that ſcarce any obſervable Difference could be found in theſe Productions, let the Animal Subject be what it would; except only in reſpect of the Oil, which abounds more plentifully in one Part than in another. The Oil, in the Diſtillation, acquires a perfectly intolerable fetid Odour, which infects all the Things it touches with an abominable Taſte and Smell, not to be got out. And hence the ſolid Subſtances, thus diſtil'd, afford theſe Productions; the more infected and diſagreeable, the more Oil they contain: And hence it is, that Hartſhorn, which is leſs unctuous, affords a leſs nauſeous Oil and Spirit than Ox-bones, which are full of Marrow; but, except this ſingle Difference, they can ſcarce otherwiſe be diſtinguiſh'd; for all theſe Spirits and Salts, purified from their Oil, become the ſame thing; nor could I ever find any Difference betwixt theſe Productions, yielded by different Animals; for Horſes Hoofs, the Horns of Oxen and Stags, Ivory, Tortoiſe-ſhell, Hair, and Silk, afford all the ſame. Whence it is of little Importance from what Subject theſe Things are produced, only with reſpect to the Oil, as above explain'd. I could never find, that the Spirit of human Blood, Hartſhorn, Horſes Hoofs, or raw Silk, differ'd in any thing, but the Oil. *Helmont*, I know, recommends the

ſaline

ſaline Spirit of human Blood before all others, becauſe it cures the Falling-ſickneſs: And, in *England*, *Goddard*'s Drops, diſtil'd from Silk, are prefer'd to others of the ſame Kind; but I have long obſerved, that theſe Differences are ſeldom found, with any Certainty, in the Practice of Phyſic. This is evident, that all the Matter, capable of affording theſe Principles by Diſtillation, may be extracted by diſſolving Animal Solids in boiling Water; whilſt what remains, after a thorough Boiling, will afford little thereof: In theſe, therefore, almoſt inſipid and ſcentleſs Decoctions, all that Matter lies conceal'd, which affords Salts, Spirits, and Oils, by Diſtillation. Theſe Salts, therefore, of Animals could not be render'd alcaline or volatile, by ſo long and repeated a boiling. It is alſo certain, that the Air, Water, and Sun, at length deprive the Bones expoſed thereto of all that Animal Matter, which, in Diſtillation, would afford Water, Oils, Salts, and Spirits; and in old Bones, grown perfectly white, is found, upon committing them to Diſtillation, nothing of theſe Principles, but only a ſimple Earth, Putrefaction having carried away the reſt. It is an agreeable Experiment to boil an Animal Muſcle, or, for Example, an Ox's Heart, ſo long in ſeveral Waters, till at laſt the Water comes off as pure as it was put on; then, gently ſqueezing the Water out of the Heart with the Hand, and repeating this ſeveral times, and boiling it in freſh Water, the external thin Membrane being taken off, that the Fat alſo may be reſolved and ſeparated in the Boiling, there will thus be, at length, obtain'd a perfectly ſolid, dry, and incorruptible Muſcle, exhibiting all the Fibres; eſpecially if hot Water has been firſt injected with a Syringe thro' the Coronary Veſſels, ſo as perfectly to waſh out the Blood from the Veins and Arteries; for thus the mere Skeleton of the Muſcle will be obtain'd.

Rectification of animal alcaline Salts, Spirits, and Oils.

Take the entire Production of the Proceſs deſcrib'd above, and put it into a large Glaſs Body, to be hereafter kept for this Purpoſe; apply a large capacious Head, with its Pipe cut in the wide Part, ſo that the Salt may eaſily paſs into the Receiver; otherwiſe it would there ſtop, block up the Pipe, and forcibly throw off the Head. Set the Veſſel in a Bath Furnace, with a continued Heat of an hundred and fifty Degrees, ſo as firſt to bring over what will riſe with this Degree: A fat, volatile, alcaline Spirit thus comes over, along with a white ſolid Salt. When no more aſcends, change the Receiver, and keep this Liquor, with its volatile Salt, apart; and if the Salt, by ſhaking, does not diſſolve in its Spirit, it is a Sign, that the Spirit, being pour'd out, and kept ſeparate, is as ſtrong and rich as can any way be procur'd: Let it therefore be kept for its particular Uſes, in a cloſe ſtopt Glaſs, under the Title of Spirit of Hartſhorn, Spirit of human Blood, *&c.* And let the Salt alſo, which would not diſſolve in this Spirit, be preſerv'd under the Title of the volatile oily Salt of Hartſhorn, or of whatever other Subject it was procur'd from.

Urge the Remainder with the Heat of boiling Water, and there will come over another Spirit more ſlowly than the former, together with a light Oil floating thereon, and ſome Quantity of volatile Salt; continue this, till no more riſes, with the ſame Degree of Heat; and again, keep this aqueous, oily, and ſaline Liquor ſeparate; a groſs fetid Oil will now remain at the Bottom of the Veſſel.

Thus we obtain, from the above-mention'd Subſtances, a Water which is neither oily nor ſaline at firſt, as we ſaw in the Beginning of the preceding Proceſs; next, an alcaline oily Spirit; thirdly, a volatile oily Salt; fourthly, a volatile Oil, with an oily Alcali a little more fix'd, and a fetid Water; fifthly, a more fix'd Oil than could be ſeparated by a Heat of two hundred and thirteen Degrees.

If the firſt Spirit be again diſtil'd in a freſh Glaſs, with a hundred Degrees of Heat, the Salt is thence obtain'd purer, and almoſt in a ſolid Form. And if the Operation be continued, till the Salt ſublimed begins to diſſolve by the ſubſequent Liquor, an aqueous Fluid will remain at the Bottom, with an Oil floating thereon: So that theſe Spirits conſiſt of an extremely light Water, Oil, and Salt united together; whence they again reſolve into theſe three. This Spirit, therefore, is a volatile ſaponaceous Lixivium; and the remaining Water and Oil may be ſo ſeparated, by a freſh Diſtillation, that the Water ſhall remain taſteleſs, tho' fetid, and the Oil almoſt without Mixture; all the Salt being ſeparated with the more volatile Oil: And hence we may underſtand the Nature of theſe Spirits. But the Salt, ſeparated by this Sublimation, from its Spirit, is always oily, tho' leſs ſo than the former, and therefore much whiter; becauſe upon each Rectification it leaves a yellow, and ſometimes a red Oil behind, which gave it the Colour. Hence we know, that the Salts of Animals once render'd volatile and alcaline, by Putrefaction, the Admixture of a fix'd Alcali, or the Force of Fire in Diſtillation, thereby become and remain more volatile than pure Water, and the moſt volatile Oil; and hence, that the Water, ſo deſerted, manifeſts the Oil it conceal'd before, as being united with its Alcali into a kind of Soap, ſoluble in Water: And now, when the Alcali is ſeparated, the Oil will no longer continue mix'd with the Water, but floats apart.

Let the Oil, which remains after the Depuration of the Spirits, be pour'd to that remaining at the Bottom, as above-mention'd, and mix'd therewith; then pour warm Water to them, and ſhake them together; whereby the Salt, which might chance to remain fix'd with the Oil, will be diſſolv'd in the Water; and hence the cauſtic Sharpneſs of the Oil will be got out, and the Oil itſelf be render'd more mild; let this ſaline Water be pour'd off, that the Salt may afterwards be ſeparated from it by Sublimation. Then let theſe Oils be put into a Glaſs Body, and with the Heat of boiling Water be freed from their aqueous Moiſture, till no more thereof will ariſe; then put the Oils into a Retort, and diſtil with a gentle Heat, into a capacious Receiver, gradually increaſing the Fire to the higheſt Degree Sand will give it, till nothing more comes over; and thus the Oil will become more thin, limpid, and fetid: A black Earth remains behind in the Retort; and if the Oil, once drawn off, be a ſecond time return'd, and diſtil'd upon its own black Feces, it again becomes more pure, limpid, thin, and leſs fetid; again leaving more Earth behind; and this happens upon numberleſs Cohobations. But I have ſcarce found any End in the Operation; for I have formerly, according to the Direction of *Helmont*, in his *Aurora Medicinæ*, endeavour'd, with great Patience, to prepare the oily diaphoretic Medicine he there preſcribes; and he directs the Purification of theſe Oils by Diſtillation, ſo often repeated, till at laſt they leave no earthy Feces behind. I, therefore, diſtil'd Oil of Hartſhorn in the manner above-mentioned, and cohobated it a number of times, but always found a black feculent Matter left behind; ſo that I at laſt loſt a Part of the Oil, and gained a great Quantity of Earth, and ſtill found more Earth at the Bottom of the Retort. But thus I obtain'd a very penetrating, and not ungrateful, Oil. Whence I conceive, that *Helmont*, perhaps, never brought the Experiment to a Concluſion, in the manner he directs it; and that the illuſtrious Mr. *Boyle*, with greater Veracity, affirms in his Treatiſe concerning the Tranſmutability of the chymical Principles, that, by many continued Cohobations, at length almoſt the whole Quantity of theſe Oils is converted into Earth, with a conſtant Loſs of that Acrimony which remains in the Oil after the Salt is waſh'd out. In the mean time, it is worth the while to cohobate theſe Oils fifteen times over; for thus they will become thin, pellucid, penetrating, and volatile, almoſt like Spirit, of a penetrating Taſte and Odour, and will ſtrangely enter all the Parts of the Body. They are anodyne, ſoporiferous, and reſolving, good in Fevers, and grateful to the Nerves, and cure Intermittents by being rub'd externally along the Back-bone, before the cold Fit. Their Doſe is from twenty to thirty Drops. And thus theſe Oils are reduc'd to a very large Quantity of Earth, and a very ſmall one of true Oil: And thus the greater Part of them at length nearly acquire the ſame Nature, and afterwards can ſcarce be diſtinguiſh'd from one another; ſo that all diſtil'd Animal Oils, thoroughly depurated from the other Principles, ſeem to be one and the ſame thing, from whatever Animal they were obtain'd. See ANIMAL.

The volatile Salts of Animals are depurated ſeveral Ways, ſo as to render them at laſt perfect, and without Mixture. 1. Take a large cut Glaſs Body, and put into it the volatile Salts to be rectify'd; apply a Glaſs Head with a capacious Receiver, and diſtil with a gentle Sand-heat; the Salt will riſe into the Head and the Neck of the Glaſs; continue the Operation till no more riſes. Let the Salt be taken out, and kept in a cloſe Glaſs; an Oil, and a fetid Subſtance, will be left behind. But in this Method ſome Oil always riſes with the Salt; tho' it may, by Sublimation, be in a great meaſure left behind, and the Salt be obtain'd the purer. And thus the Salt of Urine, White of Eggs, Blood, Horns, and Bones, are made to appear as the ſame Thing: For by repeated Sublimation I have brought them to ſuch a Likeneſs, that I could ſcarce diſtinguiſh between them; and this always the leſs, the oftener the Sublimation was repeated: Whence it may appear, that all the Difference of theſe volatile Salts depends wholly upon the empyreumatic Oil adhering thereto; which, when perfectly ſeparated, leaves them all alike: But the Salt, whiten'd by this Operation, grows yellow with keeping; the Oil, that was conceal'd, thus again manifeſting itſelf. This thoſe Chymiſts find, to their Diſadvantage, who prepare Salt of Hartſhorn for Sale; where an agreeable and permanent Whiteneſs is principally requir'd. I have therefore found the following Method more ſucceſsful. 2. Put the Salt, obtain'd by the preceding Sublimation, into a tall Glaſs Body, and immediately throw thereon four times its Weight of pure, hot, dry Chalk, reduc'd to fine Powder, ſo as every Way to cover the Salt; then

imme-

immediately lute on a dry Alembic-head, which the larger it is, and the wider its Pipe, the better; lute on a Receiver, and diſtil with a tepid Heat only, in Water: All the Salt will thus riſe white, pure, alcaline, and volatile, whilſt nearly all the Oil is detain'd in the dry and thirſty Chalk. In the mean time, this Addition of Chalk will not change the Nature of the Salt, but only keep back its Oil, and thus ſeparate it from that Foulneſs; and the Salts, thus prepar'd, may be long kept without changing, eſpecially if, before Sublimation, they were well ground with the Chalk: But in that Caſe much of them would be loſt, or fly off into the Air in the grinding, and the Remainder would preſently diſſolve by attracting the Moiſture of the Air. Laſtly, if, when the Salt is thus depurated, by means of Chalk, as much pure Spirit of Sea-ſalt be mix'd therewith, as ſuffices to ſaturate it perfectly, and the Sal-ammoniac, thus produc'd, be diſſolv'd in Water, perfectly filtrated, and inſpiſſated into a Salt, and this Salt be diſtil'd with a fix'd Alcali, a pure, ſolid, white, alcaline Salt riſes, which is the moſt genuine that can be procured, and perfectly free from Oil. When volatile, alcaline, oily Salts are, by theſe three Methods, reduc'd to their utmoſt Purity, there appears no ſenſible Difference between them, whether they are ſpontaneouſly generated in the Subject, or produc'd by Putrefaction, or by Fire; and they are obtain'd perfectly in the ſame Form from Birds, Land Animals, and amphibious Creatures, Fiſh, Reptiles, ſubterraneous Animals, alcaleſcent Vegetables, and Soot; for as they all, when depriv'd of their Spirit and Oil, afford the ſame Species of Sal-ammoniac, along with the Spirit of Sea-ſalt, ſo this Sal-ammoniac, being afterwards reſolv'd by fix'd Alcalies, affords the ſame alcaline Salt and Spirit of Sal-ammoniac. Hence, therefore, pure volatile Alcali is but one Thing in Nature, when obtain'd pure; but the Difference found in it always depends upon the Admixture of ſome other Principle, eſpecially the Oil adhering thereto, which is very different in different Subjects, altho' the principal Difference of the Oils is owing to a very ſmall Quantity of Spirit. Hence we ſee, that the Water, Earth, and Salt of Animals, when by the means above-mentioned reduc'd to their utmoſt Simplicity, are perfectly the ſame without any Difference; ſo that the peculiar Characteriſtic of each is principally lodg'd in the Oil alone; the Oil alone being diſtinguiſh'd by its Spirit, which when perfectly taken away, Oils themſelves alſo become wonderfully alike. This preſiding Spirit, therefore, conſtitutes the true Difference in Animals; and theſe are the ultimate and ſimple Effects of a chymical Analyſis. If the Artiſt here endeavours to proceed further, he will be in Danger of loſing his Subject; the Particles whereof are now ſubject to fly away; for when the Principles are thus purify'd, they do not greatly cohere together; tho', by differently uniting with one another, they form a prodigious Variety of Compounds.

REMARKS.

The chymical Properties and Virtues of this pure, volatile, alcaline Salt, are principally theſe. 1. It makes an Efferveſcence with all the known Acids, as ſtrong and as durable as a fix'd alcaline Salt; cloſely joins the Acid with itſelf, and retains it ſo as to form a compound Salt according to the Nature of the Acid. And thus, when fully ſaturated, it increaſes $\frac{17}{28}$ in its Weight. Whence we may underſtand the requiſite Proportion for making the Balance betwixt an Acid and an Alcali, and how much of either may be again expected upon the Reſolution of theſe compound Salts. But as ſoon as the Point of Saturation is exactly gain'd, the Action of the Salt, ſo produc'd, is neither to be eſtimated from the Acid or the Alcali of the Compoſition, but from the new Nature the compound Salt has acquir'd. And hence the Error of thoſe may be eaſily confuted, who conceive that the Virtues of compound Salts are ſuch as they obſerve in the Parts produced by a Separation. 2. This Salt, actuated with the Heat of a healthy Body, preſently inflames, burns, and cauſes a gangrenous Eſchar, and therefore perfectly deſtroys all the Parts of the human Body to which it is ſo apply'd, as that its Motion, ariſing from the Heat, may be driven in upon the Part. Thus, if a Scruple of the pure volatile Salt of Hartſhorn be laid upon the Skin, and covered with an adheſive Plaiſter, it will in half a quarter of an Hour raiſe a black Carbuncle, as if a Piece of hot Iron had been there applied; and the Colour, Pain, Heat, and Hardneſs of the Skin, are alſo the ſame as they would be in that Caſe; and it reſolves the Humours into a thin, ſanious Liquor. 3. It is the moſt moveable Body of any hitherto known, as exceeding even Alcohol in Volatility: For, if Alcohol, Water, and this Salt be put together in a tall chymical Glaſs fill'd with an Alembic-head, and a ſmall Degree of Heat be applied, the Salt will riſe by itſelf into the Head long before the Alcohol; the Alcohol will next follow, and the Water at laſt with Difficulty. And thus this Salt flies off from every heating Point, and, if laid upon the warm Hand, it preſently flies away without hurting the Hand, as in this Caſe its Reaction is not great upon the heating Body; wherein it greatly differs from the fix'd alcaline Salt, which adheres by its Weight. But when theſe volatile alcaline Salts are received into the Veſſels of the Body, and there actuated by the vital Heat, and the Force of the circulating Fluids, they act very powerfully by a ſharp, ſtimulating, and corroding Virtue, eſpecially upon the more ſenſible fine Fibres of the nervous Syſtem, which they excite to greater Motion; and at the ſame time thinning the Humours, promote Perſpiration, Sweat, Urine, and Saliva. They likewiſe frequently prove ſerviceable upon receiving their volatile Exhalation, along with the Air, into the Noſtrils; for thus they irritate the Membrana Pituitaria of the Noſe, Mouth, Jaws, Lungs, and, by irritating thereof, diſſolve the viſcous Phlegm, which may adhere thereto, provided they be uſed with Caution. 4. Theſe Salts, therefore, are proper, and have very good Effects, in aqueous, acid, and auſtere Diſtempers of the Humours, as alſo in Torpidity of the nervous Syſtem, and diſorderly Motions of the Spirits, ruſhing irregularly and involuntarily into particular Muſcles. And hence they excellently cure hypochondriacal, hyſterical, epileptical, and ſpaſmodical Diſorders. Being diluted with Water, and receiv'd in the Form of Vapour into the Vagina Uteri, they are eſteem'd one of the moſt immediate Remedies, when prudently apply'd, for promoting the Menſes, if requir'd. But they prove poiſonous in alcaline and putrid Diſorders, where the Humours are diſſolv'd, and the Body already too much agitated. They may alſo be externally apply'd, by way of a Cauſtic, for the making of Iſſues, the extirpating of Warts, and taking off Styes upon the Eyelids. The Method of uſing this Salt in theſe Caſes, is by laying it upon a little Pellet of Lint, and applying it to the Part; then covering it with an adheſive Plaiſter, and leaving it thus, till it may be thought to have performed its Office. *Boerhaave's Chymiſtry.*

The volatile Salt of Hartſhorn is by ſome ſo highly extol'd, as almoſt to be pronounc'd an univerſal Medicine in Epilepſies, Apoplexies, Lethargies, Vertigoes, and, in a Word, all the Diſorders incident to the Brain. The ſame Virtues are aſcrib'd to it in the Cure of hyſteric Fits, in opening Obſtructions of the Viſcera, in removing all Fevers, Diſorders of the Kidneys, and the Bladder, the Plague, and the fatal Effects of all Poiſons. It is no leſs extol'd in rendering the Body ſoluble when coſtive, and reducing it to a due State when it runs into the oppoſite Extreme; as alſo in provoking the Menſes, and at the ſame time giving a ſeaſonable Check to them, when they flow immoderately. According to *Ettmuller*, *Mœbius* informs us, "That the volatile Salt of Hartſhorn, duly exhibited, not "only excites a Diaphoreſis, but alſo a Vomiting." It is given internally, mix'd with other Subſtances, either in the Form of Powders, Pills, or Potions. When put into a narrow-mouth'd Glaſs, it is applied to the Noſtrils for opening their Obſtructions, created by a viſcid Lymph. It is alſo us'd in the ſame manner for recovering and animating apoplectic, epileptic, and hyſteric Patients. If the Virtues of this Medicine are really ſo great as is pretended, and if it is indiſcriminately proper in all the above-mention'd Diſorders, there would ſcarcely be a Neceſſity for any other Medicine in the Shops, beſides thoſe of the refrigerating, emollient, and emplaſtic Kind, ſince the Effects produc'd by all the others might be expected from the volatile Salt of Hartſhorn alone.

The rectify'd Spirit of Hartſhorn, according to *Ettmuller*, "is very much us'd in the Cure of Fevers, and acute ma-"lignant Diſorders, in exciting a Diaphoreſis, and removing "Epilepſies. It penetrates the whole Body, corrects Malig-"nity by its alexipharmic Quality, and expels it by a Dia-"phoreſis. It corrects vicious Acids, and promotes the Erup-"tion of Puſtules, Spots, Small-pox, and Petechiæ. Some "account it an univerſal Medicine, and certainly nothing is "more proper in the Increaſe of malignant Diſorders." *Ludovici*, in his *Pharmacopœia*, calls it a highly penetrating alexipharmic in moſt malignant Diſorders, and an excellent Cephalic in thoſe of the vertiginous and lethargic Kind, when apply'd to the Noſtrils. *Schulzius*, in his *Prælectiones*, tells us, that it is exhibited internally from ten to thirty Drops, and that robuſt Countrymen ſometimes take a Dram of it in Brandy. It is of an aperient, antiſpaſmodic, and ſedative Quality. In Conjunction with a proper Regimen, it is highly diaphoretic; but when it has not the Advantage of this, it rather proves diuretic. In *Eph. Nat. Curioſ. Dec.* 3. *a.* 1. *o.* 91. we are told, that, after the fruitleſs and ineffectual Uſe of other Means, it happily cur'd a malignant epidemical Fever, which rag'd after a moderately warm and rainy Winter; for the Patients, after the Exhibition of it, were immediately freed from the Delirium, and convulſive Motions, with which the Diſorder was accompany'd. *Spleiſſius* informs us, that it produc'd a ſurpriſing Effect upon a Woman, who, in conſequence of an intemperate Method of Living, labour'd under Indigeſtion, Loathing of her Food, Reſtleſſneſs, and Loſs of Strength: At laſt,

laſt, being ſeiz'd with ſuch a violent fainting Fit, that her Caſe was judg'd deſperate, half a Dram of the Spirit of Hartſhorn was exhibited to her, without her perceiving it; immediately after which ſhe roſe up, vomited Worms, and was in a ſurpriſing manner ſnatch'd from the Jaws of Death. *Hoffman*, in his *Acta Laboratorii Altdorfenſis*, recommends its Uſe by way of Ointment in the Cure of malignant, phagedenic, and cancerous Ulcers. He alſo orders a Mixture of it with ſome proper Decoction, to be injected into Fiſtulas by means of a Syringe.

Sydenham recommends two, three, or four Drops of Spirit of Hartſhorn, in a Spoonful or two of black Cherry-water, or of ſome proper Julap, five or ſix times repeated, as an excellent Remedy againſt thoſe feveriſh Diſorders, to which Children are ſubject whilſt breeding their Teeth. But to Adults it may be given in the Quantity of fourſcore Drops or more, if exhibited with a View of anſwering any Intention.

I ſhall ſay no more of the Virtues attributed to the Salt and Spirit of Hartſhorn, which are by ſome celebrated with extravagant Encomiums, becauſe their genuine Efficacy is ſpecify'd in the preceding Quotation from *Boerhaave*. Mean time I am abundantly ſenſible, that great Numbers of tender People do themſelves infinite Prejudice by habituating themſelves to take large Quantities of Hartſhorn-drops, and thoſe frequently repeated, as this Cuſtom paves the Way to Drams, exceſſive Diſorders of the nervous Kind, and in the End Death. And it may be remark'd, that it is no new thing for a Medicine of great Importance, when duly apply'd, to become deleterious by an improper, or too frequent Uſe. But if the Salt or Spirit of Hartſhorn happens to be adulterated, which is generally the Caſe, the Conſequences of taking it may happen to be much worſe. *Quincy*, a pretty good Judge of Subjects relating to Pharmacy, obſerves, That theſe Preparations have hitherto ſtood in the Front of nervous Medicines; but the wicked Sophiſtications of our Chymiſts have debaſed them into diſregard, and almoſt expel'd them out of Practice. To give the Spirit an uncommon Pungency and Quickneſs of Smell, which is all they want to recommend it to Sale, a Way has been found to quicken it with Lime, and urinous Volatiles; and they have been ſo hardy herein as to own it, and give it a Place in their Catalogue, of *Spiritus Cornu Cervi cum Calce*, Spirit of Hartſhorn with Lime. And now the Fraud is ſo far improv'd, that they will make it without any Hartſhorn at all, but with Bittern, that is, the Brine which they get from the Salters, Urine, and Lime, which will raiſe a ſtrong-ſcented Spirit; and this theſe very honeſt Men give ſome Scent and Colour to, with a little of the fetid Oil of Hartſhorn, and put off for what is genuine; or without that Oil, for Spirit of Sal Ammoniac. So that from eight and ten Shillings *per* Pound, which the genuine Medicine deſerv'd, theſe Gentlemen, to oblige a good Cuſtomer, can afford it now for as many Pence. But a curious Perſon may pretty eaſily diſcover this Cheat, by the rancid urinous Smell of the ſophiſticated Sort, and its whitening the Inſide of a Glaſs in which it is long kept. The volatile Salt too, which is now ſold in the Shops for that of Hartſhorn, is a perfect Cheat, and more a Cauſtic than a Cordial, by the Quantity of Lime and urinous Salt that is thrown up with it; whereas that which is carefully to be collected in the Diſtillation of the Spirits, about the Top and Neck of the Receiver, is truly an animal volatile Salt, ſoften'd with ſuch a Portion of a highly ſubtiliz'd Oil, as renders it an admirable and agreeable Medicine; but this is never to be met with, or made uſe of, unleſs the Phyſician will be at the Trouble of attending the Laboratory, or find a Perſon honeſt enough to make it on Purpoſe for him: For one Dram of this genuine Salt may be ſtretched out into one Pound of that uſed in the Shops.

With reſpect to Salt of Hartſhorn, the Doſe is from three to twelve, fifteen, or twenty Grains. But there are greats Error committed in the common Practice in its Preſcription, by putting it either into Forms which it will deſtroy, or which will make it loſe its Volatility before it gets to the Patient. In Pills it will not lie, no more than any other Volatiles, but will rarefy them into ten times their proper Bulk. Boles likewiſe it will puff up in like manner, and ſoon make its Eſcape; and in Powder, wherein it is often order'd, in a very ſmall time it is not better than a Calx, or ſo much Powder of Lime. There is therefore no Form to preſerve its Virtues in, but by diſſolving it with ſome proper Vehicles into Draughts.

Liquor Cornu Cervi Succinatus.

For preparing this celebrated Medicine, equal Quantities of the volatile Salts of Hartſhorn, and of Amber, are to be diſſolved in rectified Spirit of Hartſhorn, till the Liquor is ſaturated; then they are to be digeſted in a cloſe-ſtopt Glaſs Phial, placed in a gentle Bath-heat, till they are intimately united; then they are to be diſtil'd from a Retort, with the Junctures carefully luted, and placed in a moderate Sand-heat; after which, Cohobation is to be frequently repeated. In the *Diſpenſatorium Brandenburgenſe* four Ounces of the Spirit of Hartſhorn are directed for one Ounce of the volatile Salts of Hartſhorn and Amber. Thus the volatile Salts aſcend with the Spirit, and conſtitute the *ſuccinated Liquor of Hartſhorn*.

The remaining Caput Mortuum, when calcin'd to Whiteneſs, is of a double Uſe; for, firſt, it powerfully abſorbs any Acids lodg'd in the Primæ Viæ, and by that means accidentally, or very remotely, promotes a Diaphoreſis. Secondly, it is ſomewhat aſtringent, and for that Reaſon may be commodiouſly exhibited in acute Diſorders, accompanied with a Flux.

This Liquor was firſt brought into Uſe by Dr. *Michaelis*, a celebrated Practitioner at *Leipſic*; and *Ettmuller* informs us, that by a thouſand Experiments, both on old and young, on Men and Women, it has eſtabliſh'd to itſelf a juſt Reputation, as an approv'd Medicine. The ſame Author highly recommends a Doſe of twenty or thirty Drops of it in curing Catarrhs by a Diaphoreſis; he alſo affirms, that it is an excellent Analeptic, eſpecially when exhibited to Children, in order to correct Acidities, and incide or attenuate viſcid Crudities. *Hoffman*, in his *Acta Laboratorii Altdorfenſis*, informs us, that it is highly beneficial in Epilepſies, Apoplexies, lethargic Diſorders, convulſive Aſthmas, and other ſpaſmodic Diſorders, eſpecially thoſe incident to Children. *Konigius* tells us, that *Ettmuller* found this Liquor highly beneficial in various Diſorders of the Lymph; and that he himſelf had found it ſo in Diſorders of the Head, eſpecially in thoſe Patients who are of a hot Conſtitution. To uſe the Words of the learned *Foginus*, in his Notes on the *Diſpenſatorium Brandenburgenſe*, "Various and "ſufficiently excellent Virtues are commonly aſcrib'd to this "Liquor, eſpecially in catarrhous Diſorders, and ſuch as draw "their Origin from a Redundance of Mucus or Serum, on ac"count of its remarkably reſolvent, diſcutient, and corrobo"rating Quality; nor, when exhibited with theſe Intentions, "is it a deſpicable Medicine, provided it is only adminiſter'd "prudently, and rather to thoſe of a phlegmatic, than of a "ſanguine Conſtitution. It is proper for alleviating ſpaſmodic "Pains, inciding and reſolving particular Congeſtions of Blood, "eſpecially thoſe of long ſtanding; for by a prudent Uſe of "it alone, we read, in the *Annales Phyſ. Med. Wratiſlav. An.* "1722. *M. Februar. Claſſ.* 4. *Artic.* 17. that a violent and "highly obſtinate Hemicrania was happily and effectually re"mov'd. But even in Caſes of this Kind it is to be cautiouſly "and ſparingly uſed, leſt Symptoms as bad, or perhaps worſe "than the original Diſorder, ſhould be brought on by its Uſe; "an Inſtance of which we find in the ſaid Annals, *Ann.* "1724. *M. Aug. Claſſ.* 2. produc'd by an unſeaſonable and "too large Doſe of this Medicine." With the preceding Caution, therefore, we aſſent to what *Schulzius*, in his *Prælectiones*, affirms concerning it; which is, that it is an excellent Diaphoretic, a powerful Diuretic, and at the ſame time a valuable Antiſpaſmodic, and well calculated for checking convulſive and epileptic Motions, eſpecially in Children. To Infants one or two Drops make a ſufficient Doſe. To Children, three, five, or ſix, may be exhibited; whereas Adults may bear twenty, twenty-five, or thirty. If with the Compilers of the *Auguſtan Diſpenſatory*, for compoſing the ſuccinated Liquor of Hartſhorn, we diſſolve one Part of the ſuccinated Salt of Hartſhorn in three Parts of black Cherry-water, we obtain a Medicine of the ſame Virtues, which may be exhibited in a larger Doſe, becauſe it is more diluted and weak; for if we inquire into the Compoſition of this Remedy, 'tis obvious that it conſiſts of volatile Salts of two Kinds united together; the alcaline Salt, for Inſtance, of the Hartſhorn, and the acid Salt of the Amber. Hence *Konigius* concludes, that the ſuccinated Liquor of Hartſhorn is only of an ammoniacal Nature; for Sal Ammoniac is compoſed of a volatile alcaline Salt, and the acid Part of common Salt; and becauſe, according to him, Amber is the Produce of the Sea, he concludes that a Liquor of this Kind may be prepared in an extemporaneous Manner, by mixing the volatile Spirit of Hartſhorn well dephlegmated, that it may not again ſtand in need of being quicken'd with the volatile Salt of Hartſhorn, with the Spirit of common Salt: Hence an Effervеſcence being produc'd, a Liquor analogous to the Nature of an ammoniacal Salt is obtain'd. This Liquor is of ſingular Efficacy not only in the Diſorders of Children, but alſo in nephritic Pains. Beſides, if Spirit of Hartſhorn, or its volatile Salt, is mixed with Spirit of Nitre, and an Addition made of the *Eſſentia Theriacalis*, or the *Spiritus Bezoardicus*, a Medicine is obtain'd, which is of ſingular Efficacy in acute Diſorders, and internal Inflammations. But this Author's Aſſertions muſt be confirm'd by the Experience of others, before we give our Aſſent to his Opinion. Beſides, it may be juſtly doubted, whether Amber is produc'd by the Sea-ſalt.

CESTREUS, κεστρεύς. The Mullet.

CESTRITES *Vinum*, κεστρίτης οἶνος. Wine impregnated with Betony. *Dioſcorides*, *L.* 5. *C.* 54. gives the Method of preparing it. The Virtues may be known from thoſe of Betony.

CESTRUM, κέστρον. Betony.

CETACEUS. Cetaceous. Thoſe ſort of Fiſh are call'd by this Appellation, which are very large, and which bring forth a perfect Animal, inſtead of Spawn. Or the cetaceous Fiſhes are thoſe, which, like viviparous Animals, reſpire by means of Lungs, generate, conceive, bring forth young, and nouriſh them with Milk.

CETE, or CETUS. The Parmaſitty Whale. See BALÆNA.

CETERACH. See ASPLENIUM.

CEVADILLA, Offic. Monard. 343. *Cevadilla Hiſpanorum*, Ind. Medic. 33. *Cevadilla ſive Hordeolum cauſticum Americanum*, Park. Theat. 1625. *Hordeum cauſticum*, C. B. Pin. 23. Theat. 467. Raii Hiſt. 2. 1246. *Ytzcuimpatli, ſeu Canis interfector vel Hordeolum*, Hernand. 307. INDIAN CAUSTIC BARLEY. *Dale.*

Ray informs us from *Monardes*, that the Seeds of this Plant are ſo extremely burning and cauſtic, that they may be uſed in Gangrenes and putrid Ulcers, inſtead of the actual Cautery or Sublimate. The Seed powder'd and ſprinkled in Ulcers kills Worms, which ſometimes breed therein, and cleanſes them.

Dale ſays it is the ſeminal Capſula which is uſed. It is brought from *Mexico*.

CEVILLUS, or *Ludus*, *Paracelſi*. This is a Stone mention'd by *Paracelſus*, and *Helmont*. See LUDUS.

CHAA. The Plant of which Tea is the Leaves.

CHACEF. An Earthen Pot. *Rulandus*.

CHÆROPHYLLUM.

The Characters are, in every reſpect, the ſame as thoſe of the Myrrhis, except that the Seeds are not ſtriated.

Boerhaave mentions four Species of this Plant.

1. *Chærophyllum ſativum*, C. B. Pin. 152. Raii Hiſt. 1. 430. Tourn. Inſt. 314. Elem. Bot. 264. Boerh. Ind. A. 70. Buxb. 63. *Chærophyllon*, J. B. 3. 75. Chab. 393. *Cerefolium vulgare*, Park. Parad. 494. Ger. 882. *Cerefolium vulgare ſativum*, Ger. Emac. 1338. *Cerefolium ſativum*, Mor. Umb. 46. Hiſt. Oxon. 3. 303. *Cerefolium officinarum ſive Chærophyllon, Tourneforti*, Rupp. Flor. Jen. 228. CHERVIL.

F. Hoffman affirms, that Chervil is good for reſolving coagulated Blood; and that it is uſed in Broths with good Effect, as a Promoter of Expectoration in an Aſthma; that it is vulnerary, reſolvent, diuretic, and emmenagogue.

This is a ſmall, low, umbelliferous Plant, with winged Leaves, ſmaller and finer than Parſley; its ſlender chanel'd Stalks riſe not much above a Foot high, beſet with the like Leaves, but ſmaller, and bearing at their Tops ſmall Umbels of five-leav'd little white Flowers, whoſe Petala are cut in two, and ſucceeded by long, ſmooth, round Seed, thicker at the Bottom, and ſharper pointed at the Top. The Root is ſmall, periſhing yearly. It is ſown in Gardens.

Chervil is much of the Nature of Parſley, being aperitive and attenuating, good for the Stone and Gravel, and to provoke Urine and the Menſes. It is more uſed as a Sallad-herb, than for any phyſical Uſe. *Miller's Bot. Off.*

2. Chærophyllum ſylveſtre perenne, Cicutæ folio, *Tourn. Inſt.* 314. *Elem. Bot.* 264. *Boerh. Ind. A.* 70. *Cicutaria vulgaris*, Offic. J. B. 3. 71. Chab. 404. Raii Hiſt. 1. 429. Synop. 3. 207. *Cicutaria alba*, Merc. Bot. 1. 29. Phyt. Brit. 28. Mer. Pin. 26. *Cicutaria alba Lugdunenſis*, Ger. Emac. 1038. *Cerefolium ſylveſtre*, Diſſ. Cat. Giſſ. 51. Rupp. Flor. Jen. 228. Rivin. Irr. Pent. *Cerefolium ſylveſtre perenne ſeminibus lævibus nigris*, Mor. Umb. 46. Hiſt. Oxon. 3. 303. *Chærophyllum ſylveſtre*, Buxb. 64. *Myrrhis ſylveſtris*, Park. Theat. 935. *Myrrhis ſylveſtris ſeminibus lævibus*, C. B. Pin. 160. WILD CICELY COW-WEED.

Tragus, being perſuaded it was the Myrrhis of *Dioſcorides*, adviſes the Uſe of it for the Suppreſſion of the Terms; but *J. Bauhine* relates a melancholy Story of two Families, that had eaten the Roots of this Plant inſtead of thoſe of Parſnips. *Martyn's Tournefort.*

The Roots of this Plant are poiſonous, cauſing Difficulty of Breathing, Torpors, and Madneſs. This is, perhaps, the Root, which is often in *England* miſtaken for Parſnips, and are uſually call'd by the Country People Madnips.

3. Chærophyllum; paluſtre; latifolium; flore albo. *Myrrhis, paluſtris, latifolia alba. T.* 315.

4. Chærophullum; paluſtre; latifolium; flore albo. *Myrrhus, paluſtris, latifolia, rubra. T.* 315. *Boerhaave's Index alter Plantarum.*

CHAFAR *Alpini*. A ſort of *Egyptian* Melon.

CHAITA, χαῖτα. The Mane of a Quadruped properly, but uſed to expreſs the Hair of the Occiput by *Ruffus Epheſius*.

CHALASIS, χάλασις, from χαλάω, to relax. Relaxation.

CHALASTICOS, χαλαστικός. Relaxing. Thus *Chalaſtica Medicamenta*, are Medicines which relax Parts which are too tenſe. They differ but little from Emollients.

CHALAZA, χάλαζα, Chalazion, χαλάζιον, ſignify properly a Hail-ſtone. But they import alſo a Diſeaſe to which Swine are very ſubject, in which the Fleſh is found full of ſmall Tubercles like Hail-ſtones. *Chalaza* alſo is the Name given by Naturaliſts to a white knotty kind of String at each End of an Egg, formed of a Plexus of the Fibres of the Membranes, whereby the Yolk and White are connected together.

But the moſt common Diſorder call'd by this Name is one of the Eyelids, which conſiſts in a Tubercle like a Hail-ſtone. The Eyelids are ſubject to ſeveral Sorts of Tubercles, much of the ſame Nature, but diſtinguiſh'd by their Similitude to particular Things. Thus that which is like a Grain of Barley is call'd *Crithe*; and that which is hard like a Stone, is call'd *Lithiaſis*.

The Crithe or Barley-corn is a Tumor of various Sizes; it grows in different Parts of the Eyelids; 'tis commonly call'd a Stye. When it is ſmall, it comes only on the Edge of the Eyelids, or very near it, between the Cilia; but when it is larger, it ſpreads towards the Middle of the Lid. In their Beginning an Inflammation commonly accompanies theſe Tumors: When they do not ſuppurate, their Matter is concreted, and they become Wens, which are ſometimes ſoft, and ſometimes very hard. Though they are not very troubleſome, eſpecially when they are without Pain; yet there is no one who would not wiſh to be rid of them. This Diſeaſe is ſubject to Variations; for ſometimes it diſappears awhile, and afterwards it returns in a few Days. The Cure of this Diſeaſe is ſuited to the different Circumſtances which attend it. If there is an Inflammation, the Pap of a roaſted Apple, laid in the Form of a Plaiſter, or Poultice, ſoon diſperſes it, and ſometimes only abates the Tumor. If it hardens, and becomes concreted, apply the *Emplaſtrum Diabotanum*, or that of the *Abbot de Grace*. See EMPLASTRUM.

If it does not diſperſe by theſe means, it muſt be opened with the Point of a Lancet. Seldom any Matter is found in it; for often it is only a kind of hard Fleſh, which muſt be conſumed by a liquid Cauſtic; afterwards let the Plaiſter of the *Abbot de Grace* be laid on, and let the concreted Fleſh be touch'd ſeveral times with the liquid Cauſtic, till it be entirely waſted. Great Care muſt be had not to put too much Cauſtic at a time, leſt the Eyelid ſhould be pierced, and the ſound Part beyond the Tumor be conſumed.

If the Crithe comes on the lower Eyelid, it is generally more on the Inſide than on the Outſide; it is eaſily ſeen, if the Eyelid be turned down. It is cured by conſuming it with the Lapis Infernalis, provided the following Method of removing it be not preferable.

The Eyelid being turned down, paſs a crooked Needle, threaded with Silk, through the Tumor; when the Needle is through, let the Operator take in one Hand the two Ends of the Silk to raiſe the Tumor, whilſt, having a Lancet in his other Hand, he makes an Inciſion with it in the Membrane which covers the Tumor towards the Edge of the Eyelid; then let him lay by his Lancet, take a Pair of ſtrait Sciſſars, and, introducing one Side of them into the Orifice, let him, with the other Side, which muſt be directed on the Side of the Globe of the Eye, cut the Tumor, as near its Baſe as he can. The Wound is, for the moſt part, healed in eight Days with a Collyrium made of Water ten Parts, to one Part of Spirit of Wine. There are likewiſe other little Tumors, which come on the Edges of the Eyelids, and by reaſon of their Whiteneſs and Hardneſs are called *Chalazæ*. Their Size is not always the ſame; if they are large, they may be ſeparated from the Eyelid by a Lancet, with which an Inciſion is to be made in the Skin which covers them; then, with a ſmall Scoop, the Body of the Tumor is to be drawn out. Both theſe Sorts of Tumors will come out equally, if, inſtead of an Inciſion, the Skin which covers them is touched once or twice by the Lapis Infernalis, which will conſume it.

Beſides theſe, there is another ſort of Tumor which grows on the Eyelids, called Lithiaſis or Gravel-ſtone; they are generated by a concreted Humour, which changes, as it were, to little Pebbles, or Grains of Sand. They are cured in the ſame manner as the foregoing Tumors. *Saint Yves.*

CHALBANE, χαλβάνη. Galbanum.

CHALCANTHUM. Vitriol. See VITRIOLUM.

CHALCEDONIUS, Offic. De Laet. 76. Geſn. de Lap. 79. *Chalcedonius*, Boet. 238. *Chalcedonius, alias Carchedonias*, Charlt. Foſſ. 34. *Chalcedonius, ſeu Carcedonius*, Worm. 98. THE CHALCEDONY, a ſort of precious Stone.

As to its medicinal Uſes, it is, by ſome, thought ſerviceable againſt all Diſorders ariſing from black Bile, ſuch as Sadneſs, Melancholy, and the unaccountable Dread of Demons and Spirits. Thoſe brought from the *Eaſt Indies*, which are moderately pellucid, and variegated with whitiſh milky Streaks, if hung about the Breaſt, are ſaid to generate abundance of Milk. Some Authors alſo are ſo ridiculouſly ſuperſtitious and whimſical, as to promiſe Victory to the happy Combatant who wears the Chalcedony-ſtone about him. Its true and genuine medicinal Virtues ſeem to conſiſt in its abſorbent Quality, when it is reduc'd to a fine Powder, and exhibited like the other earthy and abſorbent Powders. But becauſe the Apothecaries have other

Subſtances

Subſtances of the ſame Virtues, and, at the ſame time, far more eaſily prepar'd, it is rarely preſcrib'd by the Moderns.

Chalcedonius is alſo the Name of a Medicine deſcrib'd by *Galen*, and directed by him to be infus'd into the Ears, in inveterate Diſorders of that Part. *Galen. de Comp. Pharm. Secundum Locos, Lib. 3. Cap. 1.*

CHALCEION, χαλκεῖον. This, according to *Boerhaave*, is the *Pimpinella*; *Spinoſa*; *ſeu Sempervirens.*

CHALCIDICA *Lacerta.* A ſort of Serpent, ſo call'd from its Reſemblance in Colour to the Chalcedony. Its Bite is ſucceeded by a pellucid Tumor, which has a kind of ſhining Blackneſs at the Margin. Drank in Wine, it cures its own Bite, according to *Paulus Ægineta, Lib.* 7. It is alſo call'd *Seps.*

CHALCITIS, Offic. Matth. 1365. Worm. 26. Aldrov. Muſ. Metall. 340. Charlt. Foſſ. 11. Kentm. 15.

As the *Miſy*, *Sory*, *Chalcites*, and *Melanteria*, are generally found in the ſame Mines, Authors uſually treat of them together, whoſe Examples I ſhall follow.

The χαλκῖτις of the *Greeks* takes its Name from χαλκὸς, Braſs, and is commonly deſcrib'd to be a metalline Recrement, of the Colour of Braſs, diverſify'd with oblong ſhining Veins, and produc'd in the ſame Ores which give Birth to the *Sory* and the *Miſy*. Betwixt theſe two Subſtances it holds a middle Rank, not only with reſpect to its Bed, but alſo with reſpect to its Conſiſtence; for, according to ſome, the Sory is thinner, and the Miſy thicker; and, according to others, the Sory is thicker, and the Miſy thinner, than the *Chalcitis*. According to *Galen*, the undermoſt Bed is of a Texture ſtony, and conſiſts of Sory: Over this lies the ſecond Bed, which is Chalcitis, and reſembles an Efflorеſcence; and the uppermoſt Bed is that of the Miſy, which reſembles Verdegriſe; but, in Proceſs of Time, the Chalcitis is converted into Miſy, and the Sory into Chalcitis. According to *Pliny*, "That Stone is call'd Chal-" citis, from which the Braſs itſelf is obtain'd. It differs from " the Cadmia in this, that the former is cut from Rocks above " the Ground, whereas the latter is only obtain'd from ſuch as " lie conceal'd under it. The Chalcitis alſo becomes immedi-" ately friable, and aſſumes a ſoft Texture, in Appearance like " that of concreted Down. There is alſo another Diſtinction " between the Cadmia and the Chalcitis, which is, that the " latter contains three kinds of Subſtances, Braſs, Miſy, and " Sory; for it has oblong Veins of Braſs. That is thought " beſt, whoſe Colour reſembles that of Honey, has ſlender " Veins, is friable, and not of a ſtony Nature. That which " is recent is alſo accounted beſt, becauſe, when old, it be-" comes Sory." According to *Dioſcorides, Lib.* 5. *Cap.* 115. " that Species of the Chalcitis is beſt which reſembles Braſs, " is friable, not ſtony, recent, and variegated with oblong and " ſhining Veins. This Subſtance is of an abſterſive heating " Nature, and cicatrizes Ulcers. It removes the tough and " viſcid Matter which ſticks in the Eyes, and their Corners. " In a Word, it is among the Number of the gently corroding " Medicines. It is an effectual Medicine againſt an Eryſipelas " and Herpes. In Conjunction with the Juice of Leeks, it ſtops " Hæmorrhages from the Womb and Noſtrils. The Powder " of it cures Diſorders of the Gums, ſpreading Ulcers, and " Tumors of the Tonſils. When calcin'd, and triturated " with Honey, it proves an excellent Medicine for Diſorders " of the Eyes. It removes and deſtroys Calloſities and Rough-" neſs of the Eyelids. It cures Fiſtulas of the Eyes, when " put into them by way of Collyrium. Of the Chalcitis is " prepared a Medicine diſtinguiſh'd by the Epithet *Pſoricon.* " For this Purpoſe we muſt take two Parts of the Chalcitis, " one of the Cadmia, and triturate the Whole in Vinegar. " But this Medicine muſt be bury'd in Dung, in an earthen " Veſſel, for forty Days, during the Appearance of the Dog-" ſtar, that it may become more acrid, which the Chalcitis " itſelf alſo does by the ſame Method. Others prepare the " ſame Medicine, by triturating equal Portions of theſe two " Subſtances in Wine. The Chalcitis is to be calcin'd in a new " earthen Veſſel, plac'd over live Coals. It is cuſtomary to " calcine the moiſter Kinds of the Chalcitis till it does not riſe " in Bubbles, and is become perfectly dry; but the other Kinds " may be taken off the Fire when they have aſſum'd a florid " Colour, reſembling that of Blood or Minium. The Sordes " appearing on the Surface muſt be blown off; or it may be " calcin'd upon Coals, blowing them all the time, till it aſ-" ſumes a paliſh Colour; or, putting live Coals under the " Veſſel, it is to be ſtir'd about till it flames, and changes its " Colour." 'Tis obvious, that the Antients reckon'd the Chalcitis among the abſtergent, drying, acrid, cauſtic, or eſcharotic Medicines. The Variety of Compoſitions, in which, according to *Scribonius Largus*, they us'd this Ingredient, is a ſufficient Proof of this. That it was apply'd to the ſame Purpoſes by their Farriers, we may find in the twenty-ſixth Chapter of the ſecond Book of *Vegetius*. *Foreſtus*, in his *Obſervat. Chirurg. Lib.* 7. *Obſ.* 12. *Schol.* recommends the calcin'd Chalcitis for drying Ulcers. At preſent torreſy'd Chalcitis is an Ingredient in the *Theriaca Andromachi*, and in the *Emplaſtrum Diachalciteos Galeni*, which is alſo call'd Diapalma. But, becauſe the Chalcitis is not generally known, the Moderns, for the moſt part, uſe white Vitriol, either calcin'd or crude, or the Vitriolum Martis, in its ſtead; which laſt *Schulzius*, in his *Blancardi Lexicon renovatum*, prefers for making the Theriaca. Whether the Chalcitis is a proper Ingredient in the Theriaca, is much diſputed; but, in my Opinion, it is not neceſſary in that Compoſition, as will appear from conſidering what kind of Subſtance it properly is. *Matthiolus ad Dioſcor. Lib.* 2. *Cap.* 78. ſeems to have been the firſt who hinted at its true Origin, in the following Words: "It is obvious," ſays he, "to every one, " from common Experience, that all Vitriol of every Kind, in " Proceſs of Time, degenerates into Chalcitis:" For it is a Species of metallic Recrement, call'd *Atramentum Rubeum*, generated of the Pyrites ſoften'd in Water, which has Iron, either pure, or mix'd with Braſs, aſſociated with it, and which is continually more and more diſſolv'd and divided till it appears friable. This Recrement conſiſts of moiſt and aqueous Particles leſs temperate, and with a ſmaller Portion of Sulphur, or ſulphureous Acid, than Vitriol. In Conſiſtence and Colour it differs from Sory and Miſy, is of an acrid, acid, and aſtringent Taſte, of a penetrating nauſeous Smell, and diffuſes an ungrateful Odour. From it are often obtain'd, in the Smelting-houſes, Braſs, Cadmia, Pompholyx, Spodium, and Diphryges. That Species of Chalcitis is by ſome eſteem'd the moſt genuine, which conſiſts of beautiful purple-colour'd Pieces: But for Uſe 'tis no Matter of what Colour it is; for what is imported into *France* for Sale from *St. Chriſtophers*, is, according to *Pomet*, of a greeniſh Colour, like that of imperfectly calcin'd Vitriol. According to the learned *Henckelius*, we ought rather to inquire after the Elixiviation of the Vitriol, of what Nature it is, whether it partakes of Iron or Copper, that we may be the better able to judge for what medicinal Purpoſes it is moſt proper. Hence 'tis obvious, that they are in the right who call Chalcitis the Colcothar, or Caput Mortuum of Vitriol; as alſo thoſe who claſs it among the vitriolic Minerals, or crude and impure Vitriols. Hence the Reaſon is alſo obvious, why it is by ſome accounted a Species of Vitriol, and why *Boerhaave* calls it Vitriolum Rubrum, becauſe, for Inſtance, it is a Compoſition of the Acid of Sulphur and Iron, in which there is, perhaps, a ſmall Admixture of Braſs. But it is more properly call'd the Colcothar of Vitriol than entire and perfect Vitriol, becauſe it wants a cryſtalline Form.

The Miſy is thus diſtinguiſh'd:

Μίσυ Dioſcoridis. *Miſy*, Offic. Matth. 1365. Worm. 26. Aldrov. Muſ. Metall. 341. Charlt. Foſſ. 11. Kentm. 15. *Dale.*

The choiceſt *Miſy* comes from *Cyprus*, reſembles Gold, is of a hard Subſtance, and, when broken, glitters like Gold, and ſhines with a Star-like Splendour.

It is calcin'd in the ſame Manner, and has the ſame Virtues, as Chalcitis, only Miſy produces no Pſoricon: As to their Qualities, Miſy and Chalcitis differ only with reſpect to Intenſeneſs and Remiſneſs. The *Egyptian* Miſy is prefer'd for its Strength, but is far inferior to the *Cyprian* in its ophthalmic Virtues. *Dioſcorides, Lib.* 5. *Cap.* 117.

Geoffroy ſays it ſeems to be nothing but an Efflorеſcence of Chalcitis.

The Sory is thus diſtinguiſh'd:

Σῶρυ Dioſcoridis. *Sory*, Offic. Matth. 1365. Worm. 26. Aldrov. Muſ. Metall. 341. Charlt. Foſſ. 11. Kentm. f. 15. *Dale.*

Some have miſtaken *Sory* for Melanteria; but they are of different Kinds, tho' not much unlike: But *Sory* is the ſtronger-ſcented, and creates a Nauſea. It is produc'd in *Egypt*, and ſome other Countries, as *Africa*, *Spain*, and *Cyprus*; but the *Sory* which bears the higheſt Price is what comes from *Egypt*, and, when broken, appears of a blacker Colour, is full of Perforations, of a fattiſh Subſtance, aſtringent, of a ſtrong Smell and Taſte, and ſubverts the Stomach. That *Sory* which does not ſparkle like Miſy when it is broken in Pieces, is reckon'd of another Kind, and of little Virtue.

It is calcin'd, and has the ſame Virtues, as the Miſy and Chalcitis. Put into a hollow Tooth, it eaſes the Pain thereof; it alſo faſtens looſe Teeth. Infuſed in Wine, it helps the Sciatica; and clears the Skin of Pimples, if rub'd thereon with Water. It is an Ingredient alſo in Medicines which make the Hair black. Generally ſpeaking, this and almoſt all other Drugs are ſtronger before they are calcin'd than afterwards, except Salt, Lees of Wine, Nitre, Quick-lime, and the like, which are of little Efficacy when crude, but have their Virtues much improv'd by Calcination. *Dioſcorides, Lib.* 5. *Cap.* 119.

Geoffroy ſays the *Sory* of the *Greeks* is a foſſil Subſtance, thicker and more compact than *Chalcitis*, which emits Sparks by Attrition, and is of a ſpongy Texture, full of Holes, of a viſcid Texture, black Colour, aſtringent, nauſeous Taſte, and of a ſtrong hurtful Smell. This Deſcription agrees very well with a Subſtance which the *Turkiſh* Women make uſe of to take off Hairs from their Bodies, call'd by them *Ruſma*, which is deſcrib'd by *Bellonius* to be a Foſſil, almoſt like Excrement in Appearance,

Appearance, but lighter, and of a black burnt Colour like Pitch, found in ſome Mines in *Gallo-Græcia*. The Way of uſing it is this:

They reduce it to a fine Powder, and, mixing with it an equal Quantity of Quick-lime, they macerate it in Water, in an earthen Veſſel. When the Women are to go into the Bath, they lay it on ſuch Parts as they want to have ſmooth, and let it remain for about as long as is requir'd to boil an Egg. Then, finding by the Touch, that the Hairs are looſen'd, and ready to fall off, they waſh the Part with warm Water, and the Paſte and Hairs come off together. Our Barbers uſe Orpiment and Quick-lime for the ſame Purpoſe. *Geoffroy.*

The Melanteria is thus diſtinguiſh'd:

Μελαντηρία Dioſcoridis, *Melanteria*, Offic. Matth. 1365. Worm. 26. Aldrov. Muſ. Metall. 341. Charlt. Foſſ. 11. *Melanteria*, *Atramentum nigrum*, Offic. Schw. 385. *Atramentum nigrum*, *ſeu ſutorium*, *Græcis Melanteria*, Kentm. fol. 14. *Dale.*

Melanteria is ſometimes found in the Entrance of Copper-mines, where it concretes like Salt. Another Sort, which has an earthy Quality, is gathered from the uppermoſt Surface of theſe Mines. There is alſo a foſſile Kind found in *Cilicia*, and in ſome other Countries.

The beſt *Melanteria* is of the Colour of Sulphur, ſmooth, equable, pure, and which, touch'd with Water, immediately turns black. It has the ſame cauſtic Quality as Miſy. *Dioſcorides*, *Lib.* 5. *Cap.* 118.

All theſe foſſile Subſtances are now rarely found in Apothecaries Shops, being to be had no-where elſe than in *Cyprus*, *Aſia Minor*, or *Egypt*. They are cauſtic, and burn to an Eſchar, and are, in ſome degree, aſtringent. *Chalcitis* was us'd in the Theriaca in *Andromachus*'s Time; but, as it can ſeldom now be had, Colcothar, or Vitriol calcin'd to a Redneſs, is ſubſtituted for it. *Geoffroy.*

CHALCOS, χαλκὸς. Braſs. See Æs.

CHALCUS, χαλκοῦς. A Weight of about two Grains, the ſame as ÆREOLUM.

CHALCUTE. Burnt Braſs. *Rulandus.*

CHALEPOS, χαλεπὸς. Difficult, dangerous.

CHALICRATON. A Mixture of Wine and Water, ſo call'd from χαλὶς, an old Word which imports pure Wine, and κεράννυμι, to mix.

CHALINOS, χαλινὸς. That Part of a Bridle which is put into the Mouth of a Horſe; but it is us'd to expreſs that Part of the Cheeks, which on each Side is contiguous to the Angles of the Mouth.

CHALYBS. Properly Steel, but us'd in Medicine to ſignify Iron; for Steel, that is, Iron harden'd, is not ſo proper for medicinal Uſes as Iron itſelf. *Sydenham* even ſays, he was inform'd, that the Ore of Iron, as taken out of the Mine, was more effectual in the Cure of Diſtempers than Iron itſelf, which I have ſome Reaſon to believe to be true. Steel, then, properly ſo call'd, is of no farther Uſe in Medicine, than as it affords Chirurgical Inſtruments.

CHAMA, Offic. Charlt. Exer. 65. Bellon. de Aquat. 403. *Ab altero tantum latere ferè naturaliter hiantibus*, Liſt. Hiſt. Conch. 3. n. 258. *Chama*, *alio nomine Glycymerides magna*, *hoc eſt*, *Chama magna dulcis*, Bonan. 106. n. 59. *Chama Glycymeris*, Aldrov. de Exang. 473. Rondel. 2. 13. Jonſ. Exang. Tab. 14. Geſn. de Aquat. 71. BASTARD-COCKLE.

It is found in the *Mediterranean* Sea. *Dioſcorides* ſays, that the Broth of this and other ſuch Shell-fiſh, made by boiling them in Water, is laxative, and keeps the Belly open: He adds, that it is uſually taken with Wine.

CHAMÆACTE, from χαμαὶ, upon the Ground, and ἀκτὴ, the Elder, Dwarf-elder, or Danewort. See SAMBUCUS.

CHAMÆBALANUS *Leguminoſa* is the *Lathyrus*; *arvenſis*; *repens*; *tuberoſus*. See LATHYRUS.

CHAMÆBATOS. The Dewberry. The ſame as the *Rubus*; *repens*; *fructu cæſio*. See RUBUS.

CHAMÆBUXUS. A Name for the *Polygala*; *fruteſcens*; *folio Buxi*; *flore maximo*. See POLYGALA.

CHAMÆCEDRYS. The *Abrotanum Fœmina*. *Blancard.*

CHAMÆCERASUS. *Upright Honeyſuckle.*

The Characters are;

The Calyx is thin, long, and narrow; conſiſts of two Leaves, in the Middle of which is the Ovary. The Flower is monopetalous, tubulous in the lower Part, and bilabiated at the upper; its upper Lip multifid, the lower like a ſimple Tongue; It is ſeated on the Ovary; ſometimes two belonging to one Ovary; and is furniſh'd with five Stamina. The Ovary is ſometimes double on one Pedicle, ſhooting forth a long Tube between every Floſcule; and at laſt forms ſoft Berries, full of flattiſh and roundiſh Seeds. *Boerhaave Index alter.*

Boerhaave mentions three Species of this Tree.

1. Chamæceraſus; Alpina; fructu gemino, rubro, duobus punctis notato. *C. B. P.* 451. THE GREATER UPRIGHT RED-BERRY'D HONEYSUCKLE.

2. Chamæceraſus; montana; fructu ſingulari, cæruleo. *C. B. P.* 451. THE UPRIGHT BLUE-BERRY'D HONEYSUCKLE.

3. Chamæceraſus; dumetorum; fructu gemino, rubro, *C. B. P.* 451. THE UPRIGHT RED-BERRY'D, OR FLY HONEYSUCKLE. *Boerhaave's Index alter Plantarum*, *Vol.* 2.

They are all topiarian Plants, and not of any Uſe in Medicine, that I know of.

CHEMÆCISSUS. Ground-ivy. See CHAMÆCLEMA.

CHAMÆCISTUS. Several Species of the *Helianthemum* are call'd by this Name. See HELIANTHEMUM.

CHAMÆCLEMA.

The Characters are;

The Root is very creeping, and the Stalks run into leſſer Shoots; the Leaves are thick, furrow'd, roundiſh, and crenated; the Galea erect, roundiſh, bifid; the Beard trifid. The Flowers grow on branched Pedicles, on both Sides of the Joints of the Stalks. *Boerhaave Index alter.*

Boerhaave takes notice of four Plants under this Name.

1. *Chamæclema*; *vulgaris*. Boerh. Ind. A. 172. *Hedera terreſtris*, *Chamæciſſus*, Offic. Merc. Bot. 1. 41. Phyt. Brit. 57. *Hedera terreſtris*, Ger. 705. Emac. 856. Raii Hiſt. 1. 567. Mer. Pin. 60. *Hedera terreſtris vulgaris*, C. B. Pin. 306. Park. Theat. 676. Hiſt. Oxon. 3. 409. *Chamæciſſus*, *ſive Hedera terreſtris*, J. B. 3. 855. Chab. 649. Buxb. 64. *Chamæciſſus*, Rivin. Rupp. Flor. Jen. 188. *Calamintha humilior folio rotundiori*, Tourn. Inſt. 194. Elem. Bot. 163. Dill. Cat. Giſſ. 45. Raii Synop. 3. 243. GROUND-IVY.

Ground-ivy has a great many ſmall creeping ſtringy Roots, from which ſpring ſquare weak Stalks, which, from their lower Parts, take Root again by ſmall Fibres. The Leaves grow in Pairs oppoſite to one another, being, as well as the Stalks, ſomewhat rough and hairy; they are roundiſh, hollow'd in next the Stalk, and indented about the Edges. The Flowers grow three or four together among the Leaves, labiated and galeated, the Galea cut in two, and the Lip into four Parts: They are of a bluiſh Colour, longiſh and hollow, ſet in a ſhort Calyx, which includes four ſmall long Seeds. It grows every-where in the Hedges and ſhady Places, and flowers in *April*. The whole Herb is us'd.

It is accounted a very good pectoral Herb, being much uſed for Coughs, Shortneſs of Breath, and other Diſorders of the Lungs; for which, a Tea made of the Leaves, and a Syrup of the Juice, is very beneficial. It is frequently put into Ale, which it refines and clarifies; and great Quantities of it are drank in Town, under the Name of Gill-ale, being reckon'd antiſcorbutic and aperitive, and good to provoke Urine, and cleanſe the Ureters. Some Authors commend it, ſteep'd in Brandy, as of great Service againſt the Colic.

The only officinal Preparation is a Syrup of the Juice, which is left out of the laſt Diſpenſatory. It is made by boiling up the depurated Juice with Sugar. This *Boerhaave* recommends much in the Chin-cough, Spitting of Blood, and againſt making bloody Urine. *Miller's Bot. Off.*

Pitcairn ſays, that Ground-ivy excels all Vegetables as a Remedy for a Conſumption.

The Leaves of *Ground-ivy* are bitter, a little aromatic, and give hardly any Tincture of Red to blue Paper; ſo that it is probable its Salts may, in ſome meaſure, reſemble vitriolated Tartar. This Salt is mix'd with a very little Sal Ammoniac, but with a great deal of Sulphur and Earth. It yields no concreted volatile Salt by Chymical Analyſis, but a little urinous Spirit: All the reſt which is obtain'd from it is Acid, Alcaline, Oil, and Earth; and theſe two laſt Parts are found in it in great Quantity.

Ground-ivy is very aperitive, deterſive, and vulnerary. *Camerarius* and *Cæſalpinus* commend it very much for provoking Urine, and expelling the Stone. *Simon Paulli* gave its Powder to drink, mixed with an equal Quantity of Sugar, and ſteeped in the diſtil'd Water of the ſame Plant. It conſolidates Ulcers alſo. It is given in Broths and Decoctions to thoſe that are phthiſical, or make purulent Urine. *Lobel* made uſe of it to prevent the Gout, and open the Bowels. An Extract, a Conſerve, and a Syrup, are prepared, by ſome, of the Leaves and Flowers of this Plant. *Martyn's Tournefort.*

2. Chamæclema; minus. LESSER GROUND-IVY.

3. Chamæclema; minus; flore purpureo.

4. Chamæclema; minus; folio variegato, aureo.

CHAMÆCRISTA. A Name given to two æſchynomenous Plants taken notice of by *Ray* from BREYNEUS. The firſt is a Native of *Braſil*, and is called *Chamæcriſta Pavonis Braſiliana*, *ſiliqua ſingulari*. The ſecond grows in *Curacao*, and is call'd *Chamæcriſta Pavonis Americana ſiliqua multiplici*. I find no medicinal Virtues attributed to either of them.

CHAMÆCYPARISSUS. A Name for the *Abrotanum Fœmina*, Lavender Cotton. See ABROTANUM.

CHAMÆDAPHNE. A Name for the *Laureola*. According to *Boerhaave*, *Chamædaphne* is the *Laurus Alexandrina*, which he makes a Species of *Ruscus*.

CHAMÆDROPS, in *Paulus Ægineta* and *Oribasius*, is the ſame as CHAMÆDRYS, which ſee.

CHAMÆDRYITES, χαμαιδρυίτης οἶνος. Wine which has had Germander (*Chamædrys*) infus'd in it. *Dioſcorides*, *Lib.* 5. *Cap.* 51.

CHAMÆDRYS.

The Characters are;

It has an herbaceous Appearance; the Leaves reſemble thoſe of Oak, and are ſmall and thick; the Calyx is tubulated; the Flower is like that of the TEUCRIUM.

Boerhaave takes notice of ſeven Sorts of the Chamædrys.

1. Chamædrys; major; repens. *C. B. P.* 248. *Dod. p.* 43. *M. H.* 3. 422. THE GREATER CREEPING GERMANDER.

2. Chamædrys; minor, repens, *C. B. P.* 148. *Hiſt. Oxon.* 3. 422. *Tourn. Inſt.* 205. *Boerh. Ind. A.* 182. *Chamædrys*, *Triſſago*, Offic. *Chamædrys*, Chab. 427. *Chamædrys vulgaris*, Park. Theat. 104. Raii Hiſt. 1. 527. *Chamædrys minor*, Ger. 530. Emac. 656. *Chamædrys vulgò vera exiſtimata*, J. B. 3. 228 Elem. Bot. 173. GERMANDER.

Germander has a ſpreading creeping Root, which ſends forth ſeveral ſquare hairy Branches, ſcarce a Foot high, having two ſmall Leaves at every Joint, on ſhort Foot-ſtalks, about an Inch long, and half an Inch broad, cut in with ſeveral Sections, ſomething reſembling in Shape the Leaves of an Oak, ſomewhat hard and crumpled, green above, and hoary white underneath. The Flowers grow towards the Tops of the Branches among the Leaves, whorle-faſhion, of a purpliſh-red Colour: They are labiated, the Lip turning upwards; but they want the Galea, having in its Place ſeveral Stamina ſtanding erect. The Seeds grow four together in the hairy five-pointed Calyces. It grows with us only in Gardens, and flowers in *June* and *July*. The Leaves and Tops are uſed.

Germander is an Herb of warm thin Parts, opening Obſtructions of the Liver, Spleen, and Kidneys, and of Uſe in the Jaundice, Dropſy, and Stoppage of Urine. It is a good Emmenagogue, and is commended by ſome as a Specific for the Gout, Rheumatiſm, and Pains in the Limbs. *Miller's Bot. Off.*

The Leaves of this Plant are bitter and aromatic. They give no Tincture of Red to blue Paper, which ſhews, that they contain Principles different from thoſe of the ſmall Centaury. The Salt of the Germander is not different from that which is natural in the Earth, which is a Mixture of marine Salt, Nitre, and Sal Ammoniac. It is acrid, very bitter, and very aperitive. It is probable, that what is found in this Plant has loſt its Acrimony by the Mixture of a great deal of eſſential Oil, which renders the Germander aromatic. It is febrifugous, ſtomachic, aperitive, and diaphoretic. They infuſe, cold, over Night, a Handful of its Leaves in a Glaſs of White-wine, with half a Dram of vegetable Salt; and give the Infuſion to drink, faſting, for the Green-ſickneſs. They prepare an Extract of the Leaves and Flowers, and give a Dram of it, with a Drop or two of the Oil of Cinnamon, and make an Infuſion of the Leaves like Tea, principally for the Gout and Sciatica. They enter the Powder of the Prince of *Mirandola*, which paſſes for a great Specific in ſuch Diſeaſes. The Compoſition is as follows:

> You muſt dry, and reduce to a very fine Powder, an equal Quantity of the Leaves of Germandér, Ground-pine, ſmall Centaury, the Roots of the great Centaury, round Birthwort, and Gentian. Mix all theſe Powders, and keep them in a dry Place, and in a Box cloſe ſhut, after having ſifted them thro' a Searce of Silk. Infuſe a Dram of it all Night in half a Glaſs of good old Wine, or lean Broth. It is better to drink it in Subſtance, than to throw away the Feces, and drink only the ſimple Infuſion.

They pretend, that this Powder muſt be uſed for a whole Year, every Day, either Evening or Morning, or every other Day, or, at leaſt, once a Week. The Patient muſt take nothing elſe till three or four Hours after this Medicine: He muſt be purged, by the Advice of a Phyſician, in the Beginning of the Seaſons, or oftener, if it is neceſſary: He muſt avoid Ragous, Milk Diet, and violent Exerciſes. This Powder alſo is excellent for intermitting Fevers, for the Dropſy, and for all Diſeaſes where there are great Obſtructions in the Bowels. The *Germander* is uſed in the *Venice* Treacle, *Hiera Diacolocynthidos*, Syrup of Mugwort, hydragogic Syrup of Mr. *Charas*, aperitive and cachectic Syrup of the ſame Author, compound Oil of Scorpions, *Unguentum Martiatum*, and in the Mundificative of Smallage. *Martyn's Tournefort.*

3. Chamædrys; foliis laciniatis. *Lob. Obſ.* 209.

4. Chamædrys; folio pulchrè laciniato, majore, odorato; flore rubello. *b.*

5. Chamædrys; major; repens; flore albo. *C. B. P.* 248. *Var.*

6. Chamædrys; Hiſpanica; tenuifolia; multiflora. *H. R. Par. T.* 205. *H. R. D.*

7. Chamædrys; Hiſpanica; tenuifolia; latiori folio; multiflora. *H. R. Par. H. R. D. Boerhaave's Index alter Plantarum, Vol.* 1.

CHAMÆDRYS PALUSTRIS, ALLIUM REDOLENS. See SCORDIUM.

CHAMÆDRYS, FRUTICOSA, SYLVESTRIS, MELISSÆ FOLIO. See SCORDIUM.

CHAMÆDRYS FRUTESCENS. See TEUCRIUM.

CHAMÆDRYS SPURIA ANGUSTIFOLIA. See VERONICA.

CHAMÆDRYS SPURIA LATIFOLIA. See VERONICA.

CHAMÆFICUS. The *Ficus humilis*. C. B. P. See FICUS.

CHAMÆFILIX is the *Filix Marina Anglica*. *Parkinſon.*

CHAMÆGENISTA is the *Geniſtella*; *herbacea*; *ſive Chamæſpartium*. J. B.

CHAMÆIASME *Alpina* is the *Sedum Alpinum* 4 *Cluſii*, Ger. Emaculat.

CHAMÆIRIS. A Name for ſeveral Species of the IRIS, which ſee.

CHAMÆITEA is the *Salix pumila anguſtifolia recta*. The ſtrait Dwarf-willow with narrow Leaves. *Park.*

CHAMÆLÆA. Widow-wail.

It has the Appearance of a Shrub, and the Leaves are like thoſe of the Olive-tree; the Calyx is ſhort, conſiſts of one Leaf, and is indented in three Places; the Flower tripetaloidal, ariſing from the Baſe of the Ovary, whence three Stamina ariſe, in the Spaces between the Petals. The Ovarium, in the Bottom of the Calyx, is furniſh'd with a long Tube, is of a triangular Shape, and, when ripe, conſiſts of three Berries. The Seed is oblong. *Boerhaave*, *Index alter.*

Boerhaave mentions but one Species of this Plant.

Chamælæa; tricoccos. *C. B. P.* 462. *J. B.* 1. 584. *Chamælæa.* Dod. p. 363. H. *Boerhaave's Index Plantarum*, *Vol.* 1.

Ray informs us, that the Virtues of the *Chamælæa* are, in a great meaſure, the ſame with thoſe of the *Laureola*, or Spurge-laurel; but, as it is dubious whether it is really the *Chamælæa* of the Antients, we ſhall not aſcribe to it the Virtues which *Dioſcorides* and *Pliny* attribute to that Plant. But, ſays *John Bauhine*, the Juice of the whole Plant is much uſed at preſent, eſpecially at *Montpelier*, where, according to *Rondeletius*, the Apothecaries keep it expreſſed and inſpiſſated; in Imitation of whom I have often, with great Succeſs, exhibited one or two Drams of the recent inſpiſſated Juice by itſelf, and oftener in Conjunction with other hydragogue Cathartics. But it does not produce ſo large a Diſcharge of the peccant Matter, nor operate with ſuch a Degree of Violence, as the Spurge-laurel, the *German* Mezereon, and the Gratiola, generally do. Sometimes it operates little, or none at all, except when mix'd with ſome mild and gentle Cathartics. When exhibited to Children, it neither excites Gripes nor Vomitings, bnt only diſcharges Water and Serum. When apply'd to the Pubes and Abdomen of dropſical Patients, no Medicine is more effectual for provoking Urine; in which manner *Rondeletius* uſed it with Succeſs.

The *Thymelæa*; *Lauri folio deciduo*; *ſive Laureola fœmina*, Mezereon, or Spurge-olive, is ſometimes alſo call'd *Chamælæa*. See THYMELÆA.

The Names of theſe Plants were confounded in the Days of *Dioſcorides*.

CHAMÆLÆAGNUS. A Name of the *Myrtus Brabantica*, or *Gale*. See GALE.

CHAMÆLAITES *Vinum*, χαμαιλαίτης οἶνος. *Dioſcorides*, *L.* 5. *C.* 79. Wine impregnated with the *Chamælæa*. It is not certain what the *Chamælæa* of *Dioſcorides* is.

CHAMÆLARIX. The Name of a Plant which grows at the *Cape of Good Hope*. *Raii Hiſt. Plant.*

CHAMÆLEON, Offic. Charlt. Exer. 38. Caii de Animal. 80. Geſn. de Quad. Ovip. 3. Bellon. de Aquat. 55. Ejuſd. Obſ. ed. Cluſ. 125. *Chamæleon cinereus verus*, Aldrov. de Quad. Ovip. 670. Jonſ. de Quad. 140. *Chamæleo*, Raii Synop. A. 276. THE CHAMELEON.

The Gall, Heart, and the Animal itſelf, are in Uſe. The Gall removes Suffuſions. *Marcellus*. *Pliny* recommends the Heart againſt Quartans, and *Trallian* recommends it againſt Epilepſies and the Gout. *Dale.*

In Botany, the *Chamæleon Albus* is the *Carlina*, *acaulos*, *magno Flore*. See CARLINA. The *Chamæleon Niger* is the CARTHAMUS, (Baſtard-ſaffron) which ſee.

CHAMÆLEUCE is, according to *Blancard*, the *Tuſſilago*, Colt's-foot.

CHAMÆLINUM. A Name for the *Linum Catharticum*, Purging Flax. The *Knawel*; *folio Alſines*; *glabro*; *floſculis plurimis*, is call'd, by *Tournefort*, *Chamælinum vulgare*.

CHAMÆMALUS. A kind of dwarf Apple-tree, call'd by *Gerard* the Paradiſe-apple.

CHAMÆMELUM.

The Characters are;

The

The Root is fibrous, the Calyx squamous, and expanded with a manifold Series of Leaves. The Flower is generally radiated, seldom naked, with radiated Petals, for the most part white, and a yellow Disk. The Leaves are finely indented. In other things this Plant resembles the *Bellis*. *Boerhaave*, *Index alter*.

The last-quoted Author mentions fourteen Sorts of Chamomile.

1. Chamæmelum; vulgare; Leucanthemum Dioscoridis. *C. B. Pin.* 135. *Cod. Med.* 34. *Tourn. Inst.* 494. *Elem. Bot.* 395. *Boerh. Ind. A.* 195. *Hist. Oxon.* 3. 35. *Dill. Cat. Giss.* 78. *Rupp. Flor. Jen.* 139. *Vaill. Bot. Par.* 34. *Chamæmelum vulgare*, Offic. Park. Theat. 85. *quoad iconatem*, Buxb. 65. *Chamæmelum*, Ger. 615. *quoad etiam iconatem*, & Emac. 753. Raii Synop. 3. 189. *Chamæmelum vulgare amarum*, J. B. 3. 116. Raii Hist. 1. 355. *Chamæmelum majus foliis tenuissimis, caule rubente*, Hort. Monsp. *Chamæmelum elatius, foliis obscurè virentibus, semine nigro*, Pluk. Almag. 97. *Anthemis sive Chamæmelum*, Chab. 362. *Chamomilla Officinarum*, Volck. Flor. Nor. 100. WILD OR DOG'S CHAMOMILE.

It is found in uncultivated Places, and amongst Corn, and flowers in *June*. The Herb and Flowers are used. They are believed to be possessed of the same Virtues with the second Species of Chamomile. *Dale*.

This Plant is bitter, aromatic, and gives a deep red Colour to blue Paper. It seems to contain some Sal Ammoniac, loaded with a great deal of Acid, and involv'd by a great deal of Sulphur and Earth. It is aperitive, diuretic, lenifying, and febrifugous. The Powder of its Flowers were us'd in *Dioscorides*'s Time to cure intermitting Fevers. *Riverius* prescrib'd it on the same Occasions; and it is still the common Febrifuge of the *Scotch* and *Irish*. The Infusion of its Tops, with those of Melilot, gives great Ease to such as are tormented with a nephritic Colic, and Retention of Urine. It asswages the acute Pains of Women newly brought to Bed. *Simon Paulli* recommends a strong Infusion of Chamomile-flowers in Wine, taken by Spoonfuls, while a Hog's Bladder, fill'd with a Decoction of the Herb, is applied hot, and renew'd as Occasion requires, in pleuretic Cases. It is also used in lenifying and resolving Clysters, Fomentations, Cataplasms, and Baths, for the Gout, Sciatica, and the Piles. The Oil of Chamomile, made by Infusion, is very good in the same Cases. A Liniment of an equal Quantity of Chamomile and Oil of St. John's-wort, with camphorated Spirit of Wine, in which a twice-folded Cloth has been dipt, and applied very hot to the affected Part, is good in Rheumatisms. *Martyn's Tournefort*.

2. Chamæmelum; nobile; sive Leucanthemum; odoratius. *C. B. P.* 135. *Tourn. Inst.* 494. *Elem. Bot.* 395. *Boerh. Ind. A.* 109. *Dill. Cat. Giss.* 78. *Rupp. Flor. Jen.* 139. *Chamæmelum*, Offic. Ger. 616. Emac. 755. Mer. Pin. 25. Park. Parad. 289. *Chamæmelum vulgare*, Mer. Bot. 1. 28. Phyt. Brit. 26. Park. Theat. 85. Pharm. Edinb. 6. *Chamæmelum Officinarum*, Act. Reg. Par. Oxon. 3. 35. *Chamæmelum Romanum seu Chamæmelum odoratissimum repens flore simplici*, Chab. 362. *Chamæmelum vulgarius odoratum*, Schw. 47. *Chamomilla Romana Officinarum*, Buxb. 65. CHAMOMILE.

The *Chamomile* which is used in the Shops seldom rises very high, but creeps upon the Ground, with fine winged Leaves, cut into many thin slender Divisions, among which grow the Flowers, upon long Foot-stalks, not growing together, but here-and-there one, consisting of broad white Petals, set about a yellow fistular Thrum, in which lie small flat Seeds. The Root is composed of small Strings, creeping and spreading in the Ground. The Leaves and Flowers have a strong, not unpleasant Scent, and a very bitter Taste. It grows upon Heaths and Commons, flowering in *June* and *July*. We have a Species of this, which is planted in Gardens, and bears double Flowers, which, because of their Beauty and Largeness, are mostly used in the Shops; tho' many are of Opinion, that the single Flowers are stronger, and of more Virtue, having a greater Quantity of the yellow Thrum, in which lies the Strength of the Plant.

Chamomile is a Plant of many Virtues, being stomachic, hepatic, nervine, emollient, and carminative; it strengthens the Stomach and Bowels, helps the Colic, Jaundice, Stone, and Stoppage of Urine. It is good against quartan and other Agues. Outwardly it is used in Glysters, in Baths, and Semicupia for the Stone, and Stoppage of Urine; also in Fomentations for Inflammations and Tumors. Outwardly applied hot to the Sides, it helps the Pains thereof. The Herb and Flowers are used.

Officinal Preparations are, the simple Water, the *Aqua Chamæmeli composita*, the distil'd Oil, and the Oil by Infusion or Decoction. *Miller's Bot. Off.*

Morton, speaking of intermittent Fevers, uses these Words: "Doctor *Elisha Coysh* often protested to me, with the utmost "Appearance of Sincerity, that he had found Chamomile-"flowers, reduc'd to a fine Powder, exhibited in a proper Ve-"hicle, and used at due Intervals, as successful and infallible, in "curing these Disorders, as the *Peruvian* Bark itself. Whe-"ther the Author's Assertion was true or false, let others judge; "as for my own Part, I never made an Experiment of the "Efficacy of this simple Medicine; but by means of it, in "Conjunction with other Ingredients, I, in two Days time, "perfectly cured the Son of one Mr. *Barnard*, a Lawyer of "*London*, of that Species of Fever call'd Hemitritæa, after I "had not been able to free him from one Paroxysm of the Dis-"order by a long and copious Use of the *Peruvian* Bark. By "means of the same Secret, exhibited at proper Intervals, I, "in the Space of two Days, cured one Mrs. *Gimley*, an old "Gentlewoman, labouring under a tertian Fever, and who "had made a long, but fruitless, Trial of the Virtues of the "*Peruvian* Bark. By the same Medicine, and in the same "Time, I also perfectly, and without a Relapse, cured the "Wife of Mr. *Royston*, the King's Bookseller, tho' almost "seventy Years of Age, after she had for two Years laboured "under an intermitting Fever, which was sometimes a tertian; "sometimes a quartan, and sometimes that Species call'd "Hemitritæa. I must confess, that I do not remember "to have made Trial of this Medicine upon any other Pati-"ents labouring under intermittent Fevers; for except in these "three Instances, I cannot call to mind any Patients in whom "the *Peruvian* Bark did not answer my Expectations. I "therefore thought it criminal and indecent to make wanton "Experiments upon Mankind, by preferring an uncertain and "little known Remedy to one whose Virtues were approved, "and sufficiently ascertain'd. I shall, however, for the sake "of the Curious, give the Formula of this Medicine, that "they may, if they have a mind, make a Trial whether "it is an infallible Febrifuge; or, at least, whether, as it hap-"pen'd in my Practice, it is able to supply the Defects of the "*Peruvian* Bark. The Powder itself is thus prepar'd:

"Take of the Flowers of Chamomile, one Scruple, more "or less according to the Age of the Patient; of diapho-"retic Antimony, and Salt of Wormwood, each half a "Scruple: Mix up into a Powder, to be taken in a "Draught of Posset-drink, or any temperate Jalap; or "it may be exhibited in the Form of a Bolus, with Syrup "of Clove-gilly-flowers; or it may be reduced to the "Form of Pills with Mucilage of Gum Tragacanth, and "exhibited every sixth Hour for two or three Days." *Morton's* Πυρετολογία.

No Simple in the *Materia Medica* is possess'd of a Quality more friendly and beneficial to the Intestines than Chamomile-flowers; for which Reason I have, instead of all other Ingredients, hitherto, with great Success, prescrib'd Chamomile-flowers for Clysters, in all Disorders which indicate their Use; adding, when there is a Necessity for it, Oil of sweet Almonds; and, for Patients of the poorer Sort, Linseed-oil, or Oil of Turnep-seeds; or, for evacuating the Fæces, a sufficient Quantity of common Salt, which, for its stimulating Quality, is of more Service than the whole Train of laxative and purgative Extracts or Electuaries, which may be very well left out of Clysters. These Flowers make an excellent Cataplasm for discussing, softening, and maturating Abscesses. When boil'd in Milk, and put into a Bladder, either alone, or in Conjunction with the Flowers of Elder, Mallows, Yarrow, or Saffron, they are highly efficacious in alleviating Pains, and softening Tumors, if the Bladder is applied to the Part affected. I have learn'd, from long Practice and Experience, that Brandy distil'd from the Tops of Yarrow, Chamomile-flowers, Anise-seeds, and *Ethiopic* Cumin, is of more Efficacy, in discussing Flatulencies, than any of the other so much extol'd carminative and antispasmodic Preparations. *Hoffman de Præstantia Remediorum Domesticorum*.

For the Method of making the simple and compound Chamomile-water, see the Article AQUA.

Boerhaave represents the simple Water of Chamomile, prepared by repeated Cohobations, as effectual in curing tertian Agues.

The *Oleum Chamæmelinum*, in the *London Dispensatory*, is directed to be made by

Infusing four Ounces of bruised Chamomile-flowers in a Pound of Olive-oil, in the Sun: The Oil must then be press'd out, and fresh Flowers added, infused, and then press'd out again; and this must be repeated once more.

This Oil is esteem'd a good Discutient, and is used externally in that Intention. It is also a frequent Ingredient in Clysters.

The same Oil is directed to be made in a somewhat different manner in the *Edinburgh Dispensatory*.

Take

Take a Pound of the bruiſed Flowers of Chamomile, and three Pints of ripe Olive-oil: Put them into a Glaſs Veſſel, or one of glaz'd Earth; cloſe it well, and expoſe it to the Heat of the Sun for fifteen Days; then add four Ounces of the Juice of Chamomile; and boil the Whole gently, till the Juice is evaporated; and afterwards force out the Oil with a Preſs.

For the Way of making chymical Oil of Chamomile, ſee OLEUM.

Boerhaave ſays, the eſſential Oil of Chamomile, made into Pills with a Bit of Bread, and given two Hours before Meals, after faſting a conſiderable time, is a certain Cure for the Worms.

This is a Shrub which grows in many Parts of *Great Britain*, on the very Summits of the Mountains, in a rotten and boggy Soil. The Leaf is like that of the Mallow, Mulberry, or rather, according to *Ray*, like that of the Currant-tree. The Fruit is ſomewhat like the Mulberry, or Raſpberry, which is at firſt white and ſour, but by Maturity ſweet, but with a Degree of Tartneſs, and red, with a yelloviſh Caſt.

Ray thinks the *Chamæmorum Norwegicum Cluſii*, Park. to be the ſame Plant as the preceding. The Fruit is ripe in *July* and *Auguſt*.

The Inhabitants of *Norway* and *Finland*, ſays *Heierus*, prepare every Year, after a coarſe manner, an Electuary of this Fruit againſt the Scurvy. They boil the Berries by themſelves, in an Earthen or Copper Veſſel, to a moderate Conſiſtence, without adding any Liquor; for the Fruit is ſo ſoft, and full of Juice, as not to require Irrigation by extraneous Liquids; tho' ſome, who are of nicer Palates than the reſt, pour on it ſome Mead, which is highly coveted by theſe Northern People. After it is thus boil'd, they diſpoſe of it in proper Veſſels; and, to preſerve it from being corrupted by the Air, pour over it melted Butter, which forms itſelf into a Covering. They are very careful to keep this in their Houſes, and eſteem it, as it really is, a noble and excellent Remedy againſt the Scurvy. It is almoſt incredible what ſurpriſing Cures are every Day perform'd by Help of this Medicine alone; and it muſt be confeſs'd, that neither Scurvy-graſs, ſo much in Requeſt hitherto, nor Brook-lime, nor Water-mint, nor Meadow-creſſes, nor other Things of that Kind, which are ſo much extol'd by the *Germans*, deſerve to be mention'd with it.

Some cure the Scurvy by a ridiculous, though ſucceſsful Method, which is as follows: They expoſe the Patients in ſome neighbouring Iſland which abounds with the *Chamæmorus*; and, leaving them by themſelves, never ſuffer them to return home before they have recover'd their Health. The Sick, thus left to ſhift for themſelves, and yet deſirous, as we may ſuppoſe, of Life, are obliged to feed on this Fruit, either as being the laſt Remedy which they can uſe for the Recovery of their Health, or to ſatisfy their Thirſt, with which they are very much tormented; and, while they thus feed to Satiety, they infallibly recover in a few Days. In the Winter, when this Method cannot be uſed, they have recourſe to their Electuary with the ſame Succeſs, not confining themſelves to any particular Doſe or Regimen. *Raii Hiſt. Plant.*

There is another Species of this, call'd *Chamæmorus altera Norwegica*. J. B. Cluſ. Park.

CHAMÆNERION. A Name for ſeveral Sorts of the *Lyſimachia*, as the *Lyſimachia, Chamænerion dicta, latifolia*, C. B. ROSE BAY-WILLOW-HERB.

Lyſimachia, Chamænerion dicta, anguſtifolia, C. B. THE NARROW-LEAVED CODDED LOOSE-STRIFE.

Lyſimachia, Chamænerion dicta, Alpina, C. B. Park. THE MOUNTAIN CODDED LOOSE-STRIFE.

CHAMÆORCHIS is the *Orchis*; *Lilifolia*; *minor*; *ſabuletorum Zelandiæ, & Bataviæ*. Boerh. Index A. Pars 2. P. 152.

CHAMÆPERICLYMENUM is the *Chamæceraſus*; *Alpina*; *fructu gemino, rubro, duobus punctis notato*. Boerh. I. A. Pars 2.

CHAMÆPEUCE. *Dioſcorides, L.* 4. *C.* 127. mentions the χαμαιλεύκη, *Chamæleuce*, which his Tranſlators call *Chamæpeuce*, for what Reaſon I cannot tell. The *Chamæleuce* is the *Tuſſilago*, Colt's-foot.

CHAMÆPITUINUM *Vinum*, χαμαιπιτύινος οἶνος, *Dioſcorides, L.* 5. *C.* 180. is Wine, in which the bruiſed green Leaves of the *Chæmepitys* have been infuſed. It excites Urine.

CHAMÆPITYS, χαμαίπιτυς.

The Characters are;

The Leaves are narrow and trifid; the Place of the Galea of the Flower is ſupply'd by little Teeth; the Beard, or lower Lip, is divided into three Parts, the middle Segment being again divided into two Parts: The Flowers grow in Whorles; but theſe conſiſt of very few Flowers, one or two at moſt on each Side, diſperſed here-and-there, in the *Alæ* of the Leaves.

1. Chamæpitys; lutea; vulgaris; five folio trifido. *C. B. P.* 249. *Tourn. Inſt.* 208. *Elem. Bot.* 177. *Hiſt. Oxon.* 3. 424. *Boerh. Ind. A.* 183. *Buxb.* 67. Phyt. Brit. 27. *Chamæpitys Officinarum*, Rupp. Flor. Jen. 178. *Chamæpitys vulgaris*, Park. Theat. 283. Raii Hiſt. 1. 573. Synop. 3. 244. *Chamæpitys vulgaris odorata, flore luteo*, J. B. 3. 295. GROUND-PINE.

Ground-

Ground-pine has a long woody ſingle Root, which ſtrikes deep into the Earth, with many Fibres. It ſends forth a great many Stalks, four or five Inches long, leaning towards the Earth, cover'd thick with Hairs: The Leaves ſtand ſo thick on the Stalks, two oppoſite to one another, that the Bottoms are hardly ſeen, the Tops of them being divided into three Parts: They are alſo very hairy. The Flowers are yellow and labiated, but have little or no Galea. They grow at the Joints, among the Leaves, ſet in Calyces that belly out round, each containing four Seeds. The whole Plant is of a ſtrong reſinous Scent; and the Stalks, being ſet thick with Leaves, appear like a ſmall Pine, whence the Name.

It grows in fallow Fields, and chalky Grounds, particularly in *Kent*, in great Plenty; and flowers in *June* and *July*.

The Leaves of Chamæpitys, drank in Wine, for ſeven Days together, cure the yellow Jaundice: Drank forty Days together, in Hydromel, they cure the Sciatica. They are preſcrib'd alſo for Diſtempers of the Liver, Difficulty of Urine, and as a Specific in Diſorders of the Kidneys: They alſo help the Gripes. The Inhabitants of *Heraclea*, in *Pontus*, uſe this Herb as an Antidote for thoſe who have drank the Decoction of Aconitum. The Decoction of the Herb, mix'd with Polenta, is made into a Cataplaſm for the aforeſaid Diſorders. Pulveriz'd with Figs, and made into Pills, it purges by Stool. Taken with Honey, Squama Æris, and Rozin, it alſo ſerves for a Purge. Made into a Peſſary, with Honey, it cleanſes the Uterus. It diſcuſſes Hardneſſes of the Breaſts, conglutinates Wounds, and reſtrains the Herpes, if made into a Cataplaſm, with Honey, for theſe Purpoſes. *Dioſcorides*, *Lib.* 3. *Cap.* 175.

The ſame Author informs us, that, in *Pontus*, it was call'd *Holocyron*, ὁλόκυρον; at *Athens*, *Ionia*, Ἰωνία; and in *Eubœa*, *Siderites*, σιδηρίτης.

Ground-pine is hot and dry, warming and ſtrengthening the Nerves, helps the Palſy, Gout, Sciatica, and Rheumatiſm, the Scurvy, and all Pains of the Limbs. It is a ſtrong Diuretic, opens Obſtructions of the Womb, and powerfully promotes the Menſes, and that ſo ſtrongly, that it is forbid to Women with Child, for fear of Abortion. *Miller's Bot. Off.*

This Plant is bitter, aromatic, and gives a faint red Colour to the blue Paper; by which it ſeems to contain ſome aromatic oily volatile Salt, loaded with a great deal of Sulphur and Earth; for, by the chymical Analyſis, the Ground-pine yields ſeveral acid Liquors, a little urinous Spirit, a great deal of Oil, and more Earth.

No Wonder, then, if this Plant reſtores the ordinary Courſe of the Spirits and Liquors in the Nerves and Capillary Veſſels; whence it is very good in nervous Affections. It is diuretic, emmenagogic, and diſſipates the Cauſe of the Gout. Drink its Infuſion in Wine, or make a Ptiſan of it, with Germander. The Juice enters *Nicolaus Salernitanus*'s Arthritic Pills. *Martyn's Tournefort.*

2. Chamæpitys Moſchata foliis ſerratis an prima Dioſcoridis, *C. B. Pin.* 244. *Tourn. Inſt.* 208. *Elem. Bot.* 177. *Boerh. Ind. A.* 183. *Raii Hiſt.* 1. 574. *Chamæpitys altera*, Offic. *Chamæpitys Moſchata*, Cod. Med. 34. *Chamæpitys ſive Iva Moſchata Monſpelienſium*, J. B. 3. 425. *Chamæpitys, Iva Moſchata Monſpeliaca*, Ger. 422. Emac. 525. *Chamæpitys Anthyllis altera Herbariorum*, Park. Theat. 282. FRENCH GROUND-PINE.

It is often found in *France*, and flowers in *June*. The Herb is uſed. *Dale.*

Beſides the two preceding Species, *Dale* mentions a third.

3. *Chamæpitys tertia ſeu Mas*, Offic. *Chamæpitys odoratior*, Park. Theat. 283. *Chamæpitys incana exiguo folio*, C. B. Pin. 249. *Chamæpitys folio non laciniato*, J. B. 3. 297. *Chamæpitys folio non laciniato ſeu tertia Dioſcoridis Matthiolo*, Chab. 431. Raii Hiſt. 1. 574. *Chamæpitys tertia Dodonæi*, Ger. Emac. 532. ITALIAN GROUND-PINE.

This is common in *Italy*, where it flowers in *June*.

Dioſcorides ſays, that the two laſt are poſſeſs'd of the ſame Virtues as the firſt, but in a weaker Degree.

CHAMÆPLION. A Name in *Oribaſius* for the *Eryſimum*.

CHAMÆPYXOS. A Name for the *Pſeudo-chamæbuxus*, Park.

CHAMÆRAPHANUM. The upper Part of the Root of *Apium* is thus call'd by *Paulus Ægineta*, *L.* 7. *C.* 10.

CHAMÆRIPHES. A Name for the *Palma*; *humilis*; *Dactylifera*; *radice repente*, *ſobolifera*; *folio flabelliformi*, *pedunculo ſpinoſo*. Boerh. I. A. Pars 2. P. 169.

CHAMÆRODODENDROS. See ÆGOLETHRON.

CHAMÆROPS. A ſort of Palm, call'd *Palma*; *Chamærops*; *Plinii*. Boerh. I. A. Pars 2, P. 169. See PALMA.

CHAMÆRUBUS. A Name for the *Rubus*; *Alpinus*; *humilis*. Boerh. Index A. Pars 2. P. 60. See RUBUS.

CHAMÆSYCE. A Name given to ſome Species of the TITHYMALUS, which ſee.

CHAMÆZELOS, χαμαίζηλος. Low, depreſs'd. *Hippocrates.*

CHAMBAR. The ſame as *Magneſia*. *Rulandus.*

CHAMELÆA. See CHAMÆLÆA.

CHAMEUNIA, χαμευνία, from χαμαὶ, on the Ground, and εὐνὴ, a Bed. A lying on the Ground, or on any hard Place. *Galen.*

CHAMPACAM, H. M. *An Flos Indicus Champacca dictus* Bontii, *An Champe dicti flores Indici Garziæ*, I. B.

A large tall Tree, which grows in the *Eaſt Indies*, and bears very fragrant Flowers, twice a Year, but no Fruit, till much advanc'd in Age.

The dry'd Root, and its Bark, bruis'd, and mix'd with thick Milk, call'd *Dayr*, ſerve to maturate and break Abſceſſes; pulveriz'd, and given in warm Water, they provoke the Menſes, and expel the Fœtus. The Flowers bruis'd, and boil'd in Oil, make an Ointment for the Head-ach, diſeas'd Eyes, and the Gout; expos'd to the Sun in Oil, for forty Days together, they work the ſame Effect. The diſtil'd Water of the Flowers has a fine Smell, and chears the Heart. *Ray* thinks this Tree to be the *Champacca* of *Bontius*. *Raii Hiſt. Plant. p.* 1642.

CHANCRE.

Chancres are reputed among the firſt Symptoms which appear in the Venereal Diſeaſe, and *Antonius Muſa Braſavolus* obſerves, that the Puſhes on the Prepuce, Glans, or on both, are occaſioned by the Sharpneſs of Humours, which are ſtirred in time of Coition, and the malignant Quality of the Venereal Taint contain'd in the Vagina, or that flows from the adverſe Party. This being premis'd, it is certain the Chancres on the Frænum and Prepuce differ very much from thoſe on the Glans, and other Parts. For theſe are a ſort of Tumor with hard Edges, and the former riſe not above the Skin, but are likewiſe hard, and ſhed a watery Subſtance. They reſemble the Sores on the Inſide of the Lips, we commonly call Cankers; and all theſe Names vary little from thoſe of the *Greek* and *Latin*, firſt given them. Now, as both Kinds of Chancres are hard, their Liquors corroſive, and agree in many other Qualities obſerv'd about Cancers, they are properly enough ſaid to καρκινοῦσθαι. And the common Uſe of Cancers, and Carcimona, among *Greek* and *Latin* Authors, ſufficiently warrants the analogical Name given to theſe new Sores.

The Cure of Chancres, eſpecially of thoſe of the Frænum and Foreſkin, having greatly perplex'd and puzzled Authors, they did not ſufficiently attend to their Nature or Symptoms; by which means the Deſcription given of them has been obſcure, and their Names ill aſcertain'd. The corrupted Matter of the Gonorrhea, flowing out of the Penis, produces a Chancre; and if we reflect on their Hardneſs, and other Qualities, we muſt be perſuaded, that this acrimonious Matter either coagulates the Liquors of the Parts it is apply'd to, or diſſipates them; as we find Fire does, and renders the Parts harder; ſo that it bears ſome Analogy to Oil of Vitriol, Oil of Origanum, Lapis Infernalis, and other Cauſtics, or to Fire itſelf.

This ſingle Coagulation, or even Diſſipation of the Humours, ſufficiently explains the Chancres on the Frænum or Foreſkin, and other membranous Parts: But the Coagulation of the Liquors in the Glans, or their Obſtruction, contributes more eſpecially to produce the Chancres there, and to raiſe the Tumors that are obſerv'd in them, which are not to be ſeen in thoſe of the Foreſkin.

From conſidering the comparative Degrees of Corroſiveneſs in the Matter of a Gonorrhea, it is evident, that the Hardneſs of Chancres is not ſo much acquir'd by diſſipating the Humours, as it is by their being coagulated. This is manifeſt from the Uſe of a Medicine which has been invented ſome Years ago, but never before communicated to the Public; for the Liquors may be reſolv'd again by this Medicine, without any Pain, and the Chancre cured without any Loſs of Subſtance; whereas, when eſcharotic Medicines are apply'd, they deſtroy the Part with much Pain, and give Occaſion to Phyſicians to ſuſpect, that the productive Matter of Chancres had ſome Reſemblance to Fire in its Operation. *Cockburn*, by this Medicine, means that given below from this Author.

Now as Chancres are occaſion'd by the ſharp Matter of a Gonorrhea, which ſticks to the Glans or Foreſkin, the ſofteſt Nuts take the Infection moſt eaſily, and the Corroſion will be the ſtrongeſt when the Quantity is the greateſt. This is the common Caſe of Men, who have their Glans always cover'd with the Foreſkin; for they have the ſofteſt Glans, and their Foreſkin detains the Matter longeſt upon it; upon which Account both theſe Parts are moſt corroded with Chancres. By this Method of Reaſoning, we become eaſily appris'd how Chancres are communicated between the Sexes, in time of Coition; and the Way of their being form'd is a little more obvious, by what we often find when *Mercurius dulcis* is improperly

properly given, and when it is not duly clear'd from its corroſive Salts; for then ſuch Sores, as the Chancres on the Foreſkin, are produc'd in the Tongue and Cheeks.

Hence it follows, that we may eaſily determine when Chancres are as much Originals as the Gonorrhea itſelf; when they are Symptoms; and when they are independent of it, or are the Effects of the Pox; and all this by obſerving the Times wherein the Chancres appear, and other Circumſtances, with reſpect to a Gonorrhea, and the times of Coition: A Difficulty ſo great at preſent, that it has eluded the Obſervation of the beſt Phyſicians, tho' they have been converſant in the Practice of every Part of the Venereal Diſeaſe. M. *Blegny* acknowledges all theſe different Kinds of Chancres I have mention'd, however ſurpriſing they will appear to ſome; and tho' he is not able to give us any Method whereby we may know them from one another, yet it is very proper to recite his Words. "We "know by Experience, ſays he, that ſome are affected with "Pains, Tetters, Warts, Ulcers, and Chancres, and yet, "after all, are far from being pox'd." He ſpeaks, indeed, of finding ſomething peculiar in them, whereby the one Sort may be known from the other, but he has not hitherto made that uſeful Diſcovery; tho' this Difference is become very plain from the foregoing Accounts. *Cockburn of a Gonorrhea.*

Aſtruc ſays, that Chancres are occaſion'd as well by a latent Pox, as by a recent Contagion. And he tells us, that not only the Pudenda are liable to them, but likewiſe the other Parts by which the Contagion is admitted; as the external and internal Parts of the Anus in Catamites, the Nipples of the Breaſts in Nurſes; and in ſucking Children, and thoſe that receive the Poiſon by Kiſſing, the Lips, internal Cheeks, Gums, and Tongue.

He reckons the Seat of theſe Ulcers to be the ſebaceous Glands.

He obſerves, that they ſeldom break out, if the Pudenda, immediately after a ſuſpected Venereal Intercourſe, are well waſh'd with Wine, Water, or Urine.

When theſe Ulcers take an angular Shape, which is one Sign of Malignity, he ſays it is owing to the greater Degree of Virulence in the Venereal Poiſon, by which it ſpreads Corroſion more ſpeedily thro' the neighbouring Parts.

In computing the Degrees of Malignity in theſe ſmall Ulcers from their Situation, he ſays, thoſe are more malignant, 1. That affect the Prepuce, than thoſe which have their Seat in the Glans in Men: And in Women, thoſe upon the Clitoris and Carunculæ Myrtiformes, than thoſe which appear upon the Labia Vulvæ or Nymphæ. 2. That of thoſe which affect the Glans, thoſe are more malignant which break out upon the Frænum or Corona, than thoſe upon its Back or lateral Parts. 3. And that thoſe are more malignant which break out on the Margin of the Prepuce, than thoſe which appear upon its middle or lower Part.

He accounts for theſe different Degrees of Malignity, from the greater Senſibility of the Parts in which they are moſt malignant.

Where theſe ſmall Ulcers are frequent, and of a malignant Kind, he ſays, that by inflaming the Parts, they produce a Phymoſis, Paraphymoſis, Cryſtallines, Carcinoma of the Glands, Gangrenes, and Sphacelus.

As for the Diagnoſis, he ſays, theſe Venereal ſmall Ulcers are eaſily diſtinguiſhable from thoſe Excoriations which ſometimes happen from Coition with a Woman, who is juſt under an acrid menſtrual Diſcharge, or has lately had one, or from the mere Acrimony of the Patient's proper ſebaceous Secretion; becauſe theſe Excoriations are broad, irregular, without any Callofity, and only ſuperficial; and beſides, they eaſily dry up, either of their own Accord, or by vinous or vulnerary Lotions. Neither, ſays he, is there any great Difficulty in diſtinguiſhing them from thoſe Ulcers, which ſometimes, tho' ſeldom, break out upon the genital Parts, as well as the reſt of the Body; becauſe theſe Ulcers are broad, irregular, and deep, without any ſurrounding Callofity or Mucus at their Bottom.

As for the way of diſtinguiſhing Chancres proceeding from a recent Contagion, from thoſe that take their Riſe from an old Pox, tho' he owns there is no certain Rule to judge by here, yet if they appear upon the Frænum in Men, upon the Carunculæ Myrtiformes, Nymphæ, or Clitoris, in Women, if they are numerous and malignant, and if they perform their Stages ſpeedily, he ſays, there is Reaſon to ſuſpect, that they proceed from a recent Infection: Since thoſe which are the Effects of an old Pox are generally endow'd with oppoſite Qualities, and do not affect the fore-mention'd Parts more than the other Parts of the Pudenda.

Thoſe Chancres, he ſays, which have their Seat within the Extremity of the Urethra, are frequently confounded with a Gonorrhea, tho' they may be diſtinguiſh'd by the following Symptoms: (1.) The Smallneſs of the Diſcharge. (2.) The Pain in Erection, not in the Perineum, but in the Extremity of the Penis. (3.) A Pain felt at the Root of the Glans. (4.) By examining the Ulcer with the Touch of a Probe, or a Wax-candle, in order to be able to judge of its State, whether callous or not.

As to the Cure, *Turner* ſays, That if there be only a ſimple Excoriation on the Glans or Prepuce, a Pledget of Diapompholygos may be ſufficient; but if Ulceration, you muſt forward the Digeſtion, eſpecially if there be Callofity, or Chancres, already form'd; at which times your red Precipitate of Mercury ſprinkled thereon, with the Digeſtive over, may be convenient and proper alſo to deterge them. After which you need not be over-haſty to dry them up, till the Virulency is purged off, and corrected by Internals; leſt, ſtifling the Venom here, it ſhould ſhew itſelf after in other pocky Eruptions, and ſtand then in need of the Method of Cure for a confirm'd Lues. Again, if your Precipitate prove inſufficient to correct the Virulency, and ſubdue the chancrous Excreſcence, you may touch it with the Milk of corroſive Sublimate, or lay on a ſmall Pledget expreſs'd from the ſame; alſo a light Touch of the Butter of Antimony, or of the lunar Cauſtic, may be ſometimes neceſſary: But if they ſtill happen to improve in their Virulency, or grow more ſpreading and corroſive, whilſt your Patient is purged with Mercurials, there is no better way of making Revulſion than by exhibiting eight, nine, or ten Grains (according to the Age, Strength, and Habit, as alſo Uſe to the like Medicines) of the Turpeth-mineral, in a Bole, with Conſerve of Roſes; and to repeat the ſame Remedy, if there be Occaſion, at two or three Days Diſtance, twice or thrice, by which you will find the Chancre abate of its fretful Nature, and grow milder, and more manageable.

I ſhall not omit, ſays *Turner*, a Method which I have, of late Years, found always ſucceſsful in overcoming theſe chancrous Ulcerations, either on the Glans or Præputium in Men, and the Labia, as well as Sinus Pudoris, in Women; and that is the ſmoking them with Cinnabar, thrown upon a hot Iron, or a common Heater, the Fume aſcending thro' a Funnel, or a Seat perforated like the Cloſe-ſtool, (which I make frequent Uſe of for ſuch Purpoſes) all round the diſeaſed Parts; one Dram of which Cinnabar I order to be ſprinkled on at a time, every Day, and ſometimes twice a Day, for a Week; the Iron, at the ſame time, being hot enough to raiſe a Flame with Smoak; but not ſo burning, or fiery red, as to make it inſtantly conſume away in Flame alone. *Turner's Syphilis.*

Cockburn ſays, That, to bid an eternal Farewel to the long, tedious, and uneaſy Practice of curing Chancres by Eſcharotics, he ſhall communicate a Method, whereby Chancres are cured in a very little time with great Eaſineſs, without any Pain, Inflammation, Loſs of Subſtance, or any Danger of extirpating the Member, or any Part of it. This Method does not require any Help from other Medicines for diſſolving the Chancre, and healing the Part. It is done by an Ointment, not recommended on an Opinion or Perſuaſion, that it will ſucceed, but upon its Succeſs for twenty Years paſt, the Efficacy whereof will ſufficiently anſwer all the Expectation any Perſon can have of it, as it has already done to ſome Friends, to whom it was communicated ſome Years ago. The Method is ſhort and eaſy, like the Medicine itſelf; for you are only to dreſs Chancres with this Ointment.

> Take of Quick-ſilver, as much as you pleaſe; and of Venice Turpentine, a ſufficient Quantity; mix up into an Ointment.

It is very proper to relate the Succeſs of this Ointment, in ſome other and harder Ulcers; which will be the more acceptable, becauſe the Sore is as unknown in *Europe*, as the Cure of it by this Ointment, and evinces the Efficacy of it at the ſame time. This Account was ſent me from my Couſin Dr. *Cockburn* in *Jamaica*; which therefore I will add in his Words: "I cannot ſay I have tried your Ointment on Chancres, but "I have made Trial of it on an Ulcer of the like Nature, "but in a worſe Place; which Trial was made on a Negro "of my own, who had, what we call here, the *Crab-yaws*. "They are a Sort of Ulcers, which come upon the Soles of "the Feet, with hard callous Lips, ſo hard, that it is difficult to "cut them. The general Method has been to pare them deep, "and then to burn them with a hot Iron, or with ſome cor"roſive Powder; ſuch as Roman Vitriol, or Verdegriſe, "and after all, with little Succeſs. This Boy had one of "theſe *Crab-yaws* on one Side of his Foot, where the Skin "was very hard, to which, after it was par'd, I apply'd your "Medicine; whereby all the Hardneſs was deſtroy'd in a few "Days, and his Foot is now ſoft and well. The Conſequence "of this Experiment is very obvious, and forbids me to en"large upon it." *Cockburn.*

Aſtruc is of Opinion, that the Cure of ſuch Chancres as proceed from an old Pox, is only to be expected from mercurial Unction, which he adviſes to be ſet about without Delay. And this he takes to be the beſt Method of managing, even in thoſe which are owing to a recent Taint; but as few Patients will ſubmit to that, in an Evil which appears ſo ſlight, he

he lays down the eaſier Method by repeated Veneſection, the Uſe of emollient Fomentations, and Anodynes; Mercurials, by way of Alterative, either externally or internally adminiſtred, till a Salivation approaches, then purg'd off, and repeated as often as is neceſſary. After which he adviſes the Uſe of ſudorific Decoctions of *China*, Sarſaparilla, Guaiacum and Saſſafras, boil'd with Antimony.

He recommends much the ſame Ointment as that deſcrib'd above from *Cockburn*, with an Addition of Lapis Calaminaris and Sulphur, in a ſlight Chancre.

Take Lapis Calaminaris, half an Ounce; Sulphur and Quickſilver, each a Dram; Turpentine, a ſufficient Quantity to divide the Particles of the Mercury, adding a ſmall Quantity of Hogs Lard.

In more obſtinate Chancres, *Aſtruc* adviſes the touching them ſlightly with the common or lunar Cauſtic; or rather the ſprinkling upon them the red or yellow Precipitate of Mercury, on which Spirit of Wine has been burnt, mix'd with an equal Quantity of Ceruſs in Powder; or elſe the white Precipitate of Mercury, mix'd with the Yolk of an Egg boil'd hard, and reduc'd to the Form of an Ointment with Honey. In order to eaſe the Inflammation, if troubleſome, he adviſes the Application of warm Milk; Decoctions of the Roots of Water-lilies, and Marſh-mallows; or Mucilage of the Seeds of Flea-wort, and Flax, extracted with Roſe-water, or freſh Cream; or the Yolk of an Egg, either alone, or beat up with Oil of Lilies; or the Unguentum Album Rhaſis; or Cataplaſms of the Crums of Bread. Theſe are to be repeated frequently, that the inflam'd Part may be perpetually kept moiſt, and relax'd by them.

The Falling off of the Eſchar is to be promoted by the Application of freſh Butter, the Yolk of an Egg, the common Digeſtive, or Baſilicon; or of Anodyne Topics, which promote Suppurations.

But whatever Value ſome may put upon the before-mention'd Remedies, the following Ointment, for ready and common Uſe, is to be prefer'd before them all. It is prepar'd of one Part of red Precipitate of Mercury, and ſix or eight Parts of Unguentum Baſilicon, well beat together in a Marble Mortar. This is a ſafer, as well as more effectual Medicine than the others; for the Acridneſs of the mercurial and corroſive Parts is ſo temper'd by the balſamic Parts of the Unguentum Baſilicon, that they imprint only a ſuperficial Eſchar, by a gentle Eroſion, without any Inflammation, and the ſuffering Part itſelf is, at the ſame time, ſo mollify'd by the Baſilicon, that the ſmall Eſchars thus made ſoon fall off by Bits, without any conſiderable Increaſe of the Ulcer.

Strong Eſcharotics are always to be avoided as moſt deſtructive; ſuch are all arſenical Preparations, corroſive Sublimate of Mercury, Oleum glaciale Vitrioli, Aqua Stygia, or Aqua-fortis, obtain'd from Nitre, Vitriol, Alum, or Sea-ſalt, by the Heat of the Reverberatory; the Aqua-mortua, or Secunda of the Goldſmiths, in which Silver has been firſt diſſolv'd, and afterwards precipitated by an Injection of Copper, with many other ſuch kind of Medicines, which imprint a deep Eſchar, and excite a great Inflammation.

If, after Deterſion and Mundification, there remain any ſmall Calloſities in the Ulcer, it is better to reſolve and diſcuſs them, by degrees, with ſlight and repeated Inunctions of mercurial or Neapolitan Ointment for a few Days, than to attempt their Conſumption by too free a Uſe of the ſtronger Catheretics, which would put the Patient to unneceſſary Pain, and do a conſiderable Injury to the Part, by enlarging the Ulcer.

As ſoon as the Margin of the Ulcer, after the Removal of the mucous Matter, and the mollifying of the Calloſities, appears ſoft, ſmooth, and of a roſy Colour, we muſt beware of the Uſe of Catheretics, which, by corroding, might prolong, and even dilate the Ulcer; and then we muſt employ only Traumatics, or Vulneraries, to favour the Growth of the new Fleſh, ſuch as *Arcæus*'s Balſam, or the ſimple Ointment of Baſilicon.

The Ulcer, being fill'd up and ſmooth'd by the increaſing Fleſh, is eaſily cicatriz'd by the Uſe of the ſame Remedies; or, if it be thought convenient, the Place may be ſprinkled with Powder of Tutty, Pompholyx, Ceruſs, or Turpentine boil'd to a Hardneſs and pulveriz'd; or dreſs'd with Elixir Proprietatis *Paracelſi*, which ſome extol as very effectual to this Purpoſe.

If the Diſeaſe, through the Careleſſineſs of the Patient, the Violence of the Remedies, ſome Error in Diet, the Uſe of Venereal Commerce, or any other Cauſe, happens to be exaſperated, by the Acceſſion of more formidable Symptoms, ſuch as an Inflammation of the Prepuce or Glans in Men, or of the Nymphæ, Carunculæ, or Clitoris, in Women, we are then to deſiſt from the Uſe of Eſcharotics, and attempt for ſome time not to make a perfect Cure, but employ only palliative Remedies.

The ſame Method is to be us'd for Venereal Ulcers, which ſometimes ariſe at the End of the Urethra, by inſtilling the ſame Remedies, Drop by Drop, in the ſame Order, and with the ſame Cautions, in the Part; or injecting them with a ſhort Syringe, or introducing them with a Probe, which ought to be repeated every Day, as often as, through the Declivity of the Place, or the Emiſſion of the Urine, the Part ſhall happen to be abſterged. But we muſt take care not to ſtop the Paſſage of the Urethra with a Tent, that it might retain the Ointment, as we have known it practis'd by ſome Surgeons to the great Injury of their Patients, by the Retention of the virulent Matter iſſuing from the Ulcers, which, corroding the ſound Parts, gradually increas'd the Diſeaſe.

During the whole Proceſs of the Cure, the Penis is to be ty'd up with a Fillet, in a ſupine Poſture, that the Declivity of the Way may give Occaſion to a freer Regreſs of the Blood, than can be expected from a prone or pendulous Poſition of the Penis, and conſequently that there may be leſs Danger of an Inflammation or Tumefaction. As to Diet, it will ſuffice to preſcribe ſuch as is of a tempering and moiſtening Quality, and moderate in Quantity, unleſs a Fever, Inflammation, or ſome other formidable Symptoms, ſhall require a ſtricter Abſtinence. *Abſtruc de Morb. Vener.*

Boerhaave give a very different Account of Chancres, and Venereal Ulcers, from all former Authors.

When a certain red Spot, ſays he, appearing upon the Glans or Prepuce, ſwells into a Tubercle, fill'd with a whitiſh, yellowiſh Matter, of the Conſiſtence of new Cream, like that almoſt void of Tenacity or Ropineſs to the Fingers, and which, when it dries upon the ſtiffened Linen, appears of a Colour between Green and Yellow; then the Diſeaſe always bodes unluckily, the Cure is not ſo eaſily perform'd, and the prudent Phyſician is now with Reaſon alarm'd. This Tubercle is what the Surgeons uſually call a Chancre; which I have always found to have its Seat in the unctuous Humour, which, in a natural and ſound State, fills that veſicular Texture, call'd by the Antients, the *Panniculus Adiposus*, by the Moderns *Membrana Celluloſa*. See CELLULOSA MEMBRANA.

When, therefore, this contagious Poiſon, admitted by the Pores of the Cuticula, has made its Way thro' the Subſtance of the Skin into the Cells of the adipoſe Membrane, and there has mixed itſelf with the unctuous Maſs, then it poiſons, with its virulent Quality, this tenacious Oil: In this oily Lentor it is locked up, fomented, and, growing every Day more ſharp and active, by Heat, Motion, and Stagnation, above it corrodes and deſtroys the Skin and Cuticula, while all around and below it ſpreads its Poiſon thro' the pinguedinous Cells: Whence, in ſuch Caſes, there is always a wider Breach made in the Panniculus Adipoſus, than in the Skin which covers it. The Tubercle, thus occaſioned, riſing by degrees, attended with a Tenſity, and at laſt with Pain, breaks out at the moſt prominent Part, and throws out ſuch a Matter as I have already deſcribed. As often as this is wiped off, new Matter ſtill ſucceeds; the Ulcer runs Pus without Intermiſſion, nor does all this Suppuration ſeparate the affected from the ſound Parts. On the contrary, the ſame Venom, propagated thro' the neighbouring Parts, procures a conſtant Supply of new Pus; and in this manner the Ulcers, which always have their Seat in the Adipoſe Membrane, become larger by degrees; by a ſlow Progreſs they corrupt the common Teguments, and diſcover the Muſcles ſtript of their Involucra, tho' otherwiſe entire, and of a gloſſy Surface, and high-red Colour. The Lips of theſe Ulcers, in ſuch Parts as are covered with the Skin, never appear ſwoln or retorted, but contracted, ſmooth as if poliſh'd, and of a pale Colour; and the Matter which they diſcharge is ſo remarkably different from what other Abſceſſes yield, that one who is tolerably verſed in this Diſeaſe can, at firſt Sight, diſtinguiſh it from the Ichor and Sanies of all other Ulcers, and the Lymph of Cancers; for the Pus produced in this Diſeaſe ſhines like melted Tallow, it has ſcarce any ropy Lentor, its Colour is of a particular dirty White, and, at the ſame time, inclining to Green. It ſcarce diſcovers any Acrimony, by producing either Heat, or Pain, or Twinging; nor does it ſpread Deſtruction any further than thro' the cellular Membrane, which it reſolves into a putrid Maſs, but without any conſiderable Senſe of Pain. As often as an Ulcer of this Kind happens to heal up, the Skin of the Part, to its great Deformity, becomes attached to the ſubjacent Muſcles, a Cavity remains, the Muſcles continue immoveable, and the Part rigid, with an unſeemly livid reddiſh Colour. The new Teguments are very tenſe and dry, they ſcarcely permit any of the perſpirable Matter to paſs thro' them, and their violent Tenſity gives them a ſhining Appearance. After this Cure, unjuſtly reputed ſo, is performed, immediately the like Miſchief breaks out in ſome neighbouring Part, deſcribes the ſame Courſe, and leaves the ſame Marks behind it. Sometimes theſe virulent Ulcers are ſcattered thro' a great many different Places at once over the Body, which they at laſt conſume. I once ſaw, in a handſome young Nobleman, the whole Extent of the Back flay'd here-

here-and-there with Ulcers of this kind as broad as the Palm of one's Hand, while in ſome Places, between the Ulcers, the Skin remained entire, and appeared as if it had been cut into Girdles; ſo that, after the Cure was perfected, the remaining Scars afforded a very odd Proſpect of Deformity. In this Patient obſerved, that the naked Muſcles ſtill appeared extremely beautiful and lively; and, by a diligent Examination, I found, that the Ulcers had not dug inwards, nor ſpread their devouring Rage beyond the Tunica Pinguedinoſa; and that they had not I deſtroy'd the Skin itſelf, otherwiſe than by corroding the Veſſels under it, and ſo cutting off from it all freſh Supplies of nutritious Juices. From this Caſe I became acquainted with the ſingular Genius of this Diſeaſe: Here I ſaw it in the Shape wherein it firſt diſcovered itſelf in *Europe*, and agreeable to the Deſcription given by the oldeſt Authors on this Subject: I found out the Reaſon why, upon its firſt Appearance, it got the Name of the *Variolæ Hiſpanicæ*; but, at the ſame time, I was made ſenſible what a wide Difference there is betwixt this Diſeaſe, as it then appeared, and that which at this Day is ſo familiar to all the *Europeans*.

When you make an Attempt to cure an Ulcer of this Kind by ſuch Remedies as are found to be the moſt effectual againſt other Ulcers, your Pains will be to very little Purpoſe, unleſs you ſeparate at once all the tainted Fat with the Knife, or the actual Cautery, or Corroſives: But then, after, by corroſive Applications, you have burnt the Ulcer to a Cruſt, the Poiſon retained under the hard Eſchar exerts its Fury, diffuſes itſelf ſtill more and more, ſcatters its malignant Power through the neighbouring Parts, and often produces a very virulent Pox. Upon this Account, an unlucky Practice, which, at preſent, is ſo common among ſome Phyſicians, is greatly to be condemn'd. I mean the Cuſtom of touching thoſe ſmall Ulcers with the Lapis Infernalis, Aqua divina Fernelii, Aqua Vitrioli, Precipitate, and other Applications of the ſame Nature; from which the Tribe of Mountebanks, whoſe only Aim is to fill their Pockets, promiſe ſuch mighty Things: For Applications of this Kind produce an Eſchar, from which I have very frequently ſeen a Pox enſue. The moſt reaſonable Method of treating theſe Ulcers is by emollient, ſaponaceous, watery Fomentations, that they may be kept open as long as poſſible, may remain ſoft and perſpirable, ſo as to diſcharge, by the Mouths of the open Veſſels, the poiſonous Matter thus determin'd outwards, and facilitate its Egreſs. This, to be ſure, is the ſafe, this the effectual Method of healing thoſe malignant Exulcerations, as I have often found by Experience, after other Remedies have been repeated ſeveral times with very bad Succeſs. What naturally leads one to this Practice is, that a plentiful Running, in a virulent Gonorrhea, kept up, for a long time, by proper Methods, is the moſt effectual Preſervative hitherto known from a Pox; whereas, on the contrary, nothing ſo ſoon or ſo certainly occaſions a Pox, as an unſeaſonable Stop put to this Diſcharge.

By this time, I imagine, I have given a clear Account of the Nature of this Diſeaſe, while it is yet in a ſimple State; as alſo of the proper Method of Cure, which conſiſts entirely in diſcharging all the poiſonous Particles involv'd in the oily Maſs. This is eaſily accompliſh'd in a recent Taint, affecting only one Part; but when the Diſeaſe is become inveterate, when the Poiſon has widely diſperſed itſelf thro' the Habit, and has ſeiz'd the internal Parts, which lie beyond the Reach of Fomentations, it becomes a very difficult Taſk.

It is now neceſſary to take a View of thoſe Ulcers, when they have broke out in a Part that is not covéred with the Skin. As there are a great many ſuch Parts in the human Body, I do not pretend to conſider each of them in this Condition; that would make ſufficient Materials for a large Volume: But let us ſuppoſe the Glans Penis, for Inſtance, to be affected with ſuch an Ulcer. From the Inflation of this wondrous Fabric in the Venereal Orgaſm, the nervous Papillæ are ſtretched and erected, ſo as to become ſuſceptible of the higheſt ſenſual Pleaſure. This Part conſiſts of the Corpus ſpongioſum Urethræ, produced as far as to the Orifice of this Canal, and thence reflected over the Extremities of the two Corpora ſpongioſa Penis to where it terminates, forming a riſing Limbus call'd the Corona Glandis. The proper Structure of the Glans is, therefore, principally compoſed of the ſame Subſtance with that of the Urethra. Hence, by the Torrent of arterial Blood ſtill pouring in, while its Return by the Veins is intercepted by the Action of the Muſculi Erectores, applied to the bulbous Part of the Urethra, below the Neck of the Bladder, this Fabric is brown up, ſtretched, and may be diſtended even to burſting; tho' this violent Tentigo only happens in the Venereal Action, when it is juſt upon the Criſis; ſo that, at this time, the Glans is highly inflamed: But, after the Exploſion of the Semen, this Part ſooneſt grows flaccid; and, as in that Inſtant it is become very bibulous, it eaſily ſucks into its empty'd Cells any penetrating Particles applied to its glowing Surface. Hence, in the firſt Place, we learn the Reaſon why the Contagion ſo frequently affects this Part; why the fungous Part of the Glans is often ſo turgid with the Venereal Pus already deſcribed, as that, upon Compreſſion, it ouſes out at its Pores; why Ulcers, formed in this ſpongy Fabric, conſuming its Structure, and melting it down into a Venereal Corruption, ſhall cauſe the whole mortify'd Glans to drop off, while the reſt of the Penis frequently remains entire. In the laſt Place, a Communication plainly appears, by means of the Corpus ſpongioſum Urethræ, to be continued all the Way from the Top of the Penis to below the Neck of the Bladder; and ſince one and the ſame cellular Body is continued all that Way, and the Surfaces of theſe Cells are conſtantly beſmear'd with a fat unctuous Moiſture, to preſerve them in a ſlippery expanſile State, we ſee plainly why an Infection received here proceeds in its Growth with ſo much Luxuriancy.

Beſides the Corpus ſpongioſum Urethræ, a numerous Series of ſenſible nervous Papillæ contributes to the Compoſition of the Glans. Theſe lie diſpoſed in regular Rows upon the Surface of the ſpongy Fabric, and conſtitute in ſuch a manner the Surface of the Glans, that the Extremities of theſe Nerves, which are the proper Organs of Pleaſure and Pain, lie upon one another, and are braced down by that very tender Membrane, which covers the Glans. Hence, when the Glans is bared of this external Involucrum, the looſen'd diſengag'd Papillæ ſtare outwards, and the whole Surface of this Part appears jagged and villous. Again, every one of theſe Papillæ is wrapt up, ſeparate from the reſt, in a ſubtle cellular Membrane. When, therefore, the Venereal Poiſon, after having made its Way thro' the thin external Membrane of the Glans, has alſo deſtroy'd the proper Involucra of thoſe Nerves, the Papillæ are now laid bare. But then what an intolerable Pain is raiſed! Such an exquiſite one, that there is ſcarce a more inſupportable Symptom attends the Venereal Diſeaſe. If then this ſlight cellular Texture be deſtroy'd by the acrid Poiſon, the unconfin'd Papillæ will begin to ſprout, and form Venereal Warts. This dreadful Symptom appears principally upon the Corona of the Glans, where the Papillæ are the moſt numerous. I have ſeen with Horror the Glans deformed, and become prickly like a Hedge-hog, and the Prepuce almoſt quite depriv'd of Motion, by thoſe dreadful Excreſcences: And it has frequently happened, in ſuch a Caſe, from an unſkilful Management, ſuch as the Fretting the naked, ſenſible, papillous Subſtance of the Glans, by acrid Applications, that the whole Body of the Penis has become moſt miſerably inflamed, bloated, and ſeiz'd with an exquiſitely painful Priapiſm. Wherefore the ſafeſt Remedies againſt this kind of Misfortune too, are emollient, moiſtening, relaxing, anodyne Applications, and ſuch things as ſolicit the Poiſon outwards. Theſe Remedies you will be obliged to have recourſe to, tho' late, when the Diſturbances, roufed by corroſive Applications, are to be appeaſed. In thoſe Caſes I have perform'd by Milk and Marſhmallows what I could not by Quickſilver; and I have found the good Succeſs of Unguentum de Althæa, or Nutritum, where Ægyptiacum and mercurial Ointments were of no Uſe.

The laſt Part which helps to conſtitute the Glans, is that forementioned fine Membrane in which it is inveloped. This is a Production of the Cuticula, which lines the internal Surface of the Præputium; whence it aſcends over the Corona Glandis, and gives a Covering to the whole Glans. It is likewiſe expanded over the external Surface of the Prepuce, and the Integuments of the whole Penis forming its Epidermis. And thus, by its means, an Intercourſe and Sympathy is carried on betwixt the Cuticula of the Penis and the Surface of the Glans. Hence it is, that malignant Ulcers of the Penis have ſometimes been known to have infected the Glans, and Diſorders of the Glans to have propagated their Contagion to the external Parts of the Penis. Here then we ſee one Inſtance of the wondrous and artful Mechaniſm, by which Nature produces ſo many different Miſchiefs by the ſame Poiſon, ſtill mixed with the oily Humours, but exerting itſelf upon different Parts of the Body.

If, therefore, the Contagion has been lately applied to a Part covered with the Cutis, let it be well chafed, for a long time together, with warm Wine, Honey, and Salt, mixed: After this let the Part be wrapt up in Cloths dipt in the ſame Fomentation, and kept conſtantly in an equal Heat. If the Infection has lodged there for any conſiderable time before the Phyſician was call'd, after the Part has been bathed with the ſame Fomentation very warm, let a Veſicatory, made up with Cantharides, be applied to it, with Cloths, dipt in the Fomentation, over all. After the Bliſter is cut, let the Diſcharge be kept up with Unguentum Aureum, or Tetrapharmicum, together with a very ſmall Quantity of red Precipitate, and over the Ointment too apply a Stupe of the ſame Fomentation. In this manner let the Ulcer be managed for twelve Days, or more; and if the Patient, in the mean time, abſtains from fat Meat, and every thing of a hot ſtimulating Nature, he need not be anxious about the Event.

If the Contagion is recent, and has ſeized a Part which is not covered with the Cutis, ſuch as the internal Surface of the Prepuce, the Glans, the Lips, or the Mouth; ſuppoſe either of the two firſt-mentioned Parts be affected, let the Penis, with the Prepuce drawn back, be bathed in a Fomentation of the ſame, or the like Materials. Baths for this Purpoſe cannot be of a too emollient Nature; for here the main Streſs of the

the Cure depends upon relaxing the Pores, ſo that the infecting Matter may be diſcharged by them. Thoſe Parts, therefore, ought always to be kept perſpirable, with warm, moiſt, emollient Applications; and ſuch Remedies are to be uſed even after the infected Part is ulcerated; for while a free Diſcharge is thus procured to the morbid Matter, it will ſcarce make its Way inwards; and by this means the preſent Malady is cured, and Affections which would otherwiſe happen afterwards are prevented. In the mean time, hydragogue Purges, frequently repeated, are likewiſe conducive to the ſame Ends; and an emollient Balſam, compounded of Turpentine, the Yolk of an Egg, and crude Mercury, ſpread upon a Pledget, and applied to the Ulcer, is of great Service. In ſhort, by this Method one may promiſe almoſt perfectly to remove this Miſchief, which, when neglected, very often grows up to a moſt virulent Pox. Nor let any one wonder, that I ſhould propoſe this ſimple Method of Cure, without giving inwardly ſo much as one Grain of Mercury, while it is the common Opinion of almoſt all that practiſe in this Diſeaſe, that nothing but Mercury can prevail againſt it, and that Mercury is the very thing that cannot be diſpenſed with in the Cure. Conſider only, that hitherto I have put the Caſe, that the Infection is of very ſhort Standing; that only one, and that an external Part is affected; and that the whole Fomes of the Diſeaſe lies in one ſmall Ulcer. While the Caſe ſtands thus, I dare promiſe a perfect Cure from the Method already laid down; and I am abſolutely certain, that this Method is ſufficient. Wherefore I ſhall never be reconciled to the raſh Practice of ſome, who, whenever they hear a young Fellow complain of any Venereal Diſorder, at the firſt preſcribe Mercury, which always gives the Conſtitution a Shock, and often a needleſs one.

But as the ſofter Sex are, in this Diſeaſe, for the moſt part, affected with the ſame kind of Ulcers, breaking out in the mucilaginous Sinuſes within the Pudenda, here too nothing is of greater Uſe, while the Malady is yet in the State already deſcrib'd, than to foment and bathe the Parts with emollient, relaxing, detergent, and antiſeptic Liquors. Vinegar, Wine, Honey, and Salt, poſſeſs the two laſt-mention'd Qualities; for the two firſt I would chuſe all the emollient Herbs. I have had the Pleaſure to ſee a ſpeedy Cure perform'd, by this Method, upon a great many Female Patients, while the Diſeaſe was of ſhort Standing, and as yet unattended with other Symptoms. *Boerhaave's Preface to the Aphrodiſiacus.*

CHANNA, χάννα, χάννη. A ſort of Sea-fiſh, not unlike the Perch, whoſe Fleſh, however, is ſaid to be ſomewhat harder. There is another ſort of Fiſh, not unlike this, call'd *Cannadella*, or rather *Channadella*, which, at *Marſeilles*, is known by the Name of *Channa*. *Caſtellus.*

CHANTERELLA *flava, gelatinoſa. Fungus gelatinus, flavus.* Vaill. 58.

This is about an Inch in Height, and about a Line or two thick; it uſually grows in Cluſters. The Stalks are a little flatted, and furrow'd on one Side; and their Surface is ſhagreen'd. The Head is uſually angular, with the Centre ſunk into a kind of Navel; and the Edges, which are turn'd down, are cut into three or four rounded Segments. The upper Surface of the Head is yellow, but more dirty and livid than the Stalks. When it decays, it turns into a greeniſh Jelly.

Under the Name of *Chanterella*, I comprehend thoſe Fungi, whoſe Head is ſolid, that is, neither lamellated, nor porous, nor latticed, nor prickly, nor turning to Duſt when ripe. *Martyn's Tournefort.*

CHAOMANTIA, amongſt the enthuſiaſtical Chymiſts, is the Art of making Preſages from Obſervations on the Air.

CHAOS, in the Phraſe of *Paracelſus*, imports the Air. It has alſo ſome other whimſical Significations among the Alchymiſts, of very little Importance.

CHAOSDA. An Epithet for the Plague, us'd by *Paracelſus.*

CHAOVA. The *Egyptian* Name for COFFEE, which ſee.

CHARA is a Genus of Plants deſcrib'd, among many others, by M. *Vaillant*, in the Memoirs of the Academy of Sciences, for the Year 1719. as follows: The Flowers of all the Species grow upon the Leaves, and are imperfect, regular, monopetalous, and Hermaphrodite. The Ovary grows on the Top, where, by its Indenture, it repreſents the Figure of an antique Crown, whence it becomes a coronated Seed-veſſel, ſolid, and monoſpermous, or containing a ſingle Seed. The Leaves are ſimple, without Pedicles, and diſpos'd in Circles about the Stalks at Intervals; thoſe on which the Flowers grow are indented in ſuch a manner, that the Segments are directly oppoſite, ſo as to form, by their Conjunction, the Reſemblance of a Pair of Pincers, in every one of which is lodg'd an Ovary.

M. *Vaillant* diſtinguiſhes nine Species of the *Chara*, but I find no medicinal Virtues attributed to either of them. All theſe Species were before call'd by the Name of *Equiſeta*, Horſetails.

CHARABE, or *Carabe*, Amber. See AMBRA.

CHARACIAS, from χάραξ, a Bulwark, or Fence. An Epithet given to ſome Plants, which require a Support, as the Vine. It is commonly join'd with the *Arundo Vallatoria*; and by *Dioſcorides*, *L.* 4. *C.* 165. to the *Tithymalus Mas.*

CHARACTA, a Weight call'd a Carat. See CARATA.

CHARACTER, in Botany, is that Aſſemblage of Marks, by which every Species of Plants is diſtinguiſhed from every other Species.

In Chymiſtry it imports a Mark importing ſome particular Thing, the Principal of which I have given *Tab.* 20. and 21.

Character alſo ſometimes ſignifies an hereditary Diſpoſition to ſome particular Diſeaſe.

CHARADRIUS, χαραδριός. A Sort of Bird, of which *Ælian* fabulouſly relates, that the Sight of it cures a Perſon of the Jaundice. It is call'd alſo *Galgulus*, and *Hiaticula.*

CHARAMAIS. The *Turkiſh* and *Perſian* Name for the AMBELLA, which ſee.

CHARANTIA. The *Balſamina Mas*, or *Momordica.*

CHARCEDONIUS *Lapis.* The ſame as *Chalcedonius Lapis.*

CHARIEN, χάριον. The Name of a Plant, the Root of which, if applied to the Navel but a very ſhort time, expels the dead Fœtus. I don't find, that it is preciſely known what this Plant is. Some take it to be the *Tithymalus Characias.*

CHARISTOLOCHIA. A Name for the *Artemiſia*, Mugwort.

CHARME, or *Charmis.* The Name of an Antidote mention'd by *Galen*, *Lib.* 1. *de Antidot. Cap.* 4.

CHARONIUS, χαρώνιος, Charonean. An Epithet for Caves, ſome of which are found in *Italy*, and in other Parts of the World, where the Air is ſo loaded with a poiſonous Vapour, that Animals cannot live in them, even a few Moments.

CHARTA VIRGINEA. A Name for the AMNIOS.

CHASME, χάσμη, or χασμός. Oſcitation, Gaping. *Hippocrates*, in his *Epidemics*, *Lib.* 2. informs us, that long Reſpiration is a Cure for continual Oſcitation. I ſuppoſe he means deep Reſpiration, and drawing in the Air at long Intervals.

CHATE. The *Egyptian* Cucumber, call'd by *Boerhaave Cucumis*; *Ægyptius*; *rotundifolius.* See CUCUMIS.

CHAULIODONTA, χαυλιόδοντα. Thoſe Animals are thus called, whoſe Teeth grow a great Length out of their Mouths, as the Boar and Elephant.

CHAUNOS, χαυνός. Soft, lax, yielding to the Preſſure of the Fingers, fungous. It is applied by *Hippocrates* to Tumors, and to the Bones; and alſo ſometimes to Urine, when it imports that which is aqueous and thin, and without any Sediment or Cloud; or perhaps that in which a kind of ſpongy Cloud appears.

CHEDROPA, χεδρόπα. All Sorts of Corn and Pulſe.

CHEILOCACE, χειλοκάκη, from χεῖλος, a Lip, and κακὸν, an Evil. Literally the *Lip-evil*; a Swelling of the Lips, to which the Inhabitants of Northern Countries, eſpecially Children, are ſaid to be very ſubject.

CHEILOS, χεῖλος. A Lip.

CHEIMETLON, χείμετλον, from χεῖμα, the Winter. A Chilblain. See PERNIO.

CHEIMIA, χειμία. Cold, Shivering.

CHEIMON, χειμών. Winter, or cold Weather.

CHEIR, χείρ. The Hand. See BRACHIUM.

CHEIRAPSIA, χειραψία, from χεὶρ, the Hand, and ἅπτομαι, to touch. Scratching. *Cœl. Aurelianus.*

CHEIRI, *Cheyri*, or *Keiri.* Wall-flower. It is the *Leucoium*; *luteum*; *vulgare.* See LEUCOIUM.

CHEIRIATER, χειριάτρος, from χεὶρ, the Hand, and ἰατρὸς, a Phyſician. A Surgeon.

CHEIRISMA, χείρισμα, or χειρισμός. A handling of any thing, or a manual Operation.

CHEIRIXIS, χείριξις. Surgery in general, or the Treatment of any Diſorder, comprehending every thing which is done with a View of curing it.

CHEIRONOMIA, χειρονομία. An Exerciſe mention'd by *Hippocrates* in his Treatiſe *De Victus Ratione*, *L.* 2. which conſiſted in particular Geſticulations of the Hands.

CHEIZI, in the Phraſe of *Paracelſus*, when, ſpeaking of Minerals, imports Quickſilver; but, relative to Vegetables, it ſignifies their Flowers. Some interpret it the *Aurum Potabile*, others Antimony. *Rulandus.*

CHELA, χηλὴ, has many Significations in Medicine; for it imports a forked Probe, mentioned by *Hippocrates*, *Lib.* 2. *de Morbis*, uſed in extracting a Polypus of the Noſe. But, in *Ruffus Epheſius*, *Cap.* 4. χηλαὶ, *Chelæ*, implies the Extremities of the *Cilia*, which touch each other when the Eyes are ſhut. But the moſt frequent Signification of *Chelæ* is Claws, particularly thoſe of the Crab. *Chelæ*, further, ſignifies Fiſſures in the Heels, Feet, or Pudenda.

CHELIDON, χελιδὼν, The Swallow. See HIRUNDO. The Hollow alſo, at the Flexure of the Arm, is call'd by this Name.

CHELIDONIUM *Majus.* The greater Celandine.

The Characters are;

The Flower-cup conſiſts of two Leaves, which ſoon fall away. The Flower is tetrapetalous, cruciform, and ſoon falls off. The Petals grow round the Baſe of the Ovary, whence alſo ariſe many Stamina. The Ovary is furniſh'd with a Tube, and becomes a Pod, with one Seed-veſſel, which is bivalve, the Valves adhering to the Feneſtra, and contains many roundiſh Seeds. The Plant abounds in every Part with a gold-colour'd acrimonious Juice. *Boerhaave's Index alter, p.* 305. *Pars* 1.

Boerhaave mentions five different Sorts of this Plant.

1. Chelidonium; majus; vulgare. *Park. Theat.* 616. *C. B. Pin.* 144. *Hiſt. Oxon.* 2. 257. *Dill. Cat. Giſſ.* 56. *Tourn. Inſt.* 231. *Elem. Bot.* 198. *Buxb.* 68. *Boerh. Ind. A.* 305. *Mer. Pin.* 26. CHELIDONIUM MAJUS, Offic. Ger. 911. Emac. 1096. Chab. 484. Merc. Bot. 1. 28. Phyt. Brit. 27. Raii Hiſt. 1. 858. *Chelidonia*, J. B. 3. 482. *Chelidonium, ſive Chelidonia*, Rupp. Flor. Jen. 56. *Papaver corniculatum luteum Chelidonia dictum*, Raii Synop. 3. 309. CELANDINE.

The Root of this *Celandine* is pretty thick at the Head, divided into Branches, which fix themſelves pretty deep in the Earth; from which ſpring bluiſh-green wing'd Leaves, divided generally into five Parts, ſomewhat like Columbines, but longer, the Section at the End being the largeſt. The Stalks grow to be a Foot or more high, full of thick Joints or Knees, having two ſmaller Leaves at each Joint. The Flowers grow ſeveral together, upon a Foot-ſtalk three or four Inches long, each having a ſhorter of its own. They conſiſt of four ſmall yellow Leaves, included in Calyces of two hollow Parts; and after they are fallen, which they ſoon do, they are follow'd by pretty long narrow Pods, full of ſmall round ſhining black Seed. Every Part of the Plant, when broken, emits a yellow bitter acrid Juice. It grows among waſte Grounds and Rubbiſh, upon Walls and Buildings; and flowers in *May*.

Celandine is aperitive and cleanſing, opening Obſtructions of the Spleen and Liver; and of great Uſe in curing the Jaundice and Scurvy. Some reckon it cordial, and a good Antidote againſt the Plague. Some Quantity of it is put into the *Aqua Mirabilis*. Outwardly it is uſed for ſore Eyes, to dry up the Rheum, and take away Specks and Films; as alſo againſt Tetters and Ring-worms, and ſcurfy Breakings-out. *Miller's Bot. Off.*

Dioſcorides relates, that it was believed in his Time, that the Swallows, by the Application of this Herb, reſtored Sight to their young ones, whoſe Eyes had been put out. *Ariſtotle* was of the ſame Opinion; but *Celſus* juſtly rejected this Error, for Experience ſhews, that in leſs than an Hour an Animal ſees clearly, tho' the horny Coat of the Eye has been pierced, ſo that ſeveral Drops of the aqueous Humour came out. Celandine is bitter, acrid, and burning, eſpecially the Root, which yields more Orange-colour'd Juice than the other Parts of the Plant: It gives but a faint red Colour to blue Paper; and ſmells like rotten Eggs, which makes one believe, that its Juice is (if I may ſo ſay) phagedenic, ſomething like the Liquor which reſults from the Mixture of the Solution of Sublimate and Lime-water, or Milk which has boil'd ſome time with an acrid Salt.

Celandine, by a chymical Analyſis, yields a good deal of Salt, both fix'd and volatile; but it is involved in a great deal of Sulphur and Earth.

This Plant, taken inwardly, is very aperitive: The Infuſion of a Pugil of its Leaves, macerated cold, a whole Night, in a Glaſs of Whey, with one Dram of Cream of Tartar, is a good Remedy for the Jaundice and Green-ſickneſs: Some add to it an Ounce of the Syrup of Succory. For the Dropſy they infuſe, for twenty-four Hours, one Ounce of the Root of Celandine, and half an Ounce of Tincture of Steel, in a Pint of White-wine: They ſtrain the Infuſion thro' a Linen Cloth, and give the Patient three Ounces of it twice a Day. The following Preparation is very good for Vapours, and a Conſumption of the Lungs:

> You muſt put in Digeſtion, for eight Days, twelve Pounds of the whole Plant, gently bruiſed; three Dozen of Crayfiſh, cut ſmall; and two Pounds of Honey: Lute the Alembic, and diſtil theſe Ingredients *in Balneo Mariæ*.

This Water, being drank from two to four Ounces, is excellent for the Vapours. It abates the Inflammation of the Eyes, and dries up the Ulcers of thoſe Parts, as well as the Juice of Celandine, temper'd with Milk. It is applied, without Milk, to Webs in the Eyes, in order to eat them away. *Julian Paulmier*, a famous Phyſician of the Faculty of *Paris*, ſet a great Value on the Juice of the Root of this Plant, in the Plague. The Herb, bruiſed, cures Wounds: Some add to it the Leaves of the horned Poppy. *Martyn's Tournefort.*

2. Chelidonium; majus; foliis quernis; flore laciniato. *M. H.* 2. 257. GREATER CELANDINE, WITH LEAVES LIKE THE OAK, AND LACINIATED FLOWERS.

3. Chelidonium; majus; foliis & flore minutiſſimè laciniatis. *H. R. Par.* 49. GREATER CELANDINE, WITH FINE-CUT LEAVES AND FLOWERS.

This, *Boerhaave* ſays, is the *Othonna* of *Dioſcorides*. See AFRICANUS FLOS.

4. Chelidonium; maximum; Canadenſe; ἄκαυλον. *Corn.* 212. LARGE CANADA CELANDINE, WITHOUT STALKS.

5. Chelidonium; majus; vulgare. *C. B. Pin.* 144. *Boerhaave's Index alter Plantarum, Vol.* 1.

CHELIDONIUM MINUS. The leſſer Celandine.

The Characters are;

It has a grumous, or glandulous, perennial Root: The Leaves are roundiſh; the Flower-ſtalks trail upon the Ground; at their Top they bear a Placenta, whoſe Baſe is ſurrounded by the Perianthium, which conſiſts of three Leaves, ſometimes of four, but ſeldom of five, which are always caducous. The Flower is roſaceous, expanded, conſiſting of five or more Petals, which ariſe from the very Bottom of the Placenta, within the Flower-cup, with a Multitude of Stamina, ariſing from the Bottom of the Placenta, between the Petals and the Ovary. The Placenta contains an Ovary of a globular Form, each of whoſe Cells, or Eggs, are furniſh'd with a crooked Vagina, which has a fungous Apex. *Boerhaave's Index alter.*

Boerhaave takes notice of four Species of the leſſer Celandine.

1. CHELIDONIUM; MINUS. Offic. Ger. 669. Emac. 816. Chab. 484. Park. Theat. 617. Raii Hiſt. 579. Synop. 3. 246. Mer. Pin. 26. Boerh. Ind. A. 29. *Chelidonium minus, ſive Scrophularia minor*, Merc. Bot. 1. 28. Phyt. Brit. 27. *Chelidonia rotundifolia minor*, C. B. Pin. 309. *Scrophularia minor ſive Chelidonium minus vulgo dictum*, J. B. 3. 468. *Ficaria*, Dill. Cat. Giſſ. 39. *Ficaria vulgaris*, Rupp. Flor. Jen. 127. Buxb. 110. *Ranunculus vernus rotundifolius minor*, Tourn. Inſt. 286. *Ranunculus præcox rotundifolius radice granuloſa*, Hiſt. Oxon. 2. 446. *Ranunculus Chelidonides rotundifolius præcox radice granulata*, Pluk. Almag. 314. *Ranunculus rotundifolius minor*, Hort. Monſp. 169. PILEWORT.

This ſmall Plant, beſides the ſlender white fibrous Root, which ſpreads and faſtens itſelf in the Ground, has ſeveral ſmall oval whitiſh Tubercles, ſomewhat reſembling the Piles, or the Swellings of the Hæmorrhoids, whence it takes its Name. The Leaves grow upon long Foot-ſtalks, ſmooth and ſhining, in Shape of Ivy-leaves, but leſs, rounder-pointed, and of not ſo firm a Texture, ſometimes ſpotted with whitiſh Spots. The Flowers grow upon pretty long Stalks inclining to the Earth, with a Leaf or two on them more angular, ſharper-pointed, and ſmaller, than the others: They conſiſt of eight or nine narrow ſharp-pointed Petala, of a ſhining yellow Colour, with a few yellow Stamina in the Middle, ſet about a greeniſh Head, which is compoſed of ſmall naked Seeds.

It grows in Meadows and moiſt Paſtures, and by Hedgeſides; and flowers in *April*.

This Herb, on account of its Signature, is accounted to be good for the Hæmorrhoids or Piles, to eaſe their Pain and Swelling, and ſtop their Bleeding, the Roots being taken inwardly, and an Ointment, made of the Leaves and Roots, applied outwardly. Some commend it for the Jaundice and Scurvy, eſpecially in the Mouth, to ſtrengthen the Gums, and preſerve the Teeth. *Miller's Bot. Off.*

It is alſo eſteem'd a good Remedy, either internally or externally uſed, for the Hernias in Children.

2. Chelidonium; minus; folio anguloſo, maculoſo.

3. Chelidonium; minus; flore pleno. *Camerar. Hort.* 40. THE LESSER CELANDINE, WITH DOUBLE FLOWERS.

4. Chelidonium; minus; folio majori, anguloſo. *Boerhaave's Index alter Plantarum, Vol.* 1. *p.* 29.

CHELIDONIUS *Lapis.* A Stone, found, as is ſaid, in the Craw of a young Swallow. *Dioſcorides, L.* 2. *C.* 60. informs us, that, if you open young Swallows, you will find in the Craw ſome Stones: Of theſe, ſays he, take two, one of various Colours, and another of only one Colour; incloſe theſe, before they have touch'd the Earth, in a Piece of the Skin of a Heifer, or Stag; then tie them about the Arm, or Neck, and by this means you will relieve epileptic Patients, and generally reſtore them to Health. The ſuperſtitious Circumſtances, with which this Remedy is to be attended, render its Efficacy much ſuſpected; for, firſt, the young Swallows muſt be thoſe of the firſt Brood which the old Bird has had, a Thing very difficult to aſcertain. Secondly, the Stones muſt be taken out of the Craw during the Increaſe of the Moon. Thirdly, they muſt never touch the Ground. I don't know, that any Experiments have been made with theſe Stones, either to determine, or diſprove their Virtues; neither ſhould I think it worth the while.

CHELONE, χελώνη. A Tortoiſe. It imports alſo a Part of a chirurgical Machine, mention'd by *Oribaſius de Machinamentis, Cap.* 4. & 5. See TESTUDO.

CHELONE. A Plant, ſo call'd by *Tournefort*, in the *Memoirs of the Royal Academy of Sciences for* 1706. from the Reſemblance of its Galea to a Tortoiſe.

The Characters are;

It has a ſquamous, ſhort, green Calyx; the Flower is monopetalous, and bilabiated; the Galea reſembling the Shell of a Tortoiſe, with a bifid Apex, and a trifid Beard, extending beyond the Galea. From the inner and lower Part of the Flower ariſe four Stamina, with teſticulated Heads. The Ovary grows to the Placenta in the Bottom of the Calyx, within the Flower, is furniſh'd with a long Tube, and becomes a Fruit perfectly reſembling that of the Fox-glove, roundiſh, oblong, bicapſular, and full of Seeds, which are adorn'd with a ſmall foliaceous Fringe round the Edges. *Boerhaave's Index alter, Part* 1. *p.* 240.

Boerhaave mentions but one Species of this Plant, which is, Chelone; Acadienſis; flore albo. WHITE FLOWERING CHELONE OF ARCADIA.

Boerhaave Index alter Plantarum, Vol. 1.

CHELONIUM, χελώνιον. The convex Part of the Back, which is ſituated immediately under the Neck.

CHELONITES *Lapis*. A Name of the *Lapis Bufonites*.

CHELYS, χέλυς. The Breaſt; ſo call'd from its Figure, reſembling the Back of a Tortoiſe.

CHELYSCION, χελύσκιον, from the preceding Word, imports a ſhort dry Cough.

CHEMA, χήμη. This, according to *Blancard*, *Lex. Renov. & Lem. Phar.* is the Name of a certain Meaſure ſometimes mention'd by the *Greek* Phyſicians, and which is thought to have contain'd about two ſmall Spoonfuls. But we muſt obſerve, that the *Athenians* had two *Chemas*, the larger of which weigh'd three Drams, and the leſſer two; which latter is equivalent to the thirtieth Part of the *Cotyle*, or Half-pint. It is not improbable, that, by the *Chema*, a certain Meaſure is denoted, containing as much as a certain Sea-ſhell, call'd *Chama*, holds. The determined Weight of this Quantity cannot be accurately aſcertain'd, in conſequence of the different ſpecific Gravities of different Subſtances: Juſt as, at preſent, the Word *Spoonful* is uſed in a vague and undetermin'd Senſe, eſpecially with reſpect to Subſtances, of which 'tis a Matter of Indifference, whether a little more or a little leſs be uſed.

CHEMIA, χημεία, is, by *Suidas*, defin'd ἡ τῦ ἀργύρυ καὶ χρυσῦ κατασκευή. The Preparation of Silver and Gold. The Word κατασκευὴ ſeems to imply no more than the Separation of Silver and Gold from their Ores. *Suidas* adds, that the Emperor *Dioclesian* order'd all the Books he could procure, which treated on theſe Subjects, to be burnt; leſt the *Egyptians* ſhould by this Art grow rich, and be tempted to rebel.

It ſhould, at firſt Appearance, ſeem ſtrange, that a flat Country, like that of *Egypt*, which was never remarkable for abounding with Mines of Metals, ſhould be celebrated for the Skill of its Inhabitants, with reſpect to the Treatment of Metals. But, if we conſider the prodigious Riches of the antient *Egypt*, we may, perhaps, find Reaſon to ſuſpect, that it had ſome other Source of Wealth than the Fertility of the Soil. 'Tis not improbable, that the antient *Egyptians* carry'd on a Commerce into the inland Parts of *Africa*, where Gold Ore, or Gold Duſt, was found, and perhaps Silver; which Traffick, for political Reaſons, they might conceal from other Nations. As the Prieſts ingroſs'd all the Learning, as well as Wealth, of the Country, theſe were probably the Smelters and Refiners of their Ores; and the Method of treating them they would probably keep to themſelves, both for national and private Conſiderations. Hence, if they wrote upon the Subject, whatever they deliver'd was ſo involved in Allegory, and deſignedly obſcured, that nobody, but their own Order, could find out the Meaning.

It is even probable, that they pretended to the Art of converting baſer Metals, which they uſed in their Proceſſes, into real Gold, the better to conceal the true Sources of their Wealth. Now when Men of Learning, in after Ages, met with their Books, not being able to underſtand their true Meaning, and not knowing how to decypher them, they might take their Allegories in a literal Senſe, and thus believe, that there really was a Method of making Gold from other Metals. When ſuch a Notion, fooliſh as it was, had once begun to prevail, it was natural enough for the Avarice of Mankind to leave nothing untry'd for the Revival of ſo beneficial an Art, ſuppoſed to be loſt. This Miſtake was, probably, the Foundation for all thoſe Reſearches which have been made after the Tranſmutation of Metals; for I can never believe, that there ever was, in reality, any ſuch Art; the converting of one Metal into another being, in my Apprehenſion, attended with as much Difficulty as the converting a Thiſtle into a Cedar. The Miſtake was, however, very fortunate for Phyſic; becauſe the Experiments made on this account gave Occaſion to the Diſcovery of many important Remedies.

With reſpect to the Orthography of Chymiſtry, though a thing of no great Importance, ſome Controverſies have been raiſed upon this Subject, which it is not worth while to enter upon. I ſhall only remark, that the Derivation of the Word is utterly uncertain; and, therefore, I ſhall always make uſe of *Chymiſtry* as a Word already received in the *Engliſh* Language; tho' ſome, either out of an Affectation of Singularity, or too ſervile a Complaiſance to the celebrated *Boerhaave*, or to the *French*, have lately call'd it *Chemiſtry*, or *Chemy*; the laſt of which particularly appears to be a very trifling and idle Innovation.

Having given ſome Account of the Introduction of Chymiſtry into Medicine in the *Preface*, it remains, that I point out the Imperfections and Excellencies, the Uſes and Abuſes, of the Art; and give a Catalogue of the principal Authors who have wrote on chymical Subjects. The firſt of theſe I ſhall do by giving the Subſtance of an Oration, wrote by *Boerhaave* with this View. Mean time, thoſe who are inclined to be acquainted with the learned, but trifling Controverſies relating to the Antiquity of Chymiſtry, may conſult *Borrichius*, and *Conryngius de Hermetica Medicina*. See alſo our *Preface*.

The Art of Chymiſtry is, by ſome of no mean Reputation for Wiſdom and Gravity, exploded as ſubject to a Multitude of Errors, productive of very little uſeful, but conſuming a Man's Fortune, and reducing him to Beggary, and, in ſhort, as the Plague and Curſe of a rational Mind. There are others, on the contrary, who, from a natural Inclination to the Art, or convinced by Experiments, think, that nothing worthy of the Subject can be ſaid in Praiſe of Chymiſtry. But their Authority has but little Weight with good Judges, who know they are as much to be cenſur'd for their doting Fondneſs, as the former for their unreaſonable Deteſtation and Reproaches. Confeſſing, therefore, thoſe Errors which have been introduced by the Chymiſts into Arts and Sciences, I ſhall endeavour to prove, that theſe Errors are moſt effectually removed only by the Induſtry of the Artiſts in Chymiſtry.

With reſpect to the well-known Enthuſiaſm, and fabulous Turn, of the Chymiſts, there are ſome Cauſes to be aſſign'd, in the Nature of Things, why thoſe who firſt cultivated this Art were ſo extremely addicted to Fiction. Chymiſtry was formerly in the Hands of Miners, and Smelters of Metals, Men unacquainted with the liberal Sciences, debarr'd from all Commerce with the learned World, condemn'd to lead their Lives in Darkneſs under Ground, and to ſupport their wretched Beings with coarſe and hard Fare. Conſider theſe Men daily obnoxious to a thouſand Dangers, dreading what may happen, diſturb'd in Mind, and leading a very uneaſy Life. They tremble at the frequent Earthquakes, the rapid Torrents from the Mountains, at the Meteors and Damps, the Coruſcations of the groſs and ſulphurous Exhalations, the Reſoundings of the Caverns, and the ſubterraneous Bellowings. Under all this they have no wiſe or prudent Perſon to conſult, who might remove their vain Fears, and reſtore Light to their troubled Minds: Hence they give their Attention to ſuperſtitious Tales, and fabulous Stories, calculated to frighten as well as amuſe, and, by increaſing Melancholy, to change Fools into Madmen. He who chuſes ſuch Maſters as thoſe for his Tutors in any Art, had need of an uncommon Firmneſs of Mind to keep himſelf free from thoſe Errors and Vanities, with which they are corrupted: For ſuch is the Caſe with thoſe who give themſelves to learn an Art, that the Authority of a Maſter, a Fable propagated by Tradition, and a Frequency of Examples, ſeduce thoſe, who, in other reſpects, are very diſcreet, and ſkilful in diſtinguiſhing Fictions from Realities.

What made a fatal Addition to this Evil, of which we complain, was, that very learned Phyſicians, deſpiſing *Galen*, with the *Peripatetics* and *Arabians*, devoted themſelves wholly to the Chymiſts. For when they found, that the firſt entertain'd them, for the moſt part, with nothing but Words, the other with Experiments; that the former were ſtock'd with nothing but general Notions, and Speculations, form'd in the Brain; but that the latter gave ſenſible Proofs of their Art by outward Effects; admiring the Difference, they ran blindly into the Opinions, and embraced all the Ratiocinations of thoſe Teachers who had ſo agreeably entertain'd them. This gave Occaſion to the Revival of all thoſe old and abſurd Notions of the *Magi*, *Chaldæans*, and *Perſians*, that the Fire was God; with the fine and flattering Opinion of *Pythagoras*, concerning the Tranſmigration of Souls. Some, with *Epicurus*, aſſerted the Mind to be a ſmall Cloud of Corpuſcles, which were inviſible, on account of their Minuteneſs; others, with *Plato*, imagined Demons exiſting every-where. Some try'd the magic Arts of *Zoroaſter*; and you might obſerve the graveſt and principal Men among the Chymiſts, ſeriouſly teaching and inculcating, as real Verities, all the ingenious Fictions of the Poets concerning the Fauni, Satyrs, Genii, Nymphs, Pygmies, and Demigods, the Lords of the Woods, Mountains, Waters, ſubterraneous Places, and the Air. They impoſed on their Diſciples a Belief of the Sorceries, Faſcinations, and Inchantments of Shepherds and Swineherds, the vain Conjectures, and direful Prognoſtications, of Aſtrologers; the Amulets worn by barbarous Nations, Taliſmans, Genii confin'd by Seals within Metals,

tals, and Spirits infused by Inchantments into ſolid Bodies. No Wonder if theſe ſublime Doctors proceeded at laſt to violate what was ſacred, and treated the Pentateuch of *Moſes*, the Writings of *Solomon*, and the Revelation of St. *John*, as Deſcriptions of the Gold-making Art. There was nothing but what they debaubed with their Commentaries, Allegories, Emblems, Types, and Riddles; inſomuch that you can find no Paſſage in ſacred Writ ſo clear, ſo plain and explicit, which they did not pervert to a wrong Senſe; the fanatical Humour prevailing at laſt to ſuch a Degree, as to change the Hiſtory of Facts, and the Miracles wrought for Confirmation of the Goſpel, into the Precepts and Maxims of Alchymy. He who conſiders theſe Things cannot but be concern'd, and, being prompted by Indignation, may perhaps be ready to condemn the whole Art, and wiſh it exterminated. But if he will pleaſe to aſſume the Character of an impartial Moderator, and can have Patience to hear the Truth on both Sides, he will be convinc'd, that all this numerous Train of Errors and Abſurdities are very fairly condemned, exploded, and confuted by Chymiſts themſelves, and that from Arguments and Reaſons afforded by the Art of Chymiſtry. It would be endleſs to enter into Particulars, but I cannot forbear taking notice of an illuſtrious Chymiſt in the thirteenth Century, I mean *Roger Bacon*, an *Engliſhman*, who was excommunicated by the Pope as being guilty of Magic. This extraordinary Perſon knew ſo well how to reduce the Powers of Nature within the Rules of Art, as, by their Combination, to perform Things which far ſurpaſs'd the pretended Miracles of the Magicians. He demonſtrates, by Experiments, that human Induſtry, with an Inſight into Nature, can produce Effects, which they, with all their Charms, Sorceries, and Invocation of Demons, are unable to imitate. He very eaſily, and with admirable Ingenuity, expoſes the monſtrous and hurtful Superſtitions, Deliriums, and Enthuſiaſms of the Times in which he liv'd. He very judiciouſly and religiouſly diſtinguiſhes between the ſacred Myſteries of Piety, and the ridiculous Chimæras and Inventions of an unſettled Brain; between the corruptible Principles of the Body, and the celeſtial Origin of the Soul; between Nature and God. We admire ſuch a Man, living in the very Dawn of Chymiſtry, and have a Veneration for him to this Day. Another Chymiſt of the ſame Nation was the illuſtrious *Boyle*, who was ſurpaſs'd by none for Diligence or Succeſs in this Art. He ſpent his Life in ſoliciting Nature, and making Experiments; and with the greateſt Freedom and Good-nature oblig'd others, by communicating thoſe Diſcoveries, which himſelf alone, with incredible Pains, Danger, and Expence, had firſt made.

Boerhaave has, in this laſt Part of Mr. *Boyle*'s Character, I think, carry'd his Encomium too far; for whoever reads his Works will find, that tho' Mr. *Boyle* communicates ſome Things, yet he mentions others, which he informs us are to be done, without telling us how. And it is well known, that he conceal'd ſome of his moſt important Diſcoveries from all the World, except perhaps his own Workmen, from whom he could not always hide them.

The Changes which happen in Bodies are cauſed by Motion, which is infus'd into the vaſt corporeal Syſtem, and agitates the ſame. We are therefore to inquire into the Cauſes of this Motion, and by what means it may be excited, diverted, or ſtopt in Bodies. Theſe impulſive Powers are not within the Reach of Reaſon, unaſſiſted by the Obſervations of Effects evident to the Senſes. It will then be worth our Pains carefully to obſerve thoſe Motions, which ariſe from the Action of Bodies in the Vicinity of others, or to apply Bodies to Bodies, and again to remove them at a Diſtance from each other, while, by means of Fire, you excite in each Body a proper Motion, which is accounted the moſt effectual Method to diſcover the Virtues of Bodies. All this is the Work of Chymiſtry, which on that account muſt be acknowledg'd of great Service in the Bounds of Phyſics, there being none ſo well accommodated for diſcovering the Secrets of Nature; and yet it cannot be deny'd, but that it has been the Occaſion of great Errors in ſearching into the Nature of Things. The principal Error was, that as ſoon as the Chymiſts had found out, by Experience, the Action which was peculiar to ſome ſingle Body, they preſently regarded this Way of Nature as univerſal, and confidently aſſerted it to belong to all other Bodies in general. In this Point the Chymiſts ſeem'd to copy after that Philoſopher, who, obſerving the mutual Attraction between the Magnet and Iron, aſcribed the ſame to all other Bodies. From this fallacious Way of Reaſoning, the Doctrines of Ferments, Efferveſcences, oppoſite Salts, heating Sulphur, Fermentation, Putrefaction, Generation, Tranſmutation, Precipitation, became ſo univerſal, with an infinite Number of others deduced from them. How did the Face of Phyſics change, as ſoon as theſe few Actions were found out! None but theſe were admitted in explaining the Laws of Nature, and whatever could not be reconciled with it, was exploded; and in a little time the Notion ſo far prevailed, that all the Powers of Nature were circumſcribed within the narrow Limits of this way of Acting; and had not Chymiſtry itſelf ſet Bounds to this licentious way of Reaſoning, all Phyſics had been reduced to depend on a few Laws eſtabliſhed by the Chymiſts. But when Chymiſtry began in good Earneſt to make Improvements of Inventions, to try the ſame Methods upon different Bodies, and to try different Methods upon the ſame Bodies, there appear'd ſo great a Diſſimilitude in Bodies, and ſo much Diſagreement in the Operations, as would no longer ſuffer the vaſt and comprehenſive Nature of Things to be reſtrain'd within the Bounds of a few Examples. Men were then convinc'd, that there were in Bodies a Variety of Qualities, before unknown, but of mighty Efficacy, and productive of peculiar, but often very conſiderable Motions. We will illuſtrate this by an Example: Thoſe Vegetables which turn acid of themſelves, if kept in Veſſels, will be put in Motion only by the Warmth of the Air; and this Motion, if continu'd to a proper Length of Time, will change Part of the native Oil into volatile Spirits, which will bear to be mix'd with Water, but burn in the Fire. Again, the ſame Vegetable, by a Motion not much unlike the former, ſhall change the ſame Part of its Oil into acetous Spirits, which will mix with Water, but extinguiſh Fire. They call'd both Actions *Fermentation*; there was a remarkable Change of Elements, ſuch as they had never ſeen in any other Subject. Thus far Matters went ſmoothly; but here they fall into a looſe way of Arguing, while they warmly inſiſt, that there can be no true Change but by virtue of a Ferment, none without Fermentation. Having thus the Misfortune to overſhoot themſelves, tho' pleas'd and ſatisfy'd with their new Diſcovery, they take Occaſion from thence to form a Notion of a far more univerſal Ferment, of ſo mighty and extenſive Virtue, that the leaſt Particle of it, united with the proper Ferment of any Body whatſoever, ſhall impregnate it in ſuch a manner, as to aſſimilate and convert the Ferments of all other Things into its own Nature. Thus from the narrow Rounds of a ſingle Experiment, they dare expatiate and range over an Infinity of Things. Nor muſt we imagine, that this is true only in one Inſtance; for there is ſcarce a Subject of any Importance, in which they do not argue at the ſame Rate. Hence it is, that there are ſuch a Multitude of Sects among them, every one forming an univerſal Doctrine, peculiar to himſelf, and built upon his own private Experiments, ſo that you ſhall hardly find two of them agreeing in one Thing; while thoſe among them, who were bred up to the Studies of Literature, but wanted Experience, rejecting the Doctrines of the Schools, and longing after Certainty, after they had apply'd themſelves to Chymiſtry, were ſtill doubtful and fluctuating, and, among ſuch a Multiplicity of Opinions, knew not which of them to embrace. Chymiſtry groaned under ſo great a Load, but ſtill had Reſources within itſelf, and there found Means again to emerge and free itſelf. None of the Sciences came in to its Aſſiſtance, but it was forced to work out its own Deliverance. Nor will this ſeem extraordinary to one who conſiders, that the Application of ſome Bodies to others always produced new Appearances, different Actions, diſſimilar Effects, which could by no means be reduced to one univerſal Law common to all. Men were convinced from very noble, uſeful, and entertaining Inventions made by the Chymiſts, that there needed a vaſt Number of Obſervations, a very careful Examination of them, and a judicious and wary comparing of them one with another, in order to eſtabliſh an univerſal Mode, to which all the Actions of Nature are ſubjected; that there is nothing more fallacious, than from a Similitude in one Thing to explain and judge all the reſt; and that as it is uſual for a young Beginner to deduce the Cauſes of all Events from one ſingle Mode or Property, ſo mature Age, taught by Experience, takes up with true ſolid Wiſdom, whoſe Dictates to a Chymiſt are, that he proceed by ſlow Steps, with the greateſt Caution, and with the moſt ſolicitous Circumſpection and Attention to every Particular, before he preſumes to paſs his Judgment upon natural Things. Thus is Chymiſtry, by correcting Errors, adorning Truths, and amending Abuſes, become a certain, pure, moſt uſeful, and reputable Part of Learning. For the Truth of theſe Things I appeal to thoſe who ſhall compare *Homberg* with *Tachenius*; *Boyle* with *Helmont*; and the Writings of the vulgar Chymiſts with the *German* Miſcellanies, and the Memoirs of the Royal Academy of *Paris*.

Phyſics have ſo near a Relation to Medicine, that the Errors of the Chymiſts in the former communicate themſelves to the latter, corrupting not only the Theory, but the practical Part of Medicine. Give me Leave to point out the Original of ſo many Faults. The Chymiſts, by the artificial Means of a great Fire, with Veſſels and Inſtruments, excited different Kinds of Motions, by which Bodies, being mix'd or ſeparated in various Manners, aſſum'd different Forms, whence proceeded new Powers of acting undiſcover'd before. Now when theſe Bodies came to be examin'd by a chymical Proceſs, very many Kinds of Motion were diſcover'd, which no other Art was capable of producing, nor Nature, left to itſelf, had ever offer'd to Obſervation. The Artiſt had Reaſon to rejoice

over his Invention; but the Pleaſure of the Succeſs dulled the Mind of the Inventor; he ventur'd to aſſert, and at length aſſum'd it for a moſt certain Truth, that the ſame obtain'd in the Nature of Things, and in the human Body; that ſuch Things as could not be produc'd in the Way of Art, but by the moſt intricate, moſt violent, and operoſe artificial Means, muſt reſult from the ſedate Motions of the human Body, and be nouriſh'd and maintain'd by the ſame; and that all Things in the Earth, Water, and Air, were furniſh'd with them. This was a moſt plentiful Source of Errors, and hence acrid alcaline, fix'd, and igneous Salts, were ſaid to prevail in the Bodies of Animals and Vegetables; and volatile, highly acrid, and alcaline Salts, to impregnate the mildeſt Humours of the human Frame, as well as the moſt ſolid Parts, and to lodge themſelves in the Teeth, and in the very Milk. Sometimes Acids were in higheſt Reputation, as being found not only in Foſſils and Vegetables, but particularly in Man in ſuch Quantities, as, by their corroſive Acrimony, to carry all before them. Hence the human Body was turned into a Chymiſt's Shop, or a Theatre, in which chymical Plays were acted, and Conflicts, Effervescences, Peace, Generation, Deſtruction, and various Effects of oppoſite Salts, were repreſented as on their proper Stage; and hence all Diſtempers were accounted for, and the curative Indications taken, in a manner too ridiculous to expatiate upon, tho' ſupported by the Authorities of *Sylvius de la Boe*, and *Tachenius*. It would be endleſs to recount all the Errors and Dreams with reſpect to Theory and Practice, which different Chymiſts gave into. What can be more whimſical than the Character of Antimony, which ſome of them repreſented as curing all Diſeaſes, for no other Reaſon, but becauſe, when fus'd with Gold, it deſtroys all the Impurities and baſer Metals mix'd with it? What more abſurd, and even contrary to his own Experience, than the Boaſts of *Paracelſus* with reſpect to his ſecret Medicine, by which he promis'd himſelf the Age of *Methuſalem*? What more ridiculous than the Extravagancies of the *Roſicrucians*? What more enthuſiaſtical and idle, than the Liquor propos'd by *Van Helmont*, and prepar'd, as he ſays, from the immortal Cedar of *Lebanon*, by Art of the wiſe Men, which would ſo enrich the vital Humours with its ſalutary Virtue, that by purging off all Sordes, and ſupplying all Deficiencies, with proper Recruits of invigorating Spirits, it would cauſe a Man to live for Ages in the conſtant Enjoyment of a crude and vigorous old Age? You would ſay I tranſgreſs'd the Bounds of Probability. But if I ſhould tell you of *Butler*'s Stone, which, by one ſlight Touch of the Top of it with the Tip of the Tongue, inſtantly cured the moſt obſtinate Diſeaſes; or of *Artephius*, by an electrical Virtue, attracting to himſelf the vital Spirits from a youthful Body, and perpetually ſuſtaining the vital Flame with its medicinal Exhalations, render'd it immortal as the veſtal Fires; and of many other vain, empty, fabulous Vanities of the Chymiſts, I ſhould exhauſt your Time and Patience. Yet theſe Things, abſurd and incredible as they are, became the Regard and Concern of Phyſicians; in Search of theſe, many of the wiſeſt and moſt learned among them devoted their Eſtates, Fame, Life, and Soul; and the Infatuation became ſo general, as hardly to admit Hopes of a Remedy. Chymiſtry itſelf, at laſt, furniſh'd us with the only proper Means for the Cure of thoſe Evils, to which itſelf had given Occaſion. *Libavius*, *Boyle*, *Bohnius*, and very many others, ſearching diligently into Things, and leaving nothing unexplor'd, came at laſt to demonſtrate, from Chymiſtry itſelf alone, that the Things which *Art* prepares, are quite foreign to thoſe which *Nature* effects; and conſequently that the Inſtruments which Nature uſes, and thoſe which Chymiſtry employs, are not to be conſidered as of one and the ſame Kind. For Nature, in Man, does not work by all thoſe Ways and Means which Chymiſtry uſes to bring about its Ends; and therefore the Actions exerciſed by the induſtrious Chymiſt are vaſtly different from thoſe by which Nature proceeds; and that we are not to argue from one to the other without good Evidence derived from elſewhere. Hence it appeared, that Chymiſtry often produces ſuch Effects as were never diſcover'd in the human Body, nor in any other Part of Matter; that it was wrong arguing from the Depuration of Metals, to the rendering a Man free from Diſeaſes. The World was convinc'd, that the Methods, by which the Life of Man ſupplies Matter for the Cauſes of Diſeaſes, are altogether inimitable by the Arts of Chymiſtry; and that Life and Health depend upon ſo many different, intricate, ſubtile, and tender Cauſes, that Chymiſtry was utterly incapable of performing the wonderful Things ſhe had promiſed on that Score. All theſe Errors, with an infinite Number of others, after Conviction from true Experience, were happily corrected, and expel'd the Bounds of Medicine; and now we have Reaſon to congratulate ourſelves on the flouriſhing State of Chymiſtry in *Europe*, which is no longer accounted a fallacious, but a very uſeful Art, and of the greateſt Service in Phyſics and Medicine; in Confirmation of which, beſides the Authority of the great Reſtorer of Learning, my Lord *Bacon*, and that ſagacious Chymiſt Mr. *Boyle*, hear the Teſtimony of a Man, in whom Nature ſeems to have ſet the Bounds of human Perſpicacity, I mean the incomparable *Newton*, who, tho' of the deepeſt Inſight of any mortal in Phyſics, yet demonſtrates the Laws, Actions, and Forces of Bodies as known by their Effects, all from Chymiſtry; and when he applies thoſe Forces, thus found, to the Explication of Phenomena, he does it all by the Help of Chymiſtry; which is a clear Proof, that without Chymiſtry the Nature and Properties of ſingle Bodies could ſcarce ever have been known by the moſt perſpicacious of Mortals.

Chymical Authors, *including* Alchemists *and* Metallurgists.

We have an Account of ſeveral *Greek* chymical Manuſcripts in the Emperor's Library at *Vienna*; that of the King of *France* at *Paris*; the *Elizabeth* Library at *Breſlau*; that of the Duke of *Saxe-Gotha*; and in the Libraries of the *Eſcurial*, and the *Bodleian*. Dr. *Shaw*, in his Tranſlation of *Boerhaave*'s Chymiſtry, has, by way of Note, given a Catalogue of theſe Writings, which the Reader may conſult; or *Fabricius*, in his *Bibliotheca Græca*, who takes notice of theſe Authors. Mean time it would be ſuperfluous to particularize them in this Place, becauſe they are not to be procur'd. I ſhall, however, give the Judgment of the learned *Reineſius*, on that Collection in the Duke of *Saxe-Gotha*'s Library.

The Judgment of the learned Reineſius, *concerning the Collection of* Greek *chymical Manuſcripts, in the Library of* Saxe Gotha, *A. D.* 1634.

The *Greek* Manuſcript Copy, tranſcrib'd from another Copy in the Library of *Ausbourg*, in the Year 1623, conſiſts of a Variety of Treatiſes, ſome of which bear the Names of their true and undoubted Authors, others are aſcrib'd to thoſe who knew nothing of them, and others again are nothing but Collections from various Authors. They all treat of what they call the *Divine Art*, of the Philoſophers Stone, or the Great Magiſtery, that is, how imperfect Metals may be brought to Perfection by Tranſmutation into Gold or Silver; alſo of the various Kinds of Veſſels and Furnaces, and the different Operations which are in Uſe among Chymiſts at this Day. There is alſo a brief Treatiſe of Weights and Meaſures, with a ſhort Account of the Manner of preparing *Polenta* from Barley, and how they make Beer, in *Egypt* he muſt be ſuppos'd to mean; alſo of the Degrees of Fire, Colours, and other common Operations belonging to Chymiſtry. And becauſe this Art was at all times communicated in allegorical Words, by Parables and Riddles, which *Zoſimus* calls λοξὰς γραφὰς, "figurative Writings," and *Stephanus*, ἀλληγορικὰς, allegorical," and was expreſſed and deſcribed by certain Characters and Signs, there is added a Lexicon, which ſhews what is meant by thoſe Words which in *Greek* Authors have a very different Senſe, and explains the Characters and Signs.

There is alſo a Manuſcript Copy taken from another, which, they ſay, is extant ſomewhere in *Italy*, and quoted by *Robertus Valenſis*, in his Book of the Verity and Antiquity of the chymical Art, and by *Geſner* in his *Bibliotheca*; or from that which is in the moſt Chriſtian King's Library, and quoted by *Iſaac Caſaubon* on the Annals of *Baronius*, and by *Salmaſius*, in his *Exercitationes Plinianæ*, whoſe Quotation anſwers Word for Word to this Manuſcript. And *John Dee*, a Doctor of Phyſic in *London*, who dedicated his *Monas Hieroglyphica* to *Maximilian*, King of the *Romans*, A. D. 1564. is ſaid to have had a Manuſcript Copy of the Phyſics of *Democritus*, with Notes by *Syneſius*, *Pelagius*, and *Stephanus*; which Treatiſe was tranſlated by *Pizimentius* into *Latin*, and printed at *Cologn*, A. D. 1574. with *Mizaldus*'s *Memorabilia*. But then theſe Writings are all or moſt of them tranſlated into *Latin*, and inſerted * in the *Theatrum Chymicum*, the *Turba Philoſophorum*, the *Aureum Vellus*, and other Books of that Kind. Tho' *Democritus*'s Phyſics and Magic are quoted by *Hermolaus Barbarus* on *Dioſcorides*; the Epiſtle of *Pſellus* to *Xiphilin* the Patriarch is cited by *Mylius*, in his *Baſilica Philoſophica*, and the Works of *Zoſimus*, the Praxis of *Stephanus*, and other Pieces, are cited by ſome or other; yet they were never printed in *Greek*, as far as I know, tho' they certainly deſerved it, becauſe they contain many valuable Things of Antiquity, and inform us of the Beginning of the Art at ſo long a Diſtance of Time. As to the reſt, becauſe they are very obſcure, and conſiſt merely of Fragments, they will conduce perhaps but little to the Promotion of Chymiſtry. In general, it may be ſaid of theſe Writings, that they were all compoſed by Monks, and other learned Men, firſt of *Alexandria*, and after ſome Diſtance of Time at *Conſtantinople*; were there collected into one Body, and brought from thence into *Italy* by the *Conſtantinopolitan* Exiles, who flock'd thither in great Number ſome time before, and at the Taking of

* *Fabricius* ſays, that very few, or none of them, can be found inſerted in thoſe Collections.

Conſtantinople by the *Turks*, *A. D.* 1454. and afterwards brought into *France*, and placed in the Royal Library.

That we may ſay ſomething in particular of the Writers whoſe Names are extant in this Collection, it is to be obſerved, that ſome of them were Heathens, others Chriſtians *; that they lived firſt at *Athens*, afterwards at *Alexandria* in *Egypt*, where Philoſophers were more eſteem'd than at *Athens* itſelf. For, before that Time, both there and in *Perſia*, the Art of making Gold was much ſtudied among *Jews*, *Chriſtians*, and *Heathens*, in the Reign of the Emperor *Diocleſian*, as *Suidas* informs us under the Word χημεία. And we are aſſured, that *Heliodorus*, whoſe Name is prefix'd to one of theſe Treatiſes, was an *Alexandrian* by Deſcent; and was, with his Brother *Ammonius*, placed by his Parents, *Hermias* and *Ædeſia*, with *Proclus* the moſt famous Philoſopher of thoſe Times, but later than *Theodoſius*. And poſſibly this Philoſopher, who was addicted to this Art, and had ſome Skill therein, might dedicate ſome Writing of that Nature to *Theodoſius* the Great; and it is probable, that this Emperor took great Delight in it, as well as many belonging to his Court, and among them *Eugenius*, to whom one Proceſs is aſcrib'd. The Names of *Archelaus*, *Hierotheus*, and *Theophraſtus*, are all fictitious; and the bad Poetry belongs all to one Author, being nothing but *Stephanus* verſify'd. It is certain alſo, that this *Heliodorus* before-mention'd was a Pagan of the *Platonic* Sect, but the Author of theſe Verſes a Chriſtian; and *Pappus*, to whom one Proceſs is inſcrib'd, was a Philoſopher of *Alexandria*, Author of the *Mathematical Collections*, and lived under the ſaid Emperor *Theodoſius*.

As to *Syneſius*, whoſe *Scholia* on the Phyſics of *Democritus*, and *Myſtica* to *Dioſcorus*, the Prieſt of the great *Serapis*, we have amongſt them; there was, it is true, a *Syneſius* in the Time of the *Theodoſii*, who ſtudied at *Athens* and *Alexandria*; and *A. D.* 410. was made Biſhop of *Cyrene* in *Libya*, and whoſe Works were publiſh'd by M. *Petau*, 1633. at *Paris*, with Notes. But this *Syneſius* cannot be thought the Author of the *Scholia*, becauſe they contain a very childiſh Error, concerning *Oſtanes* and *Democritus*, of which more below; whereas *Syneſius* was a very learned and judicious Perſon, as appears by his Writings, in which there is not the leaſt Footſtep of Chymiſtry, nor of his Familiarity with *Dioſcorus*. *Zoſimus*, a Philoſopher of *Alexandria*, wrote about the ſame Time, and has various brief Diſcourſes interſperſed throughout the Volume, which, however, cannot be all of them juſtly aſcrib'd to him; for in ſome there is mention made of Things unknown to the antient *Greek* Phyſicians, and which were brought in Uſe and named only by the *Perſians* and *Arabians*, ſuch as βειλεγ, νατρη, Νιτραε, and others. That this *Zoſimus* was the ſame with the Hiſtorian of that Name, can hardly be doubted; for tho', in his Treatiſe *ad Theoſebian*, he makes mention of the Creation, Incarnation, and Paſſion, yet he accommodates the *Platonic* Speculations, and the Fables of the antient *Egyptians*, taken out of the *Pœmander* of *Triſmegiſtus*, to his Art; and apply'd the prophetical Viſion of *Ezekiel*, concerning the diſperſed dry Bones, to his chymical Proceſſes. *Suidas* mentions *Zoſimus*, and ſays, that he wrote χημευτικὰ, and calls him an *Alexandrian* Philoſopher; and *Photius*, in his *Bibliotheca*, ſpeaks of his λόγοι χημευτικοί. In ſome Places of this Manuſcript he is call'd, perhaps from his Country, *Panopolita*.

Olympiodorus, whoſe Treatiſe is in this Manuſcript, wrote after *Zoſimus*; but *Salmaſius* ſeems to be miſtaken in placing him among the Writers of the laſt Ages of *Greece*, becauſe he never mentions *Stephanus*, who flouriſh'd about *A. D.* 620. and was ſkill'd in this Art; but frequently ſpeaks of *Zoſimus* and *Syneſius*, who lived a little before; whereas it is a received Cuſtom among Writers on theſe kinds of Subjects, to mention, and quote by Name, all their Predeceſſors in the ſame Art. I take this *Olympiodorus* to be the ſame with him of that Name who was born at *Thebes* in *Egypt*, and wrote a Hiſtory of his own Times from *A. D.* 400. to *A. D.* 425. and dedicated it to *Theodoſius* the younger. In *Folio* 182. he quotes *Hermes*, ἐν τῇ κυρανίδι βίβλῳ, which is the ſame with *Hermes*'s Phyſics, quoted by *Zoſimus*, *Lib.* 9. *de Chemia ad Theoſebian*. Now the Name *Kyranidum* ſignifies a Volume compil'd from many others; and becauſe the *Perſians* and *Arabians* compoſed this Book out of the magical Treatiſes of their own and other Nations, they call'd it *Curanon*; as the *Alcoran* is, by the later *Greeks*, call'd κυρίευον, that is to ſay, a Collection of divine Precepts. And we are told by *Suidas*, that *Diocleſian*, beſides aboliſhing the antient *Egyptian* Supputation of Time, order'd the Books of the *Egyptians*, which treated of the Art of making Gold, to be burnt, that he might deprive them of the Means of rebelling; and did the ſame, as far as his Power reach'd, by the Books of the *Perſians*, which treated of the ſame Art, that was, at that Time, very much cultivated in *Perſia*, and enabled that Nation frequently to be very troubleſome to the *Romans*.

Stephanus was a Chriſtian, as appears by his quoting the Evangeliſts and St. *Paul*. He lived in the Time of the Emperor *Heraclius*, and there is no Part in all the Collection, in which the Doctrines of the Antients are better explain'd.

As to *Democritus*, who is not only frequently mention'd in this Collection, but has, beſides, entire Treatiſes in it, as his Book of the Colour of Purple, and of making Gold, Silver, and Gems, there is an antient, indeed, but fooliſh Opinion, that he is the ſame with the Philoſopher of *Abdera*, who lived in the Time of the *Perſian* Monarchy. The *Pſeudo-Syneſius* ſays ſo in expreſs Words; and you may find the ſame in the *Greek* Chronicle of *Euſebius* †. But *Scaliger* thinks that Story to be none of *Euſebius*'s, but compoſed by *Panodorus* the Chronographer, an *Egyptian* Monk, who lived in the Time of the Emperor *Arcadius*; and being extracted by *Syncellus*, who tranſcrib'd that Author's whole Chronography, about the Year 792. was inſerted into that Collection. But it is very probable, that it was not written by *Euſebius*; for St. *Jerom* found no ſuch thing in that Author; and the Tale is moſt likely to be forged by an *Egyptian*, who thought it an Honour to his Nation to have it believed, that the moſt famous of the *Grecian* Sages ſhould be initiated in the *Egyptian* Myſteries. But this *Oſtanes*, as appears by a Fragment, *Fol.* 66. was a Chriſtian; and conſequently the *Democritus*, to whom theſe Works are aſcrib'd, could not be the Philoſopher of *Abdera*. And, tho' any one ſhould object, what I alſo believe, that this Fragment was falſly and abſurdly aſcrib'd to *Oſtanes*, yet it appears, from the Style, that the Book before-mention'd could never be the Work of ſo antient a Philoſopher. However, the Piece is of ſome Antiquity, and the Product of an Author who had a good Inſight into the Nature of Minerals, and was ſkilful in Medicine; and perhaps it was ſome Perſon of this Name, who, before *Conſtantine* the Great, ſaid to have been an Initiate of *Democritus*, in the Time of King *Sapor*, (the ſame who, in the Collection, *Fol.* 85. is call'd *Sophar*) went into *Perſia* with a Deſign to learn the ſacred Art. Now *Sapor* lived to the Year of our Lord 270. whence we may probably conjecture, that this *Democritus*, about *A. D.* 300. and conſequently the Third of that Name, might be making the Tour of *Egypt*. Perhaps, again, whatever is related by *Syneſius* and others of *Oſtanes* and *Democritus* is merely fabulous, and thoſe Pieces belong to other Authors, who, to gain Reputation to their Works, prefix'd to them the Names of thoſe antient Philoſophers, who were moſt celebrated for their Knowledge in the occult Sciences. Nor is it ſtrange, that, in ſo rude and ſimple an Age, theſe Writings ſhould be father'd upon that very antient natural Philoſopher *Democritus*, and ſhould paſs for genuine, ſince ſomething like it happen'd in the Time of *Pliny*, as appears, *Lib.* 24. *Cap.* 17. and *Lib.* 30. *Cap.* 1. And in *Laertius*'s Life of *Democritus*, *Gellius*, *Lib.* 10. *Cap.* 12. and *Columella*, *Lib.* 7. *de R. R.* we are inform'd, that the Memoirs of *Bolus Mendeſius de Re pecuaria* were falſly aſcrib'd to *Democritus*; ſo that many Perſons endeavour'd to recommend their own abſurd and monſtrous Conceits to the Public, under the celebrated Name of *Democritus*. The ſame thing happen'd to *Hermes Triſmegiſtus*; and Poets who lived five, ſix, or ſeven hundred Years after *Seneca*, prefix'd his Name to their Verſes.

The ſame Judgment is to be form'd of *Cleopatra*, whom theſe Writers make to be the Wife of one of the *Ptolemies*, Kings of *Egypt*, and *Stephanus* introduces talking with *Oſtanes*; for how can it be aſcrib'd to *Cleopatra*, or the antient *Geoponic* Writers, when it mentions the thirty Pieces of Silver, for which *Judas* betray'd our Saviour; and ſays, that *Job* labour'd under his Calamity ſeven Years and a half?

Michael Pſellus is known to have lived at *Conſtantinople*, *A. D.* 1080. and to have been one of the moſt learned Men

* As it appears, that the Compiler lived after the Emperor *Heraclius*, was a Chriſtian, and not only extracted and digeſted, from various Authors, what he thought fit, but alſo made Interpolations of his own, neither the Marks of Chriſtianity, nor of the Times, which we every-where meet with in his Collection, nor yet the quoting of the Authors, are a ſufficient Warrant to conclude any thing with Certainty, concerning the Age or Religion of thoſe, whoſe Names are prefix'd to the Extracts. Since, then, neither *Herodotus*, nor *Clemens Alexandrinus*, nor other antient Writers, who treat of the Learning of the *Egyptians*, nor even *Pliny* himſelf, make the leaſt Mention of Chymiſtry, I am entirely of Opinion, with *Conringius* and *Reineſius*, in Oppoſition to the very learned *Borrichius*, that whatever may be pretended in this Collection to be written by Names of the greateſt Antiquity, has, at moſt, no higher Original than the Times of *Diocleſian* and the *Theodoſii*. *Fabricius*.

† *Democritus*, the *Abderite*, was initiated into the *Egyptian* Myſteries by *Oſtanes* the *Mede*, ſent into *Egypt* by the *Perſian* King, to preſide in ſacred Offices, in the Temple of *Memphis*, with other Prieſts and Philoſophers, among which was *Mary*, a *Hebrew* Female Sage, and *Pammenes*. He wrote of Gold, Silver, Gems, and Purple, in a figurative manner. This *Democritus* and *Mary* were commended by *Oſtanes* for concealing their Art under a Multitude of ſubtle Ænigmas; but he blamed *Pammenes* for being too open and free in his Writings. *Chronicon Syncelli*.

of *Greece* in his Time, and wonderfully delighted with occult Arts and Sciences. He wrote a Multitude of Books, many whereof lie dormant in Libraries.

The Author of the *Lexicon* muſt be reckon'd among the Moderns, who lived about two hundred and fifty Years ago.

So far *Reineſius*. I now proceed to give ſome Account of the Authors, whoſe Works are more known; firſt remarking, that many Circumſtances, mention'd by *Reineſius*, ſeem to favour what I have ſuggeſted in the Beginning of this Article, relative to the Origin of the Notion of the Tranſmutation of Metals.

1. GEBER, call'd the *Arab*, but really a *Greek* by Country, according to *Leo Africanus*; having firſt been a Chriſtian, but afterwards turn'd Mahometan. He lived in the ſeventh Century, and wrote in *Arabic*.

This Author appears to have been the firſt great Reformer and Improver of Chymiſtry. His Hiſtory is very obſcure: The Name *Geber* ſignifies a great Man, and a King; whence he is commonly ſuppoſed to have been a Prince, and, as he wrote in *Arabic*, a Prince of *Arabia*. But neither his Perſon, nor the Time he lived in, is known with any tolerable Certainty.

He is ſuppoſed to have given the firſt Handle to an Inquiry after an univerſal Medicine, there being ſome Expreſſions in his Book, which might eaſily enough lead an unwary Reader to think he was acquainted therewith: As, *Gold, thus prepared, cures Lepras, cures all Diſeaſes*, &c. But we are here to obſerve, that, in his Language, the baſer Metals are leprous Men, and Gold a healthy one. When, therefore, he ſays, *I will cure ſix Lepers*, he means no more, than that he will turn them into Gold, which ſhall bear the Trial of Antimony. But, as he was no Phyſician, it is more than probable he never thought of any univerſal Remedy. After this Writer, we don't meet with any other of Diſtinction till the twelfth Century.

Golius, Profeſſor of the Oriental Languages in the Univerſity of *Leyden*, made the firſt Preſent of *Geber*'s Piece, in Manuſcript, to the public Library; and tranſlated it into *Latin*, and publiſh'd it in the ſame City in *Folio*, and afterwards in *Quarto*, under the Title of *Lapis Philoſophorum*. It contains abundance of curious and uſeful Things about the Nature of Metals, their Purification, Fuſion, and Malleability, with excellent Accounts of Salts, and Aquæ-fortes. Several of his Experiments are verified by the preſent Practice, and have paſs'd for modern Diſcoveries: The Exactneſs of his Operations is really ſurpriſing, except perhaps in what relates to the Philoſophers Stone.

His Works are theſe;

De Alchemia, vel Chimia; aut de inveſtigatione perfectionis Metallorum:

De Summa Perfectione Metallorum:

De Claritate Alchimiæ:

De Lapide Philoſophico:

De Teſtamento:

De Epitaphio:

De inveniendâ Arte Auri & Argenti. Boerhaave.

To theſe Dr. *Shaw* adds,

Geberi ſuper Artem Alchymiæ Libri VI. Or, *Geber*'s ſix Books on the Art of Alchemy; extant, in Manuſcript, in the *Bodleian* Library, Part of the Donation of *Elias Aſhmole*, Eſq;

De Alchimia Libri 3. *Argent.* 1529. *Fol.*

Geberis ſumma perfectionis magiſterii in ſua natura: Venet. 1542. 8*vo. Norib.* 1545. 4*to. c. Fig. Arg.* 1598. 8*vo.*

Chymia, ſeu traditio ſummæ perfectionis, & inveſtigatio Magiſterii: Lug. Bat. 1668. 12*mo.*

The Works of *Geber* are alſo publiſh'd in *Engliſh* by *Richard Ruſſel, London*, 1686. 8*vo.*

In the next Place might come AVICENNA, who lived in the eleventh Century; and who, as his Follower *Soranus* informs us, wrote a Book on Alchemy; but there are more chymical Pieces that go under his Name, *viz.*

Abohali, (i. e.) *Avicennæ liber de Rebus Alchymicis*; (i. e.) *Abohali*'s, or *Avicenna*'s Book on the Subject of Alchemy; extant, in Manuſcript, in the *Bodleian* Library, given by Sir *Kenelm Digby*; beſides another Copy given by *Elias Aſhmole*, Eſq;

Tractatus de Tinctura Metallorum. Franckfort. 1550. 4*to.*

Chemicus liber, porta elementorum dictus: Baſil. 1572. 8*vo.*

Mineralia, ſeu de congelatione & conglutinatione Lapidum: Publiſh'd with *Geber*'s *Summa perfectionis magiſterii in ſua Natura*; and other Pieces on the ſame Subject, *Venet.* 1542. 8*vo.* Alſo in the *Theatr. Chym. T.* iv. *p.* 986. And in *Manget's Bibl. Chym. T.* 1. *p.* 636.

The next Author is MORIENUS, a *Roman*, who lived as a Hermit at *Jeruſalem*. He wrote very gravely on the Tranſmutation of Metals, and is rank'd amongſt the pureſt Authors extant: His Works were tranſlated out of *Arabic* into *Latin*, ſo early as the Year 1182. according to *Beerhaave*.

Dr. *Shaw* adds to this,

Liber de Compoſitione Alchemiæ; extant in *Manget's Bibl. Chym. T.* 1. *p.* 509.

Liber de diſtinctione Mercurii aquarum: Found in Manuſcript in the *Bodleian* Library; given by *El. Aſhmole*, Eſq;

The next is ALBERTUS BOLSTADIUS, ſirnamed *Grotus*, commonly known by the Name of *Albertus Magnus*. He wrote upwards of twenty Volumes in *Folio*; and is ſaid to have been, at firſt, diſtinguiſh'd by his Dulneſs and Stupidity, inſomuch that he became the common Jeſt of his Fellow Students. At length, quite tired out, he reſolved to ſcale the Walls of the Convent, and run away. In this Attempt the bleſſed Virgin appear'd to him on the Wall, and there gave him that Underſtanding and Ability, which have ſince render'd him ſo famous. He was a *Dominican* Friar, and Doctor of *Paris*, flouriſh'd in 1236. and taught at *Cologne*, where he had *Thomas Aquinas* for his Pupil. He retired from his Biſhoprick to his Monaſtery at *Cologne* in 1263. and died in 1280. aged ſeventy-five. Father *L'Abbé* ſays, in his *Eloge*, that he wrote ſixty Volumes, moſt of them ſtill extant, many in Print, the reſt in Manuſcript. *Petr. Jammy* has publiſh'd an Edition of his Works, but not all, in twenty-one Volumes, *Fol. Lugdun.* 1651. The Liſt of Titles in each Volume is given by *Fabricius*, *p.* 113. *&c.* He was accuſed of Magic; but is defended by *Trithemius*, *Mirandula*, *Naudé*, and others. By a general Correſpondence with the Miners throughout *Germany*, he acquired uncommon Skill in Metallurgy. The Feaſt of the beatified *Albertus* is celebrated in the Churches of *Ratiſbon* and *Cologne*.

His Alchemiſtical Works are;

De Mineralibus & rebus Metallicis, Lib. V. *Oppenheimii*, 1518. 4*to. Argent.* 1541. 8*vo.*

Lilium floris de Spinis avulſum.

Speculum Alchemiæ de Compoſitione Lapidis, &c.

There is alſo a ſmall Piece of his upon Alchemy; intitled *de Alchymia libellus*; printed at *Baſil* in 1516.

Next, after *Albertus*, might come THOMAS DE AQUINA, a *Dominican*, born of the noble Family of the Counts of *Aquinas*, in 1234. He died in his Journey to the ſecond Council of *Lyons*, whither he had been ſummon'd by Pope *Urban* IV. in the Monaſtery of *Foſſa Nova*, not far from *Terracina*, in 1274. His Chymical Writings are,

Secreta Alchemiæ magnalia, de Corporibus ſupercœleſtibus, & quod in Rebus inferioribus inveniantur, quoque modo extrahantur:

De Lapide minerali, Animali & Plantali:

Theſaurus Alchemiæ ſecretiſſimus, quem dedit Fratri ſuo Reinaldo:

To which are added, *Johan. de Rupeſciſſa's Book of Light*; and *Raym. Lully's Clavicula & Apertorium*, publiſh'd by *Dan. Bronchuſius*, with a Preface by *Joh. Heurnius, Lug. Bat.* 1598. 8*vo.* It is in the *Theatr. Chym. T.* 3. *p.* 277.

Aurora, ſive Aurea Hora:

Commentarium ſuper turbam Philoſophorum breviorem, ut dicitur: Extant in the ſecond Decad of the *Harmon. Chym. Philoſophica*, collected by *Joſ. Rhenanus. Francof.* 1625. 8*vo.*

He was ſucceeded by ROGER BACON, an *Engliſhman*, a Monk of *Weſtminſter*, but reſiding at *Oxford*, where he flouriſh'd about the Year 1226. He excel'd in Alchemy, Chymiſtry, natural Magic, Mechanics, Metaphyſics, Phyſics, and Mathematics. He died at *Oxford* in 1284. and was buried there among the *Franciſcans*. Such of his Works as have been handed down to us, are generally written in a clear eaſy Style, without Circumlocutions.

He was, beyond all Compariſon, the greateſt Man of his Time; and might, perhaps, ſtand in Competition with the greateſt that have appear'd ſince. 'Tis wonderful, conſidering the ignorant Age wherein he lived, how he came by ſuch a Depth of Knowledge on all Subjects. His Writings are compoſed with that Elegance, Conciſeneſs, and Strength, and abound with ſuch juſt and exquiſite Obſervations on Nature, that, among all the Chymiſts, we don't know his Equal.

He writ many Treatiſes, ſome of which are loſt, or lock'd up in private Libraries. What relate to Chymiſtry, are principally two ſmall Pieces, wrote at *Oxford*, which are now in Print, and the Manuſcripts to be ſeen in the public Library of *Leyden*, having been carried thither, among *Voſſius*'s Manuſcripts, from *England*. In theſe he attempts to ſhew, how imperfect Metals may be ripen'd into perfect ones. He adopts *Geber*'s Notion, that Mercury is the common Baſis of all Metals, and Sulphur the Cement; and ſhews, that it is by a gradual Depuration of the mercurial Matter, and the Acceſſion of a ſubtle Sulphur, that Nature produces Gold; and that if, during the Proceſs, any other third Matter happens to intervene, beſide the Mercury and Sulphur, ſome other baſer Metal will ariſe; ſo that, if we could but imitate Nature's Method, we might change other Metals into Gold.

Having compared ſeveral of Frier *Bacon*'s Operations with the modern Experiments of M. *Homberg*, made by Direction of

of that curious Prince the Duke of *Orleans*, we judge, that *Bacon* has deſcrib'd ſome of the very Things which *Homberg* publiſhes as new Diſcoveries. Thus, for Inſtance, *Bacon* teaches expreſly, that if a pure Sulphur be united with Mercury, it will produce Gold; on which very Principle M. *Homberg* has made many Experiments for the Production of Gold, deſcribed in the *Memoires de l' Academie Roy. des Sciences.*

His other phyſical Writings ſhew no leſs Genius, and Force of Mind. In his Treatiſe, *Of the ſecret Works of Art and Nature*, he ſhews, that a Perſon, who was perfectly acquainted with the Manner which Nature obſerves in her Operations, would not only be able to rival, but ſurpaſs her. In another Piece, *Of the Nullity of Magic*, he ſhews, with great Sagacity and Penetration, whence the Notion ſprung, and how weak all Pretenſions to it are. Admiration, the Parent of Magic, is the Off-ſpring of Ignorance, begot upon a vitiated Imagination: When weak Minds perceive an Effect, whoſe Cauſe is hid far in the Dark, they preſently have recourſe to a Demon to ſolve the Difficulty; for they fancy it muſt be the Effect of magical Art, or the Intervention of ſome ſupernatural Power. This popular Refuge of Ignorance the judicious Author deſervedly confutes, and ſhews, there is no ſuch thing as Magic; unleſs by that Word he meant a Knowledge of the Properties of Bodies, and the Methods of Nature; by a dextrous Application whereof many Things may be produced, more ſurpriſing than all the pretended Magic has ever effected.

Such was the Scope and Tendency of his Writings. What Reward he met with, is abominable to ſay: The Man, who had thus overthrown the idle Pretenſions of the Believers in Magic, was himſelf branded for a Magician, excommunicated, and impriſon'd.

His Works are printed in 8*vo.* and 12*mo.* under the Title of *Frater Rogerius Baco de Secretis Artis & Naturæ*, and in *Folio* at *London*. From a repeated Peruſal of them, we find our Frier was no Stranger to many of the capital Diſcoveries of the preſent and paſt Ages.

Gun-powder he certainly knew: Thunder and Lightning, he tells us, may be produced by Art; for that Sulphur, Nitre, and Charcoal, which, when ſeparate, have no ſenſible Effect, yet, when mix'd together in a due Proportion, and cloſely confin'd, and fired, they yield a loud Report. A more preciſe Deſcription of Gun-powder cannot be given in Words; and yet a Jeſuit, *Barthol. Schwartz*, ſome Ages after, has had the Glory of the Diſcovery. He likewiſe mentions a Sort of inextinguiſhable Fire, prepared by Art; which ſhews he was not unacquainted with Phoſphorus. And that he had a Notion of the Rarefaction of the Air, and the Structure of an Air-pump, is paſt Contradiction.

A Catalogue *of Frier* Bacon's *Writings.*

Tractatus duo de Chemia.

Speculum ſecretorum.
Opus majus, ad Clem. IV.
Rog. Baconis epiſtolæ de ſecretis Operibus artis & naturæ, & de nullitate Magiæ. Opera Joh. Dee Londin. è pluribus exemplaribus caſtigata olim, & ad ſenſum integrum reſtituta. Nunc vero à quodam veritatis amatore in gratiam veræ Scientiæ emiſſa, cum notis quibuſdam, partim ipſius Joh. Dee, partim edentis. Cum reſponſione ad fratres Roſaceæ crucis illuſtres. Hamb. 1618. 8*vo.*

In his Works we find many elegant Diſcoveries in Mechanics, Natural Magic, and other Arts, which have been falſly attributed to later Authors, and were no leſs falſly charg'd on him as the Effect of Magic and Hereſy.

George Ripley, an *Engliſhman*, and Canon of *Bridlington*, lived in the Reign of *Edward* the Fourth, to whom, in the Year 1577. he dedicated his Book intituled *The twelve Gates*. His Writings are all very good in their Kind, being wrote in *Bacon*'s Manner, only more allegorical. As he was no Phyſician, he does not meddle with any Medicinal Preparations; but treats much of the Cure of Metals, which, in his Language, is the Purification and Maturation thereof. He purſued *Geber*'s and *Bacon*'s Principles very religiouſly; and maintained, for Inſtance, with new Evidence, that Mercury is the univerſal Matter of all Metals; that this, expoſed to the Fire with the pureſt Sulphur, will become Gold; but that if either of them be ſick or leprous, that is, infected with any Impurity, inſtead of Gold, ſome other Metal will be produc'd. He adds, that as Mercury and Sulphur are ſufficient for the making of all Metals, ſo of theſe may an univerſal Medicine, or univerſal Metal, be produc'd, for curing all the Sick, which ſome have inadvertently underſtood of an univerſal Medicine, efficacious in all Diſeaſes. 'Tis ſaid, that *Ripley* ſent an hundred thouſand Pounds, for ſeveral Years ſucceſſively, to the Knights of *Rhodes*, to enable them to defend themſelves againſt the *Turks*.

His Works are,
Duodecim Portæ.
Medulla Chimica.

A Piece on Alchemy, compoſed in *Engliſh* Verſe, and now preſerved in the Library of *Leyden*. His Works were publiſh'd together at *Caſſel*, in 8*vo.* 1649.

De Mercurio Philoſophorum; or, A Piece on the Mercury of the Philoſophers: And *Commentarium Hermeſii Philoſophi*, now in Manuſcript in the Library of *Leyden*.

Pupilla Oculi, with a Preface, preſerv'd in Manuſcript in the *Bodleian* Library, given by *Elias Aſhmole*, Eſq;

De Regimine ignium Philoſophorum, & quibuſdam probatiſſimis experimentis; that is, Of the Management of the Fires of the Philoſophers, together with ſome approv'd Experiments; found in Manuſcript in the *Bodleian* Library, part of the Donation of the ſame Perſon.

He was ſucceeded by Arnaldus de Villa nova, who was a *Frenchman*, and denominated *Arnaud de Ville Neuve*, from *Ville Neuve*, the Place of his Nativity. He was a celebrated Philoſopher, Phyſician, and Chymiſt, and thought to be deeply ſkilled in Alchemy. *Van Helmont*, a great Admirer of *Arnaud*, attributes to him the firſt introducing of Chymiſtry into Medicine. He was ſent by *Frederic*, King of *Sicily*, to cure Pope *Clement* the Fifteenth; but, being ſhipwreck'd in the Voyage, dy'd in 1313. and was bury'd at *Genoa*. The *Spaniards* maintain he was a *Catalan*. 'Tis certain he practiſed Phyſic at *Barcelona*, whence he acquir'd the Surname *Catalanus*. He was ſuſpected of Magic.

His Works are,
Roſarium.
Teſtamentum novum practicum.
De Alchemia.
Semita Semitarum.
To theſe may be added,
Roſa Novella.
Epiſtola ad Papam Pium.
Novus ſplendor, vel Lumen.
Flos florum.
De Furno Philoſophico.
De Secretis Naturæ.
De nova compoſitione Lapidis vitæ Philoſophorum.
De Principiis naturalibus, ad Clementem Papam.
Opus in Arte majore.

Beſides theſe, we have, of his Writings,

Speculum Alchemiæ, quo artis Chimicæ Myſteria, etiam Secretiſſima, luculenter enodantur & explicantur. Firſt publiſh'd by *Jer. Megiſerus. Francof.* 1602. 8*vo.* Afterwards, together with his other Chymical Works, by the ſame Editor. *Francof.* 1603. 8*vo.*

Opera, unà cum ipſius vitâ, à Symphor. Campegio deſcripta; ac tractatus de Lapide Philoſophorum. Lugd. 1530. 8*vo.*

Opera, cum Nic. Tawcelli annotationibus. Baſ. 1585. *Fol.*

Theſaurus Theſaurorum. The Treaſure of Treaſures. Preſerved in Manuſcript in the *Bodleian* Library, Part of the Donation of *Elias Aſhmole*, Eſq;

Tract. de Solutione dubiorum in Alchemia: Or, Of the Solution of Doubts in Alchemy. In Manuſcript, extant in the ſame Library. Given by Sir *Kenelm Digby*.

Raymund Lully, a *Spaniard*, born at *Barcelona* in the Year 1235. a Diſciple of *Arnaldus de Villa Nova*, died in *Africa* in 1315. He was one of the firſt who, in his Treatiſe intituled *De Quinta Eſſentia*, wrote of an univerſal Remedy for all Diſeaſes of the Body, and of the Philoſophers Stone.

This Author is ſaid by others to have been born in *Majorca*, and by ſome in *Minorca*, but ſprung from the noble Family of the *Lullies* in *Barcelona*. His Cotemporaries ſpeak of him as a Perſon eminently verſed in the Peripatetic Learning; which, indeed, appears from ſeveral of his Writings. He had the Addreſs to introduce a new kind of tranſcendental Art, call'd from him *The* Lullian *Art*, by virtue whereof a Man might diſpute whole Days upon any Topic in Nature, without underſtanding any thing of the Matter. But at length, perceiving the Vanity of his own Art, he quitted this barren Superfluity of Words, and went over to the other Extreme.

Upon applying himſelf to Chymiſtry, he ſoon began to preach another ſort of Doctrine; for, ſpeaking of that Art, he ſays it is only to be acquired by Experiment, and cannot be convey'd to the Underſtanding by idle Words and Sounds.

Lully, beſides what he did in the ſcholaſtic Way, writ ſeveral Volumes after changing his manner of Study: 'Tis difficult to ſay, how many; for it was a common Practice with his Followers to publiſh their Performances under their Maſter's Name. His later

later Works are, beyond all Expectation, excellent; ſo that it may be doubted whether they were the Production of that Age. So full are they of the Experiments and Obſervations which occur in our later Writings, that either the Books muſt be ſuppoſititious, or the antient Chymiſts muſt have been acquainted with many things, which paſs for the Diſcoveries of modern Authors. He gives plain Intimations of Phoſphorus, which he calls the Veſtal Fire, the Offa Helmontii, *&c.* and yet he muſt have liv'd two hundred Years before either *Helmont* or Lord *Bacon*.

He travel'd into *Mauritania*, where he is ſuppoſed to have firſt met with Chemiſtry, and to have imbib'd his Principles of the Art from the Writings of *Geber*; which Opinion is countenanced by the Conformity obſervable between them.

The *Spaniſh* Authors aſcribe the Occaſion of his Journey to a Paſſion he had for a Maid, nam'd *Eleonora*, who obſtinately refus'd his Addreſſes. Upon inquiring into the Reaſon, ſhe ſhew'd him a cancer'd Breaſt. *Lully*, like a generous Gallant, immediately reſolves on a Voyage to *Mauritania*, where *Geber* had lived, to ſeek ſome Relief for his Miſtreſs. But others ſay, that from thenceforward he devoted himſelf to Penance, and, among other pious Exerciſes, applied himſelf to the Converſion of Infidels, with a View to which he learned *Arabic* at thirty Years of Age. At his Solicitation, *James* King of *Arragon* founded a Seminary in *Majorca*, for the Education of Miſſionaries: After which he travel'd thro' *France*, *Germany*, and *England*; and was at laſt ſtoned to Death in *Africa* for preaching Chriſtianity.

There are ſaid to have been two *Raymund Lullies*; the one a Friar, and a Martyr, the other an Alchemiſt, and originally a *Jew*. 'Tis ſaid there are above a hundred Chemical Manuſcripts of *Raymund Lully* yet unpubliſhed, preſerved in the *Vienna* Library.

His principal Works are,

De Secretis Naturæ, ſeu quinta Eſſentia..

De Accurtatione Lapidis Philoſophorum.

Codicillum, ſeu Vade mecum de formatione Lapidum pretioſorum. A Codicil, or Vade Mecum, of the making of precious Stones, now in Manuſcript in the Library of *Leyden*.

Clavicula de Lapide Philoſophorum.

Teſtamentum.

Apertorium.

Epiſtolæ ad Edvardum Regem Angliæ.

Lux Mercuriorum.

De Mercurio.

Speculum magnum.

Teſtamentum noviſſimum.

Epiſtolæ ad Robertum Regem Angliæ.

Aphoriſmi.

Epiſtolæ accurtationum.

De Inveſtigatione occulti Secreti.

Exempla accurtationis.

All which Pieces are in Manuſcript in the Library of *Leyden*.

A fair Copy of all *Lully*'s Chemical Works, tranſcribed in 1483. and 1484. in two Volumes, Fol. is preſerved in the *Bodleian* Library, given by *El. Aſhmole*, Eſq; Some of theſe are in the *Theatr. Chym.* and *Manget*'s *Bibl. Chym.*

JOHANNES DE RUPESCISSA, a *Franciſcan*, died in Priſon, about the Year 1375. He wrote many Pieces on Alchemy. *Paracelſus* cenſures him, as having advanced things falſe and ridiculous.

This Author is held as the Patriarch of the Chymiſts: His Writings are many, eaſy to be procur'd, and of great Weight. Beſides his Theological Pieces, he wrote many Chymical ones; and had wrote more, as having a ſtrong Chymical Taſte, but that, like his great Predeceſſor *Bacon*, he was accus'd of Magic, and thrown into Priſon; where he pined away, and died of Grief; by which means he was prevented from diſcovering many Secrets of Nature, which he was become Maſter of.

His principal Works are,

Liber Magiſterii de Confectione veri Lapidis Philoſophorum. Publiſh'd with other Pieces of Alchemy. Collected by *Gratarolus*. *Baſ.* 1561. *Fol. T.* II. *p.* 126. In the *Theatr. Chym. T.* III. *p.* 189. and in *Mangeti Bibl. Chym. T.* III. *p.* 80.

Liber Lucis. Publiſh'd with the *Secreta Alchimiæ magnalia* of *Tho. Aquinas*, by *Dan. Bronchuiſius*. *Lugd. Bat.* 1598. 8*vo*. In the *Theat. Chym. T.* III. *p.* 284. and *Mangeti Bibl. Chym. T.* II. *p.* 84.

Roſarium Philoſophorum. Extant in *Mangeti Bibl. Chym. T.* II. *p.* 87. & 119.

De conſideratione quintæ eſſentiæ rerum omnium. Baſil. 1597. 8*vo*.

ISAAC HOLLANDUS, and JOHN ISAAC HOLLANDUS, born at *Stolk*, a Village of *Holland*, wrote ſeveral Pieces on Alchemy, wherein they deliver many extraordinary Experiments.

Some ſay theſe were Father and Son; others, that they were Brothers. Whether, is not eaſy to determine; but certain it is they were both Perſons of great Parts and Ingenuity, and wrote on the dry Topics of Chymiſtry with all the copious Eloquence of Orators. They ſeem to have lived in the thirteenth Century; but this is not aſſured. The whole Art of enamelling is their Invention, as is alſo that of colouring Glaſs and precious Stones, by the Application of thin metal Plates thereon.

Their Writings are in the Form of Proceſſes; and they deſcribe all the Operations to the moſt minute Circumſtances. The Treatiſe of Enamelling is eſteemed the greateſt and moſt finiſh'd Part of their Works; all that relates to the neceſſary Fuſion, Separation, and Preparation of the Metals, is here delivered. They write excellently of Diſtillation, Fermentation, Putrefaction, and their Effects, and ſeem to have underſtood at leaſt as much of theſe Matters as any of the Moderns. They publiſh'd a ſmall Treatiſe of the Philoſophers Stone, which, they hold, may be prepared from any Body in Nature. They deſcribe Ways of producing it from Lead, Blood, Sulphur, and Mercury, and other Matters. They furniſh ſeveral Experiments on human Blood, which *Van Helmont* and Mr. *Boyle* have ſince repeated. *Paracelſus* has likewiſe borrowed freely from them. There goes a very large Work, in *Folio*, under their Name, *Of the Conſtruction of Chymical Furnaces and Inſtruments.*

Their principal Works are,

De Lapide Philoſophorum. Extant in the *Theat. Chym.*

Scientia Chimiæ.

De projectione infinita.

Opera Mineralia, ſive de Lapide Philoſophorum. Extant in the *Theat. Chym.* Alſo publiſhed at *Middelb.* 1600. 8*vo*.

Opera Mineralia & Vegetabilia. Arnheim. 1616. 8*vo*.

De Vino.

Opera Vegetabilia. Francof. 1666. 8*vo*.

Beſides theſe, they alſo wrote

Manus Philoſophica.

De Salibus & Oleis Metallorum.

BASIL VALENTINE is commonly ſaid to have been a *Benedictine* Monk of *Erfurt*; tho' we are informed there never was any *Benedictine* Monaſtery at *Erfurt*; and both his Names ſeem apparently coin'd, the one from the *Greek*, the other from the *Latin*.

His Writings are much commended, and much ſought; tho' there are ſome ſpurious Pieces tack'd to them. He wrote in *High Dutch*, and but few of his Pieces have been tranſlated into *Latin*. In his Experiments, he may be depended on for his Exactneſs and Veracity; his Style is clear, open, and pure, except when he treats of his Arcana, and particularly of the Philoſopher Stone, when he is as obſcure as the reſt.

He ſhould ſeem to have been the firſt who applied Chymiſtry to Medicine; for, after every Preparation, he never fails to give ſome medicinal Uſe thereof. He it was, likewiſe, who firſt broached the Doctrine of the three Chymical Principles, Salt, Sulphur, and Mercury, which *Paracelſus* afterwards appropriated; and it might be ſhewn, that *Paracelſus*, *Helmont*, the elder *Lemery*, and many others of modern Fame, owe a great deal of what is valuable in them to this Author; ſo that it is not without Reaſon that he is judged the Father of the modern Chymiſts, and the Founder of the Chymical Pharmacy.

Van Helmont writ upon the Alcaheſt, or univerſal Menſtruum; and *Zwelfer*, pretending to know his Secret, deſcribes it as a Preparation of Vinegar and Verdegriſe, diſtil'd till the Verdigriſe diſappears. But *Otto Tachenius* ſhews, that *Zwelfer* borrow'd the whole Proceſs from a Book of *Valentine*'s, intituled, *Stan geiſt*, where, indeed, it is deſcribed in Terms plain enough: So the Sal Volatile Oleoſum, which *Sylvius de le Boe* has long had the Credit of, and many other Secrets, which make a Figure in the modern Authors, are originally derived from *Baſil Valentine*. See the PREFACE.

His Chemical Writings are;

Opus ad utrumque: Printed in the *Theatrum Chemicum.*

De magno Lapide antiquorum ſapientium. Extant in *Mang. Bibl. Chym.*

Practica, una cum XII. *Clavibus, & Appendice.* Tranſlated out of *High Dutch* into *Latin*, and publiſh'd with *Mich. Majerus*'s *Tripos aureus. Francof.* 1618. Alſo with the *Muſæum hermeticum reformatum & amplificatum. Francof.* 1677. and 1678. 4*to*. And in *Mang. Bibl. Chym.*

Apocalypſis Chymica: Erff. 1624. 8*vo*.

Currus triumphalis Antimonii, tranſlated into *Latin*, and illuſtrated with a Commentary, by *Theod. Kerckringius. Amſt.* 1671. 12*mo*.

Tractatus Chymico-philoſophicus de rebus naturalibus Metallorum & Mineralium. Francof. 1676. 8*vo*.

Chymiſche Schrifften alle, &c. that is, all his Chymical Writings, both printed and manuſcript, enlarged and amended, and divided into two Parts: In *High Dutch. Hamb.* 1677. 8*vo*. with Figures; and again, *Hamb.* 1717. 8*vo*.

Baſil Valentine's laſt Will and Teſtament, with his manual Operations, and a Tract of Things natural and ſupernatural. *Lond.* 1671. 8*vo*.

PARACELSUS comes next on the Stage, of whom I have given a very ample Account in the PREFACE. I ſhall, therefore, give here only an Account of his Works.

1. His *Chirurgia Magna*, which he dedicated to *Hieron Benerus*, Dictator of the City *Colmar*, *June* 2. 1528.
2. *Liber Apoſtematum*, which he dedicated to *Conrad. Wiſerum*, Conſul of *Colmar*, *July* 5. 1528.
3. *De Gradibus*, *Compoſitionibus & Tartaro*.
4. His *Great Surgery*, which he dedicated to the Emperor *Ferdinand* from *Munchrath*, *May* 7. 1536.
5. The ſecond Part, to the ſame Prince, *Aug.* 11. 1536.

In theſe he makes mention of ſeveral other Pieces publiſhed by him, *viz.*

6. *De Archidoxis.*
7. *De Sanationibus.*
8. *De ſanitate Microcoſmi & Elementorum.*
9. *De Generationibus Naturalium.*
10. *De Suppuratione.*
11. *De Signis.*
12. *De Characteribus & adeptis.*
13. *De Phlebotomia.*
14. *De Origine novorum Morborum.*
15. *De Magia.*

Beſides theſe, Dr. *Shaw* mentions,

1. *De Gradibus & compoſitionibus receptorum & naturalium*, *Lib.* VII. dedicated to Dr. *Eph. Clauſerus*, a Phyſician of *Zurich*. *Baſ.* 1526. 4*to*.
2. *Archidoxorum*, *Lib.* X. dedicated to the Students of *Zurich*. *Baſil.* 1527. 4*to*.
3. *Aur. Theophraſt. Paracelſi Archidoxorum, ſeu de Secretis Naturæ myſteriis, Libri* X. *quibus nunc acceſſerunt libri duo, unus de Mercuriis Metallorum, alter de Quinta eſſentia; manualia item duo, quorum primus Chemicorum verus Theſaurus; poſterius præſtantium Medicorum experientiis refertum eſt, ex ipſius Paracelſi autographo, Baſil.* 1582.
4. *Paramirica Opera*, dedicated to D. *Joach. Vadianus*, a Phyſician, 1531. *March* 5.
5. *De Natura Rerum*, *Lib.* VIII. dedicated to his Friend *John Winckeſteiner* of *Fribourg*, 1537.
6. *Opera omnia*, in two Volumes, *Folio*, *Latin*.
7. There is alſo an *Engliſh* Tranſlation of his *Archidoxa*, by *J. H. Oxon.* 1661. 8*vo*.

JOHN BAPTIST HELMONT appears next. He was born of a noble Family at *Bruſſels*, in the Year 1577. 36 Years after the Death of *Paracelſus*. He loſt his Father in 1580. and, being the youngeſt Child, applied himſelf, againſt the Conſent of his Mother, and without conſulting his Friends, to the Study of Phyſic. He finiſhed his Courſe of Philoſophy in the Year 1564. being in the 17th Year of his Age, when he was noted for a great Reader, having read *Galen* twice, *Hippocrates* once, and all the other Phyſicians, both *Greeks* and *Arabs*, with great Care, and even common-plac'd them. When going to *Lovain*, he was appointed, by the Profeſſors *Thomas Tyenus*, *Gerard Villers*, and *Hornius*, to read public Lectures on Surgery in the College of Phyſicians. In the 22d Year of his Age, being the Year 1599. he was created Doctor of Phyſic at *Lovain*, where he had begun to ſee thro' the Inſufficiency of the School-phyſic, long before he had diſcovered any better Medicines of his own. Happening to be troubled with a ſlight Itch, which he could not get rid of by the School-method, but which was eaſily removed by the means of Sulphur, he repented having ever devoted himſelf to the Study of Phyſic, conſidering the Nobleneſs of his Birth, and that none of his Family had hitherto ſtooped to ſuch a Profeſſion. On theſe Motives he threw it up, divided his Fortune among his Relations, and quitted his Country, with an Intention never to return. His Books, to the Value of 300 Crowns, he threw aſide; and, ſetting out for foreign Countries, rambled for ten whole Years, till, being inſtructed in Chymiſtry by a certain illiterate Perſon, he applied himſelf wholly to that Art; and having, in the Compaſs of two Years, obtained a few Chymical Medicines, he became capable of curing ſome Diſeaſes.

In the Year 1609. he married a rich, noble, and virtuous Wife, with whom he retir'd to *Wilwoord*, where he gave himſelf wholly up to the Purſuits of Chymiſtry. During his Noviciate in the Art, he tried many dangerous Experiments, which frequently hazarded his Life; and tho' he did not viſit Patients, and practiſe Phyſic for Gain, he aſſures us he cured every Year ſome Thouſands of ſick People. He ſpent fifty whole Years in Diſtillations. He was in high Eſteem with the Electoral Biſhop of *Cologne*, a Prince eminently ſkill'd in Chymiſtry; and was invited by the Emperor *Rodolph*, and two other Emperors, to the Court of *Vienna*; but he always refus'd. In the Year 1624. he publiſhed a Treatiſe, printed at *Liege*, *De Aquis Spadanis*, or, *Of the Spaw-waters*, and afterwards ſeveral other Pieces.

He was not able to cure two of his Sons, whom he loſt, of the Plague, nor his eldeſt Daughter of a Leproſy, though he practiſed on her full two Years; nor could he cure his Wife, nor his Maid, nor himſelf, of Poiſon. In *January* 1640. being the 63d Year of his Age, he was ſeized with a Fever, attended with a ſlight Shivering, which made his Teeth chatter, a pricking Pain about the Sternum, a Difficulty of Reſpiration, and a Spitting firſt of bloody Matter, then of pure Blood. For the Removal thereof he took Shavings of the Penis of a Stag, upon which the Pain grew leſs; then he took a Dram of Goats Blood, and the Spitting of Blood ſtopt for four Days, leaving only a ſlight Cough, with a moderate Expectoration; but the Fever ſtill remain'd, and was followed by a Pain in the Spleen, for which he took Wine boiled with Crabs-eyes; whereupon all the Symptoms diſappeared. In the Year 1643. he was ſeized with a Syncope, occaſioned by the Smoak of Charcoal, which he cured with Sulphur of Vitriol. On the 18th of *Nov.* 1644. he was ſeized with an Aſthma, attended with two Fits of a Pleuriſy; and, after languiſhing ſeven Weeks, died of a ſlight Fever, and extreme Weakneſs, on the 30th of *December* 1644.

Hence it is evident, that *Helmont* was not Maſter of the univerſal Remedy which he ſo often boaſts of; but, in chronical Caſes, he wrought extraordinary Cures, by means of violent Remedies, where the Conſtitution of the Patient was ſtrong enough to endure the Action thereof. But, for all their vain Promiſes of long Life, neither of them arriv'd at old Age.

During the Retirement of this Author at *Wilwoord*, he examined, with great Pains and Induſtry, all kinds of Bodies, both foſſile, vegetable, and animal, in a Chymical Way; and thus firſt furniſhed a new Body or Courſe of Chymical Knowledge. Here he made thoſe noble Experiments and Diſcoveries of Oil of *Sulphur per Campanam*, the *Laudanum Paracelſi*, Spirit of Hartſhorn, Spirit of human Blood, *Sal Volatile Oleoſum*, and others.

Having conceived a ſtrong Prejudice againſt the *Galenical* Method and Medicines, from his own ill Succeſs upon applying them in Practice, and finding Chymiſtry productive of ſo many, and much more powerful Remedies, he run counter, in every thing, to the *Galenic* School, and reduced the whole Art of Phyſic to Principles of Chymiſtry. With ſuch Views he began to write: His firſt Piece was of Spaw-water, printed at *Liege* in 1624. as before-mention'd, which procured him conſiderable Eſteem: There are ſeveral good Things in it, and but little of that Opinionativeneſs and Boaſting, which ſhewed itſelf in his later Works. He had it reprinted the ſame Year at *Cologne*, with new Experiments. In 1644. he publiſh'd his ſecond Piece, *De Humoribus*, a third *De Febribus*, and a fourth *De Lithiaſi*, which are all the Books he publiſh'd in his Life-time. Soon after the Publication of the laſt he died: So that the Suggeſtion of ſome eminent Chymiſts, that *Helmont* had changed his Sentiments, and had got quite other Things in View, appears without any Ground.

As he perceiv'd his Death approaching, he call'd for his Son, and gave him the following Charge: Take all my Writings, the crude as well as the finiſh'd ones; and join them together; to your Care I commit them; do with them what you think good. For ſo it has pleaſed Almighty God, who directs every thing to the beſt Purpoſes. This Son was a Perſon of deep Thought, but a little tainted with Enthuſiaſm; and in his Father's Life-time had ſtrolled about with a Gang of Gypſies. After the Father's Deceaſe, he acquitted himſelf of the Truſt, publiſhing them juſt as he found them, without any Regard to Order, Conſiſtency, or Correctneſs, and, beſides, truſted the Impreſſion principally to the Printer: So that we frequently find *Helmont* relating Things in one Place, which he contradicts in another. And, indeed, 'tis no Wonder we don't find the ſame Tenor throughout; for as Chymiſtry grew under his Hands, and as many new Views muſt turn up in forty or fifty Years, which he ſpent in gradually improving the Art, it is eaſy to conceive how there ſhould ariſe a Difference.

The Pieces publiſhed by himſelf are all excellent; that of the Stone is incomparable, and the beſt; that of Fevers is a valuable Work; and that of the Humours is a fine Piece. The Galenical Doctrine of the four Elements, four Qualities, four Degrees, and four Humours, with the Method of Cure by tempering theſe Degrees, are here clearly and directly prov'd to be falſe and inſignificant. The Treatiſe of the Plague, which is one of his poſthumous Pieces, has many good Things, tho' it does not come up to the Merit of the former. But the reſt are all ſo much inferior, that one would never ſuſpect them to have come from the ſame Hand.

The beſt Edition is that of *Amſterdam*, in 4*to*. *apud Elzevir*. In the *Venetian* Edition in *Folio*, there are ſeveral Pieces not *Helmont's*; and the ſame may be ſaid of that lately publiſh'd in *Germany*.

If his moſt ſolemn Proteſtations are of any Weight, he ſhould ſeem to have been poſſeſſed of the Univerſal Medicine; a Thing which he inculcates in almoſt all his Writings. His Notion of the Origin of ſuch an univerſal Remedy is very peculiar, and ſavours of that Enthuſiaſm, which was a Part of his Character. No Poiſon, ſays he, can act on a Carcaſe; there muſt be Life to produce an Effect: This Life he calls *Archæus*; and aſcribes both Knowledge and Underſtanding thereto. If now any heterogeneous Body happen to be preſent to the *Archæus*, it riſes into a Fervour, endeavours to expel the

the hoſtile Matter, and in order to that, exerts all the Force of the Body. To cure any Diſeaſe therefore, is to pacify and compoſe this *Archæus*. The Thing required, therefore, is ſuch a Remedy as may readily calm, and put a Stop to, this unnatural Fervour upon all Occaſions: And this, ſays he, is the univerſal Remedy.

This Doctrine of *Helmont* would not be ſo abſurd, did he not aſcribe Underſtanding to his *Archæus*. Setting this aſide, the Principle which renders Poiſons deadly, and Remedies beneficial, is the Circulation of the Blood. No doubt but *Helmont* was appris'd of this before he died. For *Harvey* had publiſhed his Diſcovery ſome Years before; which *Helmont* could not but fall into, tho' he might chuſe to diſſemble the Matter, as it untwiſted a large Part of his Syſtem, which he might want Leiſure or Inclination to reform and model new.

From *Paracelſus* and *Helmont*'s Time, the Number of Chymiſts and chymical Writers grew immenſely; ſo that to rehearſe them all would be endleſs. In *Borelli*'s *Bibliotheca Chymica*, printed at *Heidelberg* in 1653. no leſs than four thouſand chymical Writers, already extant, are enumerated; and yet he mentions none but thoſe of his own Knowledge. Others, who took more Scope, found above double that Number at the ſame time. It may be added, that the Years elapſed ſince have produced more than all the Ages before.

Here, therefore, we muſt ſtop; the Field is too vaſt to enter on. We have conducted Chymiſtry from its Riſe to its State; its Progreſs is now at an End: We ſhall only here obſerve, that as it is not only a dark and intricate, but a dangerous Art; ſo he who enters on it, muſt proceed not only with Addreſs, but Caution. That Part, which relates to Metals, is remarkably dangerous: The ſingle Vapour of Arſenic may either immediately ſuffocate, or occaſion a Weakneſs for ever; and an Author who relates an Experiment, without expreſſing every Circumſtance thereof at large, is not only uſeleſs, but even dangerous. The Event of every Operation depends on theſe minute Circumſtances; and an Alteration in any one may not only prevent the Succeſs of the Whole, but even render it unexpectedly fatal. We proceed, therefore, to ſingle out of this vaſt Number thoſe we would recommend for their Exactneſs and Fidelity in teaching the fundamental Parts of Chymiſtry; and theſe we ſhall reduce into four Claſſes. The firſt Claſs includes the ſyſtematical Writers, or thoſe who have collected all the known Operations into a Body, and digeſted them in the Form or Order of an Art or Inſtitution, for others to learn by; commonly with ſome Addition of their own Reaſonings at the End of each Operation. The ſecond Claſs contains the metallurgical Writers. The third comprehends the Authors on Alchemy: And the fourth, thoſe who have apply'd Chymiſtry to the Uſes of Natural Philoſophy, Medicine, and other Arts.

Franciscus de la Boe Sylvius, Otto Tachenius, and their Followers, contributed ſtill further to the Introduction of Chymiſtry into Medicine; ſo as to render the latter entirely dependent, both as to Practice and Speculation, on the former.

From the Whole of what has been hitherto delivered, it appears moſt advantageous to a Student in Chymiſtry, to begin with peruſing the Authors who have reduced the Operations into the Form of Syſtems: The chief of which are the following.

Systematical Writers.

1. Oswaldus Crollius was a *Heſſian*, and Phyſician in ordinary to *Chriſtian* Prince of *Anhalt*. He was a Perſon of Learning, but a ſanguine Follower of *Paracelſus*; even in his Extravagances about aſtral Virtues, Signatures, Chiromancy, Phyſiognomy, Gnomes, Sylphs, Parallels, and Reſemblances of celeſtial and ſublunary Bodies; on which he endeavours to found the Art of Phyſic. And yet the chymical Proceſſes he deſcribes are generally faithful and exact. He dedicates his Book to the Prince of *Anhalt*, from *Prague*, 1608. It ſhews the Ways of preparing ſeveral chymical Medicines, which are now commonly known.

His Works are;

The original Title is, *Baſilica Chymica, Philoſophicam, propriâ laborum experientia confirmatam deſcriptionem & uſum Remediorum Chymicorum ſelectiſſimorum è Lumine Gratiæ & Naturæ deſumptorum continens:* At the End is added, the ſame Author's *Tractatus novus de ſignaturis rerum internis*, *Francof.* 1609. 4*to.* Reprinted in 1611. 4*to.* 1620. 4*to.* and 1622. 8*vo.* *Baſilica Chymica cum augmento J. Hartmanni*, *Lipſ.* 1634. 4*to.*

——— *Genev.* 1630. 1635. 1643. and 1658. 8*vo.*

2. Beguinus comes next. He was Almoner to the King of *France*, and publiſhed

Les Elemens de Chymie, à Paris, 1615. and 1624. 8*vo.* *à Rouen*, 1637. 8*vo.* *à Lyon*, 1665. 8*vo.*

Theſe were tranſlated into *Latin*, and illuſtrated with Notes, by *Jer. Barthius*, under the Title of *Tyrocinium Chymicum*, *Francof. O.* 1618. 8*vo.* Afterwards enlarged above one half with Notes, and ſelect Forms of Medicines by *Chriſtoph. Gluckradt Regiamont.* 1618. 8*vo.* Afterwards republiſh'd with the Notes of both theſe Editors, as alſo the Forms of Medicine, digeſted into one Syſtem, by *Jo. Geo. Pelſhofer*, *Wittenberg*, 1650. 8*vo.* Laſtly, illuſtrated with a new Comment, by *Gher. Blaſius*, *Amſt.* 1659. 12*mo.* Of which another Edition enlarged and corrected was publiſhed, *Amſt.* 1669. 12*mo.* This Work is alſo tranſlated into *Engliſh*, by *Richard Ruſſel*, under the Title of *Royal and practical Chymiſtry.*

3. Jo. Hartmannus. His Works are; I. *Opera omnia Medico-chymica, collecta & in unum Volumen congeſta, atque pluribus aucta à Conr. Johrenio, Francof. M.* 1684. *Folio. Ibid.* 1690.

II. *Praxis Chymiatrica*, publiſh'd by *Jo. Michaelis*, and the Author's Son, *Everh. Hartmannus*, *Lipſ.* 1683. 4*to.* And with the Addition of three other Pieces, *Genev.* 1639. 8*vo.* and 1682. 8*vo.*

4. Christopher Glaser was Apothecary in ordinary to the King of *France*, and the Duke of *Orleans*; and gave public Lectures on Chymiſtry, and Chymical Preparations, in the Royal Gardens at *Paris*. His Book is candidly and clearly wrote, and contains a little Syſtem of chymical Proceſſes for making chymical Medicines in an eaſy and effectual Way. He keeps cloſe to the deſcribing of ſuch Operations as himſelf had frequently repeated, without intermixing any foreign Theory. The Book is ſhort, and fit for Beginners. The Original was printed at *Paris* in 8*vo.* 1688. It is alſo tranſlated into *Engliſh* by *Walter Harris*, M. D. under the Title of, *The Complete Chymiſt, or a new Treatiſe of Chymiſtry; teaching, by a ſhort and eaſy Method, all its moſt neceſſary Preparations. London*, 1677. 8*vo.* It was alſo publiſhed in *High Dutch*, under the Title of *Chemiſcher wegwiſer*, &c. *Jen.* 1710. 12*mo.*

5. Nicolas le Febure was Royal Profeſſor of Chymiſtry, and Apothecary to the Houſhold of King *Charles* II. He alſo flouriſhed in the Court of *France*, as Chymiſt to *Louis* XIV. The beſt Edition of his Works is that in 12*mo.* He is highly to be commended, both for delivering the Art, with all the Proceſſes, and preciſely noting all the minute Circumſtances. He is very faithful and accurate in relating his Experiments, and particularly careful in pointing out all the dangerous and fatal Proceſſes: But he has this Defect; that in his Reaſonings he has too much of the chymical Spirit, and talks too largely of the Virtues of his Medicines. Mr. *Boyle* quotes him under the Characters L. F. and mentions his *Ens primum of Balm*, whereby he pretended to reſtore Youth and Vigour to old worn-out Animals.

He publiſhed his *Traité de la Chymie* at *Paris* 1660. and 1669. 2 *Vol.* 8*vo.* and at *Leyden*, 2 *Vol.* 1669. 12*mo.* which was tranſlated into *Engliſh*, by *P. D. C.* Eſq; and printed at *London*, 1670. in 4*to.* under the Title of, *A complete Body of Chymiſtry, in two Parts: Containing whatever is neceſſary to be known in this Art, with the whole Practice of it.*

6. Lemery the Elder was born at *Rouen* in 1645. He acquir'd his firſt Notions of Chymiſtry from an Apothecary of the Place, to whoſe Care he was committed: But, not content with this, he went to *Paris*, and there applied himſelf to Monſ. *Glaſer*. Afterwards he travel'd for Improvement; and at the End of ſix Years, return'd to *Paris* an accompliſh'd Chymiſt. Here he exhibited his firſt Courſe of Chymiſtry in the Laboratory of his Friend M. *Martin*, Apothecary to the Prince of *Condé*; and afterwards open'd one of his own, which was ſoon reſorted to both by Natives and Foreigners: So that *Paris* was then the Seat of Chymiſtry.

He was the firſt who began to diſſipate the affected Obſcurities of Chymiſtry; reducing it to more ſimple and determinate Ideas, throwing out a deal of the Jargon, and accommodating it to the Taſte and Philoſophy of the Time.

In 1675. he printed his Courſe of Chymiſtry, which was receiv'd with great Applauſe, and tranſlated into ſeveral Languages. But he ſtill reſerved ſome of his Secrets; and is even ſaid to have contented himſelf with making ſeveral of the Operations more eaſy than they had been, without revealing the utmoſt Degree of Facility he was acquainted with.

In 1681. the religious Troubles coming on, M. *Lemery*, who profeſſed the Reformed Religion, was ſoon obliged to lay down his Courſes: Upon which the Elector of *Brandenburg* invited him to *Berlin*; but he declined it, and came over to *England*, where he was favourably received by King *Charles* II. But Matters not anſwering his Expectation here, he returned to *France*, and took the Degree of Doctor in Phyſic at *Caen*; but the Edict at *Nantz* in 1685. prohibiting the Practice of Phyſic to thoſe of his Religion, he was entirely ſtript of all Employment. Hereupon he embraced the *Roman Catholic* Faith, and thenceforward applied himſelf to Pharmacy; and in 1697. publiſhed two large Volumes, one of them intituled, *Pharmacopée univerſelle*, the other *Traité univerſel des Drogues ſimples.*

Upon the Revival of the Royal Academy in 1699. he was elected aſſociate Chymiſt; and ſoon after, upon the Death of M. *Bour-*

M. *Bourdelin*, Penſionary Chymiſt. Here he read his *Traité d' Antimonie* at ſeveral times: After which he began to droop under old Age, ſurrender'd his Place in favour of his Son, and died of an Apoplexy in 1715.

Account of his Works.

Nic. Lemery, Cours de Chymie, contenant la maniére de faire les Operations qui ſont en Uſage dans la Medicine, par une Methode facile, à Paris, 1675. 8*vo*. *Lyon*, 1724. 8*vo*. *Leyd.* 1716. 8*vo*. In *Latin*, *Gen.* 1681. 12*mo*. In *High Dutch*, *Dreſden*, 1697. 8*vo*. In *Engliſh*, by *Walter Harris*, M. D. ſecond Edit. *Lond.* 1688. 8*vo*. and fourth, tranſlated from the eleventh Edition of the *French*. The beſt Edition of the Original is that of *Paris*, in 8*vo*. 1713. which has many Things not in any of the preceding ones. It contains the principal Operations belonging to the three Kingdoms; all which are deſcribed with Candour and Accuracy. To each are added Notes, containing the phyſical Reaſons thereof: But his Reaſonings are not to be truſted. He is every-where minute in enumerating all the Circumſtances of the Proceſſes, and particularly where any Danger might ariſe.

This Performance of his has gone thro' many Editions in various Languages; and yet it is ill concerted for ſuch as ſtudy the Art: He begins with the very hardeſt Part, Metals. A great Number of his Proceſſes are merely calculated for the preparing of Remedies; and his View, throughout the Whole, is rather to furniſh the Shops with Medicines, than to inſtruct his Readers in the Knowledge and Grounds of Chymiſtry. But how hard is this, to make an Art a Drudge to Phyſic, which, in reality, is the principal Part of Natural Philoſophy!

Traité de l' Antimonie, contenant l' Analyſe Chymique de ce Mineral, & un Recueil d' un grand Nombre d' Operations, &c. *à Paris*, 1707. 12*mo*.

Beſides his Pieces above-mentioned, there are ſeveral Papers of his in the Memoirs of the Royal Academy of Sciences.

7. Le Mort was Profeſſor of Chymiſtry in the Univerſity of *Leyden*, whom *Boerhaave* immediately ſucceeded. He was a good practical Chymiſt, and explains the Operations of the Art diſtinctly, by means of the Art itſelf; of which he was a warm Patron, and zealous Defender. But many of his Proceſſes are ſuch as have long ſince been diſuſed. He will by no means allow of mathematical and mechanical Explanations in Chymiſtry, nor the Doctrine of Attraction; and is extremely ſevere upon a very learned *Engliſh* Phyſician, who attempted to explain the Operations of Chymiſtry by their Aſſiſtance. His Works are the following.

I. *Jac. le Mort Chymiæ veræ nobilitas & utilitas in Phyſica Corpuſculari, Theoria Medica, ejuſque Materia & ſignis ad majorem perfectionem deducendis.*

II. *Pharmacia Medico-phyſica, ratione & experientia nobilitata.*

III. *Chymia Medico-phyſica, Lugd. Bat.* 1696. 4*to*.

IV. *Metallurgia contracta:* To all which are added, *Collectanea Chymica Leydenſia*, &c. *Lugd. Bat.* 1696. 4*to*. *cum fig.*

V. *Jac. le Mort de Concordantiâ Operum Naturæ & Chymiæ. Lugd. Bat.* 1702. 4*to*.

VI. *Le Mort Facies ac Pulchritudo Chymiæ ab affectis maculis purificata, & ad veras naturæ & ſuæ artis leges exornata. Lugd. Bat.* 1712. 8*vo*.

8. Johannes Conradus Barchusen was Profeſſor of Chymiſtry at *Utrecht*; and deſerves well to be read, as he is an honeſt Writer, and ſufficiently accurate, and delivers good Matter in an excellent Manner; tho' his Reaſoning perhaps may be faulty. His *Elementa Chymiæ* are printed in 4*to*. and contain ſeveral particular Experiments, and manual Operations, no-where elſe to be met with.

His Works are,

I. *Jo. Conr. Barchuſen Pyroſophia, ſuccincte atque breviter Iatro-chemiam, rem Metallicam, & Chryſopœiam perveſtigans. Lugd. Bat.* 1698. 4*to*. *cum fig.*

II. *Acroamata, in quibus complura ad Iatro-chemiam atque Phyſicam ſpectantia jucunda rerum varietate explicantur. Traj. Bat.* 1703. 8*vo*.

III. *Elementa Chemiæ, quibus ſubjuncta eſt confectura Lapidis Philoſophici, imaginibus repræſentata. Lugd. Bat.* 1718. 4*to*.

Other ſyſtematical Authors are,

Zach. Brendelii Chymia in Artis formam redacta, ubi præter Methodum addiſcendi Encheireſes Chymicas facillimam, diſquiſitio curata de famoſiſſima præparatione auri potabilis inſtituitur. Jen. 1630. 12*mo*. *cum Præf. Wern. Rolfinchii. Jen.* 1641. 8*vo*.

P. Thibaut, Cours nouveau de la Chimie, 12*mo*.

In *Engliſh*, under the Title of, *The Art of Chymiſtry, as now practiſed. Lond.* 1668. 8*vo*.

A Complete Courſe of Chymiſtry, containing not only the beſt Chymical Medicines, but alſo great Variety of uſeful Obſervations. By George Wilſon. *The fourth Edition.* Lond. 1721. 8*vo*. This Book contains the chief Part of the chymical Preparations now in Uſe, with the Proceſſes faithfully deſcrib'd.

Boerhaave in his Chymiſtry. *Lugd. Bat.* 1732. 2 *Vol.* 4*to*.

Metallurgical Writers.

1. Geber, who has been already mention'd.

2. George Agricola. He was born at *Glaucha*, a Town of *Miſnia*, in 1494. and dy'd at *Chemnitz* in 1555. His Work *De re Metallica*, reprinted ſeveral times in Folio, is a Proof of the Author's extraordinary Learning and Experience. By viſiting all the Mines, and converſing freely with the Miners in *Germany*, he acquir'd a thorough Knowledge of the whole Proceſs of Metals; and from him moſt of the following Writers have taken the greateſt Part of what they know. He wrote with the exacteſt Fidelity, and in an elegant *Roman* Style; ſo that we conſult him in Metallurgy upon all Occaſions.

In the firſt Part of Metallurgy, or the Diſcovery of Metals, he is the only Author: He deſcribes, with great Accuracy and Minuteneſs, all the Arts and Inſtruments made uſe of to diſcover Mines, and to know whether, in any given Glebe, there be Metal, and of what Kind: Nor is he defective in any of the other Parts. Several Authors have wrote Comments upon him, but he is clear enough without any.

His Writings are,

I. *De re Metallica, Lib.* XII. The beſt Edition is that of *Franckfort*, containing the Treatiſe *De re Fodinaria*, at the End. See below (No. IX.).

II. *Bermannus, ſive Dialogus de re Metallica. Baſil.* 1530. 8*vo*. *ab accurata auctoris recognitione & emendatione nunc primum editus, cum Nomenclatura rerum Metallicarum. Lipſ.* 1546. 8*vo*. and *Baſ.* 1549. 8*vo*. *ap. Froben.*

III. *De Ortu & Cauſis Subterraneorum, Lib.* V.

IV. *De Natura eorum quæ effluunt ex Terra, Lib.* IV. *Ven.* 1553. *Fol.*

V. *De Natura Foſſilium, Lib.* X.

VI. *De Veteribus & novis Metallis, Lib.* II.

VII. *Explication, in* High Dutch, *of the Terms uſed in Metallurgy. Baſ.* 1546. *Fol.* and 1558. *Fol.* The ſame, with the Addition of a copious Index; the Whole reviſed, diſtributed into Chapters, with the Arguments of each Chapter, and illuſtrated with marginal Notes, by *Jo. Sigifridus*. To which are added, Obſervations upon metallic Matters and Names; from the Papers of *Geo. Fabricius*; wherein chiefly thoſe Particulars are treated of, which *Agricola* had omitted. *Witteb.* 1612. 8*vo*.

VIII. *De animantibus ſubterraneis libr. Baſ.* 1549. 8*vo*. and 1556. *Fol. ap. Froben. in certa Capita diviſus nonnullis Marginalibus exornatus, à Jo. Sigifrido. Witteberg.* 1614. 8*vo*.

IX. *De re Metallica, Lib.* XII. *quibus Officia, Inſtrumenta*, &c. Twelve Books on the Subject of Metals, wherein the Houſes,

Houſes, Inſtruments, and Machines, with every thing belonging to metallic Affairs, are copiouſly deſcrib'd, and repreſented to the Eye by Figures, inſerted in their proper Places, with the *Latin* and *German* Names thereof. To which is added, the ſame Author's Book *De Animantibus ſubterraneis*, reviſed by himſelf. *Baſ.* 1561. *Fol.* To which, in a poſterior Edition, are added, *De Animantibus ſubterraneis, Lib.* I. *De Ortu & cauſis ſubterraneorum, Lib.* V. *De Natura eorum quæ effluunt ex Terra, Lib.* IV. *De veteribus ac novis metallis, Lib.* II. *Bermannus, ſive de re Metallica, Lib.* I. *Baſ.* 1657. *Fol.*

3. LAZARUS ERCKERN. He was Superintendent of the Mines in *Germany*, *Hungary*, *Tranſylvania*, *Tyrol*, *&c.* to three Emperors, whence he was furniſh'd with a complete Stock of metallic Knowledge.

He was an experienc'd, candid, and honeſt Writer; relates nothing but what he had himſelf ſeen, without a Word of Theory or Reaſoning; and every-where ſpeaks as if he were ſitting before the Furnace, and relating what paſſed.

He never fails enumerating every Circumſtance, and always in the moſt open artleſs Manner, and a clear eaſy Style, adding Figures for farther Illuſtration. His Book was wrote in *High Dutch*, and printed at *Francof.* 1694. in *Fol.* and is ſo much valued by the Curious, that Mr. *Boyle* laments his not underſtanding that Language, merely for the ſake of reading this Author: But it has been ſince tranſlated into *Latin*, with excellent Notes; ſo that this ſingle Work might almoſt ſuffice for the whole Art of Aſſaying.

The ſame Work is tranſlated into *Engliſh*, under the Title of *Fleta minor*; or, *The Laws of Art and Nature, in knowing, judging, aſſaying, fining, refining, and enlarging the Bodies of confined Metals.* To which are added, *Eſſays on metallic Words.* Illuſtrated with Sculptures. By Sir *J. Pettus. Lond.* 1683. *Folio.*

4. JOANNES RUDOLPHUS GLAUBER was a celebrated Chymiſt of *Amſterdam*, accounted the *Paracelſus* of his Time. He had travel'd much, and, by that means, attained to a great many Secrets. He wrote above thirty Tracts, in ſome of which he acted the Phyſician, in others the Adept, and in others the Metalliſt. He principally excel'd in the laſt; and yet, even here, he comes ſhort of *Agricola* and *Erckern*, in point of Fidelity, Simplicity, and Exactneſs; being ever forward to mix his own Speculations and Reaſonings along with Matters of Fact.

He was a Perſon of eaſy genteel Addreſs, and, beyond Diſpute, well verſed in Chymiſtry, being Author of the Salt ſtill extant in the Shops under the Title of *Sal Glauberi*; as alſo of all the acid Spirits made by means of Oil of Vitriol, *&c.*

He is noted for extolling his *Arcana* and Preparations, and is even ſaid to have traded a little unfairly with his Secrets: The beſt of them he would ſell at exceſſive Rates to Chymiſts and others, and afterwards ſell them over again, or make them public to increaſe his Fame, whence he was continually at Enmity with one or other.

It was this *Glauber* who ſhewed before the States of *Holland*, that there is Gold contain'd in Sand, and made an Experiment thereof to their Satisfaction; but ſo much Lead, Fire, and Labour, were employ'd in procuring it, that the Art would not bear its own Charges. However, he ſhew'd pretty clearly, that there is no Earth, Sand, Salt, Sulphur, or other Matter, but has its Share of Gold.

He was born about the Beginning of the ſixteenth Century: He laboured greatly in the pharmaceutical and phyſico-mechanical Chymiſtry, and made a Multitude of Experiments, which, if rightly underſtood and apply'd, might conduce very much to the Knowledge of the Compoſition and Analyſis of Metals, Sulphurs, and Salts.

He ſpent his whole Life in the Exerciſe of Chymiſtry, for the Practice of which he excel'd all thoſe of his Age. But he rarely ſaw the Uſe of his own Experiments, applying Paſſages of the antient Chymiſts to his own Productions, and thence vainly pretending to the Diſcovery of *Panacea*'s, the Philoſophers Stone, *&c.* He drew many into Snares, and expos'd the Art to Cenſure and Reproach.

In his Theory he is very confus'd; but whether, in the Practice, he be guilty of ſo many Falſhoods as ſome have charged him with, may be much doubted, eſpecially if we keep ſtrictly to his Experiments, without regarding the golden Promiſes he makes.

His Writings are theſe;

I. *Furni novi Philoſophici*, &c. in *High Dutch*, I. II. III. IV. and V. Parts. *Amſt.* 1648. 1650. 8*vo.*

II. *Annotationes, uber den appendicen*, &c. Annotations on the Appendix to the fifth Part of the Philoſophical Furnaces, containing ſeveral uſeful Secrets, *&c. High Dutch. Amſt.* 1650. 1661.

III. *La deſcription des nouveaux Fourneaux Philoſophiques, traduit par la Sieur du Teil, A Paris*, 1659. 8*vo.* In *Engliſh*, by *J. F. M. D. Lond.* 1651. 4*to.*

IV. *Operis mineralis, oder vieler kunſtlicken*, &c. A Deſcription of ſeveral profitable metallic Operations, *&c. High Dutch.* I. II. III. Parts. *Francof.* 1651. 8*vo.* and 1655. 4*to.*

V. *Operis mineralis pars* I. *ubi docetur*, &c. Tranſlated into *Engliſh* under the Title of *Glauber's Golden Art, to get Gold from Stones, Sand*, &c. 8*vo.*

VI. ——— II. *Amſt.* 1652. 8*vo.*

VII. ——— III. *Amſt.* 1652. 8*vo.*

VIII. *Grundliche warhafftige Beſchreiburg*, &c. A complete Account how to prepare Tartar in great Quantities from Wine Lees, *&c. Nurinb.* 1652. 8*vo.* In *Latin*, *Amſt.* 1655. 8*vo.*

IX. *Miraculum mundi, oder anſfuhelicke beſchreibung*, &c. A complete Deſcription of the Wonders of Nature, Art, and Science, in the antient univerſal Menſtruum, or *Mercurius Philoſophorum*, &c. *High Dutch. Hanau*, 1651. 8*vo.*

X. *Pharmacopœæ Spagiricæ, oder grandlicher beſchreibung*, &c. 1, 2, 3, 4, 5, 6, and 7 Parts. *Nurinb.* 1654. 8*vo.* and *Amſt.* 1656. 1667. 8*vo.* Alſo in *Latin*, *Amſt.* 1656. 8*vo.* The I. II. and III. Parts, Appendix to the ſame. *High Dutch. Amſt.* 1667, 1668. 8*vo.* The firſt Part tranſlated into *Latin. Amſt.* 1669. 8*vo.*

XI. *Deſſ. Teutſchlands wolfahrt*, &c. The Proſperity of *Germany*, Part 1. concerning the Concentration of Wine, Corn, and Wood, *&c. Amſt.* 1656. 8*vo.*

XII. ——— ——— ——— 2, 3, 4, 5, and 6 Parts.

XIII. *Troſt de Scefahrenden*; or, Conſolation of Seafaring Perſons. *Low Dutch, Amſt.* 1657. 8*vo.* In *Latin*, *ibid.* 1657. 8*vo.*

XIV. *Tractatus de Medicina Univerſali, ſive Auro potabili vero. High Dutch. Amſt.* 1657. 8*vo.*

XV. *Opera Chymica, Bucher und Schrifften*, &c. Firſt Part, *Francf. M.* 1658. 4*to.* Second Part, *Francf.* 1658. 4*to.*

XVI. *Tractatus de Natura ſalium. High Dutch*, 1658. 4*to.* In *Latin*, *Amſt.* 1659. 8*vo.*

XVII. *Explicatio uber mein Miraculum mundi. Amſt.* 1658. 8*vo.*

XVIII. *Oeuvres Minerales*, &c. *A Paris*, 1659. 8*vo.*

XIX. *Ander. Theil*; or, Second Part of the *Miraculum Mundi. Amſt.* 1660. 8*vo.*

XX. *Reichen-Scatz und Sammel-Kaſtens*, &c. A rich Treaſure, *&c.* I. II. III. IV. and V. Centuries. *Amſt.* 1660. and 1668. 8*vo.* The 1ſt and 2d Centuries in *Latin*, *Amſt.* 1660. and 1661. 8*vo.*

XXI. *Libellus dialogorum. Amſt.* 1663. 8*vo.*

XXII. *Explicatio, oder Anſlegung*, &c. An Explication of the Words of *Solomon, in Herbis, Verbis, & Lapidibus magna eſt virtus. High Dutch, Amſt.* 1663. 8*vo.* In *Latin*, *Amſt.* 1664. 8*vo.*

XXIII. *Libellus ignium, oder fever-buchlein*, &c. A Treatiſe of Fires, *&c. High Dutch. Amſt.* 1663. 8*vo.*

XXIV. *Novum lumen Chymicum. High Dutch. Amſt.* 1664. 8*vo.* In *Latin*, *Amſt.* 1664. 8*vo.*

XXV. *Von den dreyen anfangen der metallen*, &c. Of the three Principles of Metals, Sulphur, Mercury, and Salt. *Amſt.* 1666. 8*vo.* In *Latin*, *Amſt.* 1667. 8*vo.*

XXVI. *Kurtze erklarung uber die Helliſche Gottin*, &c. Explication of the infernal Goddeſs *Proſerpina*, Wife of *Pluto*; what the philoſophical Poets, as *Ovid*, *Virgil*, and others, mean by her; and how, by *Proſerpina*'s Help, the Souls of dead Metals are delivered from the Chemical Hell, *&c. Amſt.* 1667. 8*vo.*

XXVII. *De tribus lapidibus ignium ſecretorum, oder von den drey alleredelſten geſteinen*, &c. *High Dutch. Amſt.* 1667. 4*to.* and 1668. 8*vo.*

XXVIII. *De Elia artiſta. High Dutch. Amſt.* 1668. 8*vo.*

XXIX. *De Purgatorio Philoſophorum. High Dutch. Amſt.* 1668.

XXX. *Glauberus concentratus, oder laboratorium Glauberianum*, &c. *High Dutch. Amſt.* 1668. 8*vo.*——*Oder kern der Glauberiſchen ſchrifften*, &c. The Kernel of *Glauber*'s Writings, *&c.* In *High Dutch. Lipſ.* and *Breſl.* 1715. 4*to.* ——Tranſlated into *Latin*, under the Title of *Glauberus concentratus.*

XXXI. *De Igne ſecreto Philoſophorum. High Dutch. Amſt.* 1609. 8*vo.*

XXXII. *De Lapide Animali. High Dutch, Amſt.* 1669, 4*to.*

XXXIII. *Curieuſer traät von gebrauch*, &c. A curious Tract on the Uſe of Wines, Corns, and Woods. *High Dutch. Amſt.* 1686. 4*to.*

XXXIV. His Writings, tranſlated into *Engliſh*, by *Chriſt. Pack. Lond.* 1689. *Fol.*

XXXV. *Tract. de Signatura ſalium, metallorum & planetarum. High Dutch. Prag.* 1703. 8*vo.*

XXXVI. His whole Works, tranſlated into *Latin*, in ſeveral Volumes, 8*vo.*

5. Jo. JOACH. BECHER, of *Spire*. He was born about 1625. and firſt made Profeſſor of Phyſic, and then Firſt Phyſician to the Elector of *Mentz*, and afterwards to the Elector of *Bavaria*, and Counſellor to the Emperor. He was a Man of great

great Wit as well as Learning, and ſkill'd in all the Parts of Science, as appears by his numerous Writings upon medicinal, philological, political, and mathematical Subjects; but his principal Application was to Chymiſtry, of which he made great Uſe in illuſtrating Natural Philoſophy, and diſcovering the Principles and Compoſition of Bodies. He lived ſome time in *England*, and dy'd at *London* in 1682.

He appears to have been a warm, active, induſtrious Man, and a little too much tinged with alchemical Notions; but was almoſt the firſt Author who applied Chymiſtry to Philoſophy at large, and ſhew'd its extenſive Uſes in explaining the Structure, Texture, Compoſition, and Relations of Bodies.

His Theory is by many prefer'd to that of all other Chymiſts, as ſounder and deeper. He deduces all things from Water and Earth, as the only material Principles. The earthy Principle he ſhews to be of three Kinds; that is, he makes three Species of elementary Earths. This he chiefly effected in his *Phyſica ſubterranea*, where he has ſhewn great Acuteneſs in applying the principal and known Experiments to the framing a Theory in the way of experimental Reaſoning.

His Chymical Works are principally theſe:

I. *Inſtitutiones Chemiæ, ſeu Manuductio ad Philoſophiam hermeticam. Mogunt.* 1662. 4*to.*——The ſame with Notes, and other Improvements, publiſh'd by *J. Jac. Roſenſtengel. Franc.* 1705. 12*mo.* and 1716. 8*vo.*

II. *Oedipus Chimicus, obſcuriorum terminorum, & principiorum Chimicorum Myſteria aperiens & reſolvens. Amſt.* 1664. 12*mo.*

III. *Actorum Laboratorii Chymici monacenſis, ſeu Phyſicæ ſubterraneæ, Libri* 2. *Franc.* 1669. 8*vo. Lipſ.* 1681. 8*vo.*——The ſame, with Supplements from the Author's other Writings, collected by *Jo. Ern. Stahl. Lipſ.* 1703. 8*vo.*

IV. *Experimentum Chymicum novum, quo artificialis & inſtantanea Metallorum generatio & tranſmutatio ad Oculum demonſtratur. Francf.* 1671. 8*vo.* Alſo at the End of the *Phyſica ſubterranea.*

V. *Demonſtratio Philoſophica, ſeu Theſes Chymicæ, veritatem & poſſibilitatem tranſmutationis Metallorum in aurum evincentes*, &c. *Francof.* 1675. 8*vo.* Alſo printed at the End of the *Phyſica ſubterranea.*

VI. *Experimentum novum & curioſum de minera arenaria perpetua*, &c. 8*vo. Lipſ.* 1680. Alſo in the *Phyſica ſubterranea.*

VII. *Tripus Hermeticus fatidicus, pandens oracula Chymica, ſeu*, (1.) *Laboratorium portabile.* (2.) *Nitri & ſalis texturæ Anatomia.* (3.) *Alphabetum minerale, ſeu viginti quatuor Theſes de ſubterraneorum & Mineralium Geneſi, Textura, & Analyſi*, &c. *Francof. M.* 1689. 8*vo.*

VIII. *Concordantia Chemica.* In *High Dutch, Quarto.* Not tranſlated into *Latin*, that we know of, It contains many inſignificant and uſeleſs Proceſſes, but, at the ſame time, many curious and uſeful Experiments.

IX. *Metallurgia, oder natur-kundigung der metallen*; or, The Phyſiology of Metals. *High Dutch.* There have been a great many Editions of this Book.

6. Jo. Kunkel, born about the Year 1630. was firſt bred up to Pharmacy, then to Glaſs-making: He was afterwards Chymiſt to the Elector of *Saxony*, then to the Elector of *Brandenburg*, and laſtly to the King of *Sweden.* He applied himſelf to Chymiſtry upwards of fifty Years, whereby he arrived at a Pitch of Experience ſeldom met with. Having the Advantage of his Patrons Purſes for trying all manner of Experiments, beſides being Maſter of the Glaſs-works, he had Opportunities of making the moſt tedious Experiments without Charge; Withal he was very induſtrious, perſevering, and acute in noting the Phænomena of Proceſſes; but, for the theoretical Part, he was leſs happy, as not being verſed in Philoſophy and general Knowledge. His Doctrine of Principles is fluctuating and defective.

His Writings are theſe; *viz.*

I. *Obſervationes Chemicæ.* Firſt publiſh'd in *High Dutch*, 1676. and tranſlated into *Latin*, under this Title: *Johannis Kunkelii Elect. Sax. Cubicularii intimi & Chymici, utiles obſervationes, ſive animadverſiones de ſalibus fixis & volatilibus, auro & argento potabili, Spiritu Mundi & ſimilibus; item de Colore & odore Metallorum, Mineralium, aliarumque rerum quæ in Terra producuntur*, &c. *Primum ab Authore Germanice conſcripta, nunc vero Latinitate donata à Carolo Aloiſio Ramſaio. Londin. & Roterodam.* 1678. 12*mo.*——The ſame under the Title of *Philoſophia Chemica, experimentis confirmata. Amſt.* 1694. 12*mo.*

II. *On Phoſphorus. High Dutch. Lipſ.* 1678. 8*vo.*

III. *De acido & urinoſo, ſale calido & frigido*, &c. *Berl.* 1686. 8*vo.*

IV. *Art of Glaſs*; or, *Commentary on Ant. Neri.* In *High Dutch. Francf.* and *Lipſ.* 1689. 4*to.* A curious Work, which we expect to ſee ſoon in *Engliſh*, by a very able Hand.

V. *Collegium Phyſico-chymicum experimentale; ſive laboratorium Chymicum*, &c. *Hamb.* and *Lipſ.* 1722. 8*vo. High Dutch.* A poſthumous Work.

7. Olaus Borrichius. He was born in 1626. He was Phyſician to the King of *Denmark*, and public Profeſſor in the Univerſity of *Copenhagen.* He had travel'd much, was an excellent Scholar, and a great Operator in Chymiſtry. He is famous for the Diſpute he held with the learned *Conringius*, concerning the Knowledge of the *Egyptians*, and the Antiquity of Chymiſtry, its Inventors and Authors.

His Writings are,

I. *De Ortu & Progreſſu Chemiæ diſſertatio. Hafn.* 1668. 4*to.* And in *Mangeti Bibl. Chym.*

II. *Ol. Borrichii, Hermetis, Ægyptior. & Chemicor. ſapientia, ab Herm. Conringii animadverſionibus vindicata. Hafn.* 1669. 4*to.*

III. *Conſpectus Scriptor. Chemicor. illuſtr. Libellus poſthumus. Haun.* 1697. 4*to.* And in *Mang. Bibl. Chym.*

The famous Work of *Conringius* is the following:

IV. *Herman. Conringii de Hermeticâ Medicinâ libri duo, quorum primus agit de Medicinâ, pariterque omni Sapientiâ veterum Ægyptiorum: altero non tantum Paracelſi, ſed etiam Chemicorum Paracelſi laudatorum, aliorumque, potiſſimum quidem Medicina omnis, ſimul vero & reliqua Doctrina examinatur. Helmſ.* 1648. 4*to.* A ſecond Edition, corrected, and enlarged with an Apologetic againſt *Borrichius.* 1669. 4*to.*

Decimaſtica metallica. Haf. 1660. 8*vo.* and 1677. 4*to.* and 1680. 4*to.*

Other Metallurgical Authors are,

And. Libavius, of *Hall* in *Saxony*, who died in 1616. has wrote largely of the Nature and Examination of Minerals, ſo as to be even ſet on a Level with *Agricola* for the Hiſtory of Metals he publiſh'd.

Commentaria metallica.

Ars probandi Mineralia.

J. Webster's Hiſtory of Metals. *Lond.* 1671. 8*vo.*

Alonso Barba *trattato de l'Arte Metallico compueſto en Eſpanol. en Cordoua*, 1674. His long Reſidence at *Potoſi* in *Peru* had enabled him to make many Obſervations relating to the Mines. The ſame in *Engliſh*, by the Earl of *Sandwich. Lond.* 1674. 8*vo.*

Libro ſecundo de l'Arte metallico. En Cordua. The ſame in *Engliſh*, by the Earl of *Sandwich. Lond.* 1674. 8*vo.*

It was reprinted at *Lond.* 1738. in 12*mo.* with the Addition of a third Part, containing a Diſcovery of all ſorts of Mines, from Gold to Coal, by Mr. *G. Plattes*; and a fourth Part, intituled, *Houghton's complete Miner.*

Il Marchese, Marco Antonio *della tratta, della prattica minerale.* In *Bolog.* 1676. 4*to.*

M. Reaumur's Treatiſe of converting forged Iron into Steel, and to ſoften caſt Iron, ſo as to make Utenſils thereof equally perfect with thoſe of forged Iron. *Paris, An.* 1722.

Em. Swedenborg, *Member of the metallic College in* Sweden, *Prodromus principiorum rerum naturalium ſive novorum tentaminum Chymiam & Phyſicam experimentalem explicandi. Amſt.* 1721. 8*vo.*

——— *Principia rerum naturalium ſive novorum tentaminum Phænomena Mundi Elementaris philoſophicè explicandi, cum figuris æneis*, 3 *Vol. Fol. Dreſd.* and *Lipſ.* 1734. This Book opens a new Scene in Natural Philoſophy, and is large upon the Buſineſs of Metals.

There is a curious metallurgical Book juſt publiſh'd, in *High Dutch*, by *Chriſtopher Andreas Schluter*, containing the whole Art both of Smelting and Aſſaying, as taken from the Works themſelves, and exhibited to the Eye by numerous beautiful Copper-plates, *Folio.* The Title of it is *Gruntlicher Unterricht*, &c. or, (1.) A fundamental Deſcription of mineral Works; ſhewing the genuine Way of explaining; with the ſeveral mechanical Structures and Furnaces thereto relating; with the Manner wherein they are practiſed at *Hartz*, and other mineral Works; particularly the various Methods of treating Gold, Silver, Copper, and Lead Ores, Sulphur, Vitriol, *&c.* (2.) The whole Art of aſſaying; containing the Ways of trying all ſorts of metallic Ores, refining of Silver, ſeparating it from Gold to Advantage, *&c.* (3.) A Set of Copper-plates for the two Parts, executed according to a Scale; with a proper Index to each Part. By *Chriſtopher Andrew Schluter*, Superintendent, at *Under-Hartz*, to his Majeſty of *Great Britain*, &c. *Brunſwick*, printed by *Frederic William Meyer*, 1738.

Alchemical Writers.

In the Alchemiſtic Branch the moſt approved Authors are,

1. Geber, whom, nevertheleſs, *Bernard*, Count of *Treviſa*, ranks among the ſophiſtical Authors.
2. Morienus.
3. Roger Bacon.
4. George Ripley.
5. Raymund Lully.

For the Characters and Writings of theſe five Authors, ſee above.

6. Bernard, Count of Trevisa, flouriſhed about the Year 1390. *Boerhaave* ſays he wrote in the Year 1453. He was intimate with *Thomas Bononienſis*, firſt Phyſician to *Charles* the Eighth, King of *France*, to whom he wrote an alchemiſtical Epiſtle, printed at *Baſil*, 1600. 8*vo*, and 1583. 8*vo*, under

under the Title of *Bern. Com. Treviſa, de Chymico miraculo*, &c. This is extant in the *Theat. Chym. Urſell.* and in *Manget's Bibl. Chym.*

7. JOHN ISAAC HOLLANDUS, who, perhaps, was the ſame with,

8. ISAAC HOLLANDUS, who was poſterior to *Arnoldus de Villa nova*, but earlier than *Paracelſus*. He was ſo highly eſteemed by *Penotus*, that (being diſcovered in ſome Corner, in *Paracelſus*'s Time) he took him for *Elias*, the promis'd Artiſt, who is to reveal the Secrets of Chymiſtry.

9. BASIL VALENTINE.

For the Character of theſe three laſt-mention'd Authors, ſee above.

10. ARTEPHIUS and *Morienus* are uſually ſuppoſed prior to *Roger Bacon*; but the Age, or even Country where they liv'd, is not known. The former is firmly believed by the *Adepti* to have prolong'd his Life to a thouſand Years.

11. THEATRUM CHYMICUM, *in ſex Vol. diviſum. Argent.* 1613. 1622. 1661. 8*vo*. A Liſt of the Pieces contain'd in the ſeveral Volumes of this Collection, being one hundred twenty-three in Number, is given in *Endteri Catal. Libror. Med. Phyſ. Mathem. Norib.* 1695. 4*to*.

12. TURBO PHILOSOPHORUM, *ſive auriferæ artis antiquiſſimi Authores*. 3 *Vol.* 1510. 1562. 1610. 8*vo*. In it are contain'd thirty-two Pieces.

13. PARACELSUS. For an Account of him, ſee the PREFACE; and, for his Writings, ſee above.

14. IRENÆUS PHILALETHA. There are ſeveral alchemical Books publiſh'd under the Name of *Philaletha*. The firſt anonymous *Philaletha* is ſaid to have been an *Engliſhman*, and his true Name *Thomas Vaughan*; tho', in ſome of his Works, he calls himſelf *Irenæus*, and in others *Eugenius Philaletha*. He is famous for having rendered *Van Suchten*, *Sendivogius*, and *D'Eſpagnet*, clearer in his Writings; which are principally theſe:

I. *Introitus apertus ad occluſum Regis Palatium.*
II. *Brevis manuductio ad Rubinum Cœleſtem.*
III. *Fons Chemicæ veritatis.*
IV. *Metallorum metamorphoſis.*
V. *Vade mecum Philoſophicum.*
VI. *Experimenta de præparatione Mercurii Sophici.*
VII. *Nucleus Alchemiæ.*

But, tho' this Author is ſaid to write with great Clearneſs, yet his Followers differ widely from one another.

VIII. EUG. PHILALETHES, EUPHRATES, *or the Waters of the Eaſt, treating of the ſecret Fountain, whoſe Water flows from Fire, and carries in it the Beams of the Sun and Moon. Lond.* 1665. 8*vo*.

IX. *Anima magica abſcondita.* Publiſhed together with his *Anthroposophia magica. Lond.* 1656.

X. *Secrets reveal'd; or, An open Entrance to the ſhut Palace of the King; containing the greateſt Treaſure in Chymiſtry.* By *Irenæus Philalethes, Coſmopolita*, who attained to the Philoſophers Stone, aged twenty-three Years. Publiſhed by *W. C.* Eſq; *Lond.* 1669.

XI. *Enarratio Methodica trium Geberi medicinarum, in quibus continetur Lapidis Philoſophici vera Confectio. Amſt.* 1678. 8*vo*.

XII. *A Collection of ten Treatiſes in Chymiſtry, concerning the Liquor Alcaheſt, the Mercury of the Philoſophers, and other Curioſities.* Written by *Irenæus Philaletha, Helmont, &c. Lond.* 1684. 8*vo*.

15. MICHAEL SENDIVOGIUS. He was Companion to *Alexand. Sidonius*, or *Serenus*, a *Scotch* Gentleman, who, being near the Point of Death, intreated two Things of him: To take care of the Publication of his Manuſcript; and to marry his Widow. *Sendivogius* perform'd both; but, in the Edition of his Works, ſuppreſs'd *Serenus*'s Name, and clapp'd his own in its Place. The Title of his Pieces are,

I. *Novum Lumen Chemicum.*
II. *Dialogus de Mercurio & Alchemia.*

In theſe he maintains, with great Strength of Reaſon and Experiment, that Sulphur and Mercury, united, are the Conſtituents of every Metal; by Sulphur meaning, with *Geber*, the Sun's Rays: However, his Writings ſhould be read with Caution, being full of vain Promiſes. His *Novum Lumen Chemicum* is done into *Engliſh*, and intituled, *A new Light of Alchemy, from Nature and manual Experience; with a Treatiſe of Sulphur.* To which are added, *Nine Books of the Nature of Things*, by *Phil. Theoph. Parac. Engliſh'd* by *J. F. M. D. Lond.* 1674. 8*vo*.

16. JOHN BAPTISTA VAN HELMONT; *Opera omnia. Amſtelod.* 1652. 4*to*. See an Account of this Author above.

Other Alchemiſtical Authors are,

JO. FRED. HELVETII *vitulus aureus, quem mundus adorat, & orat.* Treating of the rare Miracle of Nature, the Tranſmutation of Metals, and ſhewing how the whole Subſtance of Lead was, at the *Hague*, in a Moment's time, converted into pure Gold, by a ſmall Particle of the Philoſophers Stone. *Amſt.* 1667. 8*vo*. and *Hag. Com.* 1702. 8*vo*. Extant alſo in *Manget's Bibl. Chym.* It is alſo in *Engliſh*, under the Title of *Helvetius's Golden Calf, Lond.* 1670. 8*vo*.

De Alchymia, Opuſcula complura vet. Philoſoph. cum fig. Francof. 1550.

Four Treatiſes of the Philoſophers, by ALPHONSO, King of *Portugal*, *John Sawtre*, and *Florianus Randorf*, a *German*, *Lond.* 1652. 4*to*.

JO. SEG. WEIDENFELD, *four Books concerning the Secrets of the Adepts; or the Uſe of* Lully's *Spirit of Wine.* A practical Work, collected out of the Fathers of adept Philoſophy, reconciled together. *Lond.* 1685. 4*to*.

JAC. TOLLII, *fortuita, in quibus præter critica nonnulla, tota fabularis Hiſtoria Græca, Phœnicia, Ægyptiaca, ad Chemiam pertinere aſſeritur. Amſt.* 1687. 8*vo*.

——— ——— *Manuductio ad Cœlum Chemicum. Amſtel.* 1688. 8*vo*.

——— ——— *Sapientia inſaniens, ſive promiſſa Chemica, Amſt.* 1689. 8*vo*.

GABR. CLAUDERI *Schediaſma de Tinctura Univerſali, vulgo Lapide Philoſophorum, cum Petr. Jo. Fabri MS. res Alchymicorum obſcuras explanante, necnon Ad. Gottl. Berlichii diſſertatione de Medicina Univerſali, quin & Eman. Koenigii Epiſtola de elixirio Sophorum. Norib.* 1736. 4*to*.

Chymical IMPROVERS *of* NATURAL PHILOSOPHY *and* PHYSIC.

Among the Writers who have treated of Chymiſtry, with a View to Natural Philoſophy and Medicine, the Principal are theſe.

1. HELMONT.

2. The Honourable ROBERT BOYLE, Eſq; thro' all his Writings.

3. Jo. BOHNIUS, in his *Diſſert. Chymico-phyſicæ, Lipſ.* 1696.

He was Profeſſor at *Leipſic* in 1679. The Diſſertations above-mention'd, beſides an uncommon Reading, ſhew, that he had made a large Number of Experiments; and, as to his Reaſonings, nobody goes beyond him. His Treatiſe *de Acido & Alkali* is excellent; and has let much Light into the Affair.

4. The celebrated Dr. COX and Dr. SLARE, in ſeveral Papers in the *Philoſophical Tranſactions*.

5. M. HOMBERG.

M. *Homberg* was born at *Batavia* in the *Eaſt Indies*, in 1652. whence he came over with his Father to *Amſterdam*. He was ſent to *Jena* and *Leipſic* to ſtudy Law; but, neglecting this for what was more agreeable to his Genius, he applied himſelf to *Otto Guericke*, famous for the Invention of the Air-pump, the Hemiſpheres, *&c.* to learn Experimental Philoſophy.

From hence he went to *Padua*, where he ſpent a Year in the Study of Medicine, and particularly Anatomy and Botany. Afterwards he travel'd to *Bologna* and *Rome*; hence paſs'd into *France*, and thence into *England*, where he work'd ſome time with the great *Boyle*. From *England* he went to *Holland*, where he perfected himſelf in Anatomy under the famous *De Graaf*; and, laſtly, took the Degree of Doctor of Phyſic at *Wittembourg*.

Afterwards he made a Tour thro' *Germany* and the *North*; and likewiſe thro' *Saxony*, *Bohemia*, *Hungary*, and *Sweden*, to view the Mines. At *Stockholm* he ſtaid ſome time, and work'd in the King's Laboratory. His next Remove was into *Holland*, and thence into *France*, to pick up what had before eſcaped him.

From *Paris*, at the earneſt Deſire of his Father, he was upon the Point of returning to *Saxony*, to ſettle among his Friends; but M. *Colbert* ſending a Meſſenger to him in the King's Name, with very advantageous Offers to ſettle there, he accepted them after a ſhort Deliberation, and commenced Catholic in 1682.

In 1685. he went to *Rome*, and practiſed Phyſic there with good Succeſs; but in a few Years he return'd to *Paris*, and in 1691. was choſe a Member of the Royal Academy, and put in Poſſeſſion of its Laboratory. In 1702. he inſtructed the Duke of *Orleans* in Chymiſtry; the moſt magnificent and beſt appointed Laboratory, which Chymiſtry had ever known, being provided for this Purpoſe. The ſame Year his Highneſs procured M. *de Tſchirnhauſen*'s large Burning-glaſs from *Germany*, of which M. *Homberg* made a noble Uſe. He married a Daughter of the famous *Dodart* in 1706. and in 1715. died of a Dyſentery.

He never publiſh'd any expreſs Work, or Volume in form: His Eſſays, or *Elements of Chymiſtry*, were begun to be printed in the *Memoirs of the Academy*; and the reſt of them were found fit for the Preſs at his Death. There are likewiſe ſeveral leſſer Pieces on various Subjects, diſperſed throughout the ſame Memoirs, none of which but open new Views, and ſhine with their peculiar Light. His Way of expreſſing himſelf was ſimple, preciſe, and methodical; and he was as far from the natural Oſtentation of the Chymiſts, as from their Myſteriouſneſs and Obſcurity.

M. *Homberg*

M. *Homberg* was a moſt expert and maſterly Chymiſt. He has diſtinguiſh'd himſelf by a great Number of general Experiments, as well as by his Reaſonings; which are always perfectly fine and clear, and conducted with mathematical Severity. Natural Philoſophy would have received conſiderable Improvement from him, had his Life been continued. He was a Perſon of great Genius, profound Skill, and indefatigable Induſtry. He was ſupported by the Duke of *Orleans*, late Regent of *France*, and perform'd Experiments at his Expence; which gave him an Opportunity of trying many Things out of the Reach of a private Perſon.

STEPH. FRANC. GEOFFROY was born at *Paris* in 1672. His Father was an Apothecary, and his Mother a Surgeon's Daughter. His Father ſpared no Pains nor Expence in his Education, tho' he deſign'd him only for the Shop, as well knowing, that a large Share of Knowledge was required to arrive at any tolerable Perfection in Pharmacy. To the Study of Philoſophy in general, M. *Geoffroy* join'd private Courſes of Botany, Chymiſtry, and Anatomy.

In 1692. his Father placed him with an eminent Apothecary at *Montpelier*; and, during his Stay there, he diligently attended the Univerſity Lectures, in all the Branches of Medicine; but the *Materia Medica* was his favourite Study. In 1693. he paſs'd thro' the uſual Examination for Pharmacy with Applauſe; and now firſt imparted to his Father his Deſign of being a Phyſician, and obtain'd his Conſent. Accordingly the ſecond Son, whom his Father had deſign'd for that Profeſſion, was ſent into the Shop inſtead of his Brother, and is now one of the Chymiſts to the *French* Academy.

In 1698. Count *Tallard*, being appointed Embaſſador Extraordinary to *England*, took M. *Geoffroy* with him, as his Phyſician, tho' he had then taken no Degree in Phyſic. There he became acquainted with many of the learned Men of that Nation, and neglected no Means of making Improvements; and, in leſs than ſix Months, he was admitted a Member of the Royal Society. From *England* he paſs'd into *Holland*; and in 1700. travel'd into *Italy* with the Abbé *Louvois*, in Quality of his Phyſician; every-where making farther Obſervations, and increaſing his Stock of Knowledge. In 1699. he was made a Member of the Royal Academy of Sciences, and in that Capacity contributed, as far as his other Employments would allow, to its Ornament and Uſe.

In 1702. he took his Degree of Batchelor of Phyſic, and in 1704. that of Doctor, at *Paris*; after which he applied himſelf cloſely to his Studies, the better to fit him for Practice. In 1707. M. *Fagon*, Phyſician to the King, made him his Deputy, as Profeſſor of Chymiſtry in the Royal Garden; in which he acquitted himſelf ſo well, that in 1712. M. *Fagon* reſign'd the Charge up to him.

In 1709. the King made him Profeſſor of Phyſic in the Royal College, and here he dictated his curious and uſeful Lectures on the *Materia Medica*. In 1718. he drew up a Syſtem, or Table of the mutual Relations betwixt different Subſtances in Chymiſtry; which, if rightly underſtood, and carried on, might become a fundamental Law for Chymical Operations, and guide the Operator with Succeſs.

In 1726. he was elected Dean of the Faculty of Phyſic at *Paris*; and after the Expiration of two Years, the uſual Time of holding that Office, was continued in it by the unanimous Conſent of his Brethren. In the Beginning of the Year 1730. his Health began to decline, and he died on the 6th of *January* 1731.

He wrote a *Treatiſe of the foſſil, vegetable, and animal Subſtances, that are made uſe of in Phyſic*, &c. tranſlated from a manuſcript Copy of the Author's Lectures, read at *Paris*, by *G. Douglas*, M. D. 1736.

Beſides this, there are ſeveral other Pieces of his detach'd in the *Memoirs of the Royal Academy of Sciences*, and in the *Philoſophical Tranſactions*.

M. GEOFFROY THE YOUNGER. In the *Memoirs of the Royal Academy of Sciences*.

M. LEMERY THE YOUNGER. In the *Memoirs of the Royal Academy of Sciences*.

6. GEORGE ERNEST STAHL, born in 1660. at *Onold* in *Franconia*, took to the Study of Chymiſtry at Fifteen; and, from reading *Barnerus*'s *Collegium Chymicum*, readily diſcover'd a fix'd alcaline Body in Nitre: With the Help afterwards of *Kunkel*'s Books, and *Becher*'s *Phyſica ſubterranea*, the ſeveral Experiments of which he not only carefully weigh'd and compared, but repeated, he arrived at a great Proficiency in the Art, and has publiſh'd ſeveral excellent Pieces on Chymiſtry; which ſhew, among other Things, (1.) The Generation of artificial Sulphur. (2.) The Analyſis of Vitriol, the Volatilization of the Acid of Vitriol, and its Reſtitution to its priſtine Fixity. (3.) The Preſence and Influence of a Phlogiſton in ſeveral Bodies. (4.) The Reſolution of Sulphur into a ſubtle Acid. (5.) The different Fixity of acid mineral Salts. (6.) The ſudden Deſtruction of Nitre by Deflagration. (7.) The genuine Foundation of vinous and acetous Fermentation. (8.) The Converſion of Spirit of Wine, and its artificial Ingreſs into Vinegar. (9.) The Tranſpoſition of Juice of Citrons into Wine. (10.) The Paſſage of all fermentable Bodies into an inſipid Earth. (11.) The Solution of Gold by Sulphur. And, (12.) of Iron by an Alcali.

His principal Chymical Writings are,

I. *Prodromus de indagatione Chymico-phyſiologica, &c.* 1683.

II. *Collegium Chemicum*, firſt deliver'd in 1684. in the way of Lecture, to the Students of *Jena*; ſeveral manuſcript Copies of which getting abroad, and there being nothing like it then extant, many uſed it as a Comment on *Becher*. This, at length, induced the Author to conſent to an Edition of it, which was publiſh'd under the Title of, *Fundamenta Chymiæ dogmaticæ & experimentalis. Norimb.* 1723. The ſame in *Engliſh*, under the Title of *Philoſophical Principles of Chymiſtry*, by *P. Shaw*, 1738. 8*vo*.

III. *Zymotechnia fundamentalis*, 1697.

IV. *Obſervationes Chemico-phyſicæ*, 1697. and 1698.

V. *Diſſert. de Metallurgiæ & Docimaſtiæ fundamentis*, 1697.

VI. *Animadverſiones ad artem tinctoriam fundamentalem & experimentalem.*

VII. *Opuſculum Chymico-phyſico-medicum. Halæ Magdeb.* 1715. Conſiſting of ſeveral Pieces, which had been occaſionally publiſh'd before, *viz.* (1.) *Prodromus de indagatione Chymico-phyſiologica.* (2.) *Zymotechnia fundamentalis.* (3.) *Obſervationes ſelectiores Phyſico-chemico-medicæ.* (4.) *Experimentum novum, verum Sulphur arte producendi.* (5.) *Spiritus Vitrioli volatilis in Copia parandi Fundamentum & Experimentum.* (6.) *Vitulus aureus*, &c.

VIII. *Specimen Becherianum*, annex'd to *Becher*'s *Phyſica ſubterranæ.*

IX. *Diſſert. de elogiis vitrioli.*

X. *A Treatiſe on Sulphur, both inflammable and fix'd.* In *High Dutch.* 1708.

XI. *A Treatiſe on Salts.* High Dutch. 1723.

XII. *Commentar. in Metallurgiam Becheri*, 1723.

XIII. *Præf. in Concordantiam Chemicam Becheri*, 1726.

XIV. *Experimenta, obſervationes, animadverſiones*, 300 *numero, Chymicæ & Phyſicæ, qualium alibi, vel nulla, vel rara, nuſquam autem ſatis ampla, ad debitos nexus, & veras uſus, deducta mentio, commemoratio, aut explicatio, invenitur*, &c. *Berolin.* 1731. 8*vo*.

7. FRIDERIC HOFFMAN was born at *Hall* in *Saxony*, in 1660. To him we are principally indebted for a juſt Method of analyſing mineral Waters. He firſt diſcover'd the Errors of the Antients on this Subject, and ſhew'd the true Ingredients of Waters by chymical Experiments. The chief Points are, that the predominant Salt in mineral Waters, as well as in hot Springs, is not acid, but alcaline; that neutral Salts, calcarious Earths, and irony Matters, with a moſt ſubtile volatile univerſal Acid, are contain'd in all mineral Waters. See his *Diſſertationes de Thermarum & Acidularum Uſu ac Abuſu*; with others on the ſame Subject, all which are abridged, and publiſh'd by *P. Shaw*, 1733. 8*vo*.

His other Chymical Writings are,

I. *Diſſertationes de Generatione Salium.*

II. ——— ——— *Nitri Natura.*

III. ——— ——— *Cinnabari Antimonii.*

IV. ——— ——— *Mirabili Sulphuris Antimonii fixati Efficacia.*

V. ——— ——— *de Mercurio, & Medicamentis Mercurialibus*, &c.

VI. *Annotationes & Additamenta in Poterii Opera. Franc. M.* 1698. 4*to*.

VII. *Obſervationum Phyſico-chymicarum, ſelect. Lib.* III. *Hal. Magd.* 1736. 4*to*.

Other Writers on Philoſophical Chymiſtry are,

JAC. BARNERI *Chymia philoſophica perfecte delineata, docte enucleata, & feliciter demonſtrata*, &c. *Noriberg.* 1689. 8*vo*.

JO. FREIND, *Prælectiones Chymiæ, in quibus omnes fere operationes ad vera principia, & ipſius naturæ leges rediguntur. Amſt.* 1710. 8*vo*. and *Lugd. Bat.* 1734. 8*vo*. The ſame in *Engliſh* by *J. M.* with the Author's Defence of the Work againſt the Editors of the *Act. Erud. Lipſ. Lond.* 1712. 8*vo*.

CLAUDE BOURDELIN, Author of ſeveral Chymical Papers in the *Memoirs of the Royal Academy of Sciences.*

JOHN BROWNE. Several Papers of his detach'd in the *Philoſophical Tranſactions.*

DU CLOS, *Obſervations ſur les Eaux Minerales de pluſieurs Provinces de France, fait in l'Academie R. des Sciences. A Paris*, 1675. 12*mo*.

——— *Diſſert. ſur les principes des mixtes naturels, Amſt.* 1680. 12*mo*.

CAR. NEWMAN wrote ſeveral Pieces, which are detach'd in the *Philoſophical Tranſactions.*

CAR. MUSITANI *Pyrotechnia Sophica*, &c. *Neap.* 1683. *Colon. Allobr.* 1701. 4*to*.

——— ——— *Opera omnia. Genev.* 1716. *Folio.*

Jo.

Jo. Vigani *Medulla Chimiæ, Lond.* 1682. 8*vo. Gedan.* 1682. 8*vo. Jen.* 1687. 8*vo.*

And. Cassii *de extremo illo & perfectiſſimo naturæ opificio ac principe terrenorum ſidere, auro; de admiranda ejus naturâ, generatione, effectibus, atque ad Operationes artis habitudine. Hamb.* 1685. 8*vo.*

Boulduc, Author of ſeveral Chymical Papers in the *Memoirs of the Royal Academy of Sciences.*

J. Juncker *conſpectus Chemiæ-theoretico-practicæ in forma Tabularum repræſentatus; in quibus Phyſica, præſertim ſubterranea & Corporum naturalium principia, habitus inter ſe, proprietates, vires, & uſus, itemque præcipue Chemiæ Pharmaceuticæ & Mechanicæ fundamenta, è dogmatibus Becheri & Stahlii potiſſimum explicantur. P.* 1. *Halæ Magd.* 1730. 4*to.* The ſecond Part not yet publiſh'd.

Bibliothecarii Chemici.

Wilb. Grataroli *veræ Alchemiæ ſcriptores. Baſ.* 1561. *Folio.*

Petri Borelli *Bibliotheca Chymica, ſeu Catalogus Librorum Philoſophicorum, Hermeticorum, in quo quatuor Millia circiter auctorum Chymicorum, vel de tranſmutatione Metallorum, re minerali & Arcanis, tam manuſcriptorum quam in lucem editorum, cum eorum editionibus uſque ad annum* 1653. *continentur. Par.* 1654. 12*mo. Heidelb.* 1656. 12*mo.* The Authors are here enumerated in alphabetical Order, but not with due Diſtinctneſs nor Fulneſs.

Nath. Albinei, *Bibliotheca Chemica contracta, in qua continentur,* (1.) *J. Aur. Augurelli Chryſopœia utraque.* (2.) *Coſmopolitæ novum lumen Chymicum.* (3.) *Anonymi Galli enchiridion. Genev.* 1653. *and* 1673. 8*vo.*

——— ——— --- *Bibliotheca Chemica contracta, continens tractatus quatuor. Genev.* 1653. *and* 1654. 8*vo.*

——— ——— --- *Aureum vellus, oder guldene Schatz,* &c. *The Golden Fleece*; wherein are contain'd all the Writings of the moſt celebrated Authors in Alchemy, &c. *High Dutch. Hamb.* 1708. 4*to. Tom.* 2. *Baſ.* 1604.

Will. Cooper, *Catalogue of Chymical Books, which have been written originally, or tranſlated into* Engliſh, *in three Parts. Lond.* 1672. *and* 1675. 8*vo.* The third Part containing an Index of ſuch Things, publiſh'd in the *Philoſophical Tranſactions of the Royal Society*, as pertain to Chymiſtry, or the Study of Art in the Animal, Vegetable, or Mineral Kingdoms.

Jo. Jac. Mangeti, Bibliotheca Chymica, ſive Collectio Scriptorum præſtantiſſimorum Chemicorum, &c. *Francof.* 1702. 2 *Vol. Folio.*

Frid. Roth-Scholtzii *Bibliotheca Chemica, oder Catalogus von Chymiſcheren-buchern,* &c. Firſt, ſecond, third, and fourth Parts printed ſeparately. *Norib.* and *Altorf.* 1725. 1728. It is alphabetical: We have only ſeen ſo much of it as extends to the Middle of H; whether any more have been ſince printed, we doubt. *Shaw's Notes to Boerhaave's Chymiſtry.*

I have above given my Opinion, that it is not poſſible to tranſmute one Metal into another. I muſt, however, confeſs, that there are ſome very well atteſted Facts, which much favour the Doctrine of Tranſmutation. Theſe are collected in the *Miſcellanea Naturæ Curioſorum, A.* 1. *Dec.* 1. *Obſerv.* 17. as follows:

It is ſtill a Diſpute, whether any other Gold, beſides that which Nature prepares in the Bowels of the Earth, can be produced by Art, entirely ſimilar to natural Gold, or much more noble than it, as the Philoſophers by Fire, and the Adepts, would have it. There are a great many who abſolutely deny it, and that for various Reaſons, and from the Inſtances of ſo many Impoſtures; as of ſome who dip, into Solutions of Gold and Silver, wooden Sticks, with which they ſtir theſe Metals, and impregnate them therewith: Others mix powder'd Coals with Solutions of Gold and Silver: Others make an Ink of Gold and Silver, with which they inſcribe, on Paper, the Matter to be reduced. Others, inſtead of Sand, ſprinkle with Calx of Gold and Silver the Letters written on Paper: Others employ Crucibles, with a double Space between, the lower of which is full of Gold and Silver, and this they break in the Proceſs: Others employ Sticks, internally hollow, and full of Gold and Silver: Others fill the Coals with Gold, and cover the Crucibles with them: Others ſecretly, and by Slight of Hand, throw in Gold and Silver: Others, inſtead of common Mercury, take an Amalgama of Gold; beſides many other Methods, which Impoſtors have contrived, and which are rehearſed by *Crugnerus, Kircher*, and *Michael Mejerus*, who, in his *Examen of Chymical Cheats*, deſcribes above twenty-nine other Impoſtures.

Such as deny the Tranſmutation, alledge the great Diſagreement among Chymiſts themſelves about its proper Matter; while ſome ſearch for it in Sulphur; others in Vitriol; others in Mercury; others in Arſenic; others in an uncommon Mercury, ſuch as the returning Sun in the Month of *March* diffuſes every-where, and which is to be gather'd ripe in the Month of *October*; and ſome even in cheaper Materials: Hence *Kircher* would chuſe the mean Way, and neither aſſert the Impoſſibility of Tranſmutation, nor even that it is perform'd in the manner Alchemiſts ſuppoſe, ſo as to be genuine, and much more noble and pure than the natural Gold; and he rejects that Operation of the Stone, which conſiſts in Calcination, in the Separation, Conjunction, Putrefaction, Coagulation, Cibation, Sublimation, Fermentation, Circulation, and in fine, Projection of the four Elements: But againſt this Opinion of *Kircher, Solomon de Blawenſtein*, as alſo *Valerianus Bonvicinus* have written with great Acrimony. But *Zwelffer* oppoſes *Kircher* with great Moderation. Many, on the contrary, aſſert the Tranſmutation as a Certainty; and they attempt to teach its Preparation. *Joh. Dan. Mylius* gives us a Catalogue of them from the *Arabs, Greeks, Spaniards, French, Italians, Engliſh*, and *Germans*. And *P. Borellus* enumerates their Writings.

It is not my Deſign to ſet up for Umpire in this Diſpute; nor do I adduce the Teſtimonies of paſt Ages, and the Inſtances of *Raymund Lully, Arnoldus de Villa nova, Paracelſus, Sendivogius, Anton. Bragadinus* a *Venetian, Treviſanus, Turnheiſerus*, and others, who are ſaid to have made chymical Gold; ſeeing, in our curious Age, ſome very certain Experiments were made, outweighing the Reaſons adduced to the contrary; and the preſenting theſe to the Reader may, it is hop'd, be acceptable, as they are taken from authentic Accounts.

Dan. Sennertus ſays, that the other Metals may be reduced into Gold, a Thing that has been often prov'd in our Days; and what *Alexander Seaton*, a *Scotch* Man, has done at *Cologne, Baſil*, and other Places, is very well known; on which Head may be ſeen the Hiſtory of the Tranſmutation of Metals by *Ewaldus de Hogelande*, and the Writings of *Andr. Libavius*, which he publiſh'd in Defence of the Art of Tranſmutation.

To derogate from the Teſtimonies of ſo many excellent Perſons, ſays *Cornelius Martinus*, of *Antwerp*, who in their Writings ſolemnly affirm, that they had ſeen with their very Eyes, and not only felt with their Hands, but that they had accompliſh'd the Tranſmutation of one Metal into another, would ſeem to be acting the Part of an imprudent Perſon, and not that of a Philoſopher. When, in a public Diſputation, this *Cornelius Martinus* refuted by many Arguments the Notion of the Stone, a certain Nobleman, ſtanding up in the Company, order'd Coals and Lead to be brought him; and in the Preſence of *Martinus* and others, throwing a certain Tincture into the fus'd Metal, by means of it he tranſmuted the melted Lead into Gold; and upon this *Martinus* recanted his former Opinion.

Joh. Baptiſta Van Helmont confeſſes of himſelf; "I am "obliged to believe the Stone that makes Gold and Silver, be- "cauſe at different times, with my own Hand, I made the "Projection of one Grain, I think, upon ſome thouſand "Grains of hot Quickſilver; and, to the Admiration of many "who were preſent, the Buſineſs ſucceeded in the Fire, as "Books do promiſe. That Stranger who gave me the Gold "(for he gave me about half a Grain, with which I tranſ- "muted nine Ounces and three Quarters of Quickſilver) had "at leaſt ſo much of it, as was ſufficient to tranſmute 200,000 "Pounds into Gold." He confirms the ſame Thing in his Treatiſe *de Vitâ æterna* towards the End; and more fully in his Treatiſe, intituled, *Demonſtratur Theſis*.

In 1648. one Grain was ſent to *Prague* to the Emperor *Ferdinand* III. with which three Pounds of Mercury were converted into Gold. The Story is more accurately told thus by others, The Nobleman, who in the Preſence of his Imperial Majeſty reduc'd, with one Grain of the Powder, Mercury into Gold, was call'd *Richthauſen*, and whom the Emperor made a Baron, with the Title of *De Caos*. From this tranſmuted Gold his Imperial Majeſty order'd to be ſtruck a Medal with particular Inſcriptions on each Side; on one Side, the Figure of a naked young Man, with a Sun inſtead of a Head, and his Right Hand lifted up holding *Apollo*'s Lyre, and, in his Left Hand hanging down, *Mercury*'s *Caduceus*, with this Device, *Divina metamorphoſis exhibita Pragæ* 15 *Jan.* 1648. *in præſ. S. Cæſ. Maj. Ferdin.* III. On the Reverſe, *Raris hæc ut hominibus nota eſt ars, ita rarò in lucem prodit. Laudetur Deus in æternum, qui partem infinitæ ſuæ ſcientiæ abjectiſſimis ſuis creaturis communicat.* This Medal, afterwards found in the Emperor's Eſcritoire, was by the Emperor *Leopold* given to *Zwelffer* to be ſtruck and grav'd in Braſs, as *Zwelffer* himſelf teſtifies in his *Mantiſſa pharm. Spagyr.* where we have a Figure of it, as alſo in *Becher*'s *Oedipus Chemicus*. In what manner, and from whom this *De Caos* had the Powder, *Monconnys* gives an Account, (as the Electoral Biſhop of *Mentz*, at the Diet of *Ratiſbon* in 1664, had inform'd him) whoſe Words are to the following Purpoſe; "There liv'd one *La Buſardiere* in the Houſe of a certain "Nobleman (ſuppos'd to be the Count *de Schlick*) at *Prague*: "This Man, falling ill, and at the Point of Death, writ to his "Acquaintance *De Caos*, and begg'd of him to come to "*Prague*, as ſoon as poſſible; but the ſick Man died ſome "Hours before *De Caos* came, and, after his Arrival, inquir- "ing

" ing whether he had left any thing, the Maſter of the Houſhold " ſhews him a certain Powder, entruſted to his Care, tho' " he did not know its Uſe. This Powder was carried off by " ſtealth by *De Caos*, and with it he made ſeveral Projections; " the firſt of which was made in the Preſence of the late Em- " peror, who caus'd a Medal to be ſtruck of this Gold, on " one Side of which was the Character of *Mercury*, and, on " the Reverſe, the Day and Year it was ſtruck." Thus far *Monconnys*, who, in the Deſcription of the Medal, which he had not ſeen, differs from *Zwelffer*, who was an Eye-witneſs, and conſequently is of greater Credit in his Account of it.

Beſides, *Monconnys* was told at *Ratisbon* by Count *de Par*, Chamberlain to the late Emperor, that an unknown Perſon had offer'd the Emperor a little of a Powder that remain'd at the Bottom of a ſmall Box, which Powder, along with the Box, being put on a fus'd Maſs of equal Parts of Mercury and Silver, exhibited, with burning the Box, ſo ſtrong a Tincture, that, after that extraordinary red Maſs was broken and cut thro', it internally exhibited a great many red Veins like Blood; an Indication that the Powder was ſtill two ſtrong. After Re-fuſing that Maſs with the Addition of new Matter of the ſame Weight as at firſt, all that was converted into Gold was upwards of twenty-four Carats, in reſpect of Colour. This Perſon had receiv'd the Powder from another, and therefore he knew not the Secret of preparing it.

The ſame Count *de Par* told, that at another time a certain old Man came to the Emperor, and brought him a little of a certain Powder, and begg'd that it might be tried, becauſe he believ'd it would poſſibly be of ſome Uſe. The Emperor orders, that he ſhould return in three Days; and upon trying the Powder, eight Ounces of Mercury were converted into perfect Gold: Upon which the Emperor order'd to bring the Man, but by this time he was gone, and never after ſeen.

Strobelberger, an Apothecary at *Ratisbon*, told *Monconnys*, how a certain Merchant at *Lubeck* (who but little apply'd himſelf to merchandizing, but was Maſter of the Art of fixing and converting Lead into Gold) gave *Guſtavus*, King of *Sweden*, a Maſs of Gold of 100 Pound Weight, of which the King order'd to coin Ducats; and to diſtinguiſh them, on one Side was the King's Effigies, and on the Reverſe the Royal Arms, with the chymical Characters of Sulphur and Mercury on each Side: And from the above-mention'd Apothecary *Monconnys* had one of the Pieces. The Merchant, after his Death, tho' for many Years before he had given over Trade, and tho' he was never ſucceſsful in it, left an Eſtate of 17,000,000 Crowns. I myſelf had a Preſent made me of one of theſe Ducats by *Ludovicus de Schonleben*, and mark'd with the Characters of Sulphur and *Mercury*.

Georgius Fredericus de Greiffenclau, Archbiſhop of *Mentz*, order'd to coin Ducats from Mercury converted into Gold, and they are mark'd with the Character of *Mercury*.

Beſides the Projection, made by *De Caos* in the Preſence of the Emperor, he perform'd another before the Great Vicar of *Mentz*; and the Archbiſhop himſelf; and this, as the Elector himſelf told *Monconnys*, he effected with all the Precautions which Philoſophers uſually employ in ſuch an Operation: He took a ſmall Pill like a Lentil, prepar'd from that Powder with Gum Tragacanth, that, uniting together, they might the better cohere: He rolled this Pill in Wax, which he put into the Bottom of a Crucible, and laid upon it four Ounces of Mercury, and put it into a Fire of Suppreſſion. After a ſtrong Blaſt-heat for half an Hour, upon removing the Coals, the Gold was ſeen fus'd, yet with very red Rays, which are otherwiſe commonly green. He, therefore, thought that the Gold was ſtill too generous; and that, therefore, it was neceſſary to take it down by the Addition of Silver. The Elector himſelf threw in ſome Bits of Silver; and after a perfect Fuſion, when it was poured into the Ingot, there was a beautiful Maſs of Gold, but which was found ſomewhat acrid, the Cauſe of which *De Caos* aſcrib'd to the Smell of Braſs, which happen'd to be found in the Ingot; that, therefore, it was very proper to ſend it to the Mint to be run, after which it was very beautiful and ſweet: And the Warden of the Mint affirm'd, that he never ſaw a more beautiful Piece; that it was above twenty-four Carats; and what is greatly to be admir'd is, how that Acidity could be taken off by one ſingle Fuſion; and the Elector promis'd *Monconnys* a Bit of this Gold. *Becher*, in his *Oedipus Chymicus*, alſo confirms this very Thing: " The " ſame Perſon, ſays he, who gave the Tincture to the Em- " peror *Ferdinand*, repeated the ſame Thing ten Years ago at " *Mentz*, in the Preſence of the Elector and other great Per- " ſonages, in a pretty large Quantity: And this the Warden " of the Mint there, who coin'd Ducats of this Gold, can " teſtify."

The ſame Elector affirm'd, that, with one Grain of Powder, he had ſeen three Marks of Gold made from two Pounds of Mercury; and that, upon taking them out of the Crucible, as they were too high colour'd, by the Addition of three or four Drams of Silver they were all converted into Gold.

In what manner an unknown Perſon, meanly dreſs'd, and pretending to be born in the North of *Holland*, came *December* 27. 1666. to *Joh. Frederic Helvetius*'s Houſe at the *Hague*, and gave him a Bit of Powder, as big as a Rape-ſeed, with which, roll'd up in Wax, and thrown into ſix Drams of melted Lead, the Lead was tranſmuted into Gold, the ſame *Helvetius* relates in a Treatiſe intituled *Vitulus Aureus*. This Gold, put into the Hands of *Borelius*, General Aſſayer of the Mint in *Holland*, and examin'd, was found ſo extraordinary, that it ſtill tranſmuted ſome Part of the Silver thrown into the Gold in the Aſſay.

The Honourable Mr. *Murray*, in a Letter to *Monconnys*, dated *Auguſt* 17. 1664. likewiſe teſtifies, that Prince *Rupert* had it from the preſent Elector of *Mentz*, that the Projection of Gold was ſucceſsfully perform'd in his Preſence, and that the ſame Prince *Rupert* had in 1662. given to King *Charles* a large Piece of Gold, made at *Inſpruck* by the ſame Perſon, who gave the Powder to the Elector; and this Story Mr. *Murray* mention'd in the Preſence of *Monconnys*, as alſo the Aſſay he had made of the Gold by the King's Orders.

CHEMOSIS, χήμωσις (corruptly χύμωσις) from χαίνω, to gape, is a Diſeaſe of the Eyes, proceeding from an Inflammation, when the White of the Eye ſwells above the Black, and overtops it to ſuch a Degree, that there appears a ſort of Hiatus or Gap between them, whence it takes its Name. The Author of the *Definitiones Medicæ* defines it to be an Elevation of the Membrane which ſurrounds the Eye, and is called the *White*, being an Affection of the Eye like white Fleſh. *Galen*, *de Euphoriſtis*, calls it a red and carnous Inflammation of the Cornea Tunica. *Paulus*, *Lib.* 3. *Cap.* 22. ſays it is called a *Chemoſis*, when, through a vehement Inflammation, both the Eyelids are turned outwards in ſuch a manner, as ſcarce to cover the Eye, and the White of the Eye appears higher than the Black, and red, and occupies a good Part of the Black.

CHENALOPEX, χηναλώπηξ, from χὴν, a Gooſe, and ἀλώπηξ, a Fox. See VULPANSER.

CHENOCOPRUS, χηνόκοπρος, from χὴν, a Gooſe, and κόπρος, Dung, Gooſe-dung. It is very acrimonious, and of a reſolvent Quality, and commended in the Jaundice. Some Authors relate how a Monk cured all Patients labouring under a Jaundice, only by giving them in the Morning, for eight Days together, a Doſe of Gooſe-dung in Wine, for which Purpoſe he always fed two Geeſe, and made of their Dung a ſecret and precious Remedy to thoſe Multitudes of icterical People, who flock'd to his Houſe for a Cure. The beſt is reckoned to be the greeniſh, which is gather'd in the Meadows in the Spring-time, and, being dry'd with a moderate Heat, and pulveris'd, is given from half a Dram to a full Dram at a Doſe. *Ettmuller* ſays, that the Dung is more effectual, if the Geeſe feed before-hand upon anti-icterical Herbs. It is commended alſo in the Scurvy, being taken frequently in Wine, either in the Form of a Powder, or of a Decoction. Gooſe-dung is, beſides, a potent Diuretic, and therefore uſually recommended in hydropical Caſes. It is given internally alſo in intermitting Fevers, for the Cough, and in difficult Labours. But *Ludovicus de Pharmacia* ſays, there is generally but little Good to be expected from this ſordid Medicine.

CHENOPODIO-MORUS. Mulberry-blight.

The Characters are;

The Fruit is ſucculent, like the Mulberry or Strawberry.

The Species are,

1. Chenopodio-morus; major. GREAT MULBERRY-BLIGHT, COMMONLY CALL'D STRAWBERRY SPINAGE. *Atriplex*, *Mori Fructu*, *major*, *ſeu fragifera major*. M. H. 2. 606. *Spinachia*, *fragifera*. Aldin. H. Farneſ. 85. a.

2. Chenopodio-morus; minor. LESSER MULBERRY-BLIGHT, COMMONLY CALL'D BERRY-BEARING ORACHE. *Atriplex*, *Mori Fructu*, *minor*, *ſeu fragifera minor*. M. H. 2. 604. *Atriplex*, *ſylveſtris*, *Mori Fructu*. C. B. P. 119. *Atriplex*, *ſylveſtris*, *baccifera*. Cluſ. H. 135. a.

I find no medicinal Virtues attributed to theſe Plants.

CHENOPODIUM, CHENOPUS, χηνόπόδιον, χηνοπὸς, from χὴν, a Gooſe, and πούς, a Foot. *Gooſe-foot*.

The Characters are;

The Calyx is quadrifid, or quinquefid, with deep Inciſures, which produces eight or ten Stamina in the Bottom.

The Ovary is furniſh'd with a long, forked, expanded Tube, which, when ripe, becomes an orbicular flat Seed, inclos'd within a kind of quadrifid or quinquefid Star. The Leaves are large, ſinuous, or long.

Boerhaave takes notice of fourteen Species of the *Chenopodium*, beſides two more, which have Leaves like *Kali*.

1. Chenopodium; folio triangulo. See BONUS HENRICUS.

2. Chenopodium; Betæ folio. T. 506. *Blitum*, *minus polyſpermum à ſeminis copiâ*. C. B. P. 118. M. H. 2. 599. *Blitum*, *erectius*, *ſive* 3 *Tragi*. J. B. 2. 967. a.

3. Che-

3. Chenopodium; folio laciniato; comâ purpuraſcente. See ATRIPLEX.

4. Chenopodium; Pes Anſerinus; 1. Tabern. Ic. 427. T. 506. *Atriplex, dicta Pes Anſerinus.* J. B. 2. 975. *Atriplex, ſylveſtris, latifolia.* C. B. P. 119. M. H. 2. 604. *Pes Anſerinus.* Dod. p. 616. a.

This is eſteem'd a good Uterine and Antihyſteric; and is ſaid to provoke the Menſes, and to expel the dead Fœtus, and the Secundines.

5. Chenopodium; Pes Anſerinus; 2. Tabern. Ic. 428. T. 506. *Atriplex, ſylveſtris, latifolia, acutiori folio.* C. B. P. 119. M. H. 2. 604. *Atriplex, dictus Pes anſerinus, altera ſive ramoſior.* J. B. 2. 976. a.

6. Chenopodium; folio ſinuato candicante. T. 506. *Atriplex, ſylveſtris, folio ſinuato, candicante.* C. B. P. 119. M. H. 2. 604. *Atriplex, ſylveſtris.* J. B. 2. 972. a.

7. Chenopodium; anguſtifolium; laciniatum; minus. T. 506. *Atriplex, anguſtifolia, laciniata, minor.* J. B. 2. 972. a.

8. Chenopodium; folio laciniato; coma vireſcente. T. 506. a.

9. Chenopodium; fœtidum. See ATRIPLEX OLIDA.

10. Chenopodium; Lini folio villoſo. FLAX-LEAV'D ORACHE, COMMONLY CALL'D SUMMER CYPRESS, OR BELVEDERE. T. 506. *Linaria, Sceparia,* C. B. P. 212. *Linaria, Belvedere dicta.* J. B. 3. 462. *Oſyris.* Dod. p. 101. *Herba Studioſorum.* Tabern. a.

11. Chenopodium; Ambroſioides; folio ſinuato. See BOTRYS.

12. Chenopodium; Ambroſioides; Mexicanum. See BOTRYS.

13. Chenopodium; Ambroſioides; Mexicanum; fruticoſum. *H.* 14.

14. Chenopodium; Stramonii folio. Juſſieu. *Atriplex, ſylveſtris, major, anguloſo folio.* Barr. Ic. 540. *Atriplex, Chenopodia, folio Daturæ.* H. R. Monſ. *Atriplex, odore & folio Daturæ, minori tamen.* Læl. Triumf. apud Frat.

Chenopodium with Leaves reſembling the *Kali*.

There are two Species of this.

1. Chenopodium; ſedi folio minimo; folio Kali; ſemine ſplendente; annuum. *Kali, minus, album, ſemine ſplendente.* C. B. P. 289. M. H. 2. 609. *Kali, album.* Dod. p. 81. *Kali, minus.* H. Eyſt. Æſt. o. 6. F. 1. Fig. 3. a.

2. Chenopodium; ſedi folio minimo; fruteſcens; perenne. *Kali, fruticoſum, minus, flore minore.* M. H. 2. 611. *Sedum, minus, fruticoſum.* C. B. P. 284. *Sedum, mininum, arboreſcens, vermiculatum, flore luteo.* J. B. 3. 695. *Sedum, mininum, arboreſcens, Lobelii.* Lugd. 1132. H. R. D. *Boerhaave's Index alter Plantarum, Vol. 2. p. 90.*

CHEOPINA. See CHOPINA.

CHERAMIS, χηραμὶς, is expounded by *Erotian* on *Hippocrates*, the Hollow of a Shell-fiſh call'd *Myax*; and it takes that Name, he ſays, from χηραμὸς, which ſignifies a hollow Place. It frequently occurs in *Hippocrates*, and ſeems not much different from the *Chema*, which, in *Galen's Exegeſis*, is expounded by it. *Cornarius* alſo, on a Place in *Hippocrates*, *Lib.* 1. περὶ γυναικ. explains *Cheramis* by the Meaſure of a *Chema*, and *Calvus* on another Paſſage in *Lib.* περὶ γυναικ. φύσ. expounds it by a Pugil. See CHEMA.

CHERAS. The Struma or Scrophula, a Tumor in which Kernels ariſe. *Johnſon.*

CHEREFOLIUM. See CHÆREFOLIUM.

CHERIO is nothing but the Heat or Cold of Things, which leaves the Subſtance, and paſſes into Nature. Take an Example in Camphire: This has its Coldneſs of its *Cherio*, for which Reaſon it is a preſent Remedy in Inflations; but in its primary and eſſential Qualities [*Subſtantia ſuarum primarum*] it is ſtill hot, in the ſame manner as Sulphur and Spirit of Salt, together with Mercurialis, and precious Stones and Herbs. Beſides, whatever Nature produces has its *Cherio*, that is, elementary, external, accidental Subſtances. It is oppos'd to *Relolleum*, which ſignifies the internal intrinſical Nature. *Paracelſus de Grad. et Compoſ. Lib. 2. Cap. 3, 4.* According to *Johnſon*, the *Cherio* is the occult accidental Virtue of the external Elements, and the unmodify'd Nature of Heat and Cold.

CHERIONIUM is that in which Nature cannot be alter'd: Thus Cryſtal, harden'd by Nature, cannot be melted, as that which is made by Art. *Johnſon.*

CHERMES *& Coccus Baphica*, Offic. *Chermes ſeu Coccus inſectorius*, Park. Theat. 1395. *Kermes ſive Chermes*, Ind. Med. 63. *Chermes, Grana tinctorum, Coccus Baphica, Coccus inſectorum*, Mont. Exot. 9. *Chermes, Kermes, Coccum inſectorium, Coccus Baphica, Granum tinctorium, Scarlatum*, Chom. 313. *Coccus ſeu Coccum ex Ilice*, Bram. Hiſt. *Coccî radicum*, p. 2. KERMES-BERRIES.

This Grain is found adhering to the Branches, but rarely to the Leaves, of that Shrub, which *Dioſcorides* calls the κοκκοβαφὴ, and which is now commonly call'd *Ilex aculeata Cocci Glandifera.* The Grain itſelf is of a ſpherical Figure, as large as a Pea or Lentil, ſmooth, ſhining, and of a blackiſh-brown Colour.

The Names aſſign'd to this Subſtance amount to a pretty ſatisfactory Proof, that its firſt Inventors were not all of the ſame Opinion, with reſpect to its Origin, or whether it was an animal or vegetable Production; for *Kermes*, among the *Arabians*, ſignifies a ſmall Worm; and κοκκὸν, among the *Greeks*, whence the *Latins* borrow'd their *Coccum*, imports no more than a Grain or Kernel; for which Reaſon, among the later *Greeks*, inſtead of the Word κοκκὸν, σκώληξ, which ſignifies a Worm, is always ſubſtituted; for theſe Grains are full of ſmall Worms, the Juices of which are celebrated for dying Scarlet, a Colour ſo much admir'd in all Ages. Hence the Worm is taken for the Grain itſelf.

Pauſanias is, by *Cluſius*, in the firſt Book of his *Hiſt.* repreſented as uſing the following Words: "In the Fruit of "the *Coccus* there is a ſmall Animal form'd, which, when the "Fruit is ripe, ſallies forth into the Air, becomes immediate-"ly capable of flying, and nearly reſembles a Gnat. But "they gather the Fruit of the *Coccus* before the Conception "of the Animal, whoſe Blood it is which is uſeful in dying "Wool." According to *Salmaſius*, every Species of the *Coccum Tinctorium* is, by the *Greeks*, call'd σκωλήκιον, which ſignifies a *ſmall Worm*, becauſe it changes itſelf into that Kind of Inſect; tho', at the ſame time, each Grain contains a large Number of theſe Animalcules, ſo that it ſeems ſurpriſing how the Cuſtom prevail'd of calling the Worm itſelf the Grain, in which it is produced.

After the moſt diligent Scrutinies of the Naturaliſts into this Matter, 'tis now certain, that the Production of the *Coccum Tinctorium* is owing to a certain Inſect, or ſmall Worm; and that it is, in Reality, nothing but a certain Nidus or Follicle, fill'd with the numerous Progeny of that Animalcule.

Tho' Authors are now agreed upon this in general, yet they run into different Sentiments with reſpect to the Generation or Formation of this Animalcule in the *Coccus*. But as an Enumeration of their Opinions, with regard to this, is foreign to our Deſign, we ſhall make no farther Attempt that way.

Among the Antients, according to *Dioſcorides*, in *L.* 4. *C.* 43. the beſt *Kermes* was thought to be produced in *Galatia* and *Armenia*; the next, in Goodneſs, in *Aſia* and *Cilicia*; and the next to that, in *Spain*.

At preſent the Kermes is produced and gather'd in *Europe*, in the Countries adjacent to the *Mediterranean* Sea; but that found in *Languedoc*, in *Provence*, is accounted the beſt. That this Shrub was not, at all Ages, proper for producing Kermes fit for Uſe, was known in the Days of *Pliny*. But when that Author, in the forty-firſt Chapter of his ninth Book, affirms, that, when it is one Year old, the Juice is languid, and, when four, good for nothing, it is obvious, this Aſſertion extends only to the Plant itſelf, and not to the Grains, which are collected yearly, as *Salmaſius* would have it. The Monks, indeed, according to the *Cenſura in Antidotarium Meſuæ*, diſtinguiſh the *Coccum Tinctorium* from the *Kermes Grains*; which latter, they maintain, are found about the Roots of certain Herbs, but in greater Plenty about ſuch Roots of the *Pimpinella* as are old and thick, lying, as it were, on the Surface of the Ground. But ſince this erroneous Opinion, peculiar to theſe Monks, is ſufficiently confuted by *Matthiolus ad Dioſcor.* and by *Cæſius*, we ſhall make no more mention of it, but conſider to what medicinal Uſes *Kermes* are applied. But, before we enter directly upon the Execution of this Deſign, we ſhall pave the Way, by giving ſome Obſervations and Experiments, which have a Tendency to illuſtrate the Nature, and diſcover the Properties, of the Kermes-grain.

Firſt, then, Count *Marſigli*, in his *Hiſtoire Phyſique de la Mer*, informs us, that the internal Matter of the Coccum is poſſeſs'd of a bitter and aſtringent Taſte, like that of the Bark of the Shrub which produces it: Hence 'tis obvious, that the Juice of the Vegetable, by which the Animal is nouriſh'd, ſtill retains its original Nature and Qualities.

Secondly, in *Garidel's Hiſtoire des Plantes qui naiſſent aux environs d' Aix*, and in the *Ephemer. Nat. Curioſ. Vol.* 3. we are told, that Pigeons are very fond of the Kermes-grains, and give them to their Young, to which they frequently prove mortal; whilſt the older Pigeons with Difficulty eſcape the ſame Fate, by the Advantage of a Diarrhea, the Matter of which tinges the Walls of the Dove-coat with a reddiſh Colour.

Thirdly, Count *Marſigli*, in the before-cited Work, affirms, that the Subſtance of the Kermes-grains, mix'd with Vitriol in the Proportion, which, in Galls, is neceſſary for making Ink, produces a Subſtance of a black Colour, proper for anſwering the Purpoſes of Ink. But it cannot be hence infer'd, that the *Coccum Tinctorium* is a Species of Gall; but only, that the vegetable Matter, fit for making Ink, did not loſe its original Quality in the Body of the Animal which it nouriſh'd.

Fourthly, the laſt quoted Author informs us, that, with Oil of Tartar *per Deliquium*, it changes its lateritious Colour into that of a beautiful Crimſon, little inferior to Scarlet. With Water of Quick-lime the ſame Colour may be obtain'd, as with

with the Oil of Tartar. With Spirit of Sal Ammoniac it is changed into a beautiful red Colour; not entirely ſo red as thoſe produced by the other two alcaline Liquors.

Fifthly, the ſame Author affirms, that, when mix'd with Spirit of Vitriol and Sulphur, it does not, in the leaſt, change its lateritious Colour, nor produce any Fermentation. With Spirit of Nitre it changes its lateritious Colour into one ſomewhat yelloviſh, without any kind of Fermentation. In Spirit of Vinegar its natural Colour becomes a little darker, and ſoon after a Precipitation happens.

Sixthly, the above quoted Author tells us, that in a Decoction of Mallow-flowers, as alſo in an Infuſion of Tournſole, the Kermes-grains produce no Change; nor does their Solution, when ſprinkled upon blue Paper, in the leaſt alter its Colour.

Seventhly, *Antonius Heyde*, in his *Obſervationes Medicæ*, *Obſ.* 75. informs us, that Rain-water is deeply tinged by theſe Grains, as is commonly known. Diſſolved Pot-aſh, mixed with this Tincture, renders it more deep and pellucid, no Particles at the ſame time ſubſiding. Aqua-fortis renders the Colour fainter, and the Liquor itſelf turbid; whilſt, at the ſame time, rediſh Flakes gradually ſubſide. A few Drops of this Tincture, pour'd into a Solution of ſublimate Mercury, produce a Secretion of rediſh Flakes, which are precipitated to the Bottom. The bluiſh Colour of the Tincture of Guaiacum is not changed by an Admixture of the Tincture of theſe Grains: Hence 'tis obvious, that this Tincture is deſtitute of acid Particles, which ſeems alſo to be confirm'd by the preceding Experiments.

Eighthly, the above-mention'd Count *Marſigli* informs us, that two Pounds of the pure Subſtance of the Kermes-grains, without the Huſks, were diſſolved in Rain-water, and ſet by a gentle Fire, in order to acquire a due Thickneſs, with a View to try whether a ſolid volatile Salt could be obtain'd from the Kermes-grains: But this Experiment was not crown'd with Succeſs, tho' the greateſt Diligence and Care were uſed in carrying on the Proceſs. Two Pounds more of entire and recent Kermes-grains were, therefore, put into a luted Retort, with a Receiver adapted to it. Four Hours, or a little more, after the Diſtillation was over, the Degrees of Fire being in the mean time punctually obſerved, they at firſt yielded a Kind of aqueous Liquid, which, when inſpiſſated, aſſumed a Colour reſembling that of Blood; and when the oleous Particles began to aſcend, the whole Glaſs was fill'd with ſmall Clouds, produced by a certain Spirit of the volatile Salt; which, when the Spirit became cold, was obſerved adhering to the Sides of the Receiver. The *Caput Mortuum*, remaining in the Retort, weigh'd three Ounces. The whole remaining Part of the Matter, except a ſmall Quantity deſtroy'd by the Fire in the Courſe of the Proceſs, conſiſted of a Subſtance which was fluid, aqueous, oleous, and impregnated with a colliquated volatile Salt. When this Liquor had abſorb'd all the volatile Salt which adher'd to the Sides of the Veſſel, it diffuſed a pretty ſtrong urinous Smell, like that obſerved in Spirit of Hartſhorn, tho' not entirely ſo ſtrong. The whole Liquor, filtrated thro' a Paper, left behind it three Ounces of a browniſh-colour'd Oil. The Liquor, when clear, purged from its oleous Parts, and put into a Cucurbit, yielded, by Diſtillation, ten Ounces of a Spirit richly impregnated with volatile Salt, of a penetrating urinous Smell, and ſo ſtrong, that it ſeem'd, as it were, to conſiſt of nothing but volatile Salt. Upon continuing the Sublimation, another, but weaker, Spirit was yielded. The Spirit, impregnated with the volatile Salt, when mix'd with a Decoction of Mallow-flowers, gave it a greeniſh-yellow Tincture, like that produced by a Mixture of the Decoction of Mallow-flowers with Sea-water. Such a Change is alſo produced in it by any Subſtance of a perfectly alcaline Nature. The Caput Mortuum, when firſt calcin'd, and afterwards elixiviated, the Moiſture being evaporated to a Dryneſs, yielded only half a Dram of fix'd Salt: This ſmall Quantity of fix'd Salt yielded, ſeems to evince, that the vegetable Nature of the Juice, by which the Animalcule is nouriſh'd, is not changed into an animal Nature.

From theſe Experiments *Marſigli* concludes, that the Subſtance of Kermes-grains is richly impregnated with a volatile Salt of an alcaline Nature. Mr. *Geoffroy* alſo, upon diſtilling Kermes-grains by the Retort, obtain'd urinous and volatile Liquors; which, when pour'd into the Tincture of Turn-ſole, produced no Change, but tinged the Tinctures of Roſes and Violets with a greeniſh Colour. From one Pound of Kermes he obtain'd half an Ounce of pure concreted volatile Salt, and about a Dram or two contaminated with a yelloviſh Oil. A large Quantity of fetid Oil was yielded, which was not black, but of a deep-yellow Colour, and thick, like Butter. Hence he concludes, that the Principles of the Kermes can be more properly compared to nothing than to the Products yielded by crude Silk, when chymically examined.

As for the medicinal Virtues of the Coccum Tinctorium, *Dioſcorides*, in the forty-third Chapter of his fourth Book, deſcribes them in the following manner: This Subſtance is of an inſpiſſating Quality; and, when triturated with Vinegar, is highly proper for anointing Wounds, and cut Nerves. *Matthiolus*, from *Galen*, informs us, that the Granum Tinctorium is poſſeſs'd of an aſtringent, and, at the ſame time, of a bitter Quality, both of which dry without creating Pain; for which Reaſon it is proper in large Wounds, eſpecially thoſe of the Nerves; for which Purpoſe ſome triturate it with Vinegar, and others with Oxymel. *Pliny*, in the fourth Chapter of his twenty-fourth Book, informs us, that it is to be laid upon recent Wounds, triturated with Vinegar; upon the Eyes, when affected with Defluxions, triturated with Water; and to be dropt into inflamed Eyes. From theſe Paſſages it is obvious, that the Antients thought Kermes proper, in Caſes where the Uſe of aſtringent, and conſequently of inſpiſſating and repelling Medicines was indicated. The Moderns, with the *Arabians*, aſcribe a highly corroborating and cordial Quality to the Kermes. The Cloth dyed with theſe Grains, commonly call'd Crimſon or Scarlet Cloth, is alſo highly extol'd on account of theſe Qualities, and is, for that Reaſon, uſed not only for bringing forth the Meaſles, by wrapping the Patient in it, but alſo for corroborating the Heart, by the Application of Epithems, wrapt up in it, to the Region of that Organ. The Application of a Piece of this Cloth is alſo thought good for curing Venereal Buboes. *Schroder*, in his *Pharmacopœia*, informs us, that it is a common Practice to tie a ſilken Thread, of this Colour, about the Parts affected with an Eryſipelas, in order to remove that Diſtemper. *Simon Pauli*, in his *Quadripartitum Botanicum*, affirms, that the Eruption of the Meaſles is greatly promoted in Children by wrapping them up in this Cloth; and that he has ſeen it ſucceſsfully applied, by Men of Skill, to Venereal Buboes. For preventing Abortion, and ſtrengthening the Fœtus, ſome Women uſe, as an infallible Remedy, wearing a Belt of this ſort of Cloth, next their Skins, all the Time of their Geſtation. Others uſe the like Belt for ſuppreſſing an immoderate Flux of the Menſes and Hæmorrhoids. *Ludovici*, in his *Pharmacopœia*, inſinuates, that theſe external Applications are none of the beſt and moſt effectual. "To add, ſays he, the Knap of "ſcarlet Cloth to medicated Bags and Epithems, is a Practice "more oſtentatious than uſeful: To tie up bleeding Parts with "a ſcarlet Thread, or to ſolicit the Eruption of the Meaſles, "by wrapping the Patient in ſcarlet Cloth, ſeems a Practice "only worthy of ignorant Women." And *Hoffman*, in his *Clav. Schrod.* informs us, that, when ſcarlet Cloth is uſed for promoting the Eruption of the Meaſles, the Effect muſt rather be produced by the Force of the Patient's Imagination, than any expulſive Virtue lodged in the Cloth itſelf. Nor, according to *Lanzonius*, in *Eph. N. C. D.* 3. *a.* 1. *o.* 26. does a ſcarlet ſilken Thread, tied about the Part, remove the Eryſipelas. If we conſider, that the Principles which compoſe the animal Body have a Tendency to an alcaleſcent Diſpoſition; if alſo we conſider, that the Animalcules of the Coccum Tinctorium as yet retain ſome Properties of the Subſtance by which they were nouriſh'd, eſpecially the aſtringent Qualities peculiar to the Juice of the Shrub; we cannot deny, that the Kermes-grains contain very conſiderable Virtues, which is indicated by their bitter and aſtringent Taſte; in conſequence of which Quality it is corroborating, and calculated for removing the Laxity of the Fibres, and correcting the Peccancy of the aceſcent Humours. It is alſo obvious, that the ſaline alcaline Subſtances it yields in a chymical Diſtillation, are proper in Diſorders, where an Acid is to be corrected and ſubdued. Hence 'tis evident, whether we uſe the alcaline Salts produced by the Fire, or the unchanged Subſtance of the Grains, that the Preparations are only to be commended as excellent Corroboratives, and Cordials, in particular Caſes; but not in every Caſe indiſcriminately, and without having a regard to the predominant Fault in the Conſtitution. Hence the Reaſon is plain, why the Powder of Kermes-grains, in a poach'd Egg, with the Addition of a little Frankincenſe, or Maſtich, is ſucceſsfully uſed by the *Italian* and *Portugueſe* Women, for preventing a Miſcarriage; and why, according to *Cluſius*, the Powder of Kermes is properly exhibited to the Women of *Montpelier* in difficult Labours, and Loſs of Strength; for, by corroborating Medicines, Abortion is prevented, where Fibres, in a too lax State, are to be braced, that they may not loſe what ought to be retain'd. The Expulſion of the Fœtus, on the other hand, is promoted by increaſing the contractile expulſive Force of the Parts, which depends on the Corroboration of their conſtituent Fibres. As for the medicinal Virtues of Scarlet, or any other red Cloth, the deeper the Cloth is tinged with a ſtrong and lively Red, the more powerfully it reflects the Heat ſent from the Part to which it is applied. Hence its medicinal Effects are owing to its heating Quality, ſince it neither abſorbs nor diſſipates, but powerfully reflects the Heat it receives. The ſame is applicable to ſcarlet Silk Threads. See ALKERMES.

CHERMES *Mineralis*. See ANTIMONIUM.

CHERNIBION,

CHERNIBION, χερνίβιον, in *Hippoc. Lib.* 7. *Epid.* ſignifies an Urinal.

CHERSA, call'd alſo *Fecula*, in ſome Authors ſignifies a Root reduced to a farinaceous Powder; which Way of Preparation ſome condemn as exhauſting the Virtues of the Drug, and rendering it good for nothing; but this is to be eſtimated in proportion as it conſiſts of more or leſs volatile or fixed Parts.

CHERSÆA, χερσαία. Earthy. An Epithet of one of the three Species of Aſps. See ASPIS.

CHERSYDRUS, χερσύδρος, from χέρσος, Earth, and ὕδωρ, Water. An amphibious Serpent, ſo call'd, becauſe it lives firſt in watery Places, whence it is call'd *Hydrus*; after which it ſhifts its Habitation, and lives on dry Ground, and thence has its compound Appellation *Cherſydrus*. While it lives on Land, it is more poiſonous than ordinary; for, in moiſt and watery Places, from its plentiful Feeding on humid Aliment, its Poiſon is rendered leſs pure; but, when it becomes an Inhabitant of the Land, its Poiſon becomes purer and more exalted. It reſembles a ſmall land Aſp, only it has not ſo broad a Neck, which is the only remarkable Difference between the Cherſydrus and the Aſp.

The Bite of this Serpent, beſides the common Symptoms incident to thoſe who are bit by other venomous Serpents, ſuch as a Tumor, a continual burning Pain, a Lividneſs and Fetulency of the Part wounded, a Vertigo, Faintneſs, with bilious and fetid Vomitings, induces alſo ſtrange and diſorderly Motions of the whole Body, particularly of the Belly; and the Patient dies within three Days.

The common Remedies, and theriacal Antidotes, are of Service in this Caſe; in particular,

Take of Pills of Cypreſs, and of Myrtle-berries, each one Dram: Bruiſe them, and give them in Honey of Roſes, or Mulſum; and to the Place affected apply Quick-lime, and the like, with Oil. *Aetius, Tetrab.* 4. *Serm.* 1. *Cap.* 35.

Celſus, Lib. 5. *Cap.* 27. adviſes two Drams of Allheal (*Panacea*) or Laſer, or the Juice of Leeks, to be taken in half a Pint of Wine, and the Patient to eat plentifully of Savory. To the Wound he recommends the Application of Goats Dung, boil'd in Vinegar, or Barley-meal and Vinegar, or Rue or Cat-mint bruiſed with Salt, and Honey added thereto, which is alſo of equal Service againſt the Bite of the *Ceraſtes*.

CHERVA. Cataputia. *Johnſon.*

CHERUHUNDA. The *Solanum*; *fruticoſum*; *Indicum*; *Fructu rubro. Boerhaave, Index alter, Part* 2. See SOLANUM.

CHEUSIS, χεῦσις, from χέω, χεύω, or χύω, to pour out; ſo *Foeſius* reads the Word, *Lib.* 6. *Epid. Sect.* 8. *Aph.* 23. and underſtands by it a Liquation or Fuſion, that is, an Attenuation or Thinneſs of the Tears, to which πάχος, or Craſſitude, is oppoſed. He ſeems to be in the right; tho' all other Interpreters read γεῦσις, and take it for the Taſte.

CHEZANANCE, χεζανάγκη, from χέζω, to go to Stool, and ἀνάγκη, Neceſſity, ſignifies, in general, any thing that creates a Neceſſity of going to Stool; but particularly, in *P. Ægineta*, is the Name of an Ointment prepared of Honey and Alum, and boil'd till it be red, with which the Anus is anointed, and thereby a copious Evacuation of the Belly is procured, tho' not without Labour and Difficulty. This *Paulus* has taken from *Oribaſius, Synopſ. Lib.* 3. *Aetius* alſo, *Tetrab.* 1. *Serm.* 3. *Cap.* 135. gives the Name *Chezanance* to a purging Plaiſter applied to the Navel.

CHIA TERRA.

Terra Chia, Offic. Charlt. Foſſ. 4. Worm. 8. Aldrov. Muſ. Metall. 247. Matth. 1391. Calc. Muſ. 125. EARTH OF CHIOS.

Chuſe ſuch Earth as is whitiſh, inclining to an Aſh-colour, and like the Earth of *Samos*. It is cruſty and white, (*Oribaſius* reads λεπτὴ, thin) but made up in Maſſes of different Forms, and has the ſame Virtues as the *Samian* Earth. It clears the Skin of Wrinkles, and brightens it, and cauſes a florid and lovely Colour not only in the Face, but over all the Body; and it is uſed in the Baths as a Smegma, to ſcour and cleanſe the Skin, inſtead of Nitre. *Dioſcorides, Lib.* 5. *Cap.* 174.

It is brought from the Iſland of *Chios* (*Scio*, in the *Archipelago*); and, among other things, is good for Ambuſtions. Terra Samia, or Cimolia alba, may be ſubſtituted in its ſtead. *Dale.*

CHIACUM COLLYRIUM, in *P. Ægineta, Lib.* 7. *Cap.* 16. is a Remedy for the Eyes, in which the dry Ingredients were bruiſed and prepared in *Aminæan, Falernian*, or ſharp *Chian* Wine.

CHIADUS, in *Paracelſus*, means the ſame as *Furunculus. Caſtellus.*

CHIASMOS, χιασμὸς. is the Concourſe or Meeting of any two Things under the Form and Figure of a Croſs, or the Letter X *Chi*, whence it is named. The Adverbs *Chiaſti*, χιαστὶ, and *Chiaſtices*, χιαστικῶς, ſignify the ſame thing: Thus the optic Nerves are ſaid to meet χιαστικῶς, ſo as to croſs each other. *Caſtellus.*

CHIASTOS, χιαστὸς. The Name of a Bandage in *Oribaſius*, ſo call'd from its reſembling a Croſs, or the Letter X.

CHIBOU. See ICICARIBA.

CHIFFIR, CHIFIR, according to *Libavius*, in the Preparation of the Philoſophers Stone, is call'd *Lapis Animalis*, as the Mineral is call'd *Chaos minerale*. But *Johnſon* ſays, that the *Chifir minerale* is by ſome interpreted Gold, but that he rather takes it to be any Sulphur of the metalline Kind. *Caſtellus. Johnſon.*

CHILIODYNAMON, χιλιοδύναμον, from χίλιοι, a thouſand, and δύναμις, Virtue. An Epithet of the Herb *Polemonium*, in *Dioſcorides, Lib.* 4. *Cap.* 8. beſtow'd upon it on account of its many Virtues. See POLEMONIUM.

CHILIOPHYLLON, χιλιόφυλλον, from χίλιοι, a thouſand, and φύλλον, a Leaf. The Herb Millefolium.

CHILLI. A Species of *Indian* Pepper. See PIPER.

CHILON, χείλων, one who has great Lips, or, in one Word, *Labeo*. Thus, among the Species of Fiſhes under the Claſs of *Capitones*, ſome are call'd *Chilones*, that is, *Labeones. Caſtellus.*

CHIMALATH, CHIMALATL. See CORONA SOLIS.

CHIMETHLON, χείμεθλον. See PERNIO.

CHIMIA. The ſame as CHYMIA, or CHEMIA.

CHIMOLEA LAXA. An obſcure Term in *Paracelſus, de Morbo Gallico, Lib.* 2. *Cap.* 4. by which he intends to ſignify the Powder which is ſeparated from the Flowers of ſaline Ores.

CHIMUS. A Term in *Paracelſus*, the Meaning of which is not certain; only he ſays, that *Chimus, Realgar*, and *Gold*, are all one Ore, and yet have each of them a different Nature and Virtue; but, from what follows, we may infer, that by *Chimus* we are to underſtand the Droſs or feculent Maſs of the Ore. *Caſtellus.*

CHINA, Offic. Chab. 116. *China vulgaris Officinarum*, Ger. Emac. 1618. *China Radix*, C. B. Pin. 296. Ogilb. Chin. 1. 213. 2. 678. *China Radix Officinarum*, Park. Theat. 1578. *Chinæ Radix*; J. B. 2. 120. Raii Hiſt. 1. 657. Acoſt. Cluſ. Exot. 274. *China Orientalis ſeu Smilax aſpera Chinenſis* Lampatam *dicta in* MSS. Herman *Sankira, Smilax minus ſpinoſa fructu rubicundo, radice virtuoſa Chinæ dicta*, Kemph. Amœn. Exot. 781. CHINA-ROOT.

China-root is thick, tuberous, nodous, of full of Joints, light, ligneous, eaſily putrifies, is of a pale-red Colour on the Outſide, and white within, of a farinaceous and earthy Taſte, with ſomething of Aſtringency, but has no Smell. It is ſuppoſed to be the Root of a rough ſort of Smilax, call'd *Lampatam*, in *China*, where it grows plentifully; and, being exported from thence, is call'd *China*. They find alſo in *America*, and eſpecially in *New Spain* and *Peru*, a Root much like this, but more oblong, and ſomewhat redder on the Inſide; they call it *Weſt Indian* China, but it is inferior in Virtue to the *Eaſt Indian* China, which comes from *China*, or the neighbouring Countries.

This Root was firſt known in *Europe* in the Year 1535. according to *Thevet*, in his Coſmography; and *Veſalius* ſeems to agree with him, when he informs us, in his Epiſtle concerning the Root of China, that while he was at *Venice*, and employ'd by the principal Doctors and Profeſſors of Medicine in viſiting the Sick, this Root was imported thither, and that it was highly commended, and extraordinary Effects were expected from it. Now *Veſalius* was born in the Year 1513. and conſequently firſt entering upon the Practice of Medicine at *Venice* about the Age of two or three and twenty, when this Event happen'd, we muſt aſſign the Time of it about the Year 1535. or 1536. and the rather becauſe we are aſſured by *Andreas*, in his *Bibliotheca Belgica*, that, in the Year 1537. *Veſalius* was public Profeſſor of Anatomy at *Padua*.

The Decoction of this Root was prepared after the following Method for the Cure of the Venereal Diſeaſe:

They took an Ounce of freſh China-root, free from Putrefaction, and cut it into Bits, or thin Slices, and let them macerate four-and-twenty Hours in ſix or eight Pints of Spring-water, lukewarm; after this they boil'd it in a pretty large Earthen Pot, with a Cover, over a ſlow Fire, to the Conſumption of one Third; then ſtrained the Decoction, and ſet it aſide in a Glaſs Bottle, ſtopped, keeping it in a tepid State for daily Uſe.

The Patient then, being firſt prepared by the Uſe of Evacuations, as Purgation, and Phlebotomy, if it was thought convenient, took a Draught of this Decoction warm, to the Quantity of ten or twelve Ounces, every Day, very early in the Morning, and compoſed himſelf in his Bed, well cover'd with Clothes, to ſweat for two or three Hours. After this, wiping off the Sweat, he was permitted to riſe out of his Bed, and, being well cloth'd, to walk about his Chamber; and after ten or twelve Days, if the Weather was mild, to walk abroad,

taking care to keep himself warm. As to Diet, he was indulg'd more Freedom, than if he had took a Decoction of Guaiacum; for he was allow'd to eat Chickens or Capons, roasted or boiled, without any Salt; but he was wholly to abstain from Wine, and to use nothing for his ordinary Drink but a warm Decoction of China-root. This Regimen was observ'd for four or five and twenty Days together, in which time the Cure was thought to be perfected. If the Patient was subject to be costive, they added some Leaves of Sena to the Decoction, or administered an emollient Clyster every other Day.

The Name and Grandeur of the Emperor *Charles* the Fifth soon brought this Medicine in Reputation; for this Prince, as *Vesalius* informs us, in his Epistle *De Radice Chinæ*, residing at *Brussels*, and labouring under the Gout, and an ill Habit of Body, and having made use of Guaiacum to no Effect, took a Resolution, of his own Head rather than the Advice of his Physicians, to try the Use of China-root, by which, if he did not obtain a perfect Recovery, he certainly found himself much better. Hence it came to pass, says *Vesalius*, that the neighbouring Physicians of *Germany*, understanding that the greatest Prince in the World had made use of China-root, fell into high Notions of this Remedy, and fancy'd themselves to be very deficient in their Art, if they did not know how to prepare and exhibit this Decoction; for which Reason they so extol'd the Virtues of it to their Princes as to put them upon inquiring at the Emperor's Court, and never cease soliciting, till they had obtained from the Court Physicians a full Account of its Administration.

But, to see the mutable Fortune of new Remedies, this Root of China, so much magnify'd for its Virtues, in a short time grew out of Repute. *Vesalius* himself, in the same Epistle, which was published in 1542. assures us, that he was firmly convinc'd by Experience, that a Decoction of China-root was far inferior to that of Guaiacum, for Excrescences and Tumors of the Bones, and malignant Venereal Ulcers. Of the same Judgment was *Cardan*, *Lib. de Radice Chynæ seu de Decoctis*, 1548. *Brassavolus*, *Tract. de Radicis Chynæ Usu*, 1551. *Francantianus*, *Lib. de Morbo Gallico*, 1564. *Palmarius*, *Lib.* 1. *de Lue Venerea*, 1578. but most expressly *Gab. Fallopius*, *Tract. de Morbo Gallico*, 1560. Let no Use, says he, be made of this Root in the Lues Venerea; for I have try'd it three or four times, and could effect nothing with it. And, indeed, it has been a generally receiv'd Opinion, for a considerable time past, that China-root is of Service in the Gout, Sciatica, œdematous Tumors, Strumæ, Imbecillity of the Stomach, Hemicranias, and in Ulcers of the Reins and Bladder, but to be of little Effect in the Lues; or if it be, perhaps, of any Use, yet to be far inferior in Virtue to Guaiacum. *Astruc. de Morb. Vener. p.* 112.

The *Eastern China-root* is of a yellowish-brown Colour on the Outside, and white or reddish-white within. It comes over in flattish Pieces, long, and full of Knots, of a firm, smooth, even Body when cut, of very little Taste.

This is the Root of a sort of *Smilax aspera*, described by *Acosta*, *Garcias ab Horto*, and others; and lately, in the *Museum Museorum* of *Valentini*, at the End of it, in the *India Literat. Epist.* 34. tho' *Commelin* makes it a Species of *Senecio*, in his *Catalog. Plant. usual.* and calls it *Senecio Asiaticus*, *Jacobeæ folio radice lignosa*, *China Officinarum*, which is not likely. It bears Leaves something like those of the occidental Sort, but more oval; the Stalk is more prickly, with several Tendrils or Claspers, and the Berries of a yellow Colour. The best comes from *East-India*.

China Occidentalis Pharmacop. *China spuria nodosa*, C. B. Pin. 297. Raii Hist. 1. 658. *Pseudo-china Radix*, Chab. 116. *Pseudo-china*, Ger. Emac. 1618. Park. Theat. 1579. *Pseudo-china Radix Clusii*, J. B. 2. 122. *Kabalossa Riribunnawel*, *Smilax Indica spinosa folio Cinnamomi*; *Pseudo-china quibusdam*, Mus. Zeylan. 22. *Smilax aspera*, *fructu nigro radice nodosâ magnâ lævi farinaceâ China dicta*, Cat. Jam. 105. Hist. Ejusd. 231. Tab. 145. *Jupicanga*, Pison. ed. 1648. p. 99. *Jupicanga vulgo Radix China*, Ejusd. ed. 1658. p. 257. *Olcacatzan seu Pahuatlanica China Mexicana*, Hern. 212. *Altera Olcacatzan seu Pahuatlanica*, Nieremb. 321. AMERICAN CHINA.

This is a Root which comes from *Jamaica* in long round Pieces, full of Knots or Joints, whitish without, and red within, of little or no Smell or Taste. It is a Root of a kind of *Smilax*, call'd by Sir *Hans Sloane*, in his *Catalogue of Jamaica Plants*, *Smilax aspera*, *fructu nigro*, *radice nodosa*, *magna*, *lævi*, *farinacea*, *China dicta*. It has long climbing Branches, a little prickly, with large, firm, nervous, roundish-pointed Leaves, not at all prickly. The Fruit, or Berry, is round and blackish, about as big as a Juniper-berry.

I have known some Physicians prefer this to the *Oriental China*, especially in scrophulous Cases, and in Consumptions, where there were any Suspicions of their arising from a scrophulous Cause. *Miller's Bot. Off.*

CHINENSE, *vel* Sinense Pomum. The China Orange. See Aurantium.

CHINISCI, in *Oribasius*, *Lib. de Machinament. Cap.* 4. are Pegs, such as are in a Harp, and serv'd instead of Fibulæ, or Braces, to fasten the Axes or cross Beams; for Ornament's sake they were carv'd in the Figure of a Goose's Head.

CHIOLI, in *Paracelsus*, *de Gallic. Ulcer.* means the same as *Furunculi*. See Furunculus.

CHIRAGRA, χειραγρα, from χειρ, the Hand, and ἀγρα, a Capture or Seizure. The Gout in the Hands. See Arthritis.

CHIRAPSIA, χειραψια, from χειρ, the Hand, and ἅπτω, a Touching or Handling, in *Cælius Aurelianus*, *Acut. Morb. Lib.* 3. *Cap.* 18. is express'd by *Manuum Contactus*, and apply'd to the Rubbing of a Place affected with the Itch, or a sore Eye.

CHIROMANTIA, χειρομαντια, from χειρ, the Hand, and μαντεύομαι, to prophesy or divine. The Art of divining by the Lines and Figures of the Hand.

CHIRONAX, χειρώναξ, from χειρ, the Hand, and ἀνάσσω, to command, in *Hippocrates* is a manual Artificer, or Handicraftsman.

CHIRONIUM, χειρώνιον, an Epithet of a malignant inveterate Ulcer, difficult to be cured, with a hard, callous, and tumid Margin, so call'd from *Chiron* the Centaur, who is said to be the first who knew how to cure them. It is also called *Telephium*. *Galen*, *M. M.*

CHIRONOMIA. See Cheironomia.

CHIROTECHNES, χειροτέχνης, from χειρ, the Hand, and τέχνη, an Art, is properly a manual Artist, and so is the same as Chironax before; but *Hippocrates* uses the Word for Artist in general; in which Sense, *Lib. de prisca Med.* he says a Physician is χειροτέχνης.

CHIROTRIBIA, χειροτριβία, from χειρ, the Hand, and τρίβω, to exercise, in *Hippoc.* παρεγγελ. is the Qualification of being well versed in the Practice of Medicine.

CHIRURGIA, from χειρ, the Hand, and ἔργον, Work. Strictly manual Operation, that is, Surgery, the Part of Medicine which is employ'd in manual Operation.

As I have given some Account of the Progress of Surgery, together with Physic, in the Preface, it remains, that I give a Catalogue of Chirurgical Authors, having first inserted the ensuing Quotation, by way of Excuse for the long and many Extracts I have given from the antient Surgeons.

Dr. *Freind*, in his History of Physic, gives the Judgment of *M. C. Bernard*, whom he represents as an Honour to his Faculty and Country, on the antient and modern Writers in Surgery.

" If we inquire," says he, " into the Improvements which " have been made by the Moderns in Surgery, we shall be " forced to confess, that we have so little Reason to value our- " selves beyond the Antients, or to be tempted to contemn " them, as the Fashion is among those who know little, and " have read nothing, that we cannot give stronger or more " convincing Proofs of our own Ignorance, as well as our " Pride. I do not pretend, that the Moderns have not at all " contributed towards the Improvement of Surgery; that were " both absurd and injurious, and would argue as much Folly " as that which I am reproaching; but that which I am con- " testing for is, that it consists rather in refining and dressing " up the Inventions of the Antients, and setting them in a " better Light, than in adding many important ones of our " own. Whether it be, that the Art of healing external " Hurts, being principally the Subject of our Senses, was ear- " lier study'd, and therefore capable of being sooner brought " to a greater Degree of Perfection, than the other Branches " of Medicine; or that the Majority of the mere Professors " having been, for some Ages, illiterate and empirical, it hath " not been advanced and cultivated so as it might have been, " had they been better qualify'd than they generally were, and " do yet, for the greatest part, continue to be: For a Testi- " mony of which, that exceeding Paucity of good Writers " which occur in Surgery, when compared with those in most " of the other learned Arts and Sciences, is, in my Opinion, " sufficient; and yet, were they fewer, it would, in the " Judgment of these *Scioli*, be no great Detriment to the Art: " For the Folly of which Assertion, the best Excuse that can " be made seems to be, that, because some Methods of Pro- " ceeding in Surgery and Physic, which are incommunicable, " and to which every Man must be directed by his own Judg- " ment and natural Sagacity, not being to be found in those " Authors, whom these opinionated Practitioners have had the " Luck to consult, they are led immediately to despise all " Reading, as useless and uninstructive; especially that of the " Antients, who do not generally, I confess, write to Novi- " tiates and Fools, or to those who will be always such.

" But whoever hath been conversant in their Writings, and " hath the Opportunity and Capacity of comparing and judging " from his own Experience, will readily confess, that one " thing, which does not a little recommend the Reading of " them beyond most of the Moderns, is, that they are more " accurate in describing the Pathognomonics, and more just " and nice in distinguishing the Species of Tumors and Ulcers,

" than

" than our more refined Moderns are. If this Age hath par'd " away any rude and ſuperfluous Methods of Practice, as it " muſt be confeſs'd they have, it cannot be demonſtrated, that " they were all derived from the Antients, but were, in a " great meaſure, introduc'd by ignorant and barbarous Pro- " feſſors of a much later Date.

" There is no Queſtion, but that the principal Improve- " ments, which have theſe later Ages been made in Surgery, " are owing chiefly to the Diſcoveries which have been made " in Anatomy, by which we are better enabled to ſolve many " of thoſe Phenomena, which were before inexplicable, or ex- " plain'd amiſs; the moſt important Part, in the mean while, " (I mean the Art of Healing, to which all the others ought " to be ſubſervient) remaining very little better than the An- " tients left it.

" As an unconteſtable Proof of what I ſay, I appeal to all " thoſe Bodies of Surgery, which have been hitherto pub- " liſh'd by the moſt learned and celebrated of the Moderns, " being all manifeſt Tranſcripts from one another, and the beſt " of them from the Antients. But this may indeed be ſaid " in Defence of the Moderns in this Particular, that even " tranſcribing is not their Invention, though it be their Practice; " for *Ætius* and *Ægineta* have borrowed not a little of what " they have, from *Galen*; and *Marcellus Empiricus* more groſly " from *Scribonius Largus*, without ſo much as remembering " his Name among the reſt of thoſe Authors, to whom he " was leſs beholden.

" Among all the ſyſtematical Writers, I think there are " very few, who refuſe the Preference to *Hieron. Fabricius* " *ab Aquapendente*, as a Perſon of unqueſtion'd Learning " and Judgment; and yet is not he aſham'd to let his Readers " know, that *Celſus* among the *Latins*, (who, he tells us, is " *Mirabilis in omnibus*, and adviſes, in *Horace*'s Words, " *Nocturnâ verſare Manu, verſare diurnâ*) *Paulus Ægineta* " among the *Greeks*, and *Albucaſis* among the *Arabians*, " whom I am unwilling to place among the Moderns, being " in the Number of thoſe whom our modern Judges reject, " (either becauſe they never read him, or becauſe he had the " Misfortune to live ſix hundred Years ſince) are the Trium- " virate to whom he principally ſtands indebted, for the As- " ſiſtance he had receiv'd from them in compoſing his excel- " lent Book.

" But how many Operations are there now in Uſe, which " were unknown to the Antients? I fear, that upon a due " Inquiry, there would be more uſeful ones found to be " omitted or diſcontinued, than to have been invented by us." *Freind's Hiſtory of Phyſic.*

Catalogue of Chirurgical Authors.

A.

Abeille, le parfait chirurgien d' armée, & le traité des Playes d' Arquebuſade, &c. 8vo. A Paris, 1696.

Academiæ Petropolitanæ commentarii. Petropoli, Tom. 1. 1728. 4. Tomus 2. 3. & 4. annis ſubſequentibus.

Acta Eruditorum Lipſienſia.

Acta Phyſico-medica acad. nat. curioſ. Vol. 1. 4to. Norib. 1727. & Vol. 2. 1730. Vol. 3. 1733. & Vol. 4. 1737. *In the three laſt there are many chirurgical Obſervations.*

Actuarii (Jo.) methodus medendi. See the Article Actuarius.

Aderlaſs-büchlein (neu vermehrtes) oder Bericht vom Aderlaſſen und Schröpffen. *In High Dutch*, 8vo. Norinberg, 1665. *This is a Treatiſe on Phlebotomy and Scarification.*

Adolphi (Chr. Mich.) trias diſſ. chirurgicarum, 1.) de Spina ventoſa; 2.) de Ligaturis doloriſicis; 3.) de morborum per manuum attrectatum curatione, 4to. Lipſ. 1730.

——— de vinculis chirurgicis diſſert. 4to. Lipſ. 1730.

Æginetæ (Pauli) Opera. *This is an excellent Author. See the Article* Ægineta.

Aetii libri univerſi. *See the Article* Aetius.

As I have not ſeen all theſe Authors, I cannot be anſwerable, that there are no Miſtakes. This Catalogue is taken principally from *Heiſter.*

CHIST. The Name of a Meaſure. See SEXTARIUS.

CHITON, χιτών. A Coat or Membrane. See MEMBRANA.

CHIVEF *Thevetti*, J. B. *Ficui Nigritarum ſimilis, Fructu magno Meloni pari*, C. B. is deſcribed to be a cucurbitiferous Tree, with a fine green Leaf, exactly round, and of the Breadth of a *Louis d'Or*, and with a Fruit as big as a large Melon, very ſweet, and melting in the Mouth like Manna, and incloſing Seeds, like thoſe of our Cucumber, within a Rind, which is yellow when ripe. *Raii Hiſt.*

CHIVES are the fine Threads of Flowers, or the little Knobs, which grow on the Tops of theſe Threads.

Chives, tipt with Pendants, are the Apices of Flowers, having Farina hanging and ſhaking at their Points, as the Tulip.

CHIVETS. Theſe are the ſmall Parts at the Roots of Plants, by which they are propagated. *Miller's Dictionary, Vol.* 1.

CHIUM VINUM, χῖον οἶνος. *Chian* Wine, or Wine of the Growth of the Iſland of *Chios*, now *Scio*, is commended by *Dioſcorides, Lib.* 5. *Cap.* 10. as affording good Nouriſhment, fit to drink, leſs diſpoſed to intoxicate, endued with the Virtue of reſtraining Defluxions, and a proper Ingredient in ophthalmic Medicines. Hence *Scribonius Largus*, No. 26. 36. directs the dry Ingredients in Collyria for the Eyes, to be made up with *Chian* Wine.

CHLÆNA, χλαῖνα, in *Erotian* upon *Hippocrates*, is expounded by τὰ καινὰ ἱμάτια, "new Garments."

CHLIAROS, χλιαρὸς, tepid, lukewarm. *Galen*, on *Aph.* 37. *Lib.* 4. beſtows this Epithet on mild Fevers, in Oppoſition to acute. The ſame Author ſays, *M. M. Lib.* 1. *Cap.* 7. that χλιαρὸς, tepid, is a Medium between hot and cold.

CHLIASMA, χλίασμα, from χλιαίνομαι, to grow tepid, is a tepefactory or warming Fomentation of the moiſt Kind, as πνεῖν (*Pyrie*) is of the dry Kind, and both are directed, *Lib.* 1. περὶ γυναικ. In *Lib. de Rat. Vict. in Acut.* they are call'd διαμάσματα (*Thermaſmata*); and, in the ſame Book, χλιάσματα are preſcrib'd in Pains of the Sides, to promote Concoction and Spitting.

CHLOE, χλόη, in the *Ionic* Dialect χλοίη, is the green Herb, or Graſs. Hence χλοώδης, and χλοιώδης, is a pale or faint Green; and χλόος, or χλοῦς, is a green Colour, inclining to Paleneſs, like that of withering Herbs. Χλοώδεα, *in Coac.* apply'd to Urine, ſignifies green, or a pale Green; and χλοώδεες, thoſe of a paliſh-green Colour, in the ſame Treatiſe, are call'd, *Lib. Prorrhet.* ἰκτερικοὶ, *Icterici*, "ſick of the yellow Jaun-"dice." This Colour, *Galen, Lib.* 3. περὶ δυσπν. takes to be a Sign of a diſeaſed Liver.

CHLORASMA, χλώρασμα, from χλωρὸς. [*ſee the following Word*] is expounded, in *Galen's Exegeſis*, χλωρότης λαμπρὸν διαυγάζουσα, ᾗ ὑπὸ τὸ ὑδαρῶδες ἵσταται· "A paliſh-green "Colour, ſhining with a ſort of Splendor, and inclining to a "watry."

CHLOROS, χλωρὸς, is a Word of an ambiguous Signification in *Hippocrates*. Sometimes it means a paliſh Green, ſometimes Pale, alſo a yellow and paliſh, and an herbaceous Green, according to its various Ways of Application, as appears from *Galen*, in many Places. Thus, in the Paſſage *Prorrhet.* 2. ὑπόστασις παχὺ καὶ χλωρὸν, "the Urine thick and pale," approaching to white, χλωρὸν is put inſtead of ὠχρὸν, "pale." *Celſus, Lib.* 2. *Cap.* 7. renders it, *Urinam viridem.* In *Coac.* ἕλκος χλωρὸν γενόμενον, "an Ulcer turning *Chloron*," is condemn'd. It is to be obſerved, that χλωρὸν, *in Progn.* is expreſs'd by ὠχρὸν, "pale." Again, *Aph.* 3. *Sect.* 5. *Lib.* 6. *Epid.* χλωραὶ, apply'd to γλῶτται, (Tongues) means the ſame as ὠχραὶ, that is, yellow and pale; or, as *Galen, Comment.* 5. *in Lib.* 6. *Epid.* explains the Word, ὑπὸ τῆς ὠχρᾶς χολῆς βαπτόμεναι, "tinged with pale Bile." *Celſus, Lib.* 2. *Cap.* 8. renders χλωρὸν πύον, in *Hippoc. Progn.* by *Pus pallidum*, as do almoſt all Interpreters, meaning by *pallidum* the ſame as *luteum*, "a pale Yellow;" or rather, as they endeavour to prove, what, in *Latin*, is properly call'd *galbum*, that is, a pale Colour, betwixt Yellow and Green. Χλωρὸς alſo means a green or herbaceous Colour; for, in *Aſia*, as *Galen* writes, *Com.* 2. *in* 6 *Epid.* Greens, Trees, and Plants, are call'd χλωρὰ, and Cattle, when turn'd to feed on Graſs in Spring, are ſaid χλωρίζειν. But χλωρὸς, ſpoken of Man, ſignifies a pale Green, or a Green a little inclining to Black, like the Colour of Cabbage or Leeks, and is what *Hippocrates, Prog.* condemns in a cadaverous Face; on which *Galen* writes, that the worſt Change of Colour is to a Black, but more moderate when alter'd to a χλωρὸν, by which Epithet the Antients ſometimes intended a pale Colour, ſometimes that Colour which the Vulgar mean when they call Cabbages and Lettuces χλωρὰ, which is a Colour blacker than a Red, and a ſort of Introduction to a Black and Livid, being the Effect of Cold as well as the Black. Thus

Galen,

Galen, *Com.* 1. *in Progn.* ſays, that χλωρὸν ſometimes ſignifies Pale, ſometimes a ſort of Green, as when we call Cabbage χλωρόν. Again, *Com.* 2. χλωρὸν, he ſays, has a double Signification; under the firſt, it imports a Mixture of much pale Bile; the ſecond implies a Mixture of æruginous Bile: And, *Com. in Prorrhet.* on theſe Words, σώματι χλωρὴ σὴψις ἐπεγένετο, "putrid Matter was voided at the Mouth, which Matter was "χλωρὴ," he ſays, Things of a pale and green Colour are call'd χλωρά. It is to be obſerved, that when χλωρὸς ſignifies *Green*, it is ſpoken of Things recent, not dry; and is apply'd to leguminous Plants before they are dry, or yet come to Perfection, as *Galen* obſerves on the Words ὀσπεια χλωρά, in *Hippoc. R. V. I. A.* So χλωρὸν τίαρ, *Lib.* 1, περὶ γυναικ. is recent Fat; and χλωρὸν δέος, in *Homer*, is a new Fear or Terror.

CHLOROSIS, χλώρωσις, from the preceding Word.

F. Hoffman, and moſt Authors, treat a *Chloroſis* as a Species of Cachexy. It properly ſignifies that Diſorder, which Virgins fall into, for want of a due Menſtrual Diſcharge; which we, preſerving the Analogy of the *Greek* Name, call the *Greenſickneſs*. See CACHEXIA.

By a *Cachexia* we underſtand a depraved and tumid State of the Body, attended with an unſeemly and diſagreeable Colour of the Skin. As this Diſorder ariſes from a Redundance of peccant Serum, and a preternatural Weakneſs of the Tone of the Viſcera, it of courſe remarkably diſturbs and impairs all the ſeveral Functions of the Body.

The genuine and moſt diſtinguiſhing Characteriſtics of this Diſorder, are theſe following: A whitiſh-pale Colour of the Skin, ſomewhat upon the green or the yellow Caſt; a pretty full and tumid State of the Body, which appears cold and ſoft to the Touch, and is at the ſame time infirm and feeble. The Patient is afflicted with a Weakneſs of the Legs, a Difficulty of Breathing, eſpecially in aſcending Stairs, a Swelling and Inflation of the Feet, a Torpor, and Inactivity of Mind, an Oppreſſion during Sleep, a Swelling of the Eyelids, a ſlow and ſoft Pulſe, together with a white and turbid Urine.

Tho' the Name of this Diſorder ſeems to have been unknown to *Hippocrates*, yet, in the thirty-fourth and fifth Paragraphs of his Book *De intern. Affection.* he not only makes evident Mention, but alſo gives a pretty full Deſcription of it. But, among all the antient Phyſicians, *Cælius Aurelianus* and *Aretæus* have moſt accurately enumerated the peculiar and diſtinguiſhing Symptoms of this Diſeaſe, and aſſign'd their reſpective and adequate Cauſes. The former of theſe Authors, in the ſixth Chapter of his third Book, uſes the following Words: "A Cachexia, or bad Habit of Body, ariſes either from the "Intemperance of the Patient, the unſkilful Management of "the Phyſician in previous Diſorders, a ſlow Recovery after "Diſeaſes, Purgatives too often exhibited, a ſtony Hardneſs "of the Liver or Spleen, hæmorrhoidal Diſcharges, or Fevers "long protracted, Collections of purulent Matter, Vomitings "after Supper, and other Circumſtances of a like Nature. "This Diſorder is often the antecedent Cauſe of a Dropſy, or "of Eruptions and Spots on the Surface of the Body. The "Colour of cachectic Patients is pale and whitiſh, and ſome"times livid. The Patient, in conſequence of his Weak"neſs, is languid, ſlow, and inactive, and labours under an "œdematous Inflation. Some Patients are afflicted with a "Flux, accompanied with a gentle Fever, for the moſt part "latent, and which is exaſperated towards Evening. The "Pulſe is frequent and tenſe, the Food loath'd, and Wine "more eagerly coveted than at other times. The Urine alſo "is bilious, and the Veins diſtended."

Aretæus, in the ſixteenth Chapter of his firſt Book *Chronic.* deſcribes this Diſeaſe in the following manner: "Cachectic "Patients are afflicted with a Liſtleſneſs, and Senſe of Weight "all over their Bodies: They become pale at certain Inter"vals. Their Abdomen is diſtended with Flatulences, their "Eyes hollow, their Sleep diſturb'd, and follow'd by a Torpor. "In their Abdomen, and all the other Parts of their Body, "the natural Heat is weak and languid. Their Mind is de"jected, and unqualified for the due Exerciſe of any of its "Powers. A pruriginous Sweat breaks forth on their Bodies; "they breathe ſlowly, and their Pulſe is languid, weak, and "frequent. The Diſeaſe is generally protracted for a long "time. Digeſtion is ſlow and weak. This Diſorder ariſes "from a Suppreſſion of the hæmorrhoidal Diſcharges, or of "accuſtom'd Vomitings, or from giving over ſuch Degrees of "Exerciſe and Labour, as the Patient has formerly been ac"cuſtom'd to."

What is call'd a Cachexia in general, in Girls, before an Eruption of the Menſes, or in whom they flow too ſparingly, comes under the Denomination of *Chloroſis*, which is alſo ſtyled *the Virgins Diſeaſe*, and *the white Fever*. Concerning this *Hippocrates* principally treats in his Book *de Virginum morbis*; and it is, in reality, no more than a Species of Cachexy, ſince it diſcovers itſelf by the ſame Signs; for the Patient's Face becomes pale, and ſometimes yellowiſh. There is an uncommon Paleneſs of the Lips. The Eyes are ſunk, the Eyelids livid, and all the Members of the Body are ſeiz'd with a Laſſitude. The Patient is alſo ſeiz'd with a Torpor of Mind, a Coldneſs of the Feet, a Heavineſs, and Averſion to Motion, a Loſs of Appetite, a Nauſea, and Vomiting, turbulent Sleep, and a languid Pulſe. The Urine diſcharged is alſo aqueous, and without Colour, but, in Proceſs of Time, becomes turbid. This Diſorder is alſo frequently attended, eſpecially in aſcending Stairs, with a Difficulty of Breathing; together with a Tremor and Palpitation of the Heart. A Swelling and Inflation of the Feet, Cardialgias, intermitting Head-achs, and fainting Fits, are ſometimes alſo the concomitant Symptoms of the Diſtemper.

As to the immediate Cauſe of this Diſeaſe, and its ſeveral Symptoms or Accidents, it ſeems to conſiſt in too great a Quantity of impure Blood, and of viſcid and leſs ſpirituous Humours, collected in the Body, in conſequence of the natural Tone, Vigour, and Strength of the ſolid Parts, eſpecially of the Viſcera ſubſervient to Chylification, Sanguification, and Depuration, and of the Fluids, being conſiderably impair'd and weaken'd.

For, by reaſon of a Want of due Tone and Elaſticity in the fibrous and vaſcular Parts, the Circulation of the Blood becomes more ſlow and languid: Hence the Secretions and Excretions, on the due State of which Health depends, are impair'd. By this means the excrementitious, viſcid, bilious, ſaline, and ſerous Sordes, which ought to be evacuated, after their Secretion in the Liver and Kidneys, being in a great meaſure retain'd, render the Serum of the Blood, and the nutritious Juices, highly impure and peccant. In Proceſs of Time the moving Fibres of the ſubcutaneous perſpiratory Veſſels are, in like manner, deprived of their due and natural Strength; by which means theſe Sordes are leſs ſucceſsfully convey'd thro' the cutaneous Pores. Hence a pale-greeniſh or yellowiſh Colour of the Skin, accompanied with a certain Swelling of the Body, ariſes from a tinged Serum lodg'd in the reticular Subſtance, between the Skin and Cuticula, and the Nutrition of the Patient is entirely depraved. And ſince, under ſo peccant a State of the Blood and Humours, that ſubtile nervous Fluid, which by the Antients was call'd *Nature*, and by the Moderns the *Animal Spirits*, and which conveys Vigour and Elaſticity to the ſolid Fibres, and preſides over the Animal Functions, is no longer ſupplied by a pure and duly qualified Blood and Lymph, but by ſuch as are contaminated with a large Quantity of aqueous, viſcid, and vapid Sordes, this Fluid muſt of courſe contract a conſiderable Taint, and have its Power and Energy both over the vital and animal Actions, remarkably impair'd and diminiſh'd. Hence 'tis not ſurpriſing, that this Diſorder ſhould be accompanied with an amazing Complication of Symptoms, ſuch as an uncommon Senſe of Weight, and Languor of the Body, Loſs of Appetite, Drowſineſs, Dejection of Mind, and Torpor of the Senſes.

A naturally lax and ſpongeous Habit of Body, which conſiſts in the Softneſs of the moving Fibres, the Smallneſs and Number of the Veſſels, and the Slenderneſs of the Tendons, above all other Things, lays a Foundation for this Dyſcraſy of the Blood and Humours, and the Cachexy ariſing immediately from it: For this Reaſon we obſerve, that Women are more ſubject to this Diſorder than Men; and that it is more incident to Men of a ſanguine and phlegmatic Conſtitution, than to others of a different Habit; for the ſanguine and phlegmatic Habit is highly fit for generating a Redundance of Blood and Serum; and becauſe, in Patients of this Kind, the Blood circulates ſlowly, it becomes thicker, more viſcid, and fit to obſtruct the ſmall excretory Ducts, eſpecially thoſe of the Liver.

According to *Aretæus*, in the before quoted Paſſage, whoſe Authority is back'd in this Particular by daily Experience, an indolent State of Life, and a total Ceſſation from cuſtomary Labour and Exerciſe, may be juſtly reckon'd among the procatarctic Cauſes of this Diſorder; becauſe they contribute very conſiderably to the too plentiful Generation, to the Impurity, to the ſlow Circulation, and to the Stagnation of the Humours; as alſo to the Obſtruction of the Veſſels ſubſervient both to Sanguification, and the Depuration of the Juices. Theſe Misfortunes happen the more readily, if Aliments, eſpecially of the inflating viſcid Kind, ſweet Meats, acid Subſtances, and ſuch as are with Difficulty digeſted, are taken in a larger Quantity than the weak and exhauſted State of the Patient is able to bear, digeſt, and convert into an uſeful and ſalutary chylous Juice: Hence ariſe large Quantities of acid and viſcid Crudities, which prove the firſt Foundations of Impurity in the Maſs of Blood; for that Proverb is no leſs juſt than common, That *an Error of the firſt Concoction*, which is perform'd in the *Primæ Viæ*, *is not eaſily rectified in the ſecond*, which is perform'd in the Viſcera ſubſervient to Sanguification, and the Depuration of the Juices; much leſs in the third Concoction, which conſiſts in the immediate Act of Nutrition.

An improper Regimen, with reſpect to Drinking, variouſly diſpoſes both Women and Men to this Diſorder; for Women generally

generally drink little, and ſometimes ſcarcely once in a Day. Now, in conſequence of the daily Excretions carried on in their Bodies, a large Quantity of Fluids is carried off from the Maſs of Blood and Humours. Unleſs this be reſtored, and ſupply'd afreſh, the Humours neceſſarily, and of courſe, become thick, unfit for circulating freely thro' the capillary Veſſels, and diſpoſed to form Infarctions and Obſtructions, which are the genuine and immediate Cauſes of a *Chloroſis*. At preſent the liberal Uſe of rich Coffee is the principal Cauſe of a *Chloroſis* in ſome Women, who, neglecting Exerciſe, or being habitually coſtive, drink it daily with large Quantities of Sugar; for by this means the Blood, already too thick, is impregnated with many ſulphureous, hot, and oleous Particles; and, unleſs there is a ſufficient Secretion of theſe Particles, along with the Bile, thro' the excretory Ducts of the Liver, both the Quality and Colour of the Lymph muſt neceſſarily be changed. Nor, in my Opinion, is there a Neceſſity for aſſigning any other Reaſon, why ſcorbutic purple Fevers rage ſo frequently in our Days. Men, on the contrary, tranſgreſs by drinking too large Quantities of ſpirituous Liquors, Wines, and ſtrong Ale, which, inſtead of rendering the vital Juices ſufficiently thin and liquid, rather coagulate them, and by that means contribute very much to the Production of this Diſorder.

A depraved, and more eſpecially a cold and moiſt, State of the Air, contributes not a little to the Production of this Diſeaſe; ſince, either by conſtricting or relaxing over-much the Surface of the Body, it obſtructs the ſalutary Work of Perſpiration, and by that means increaſes, at once, the Quantity and the Impurity of the Humours: Hence alſo we frequently obſerve this Diſorder produced by the long Continuance of a cloudy and turbid State of the Atmoſphere, eſpecially when the Winds blow from the Weſt. It is alſo more frequent in the Spring and Autumn than in any other Seaſon, and may be produced by living in moiſt or marſhy Places; as alſo by lodging or ſleeping in dank and low Rooms.

A Way is alſo paved to this Diſorder by the Paſſions of the Mind; the Influence and Power of which are ſo great, that by acting immediately on the nervous Parts, eſpecially the Stomach and Inteſtines, which are entirely nervous and membranous, they conſiderably impair and weaken the periſtaltic Motion, and natural Functions, of theſe Parts. Violent Terror, long Grief, or ſuppreſs'd Reſentment and Wrath, have a moſt direct Tendency to induce a Cachexy, or Chloroſis, becauſe they either too much increaſe, or retard and ſtop, the critical Evacuations of Blood, whether of the menſtrual or the hæmorrhoidal Kind.

Both daily Experience, and the Authority of ſkilful Phyſicians, confirm, that a Diminution of the otherwiſe ſalutary and critical Evacuations of ſuperfluous Blood, whether by the Anus, or the Uterus, proves the principal Cauſe, not only of a Cachexy in Men, and a Chloroſis in Women, but alſo of other very formidable and almoſt incurable Diſorders; for when the Blood is denied its uſual Paſſage thro' theſe Ways, either by means of Spaſms, or a preternatural Infarction of the Parts by thick and viſcid Humours, it ſtagnates, becomes vitiated, is corrupted, and regurgitates to the larger Veſſels and Viſcera, by ſpoiling the Tone and Functions of which, it often excites various and violent Symptoms in the more remote Parts. This Diſorder, incident to young Women about the Time of Puberty, derives its original Cauſe only from an Obſtruction of this Evacuation. This is beautifully accounted for by *Johannes Langius, in Epiſt. Medicin. Lib.* 1. *Ep.* 21. in the following Words: "At that Time, by the Influence and Inſtigation of "Nature, the menſtrual Blood flows from the Liver to the "Cavities and Veins of the Matrix. When this Blood can"not force its Paſſage, either on account of the narrow "Mouths of theſe Veins, which are alſo obſtructed by viſcid "Humours, or on account of its own Thickneſs, it again "regurgitates to the Heart, Liver, Diaphragm, and Veins of "the Præcordia, thro' the Ramifications of the Vena Cava, "and great Artery; a large Quantity of it is alſo convey'd to "the Head; and hence violent Symptoms about the Viſcera, "ſuch as a Difficulty of Breathing, a tremulous Motion of "the Heart, an Inflation of the Hypochondria, a Loathing "of the Aliments, and a Cardialgia." Theſe Symptoms ſeize not only Virgins, and young Women, but alſo married Women, and thoſe pretty far advanced in Years, at the Time when, according to the general Laws of Nature, the monthly Evacuation ought to ceaſe; or when, from any other Cauſe, it is ſtopt. In Men alſo a Suppreſſion of the hæmorrhoidal Diſcharge, which, by deſtroying the Strength and Tone of the Parts, fills the Veſſels with a Redundance of depraved Juices, contributes not a little to the Production of a Cachexy.

After enormous Hæmorrhages, whether from the Uterus, the Anus, or accidental Wounds, nothing is more common than the Production of chronical and highly obſtinate Diſeaſes, ſuch as a Cachexia, a Leucophlegmatia, an Anaſarca, œdematous Swellings of the Feet, or an Atrophy, attended with a preternatural Languor, and Loſs of Strength; for as the Functions of all the Parts, when perform'd according to the due and ſtated Order of Nature, depend upon a proper Quantity of well qualified Blood, and its free Circulation thro' all the Veſſels, and derive their Strength and Vigour from theſe Circumſtances; ſo it muſt naturally and neceſſarily follow, that, when this vital Fluid is almoſt exhauſted, the ſolid Parts and Viſcera muſt be remarkably weaken'd, and their Functions conſiderably impair'd and diminiſh'd. But no Parts are ſo much, or ſo immediately, affected by this Misfortune, as the Stomach and Inteſtines. The Weakneſs and Want of a due Tone in which, impairs the Digeſtion, and, in conſequence of the corrupted Aliments, creates Crudities, which, paſſing into the Blood-veſſels and whole Habit of the Body, not only render Nutrition imperfect and vitious, but alſo remarkably prejudice and prevent a due Diſcharge of the Functions, which ought to be perform'd by the ſeveral Viſcera ſubſervient to Sanguification, and the Depuration of the Juices, ſuch as the Liver, Spleen, and Kidneys. When the Quantity of Blood and Humours is too ſcanty, it alſo happens, that the ſmall and capillary Veſſels, eſpecially thoſe ſubſervient to the Secretion of the laudable and uſeful, and the Excretion of the vitious and peccant Juices, become impervious, collapſe, or have their Diameters leſſen'd, in conſequence of which their Functions are highly impair'd, a Circumſtance which proves the fruitful Source of Impurities.

Nor do I think any other Reaſon can be aſſign'd, than too great a Loſs of good and laudable Blood, why thoſe Patients in a particular manner, who, not being fully recover'd from chronical Diſeaſes, eſpecially Fevers and Defenteries, but as yet remaining weak, eat a larger Quantity than the languid Action of the Stomach can digeſt, and convert into a laudable Chyle, are ſo much ſubject to Cachexies. This Diſorder alſo, according to the Dictates of Experience, and the joint Authorities of the moſt antient Phyſicians, frequently happens to thoſe who are too much weaken'd by the imprudent and prepoſterous Cure of Diſeaſes; ſuch as thoſe perform'd by the Uſe of draſtic Purgatives, or even the Uſe of Aſtringents for ſtopping violent Hæmorrhages, and ſuppreſſing the Paroxyſms of Fevers; for theſe Medicines are abſolutely of the worſt and moſt pernicious Quality, which too much exhauſt the Strength, in which the whole Energy of Nature is lodg'd. Among this Number we may juſtly reckon the draſtic Evacuants, and ſuch Medicines as conſtrict and block up the capillary Veſſels ſubſervient to the Excretion of the peccant, and the Depuration of the laudable Juices; ſince, by the Uſe of theſe Medicines, ignorant and unſkilful Phyſicians often bring on not only a Cachexia, but alſo other Diſorders, which prove as fatal to the Patients.

Becauſe there is a great Affinity betwixt a Cachexia and other Diſeaſes, we ſhall inquire wherein they agree, and in what reſpects they differ. Firſt, then, we muſt obſerve, that a Cachexia does not much differ from a Chloroſis, and a Fluor Albus, with reſpect to its Nature, but only with reſpect to the Sex of the Patient, and the Seat of the productive Cauſe, which in Men is lodg'd in the Stomach and Liver, but in Women is to be ſought for in theſe two Organs, and the Uterus, at the ſame time. Nor is there a leſs conſiderable Agreement between a Cachexia and a Cacochymia, ſince the latter, as well as the former, ſuppoſes a large Quantity of impure Juices in the Veſſels; only theſe ariſe rather from Intemperance, and a Fault of the firſt Digeſtion, than a deprav'd State of the other Viſcera, which remain in their natural Condition. Hence, from a violent Cacochymy, which conſiſts in a deprav'd Nutrition, a Tranſition is at laſt made to a Cachexy. We muſt alſo obſerve, that every pale and unſeemly Colour of the Countenance is not to be taken for an infallible and eſſential Characteriſtic of a Cachexy; ſince ſuch a State of the Countenance often remains after violent Diſeaſes; or ariſes from a Collection of peccant Humours in the Primæ Viæ, or from a Suppreſſion of Anger, or from Spaſms of the Stomach; but in theſe Caſes the Diſorder eaſily yields to proper Remedies. A Cachexia alſo bears a near Reſemblance to a Jaundice; for both Diſorders are accompany'd with a deprav'd Nutrition, a pale Colour of the Skin and Countenance, a Loſs of Strength, a Torpor of Mind, together with a Weakneſs and want of due Tone in the Stomach and Viſcera: Yet there is this Difference, that in a Jaudice theſe Symptoms draw their Origin from the Bile alone, regurgitating to the Maſs of Blood, in conſequence of the biliary Ducts being either obſtructed, or ſpaſmodically conſtricted; whereas, in a Cachexia, the Stomach, Spleen, Liver, and Kidneys, are at once ſeverely affected, ſo that when this Diſorder is violent, it degenerates into a black Jaundice, unleſs due Care be taken to prevent that unlucky Cataſtrophe by a ſeaſonable Cure. A Cachexy is alſo different from an Anaſarca and Leucoplegmatia, ſince in theſe there is a greater Inflation and Hardneſs of the inferior Parts, and after the Impreſſions of the Finger, Pits remain, which does not happen in a Cachexia, except when it approaches to a degree of theſe Diſorders. Nor are we to forget and overlook the Difference between a Cachexia and an Atrophy; for in both Diſeaſes the Fluids are highly impure, the Viſcera are depriv'd of their due

Tone, and the Nutrition is vitiated. But in an Atrophy the Body is daily more and more extenuated, and the Nutrition is entirely deſtroy'd; whereas in a Cachexy it is vitiated, but preternaturally copious: Hence the Body in a Cachexia becomes larger than it was in its natural State. Laſtly, a Cachexia is different from a Scurvy; for in every Scurvy there is a Cachexy, and an almoſt irreparable Dyſcraſy of the Humours, obſervable from the various Pains, Exulcerations, and Defedations of the Skin; but in a Cachexy this Dyſcraſy of Humours does not ariſe to ſuch a Height. And if theſe Symptoms ſhould happen to attend a Cachexy, it is call'd a ſcorbutic Cachexy.

As for the Prognoſtics of a Cachexy, I think we may lay it down as an uncontroverted Maxim, that cachectic Patients differ very conſiderably from each other; and are more or leſs eaſily cur'd, according to their Age, their Conſtitution, their Method of Life, and the greater or leſs Fault of their Humours and Viſcera. Thus, if we conſider the different Ages of Patients, old Perſons are more ſeverely afflicted with this Diſorder, than ſuch as are young, becauſe old Age itſelf is a Species of Cachexy; ſo that Patients, labouring under a Cachexy at this Period of Life, frequently fall into an Atrophy and Maraſmus. That Species of Cachexy, which is ſuddenly produced by Intemperance, and a deprav'd Digeſtion, after chronical Diſeaſes, is more eaſily remov'd, than that which makes gradual Advances in conſequence of a Fault of the Viſcera, or a ſcirrhous Obſtruction of the Liver or Spleen. Hence alſo a greeniſh, or ſomewhat blackiſh Colour of the Skin, which, for the moſt part, indicates a latent Injury done to the Viſcera, by an Admixture of corrupted Bile, prognoſticates a greater Danger than a pale Colour, which only indicates an Abundance of Phlegm. We muſt alſo obſerve, that the longer the Diſeaſe has afflicted the Patient, the greater Difficulty of Breathing it is accompanied with, the more tenſe and hard the Hypochondria are, and the more the Strength is impair'd; eſpecially, when the Patient is ſeiz'd with fainting Fits at certain Intervals, the Danger is proportionably greater. Nor does this Diſorder admit of an eaſy Cure, when it draws its Origin from a preceding, or a frequently returning, hæmorrhoidal Diſcharge. Beſides, there is no Diſeaſe which more readily degenerates into an Anaſarca, an Aſcites, an Atrophy, and a hectic Fever, than a Cachexy; eſpecially when, in the Beginning, due Care is not taken to remove it by proper Remedies. A Chloroſis, when ſkilfully treated, is neither very dangerous, nor of long Duration; but is either remov'd by a ſeaſonable Return of the menſtrual Diſcharge, or, in Virgins, happily cur'd by Marriage alone. But Women who labour long under a Chloroſis, either become barren, or bring a weak and languid Offspring into the World.

The Cure.

Having now inveſtigated the Cauſes of this Diſorder, we ſhall next lay down a proper Method of removing them, which, in my Opinion, conſiſts in the following Intentions: Firſt, to correct the crude, thick, and impure Blood and Juices; to evacuate them thro' proper Emunctories; and, in their ſtead, to promote the Generation of a fine Blood and Chyle: Secondly, to open and remove the Obſtructions of the Viſcera and capillary Veſſels, that a free and equable Circulation of the Blood may be reſtor'd thro' all the Parts of the Body, both internal and external: And, thirdly, to corroborate and reſtore the weaken'd Tone of the Stomach and Inteſtines.

But before the Phyſician attempts the Correction of the peccant Humours, he is to endeavour to cleanſe the Source, from which ſuch an Increaſe or Addition is deriv'd to the Humours. The Stomach then, and Inteſtines, conſtitute this Source, from which viſcid, mucous, and acid Crudities proceed, and which, by inciding and digeſtive Remedies, ought to be corrected and diſpoſed to Motion, that they may be eliminated with the greater Eaſe. This Intention is moſt effectually anſwer'd, by what we commonly call neutral Salts; ſuch as vitriolated Tartar, the Arcanum Duplicatum, a Solution of Crabs-eyes in Lemon-Juice, the Terra foliata Tartari, otherwiſe call'd *Tartarus Regeneratus*, Sal Polychreſtum, the Caroline and Egran Salts. *Tartarus Tartariſatus*, or Salt of Wormwood, may be us'd; theſe muſt be diſſolv'd in a ſufficient Quantity of Water, and exhibited; for theſe, often repeated or exhibited in a large Doſe, not only incide and attenuate, but alſo prove purgative, and effectually evacuate the Sordes lodg'd in the Inteſtines. If they ſhould happen not to anſwer this Intention, Evacuants are to be us'd, which may be prepar'd of equal Quantities, half a Dram, for Inſtance, of Myrrh, Gum Ammoniac, the Extracts of Rhubarb, Wormwood, Cinnabar, and the Panchymagogum Crolii, Amber, and the Salt of Amber; a Scruple of this may be exhibited for a Doſe. This Intention is alſo excellently anſwer'd by my balſamic Pills, which, at the ſame time, wonderfully reſtore and ſtrengthen the weaken'd Tone of the Stomach. Or if a Medicine in a liquid Form is more agreeable, an Infuſion in Wine may be prepared of the Roots of Burnet, wild Radiſh, Succory, Rhubarb, Agaric, freſh Orange-peel, the Tops of the leſſer Centaury, Cream of Tartar, and Currants. A ſufficient Quantity of this Infuſion is to be taken every Morning for ten Days. This Intention is no leſs effectually anſwer'd by half a Pint of the *Sedlitz* Waters, drank every other Day, with an Ounce of the Syrup of Peach-flowers, or the Syrup of Succory with Rhubarb, or the ſolutive Syrup of Roſes. If the Patient is too coſtive, it is adviſeable to render his Body ſoluble by a gentle evacuant Potion, which may be prepared in the following manner.

Take of the beſt Manna, two Ounces; Cream of Tartar, one Dram; Rhubarb and purified Nitre, each half a Dram: Mix them in eight Ounces of Spring-water.

When the Primæ Viæ are thus purg'd, the Phyſician muſt endeavour to render the whole Maſs of Blood more pure and fluid, and to open the obſtructed Emunctories, that the Blood and Serum may be the more effectually depurated. This Intention is anſwer'd by Decoctions of the Roots of Sarſaparilla, *China*, Vipers Graſs, and Succory, as alſo by Decoctions of the Shavings of Saſſafras and Cinnamon. Theſe Decoctions are to be us'd weak for common Drink, but may be exhibited pretty ſtrong in Bed every Morning, in order to promote a free and briſk Perſpiration. It is alſo proper ſometimes in the Morning to promote a Diaphoreſis, which may be obtain'd, by taking forty Drops of the Eſſence of Amber and Burnet, with Tincture of Antimony and Spirit of Hartſhorn, mix'd in equal Quantities in a warm Decoction. Nor will it be improper, if the Caſe requires it, now-and-then to exhibit a Dram of the Tincture of Tartar in a proper Decoction, in order to excite a Diureſis.

But, above all Things, a particular Regard is to be had to the State and Condition of the Stomach, for reſtoring the Tone of which, the Stomachic Elixirs are, of all other Medicines, the moſt proper. The principal of theſe are, my balſamic Elixir, *mentioned in the Notes to* Poterius; Sal volatile Oleoſum, mix'd with Tincture of Tartar; the Stomachic Elixir, conſiſting of the Eſſences of Gentian and freſh Orange-peel; the balſamic Elixir, prepar'd of the Extracts of the leſſer Centaury; Carduus Benedictus, Wormwood, Gentian, Myrrh, Amber, Saffron, and freſh Orange-peel, prepar'd without a ſpirituous Menſtruum, but with a weak Lixivium of the Salt of Tartar. Theſe Medicines, us'd at Meals, or immediately after them, contribute much, not only to digeſt the Aliments, and procure a balſamic and ſpirituous State of the Chyle, but alſo to reſtore the natural and balſamic Quality of the Juices, and ſtrengthen the Tone of the Viſcera. But, for anſwering theſe Intentions, 'tis neceſſary they ſhould be us'd for a conſirable time.

If the Diſorder is ſo highly obſtinate, as not to yield to theſe Medicines, we muſt have recourſe to proper mineral Waters, which are of ſingular Service in the Cure both of a Cachexia in Men, and a Chloroſis in Women. But this Intention I think is, among all others, moſt effectually anſwer'd by the *Pyrmont* Waters, by the Uſe of which, I have often known a Chloroſis, ariſing from an Obſtruction of the Menſes, cured in Patients, apparently of a very weak and tender Conſtitution. The *Spaw* Waters are poſſeſſed of the ſame Virtues; for ſince both of them are impregnated with a fine chalybeate Principle, they not only render the thick Juices fluid, and fit for Motion, and open the obſtructed Ducts of the Emunctories, but alſo, by increaſing the Tone and Strength of the Viſcera, excellently promote the Circulation of the Blood thro' all the Parts of the Body.

Beſides the above-mentioned Waters, which are richly impregnated with a chalybeate Principle, other chalybeate Medicines, in Conjunction with ſaline and balſamic Ingredients, when duly exhibited, are juſtly eſteemed efficacious and powerful Remedies for the Cure of a Cachexia and Chloroſis. But tho' there are various Preparations of Steel, both of the chymical and pharmaceutical kind, yet none ſeems preferable to the ſubtile Crocus, which is prepared of the coarſe Filings, not of Steel, but of Iron, ſprinkled with Rain-water, and expos'd to the Heat of the Sun. But 'tis adviſeable to exhibit this Medicine mixed with others, ſuited and adapted to the Nature of the Diſorder: For this Reaſon I generally add to it the Roots of Burnet and Arum, Cinnamon, Salt of Tartar and Sugar, with ſo much Succeſs, that I have often ſeen young Women cured by it, after they have labour'd for a great while under a Chloroſis, attended with a violent Head-ach, and other formidable Symptoms. The beſt Medicines of a liquid Form, for anſwering this Intention, are the *Tinctura Martis pomata*, the Tinctura Martis Cydoniata, that prepar'd with Lemon-juice, and above all, the *Tinctura Martis Zwelferiana*. The Efficacy of theſe Medicines is ſtill increas'd, if they are exhibited in a ſufficient Quantity of the above-mentioned Decoction,

coction, or in Broths, in which the aperient Roots of Dogs-graſs, Succory, Parſley, Sparrow-graſs, and Fennel, have been boiled.

Practical Cautions.

If ſpeedy Methods of Relief are neceſſary in any Diſorder, they are in a peculiar manner ſo in a Cachexia, ſince by Delays 'tis to be dreaded, leſt the Patient ſhould be thrown into an Atrophy, a Scurvy, or a Dropſy. When a Patient labours under a Cachexia, ariſing from a Suppreſſion of an accuſtom'd Evacuation of Blood, the Phyſician is, by proper Remedies, to attempt the Reſtitution of that Evacuation. With this View 'tis proper, if the Patient's Strength is not exhauſted by the Continuance of the Diſeaſe, to take away a ſmall Quantity of Blood at certain Intervals, every third Day for Inſtance. This Method of Relief was long ago recommended by *Hippocrates*, in the third Section of his Book *de Morb. Mulier.* and is in a peculiar manner ſalutary to thoſe, in whom the accuſtom'd menſtruous Diſcharges are ſuppreſs'd. Veneſection, on the other hand, is highly prejudicial to thoſe, who, abounding with a Maſs of peccant Humours, have, at the ſame time, but a ſmall Quantity of Blood contain'd in their Veins.

Beſides a prudent and ſeaſonable Veneſection, and proper Purging, in a Cachexia ariſing from an Obſtruction of the menſtrual or hæmorrhoidal Diſcharges, there is a ſingular Virtue lodg'd in the *Caroline* Waters, by a proper internal Uſe of which, I have often known theſe ſuppreſs'd Evacuations reſtor'd. But they are to be abſtain'd from, when the Diſorder draws its Origin from an immediate Diſcharge, either of the Menſes or the Hæmorrhoids.

The obſtructed Menſes, when Veneſection is properly inſtituted, and the Obſtructions of the Viſcera remov'd by mineral Waters, or chalybeate Medicines, ſometimes begin to flow again ſpontaneouſly. But if this ſhould not happen, it is neceſſary the Patients ſhould be put, for about an Hour's Time, into a pretty hot Bath, prepar'd with the Herbs Fever-few, Baum, Mug-wort, Penny-royal, and Savin, Flowers of Roman Chamomile, and of Sage, together with Bay-berries. A Bath of this Kind I have often found highly beneficial for attenuating the ſtagnating Humours, and evacuating the mucous and tenacious Part of the Serum thro' the Orifices of the Uterus.

Cachectic Patients are never to be treated with violent Medicines; for which Reaſon, all draſtic Purgatives and Sudorifics, as alſo immoderately hot Baths, are to be avoided, ſince, by their means, prejudicial Tranſlations of the peccant Humours to the more noble Parts are often produc'd.

As to the due Uſe of chalybeate Preparations, we muſt obſerve, firſt, That their Efficacy ought to be aſſiſted and promoted by ſufficient Motion and Exerciſe of the Body: Secondly, The Uſe of them ought to be perſiſted in for ten or fifteen Days, interpoſing, at the ſame time, every third or fourth Day, a gentle Purgative. Thirdly, A ſufficient Quantity of diluting Liquor, and an exact Regimen, are to be uſed at the ſame time.

We muſt obſerve with *Hippocrates* and *Platerus*, that, in pale and ſickly Girls, the Menſes have appear'd and continued regular, from the very firſt Night of their Marriage, after which a lively Colour, and a perfect State of Health, have enſued; for which Reaſon, we muſt in this Caſe recommend Matrimony, as the beſt and moſt proper Remedy.

The Feet, which in this Diſorder are cold and tumid, are to be kept well cover'd, and moderately warm. They are alſo to be tightly wrapt up in Linen Cloths, in order to redreſs their lax and flaccid State, and promote a briſker Return of the Fluids to the Heart. But, if they are become tumid to an uncommon Degree, medicated Bags, made up of Millet, Bran, and Salt, are to be applied to them. With reſpect to Foot-baths, we muſt obſerve, that they are not to be uſed when the Swelling is already form'd; in which Caſe, beſides the already mention'd Methods, Frictions with warm rough Linen Cloths are more properly apply'd.

As to the Regimen calculated, either for a preſervative or curative Intention, a moiſt and cold Air, as alſo low Chambers fill'd with dank Exhalations for ſleeping in, are highly prejudicial. Among Aliments, thoſe of difficult Digeſtion, ſuch as unripe Fruits, acid Subſtances, and Milk-meats, are carefully to be abſtain'd from. In this Diſorder Water alone is prejudicial for common Drink, for which Reaſon it ought to be corrected with good *Rheniſh* or *Moſelle* Wine. But we muſt obſerve, that a Cachexia is often produced and ſupported by eating too liberally; for which Reaſon Abſtinence, and a Care not to indulge the Appetite too much, are in this Caſe far more powerful and efficacious, than all the Medicines in the Shops. *F. Hoffman.*

What *Hoffman* has ſaid of the *Spaw* and *Pyrmont* Waters, holds true of our own chalybeate Waters, from which I have always obſerv'd greater Effects, when drank at the Fountain Head, with due Exerciſe, than from the *German* Waters drank at a great Diſtance from the Spring. See Cachexia.

CHNUS, χνῦς, in *Hippocrates*, *Lib.* 1. περὶ γυναικ. is fine or ſoft Wool, to which he compares an aqueous Spleen, on account of its Softneſs. Χνῦς, or χνόος, in *Heſychius*, is interpreted Chaff, and alſo Sound and Noiſe; in which latter Senſe we may underſtand the Word in *Lib. de intern. Morb.* where it is ſaid, that, in a Phthiſis, ὁ φάρυγξ χνόου πίμπλαται, καὶ συρίζει ὡς διὰ καλάμου, "the Fauces are fill'd with Sound, and utter "a ſort of hiſſing Noiſe, as if it came through a Reed." But χνόος here may well enough be taken in its former Senſe, as *Caſtellus* obſerves, and import, that the Fauces ſeem to be ſtuffed and clogg'd with a woolly Subſtance, in ſuch a manner as to make the Sound before deſcribed

CHOA. See Chus.

CHOACUM *Emplaſtrum nigrum.* The black Plaiſter call'd *Choacum*, or *Choacon*, in *Celſus*, *Lib.* 5. *Cap.* 19. is compoſed of Spuma Argenti and dry Roſin, of each an hundred Drams; but the Spuma Argenti muſt firſt be boiled in a Pint and a Half of Oil.

CHOANA, χοάνη, is a Cavity in the Brain, like a Funnel, call'd alſo σύριγξ. *Caſtellus.* See Infundibulum.

CHOANOS, χόανος, χόανον, χώνος. This laſt, in *Hippocrates*, ſignifies a Funnel. Thus, in his Book *De Corde*, he ſays, that the στόμαχος, "the Gula," ſerves as a χώνος, "a "Funnel," to receive whatever we pleaſe to put into it. χόανος, χόανον, ſignify a Veſſel of white Clay, uſed by Goldſmiths and Chymiſts in the Fuſion of Metals; we may call it a Furnace for melting or caſting of Metals. This appears from *Homer*, and his Commentators; and *Hippocrates*, in the Book before-mentioned, ſpeaking of the Auricles of the Heart, compares them to the Bellows, which Smiths adapt, χοάνοισι, "to "their Forges."

CHOCOLATA, SUCCOLATA. Chocolate. See Cacao.

CHOCUS. See Chus.

CHŒNICIS, χοινικὶς, χοινίκιον. The Trepan, ſo call'd by *Galen* and *Ægineta*, and mention'd by *Celſus*, *Lib.* 7. *Cap.* 3. where he calls it Modiolus.

CHŒNIX, χοῖνιξ. An *Attic* or *Greek* dry Meaſure, containing three Cotylæ, or Heminæ, according to *Cleopatra*, that is, one Sextarius and a Half.

CHŒRADES, χοιράδες, from χοιρὰς, a Swine. The ſame as *Strumæ*. See Struma.

CHŒRADOLETHRON, χοιραδόλεθρον, from χοιρὰς, a Swine, and ὄλεθρος, Deſtruction, that is to ſay, Hogbane. A Name in *Aetius* for the *Xanthium*, or Louſeburr.

CHOIRAS, χοιράς. The ſame as Struma, which ſee.

CHOIROS, χοῖρος, ὁ χοιρος. *Galen*, *Com. in R. V. I. A.* ſays, that the Antients call'd by this Name particularly χοῖρον τὸν μικρὸν λίαν, "a very little Hog."

CHOIAC. The Name of the Month *December* in *Aetius*, *Tetr.* 3. *Serm.* 4. *Cap.* 48.

CHOLAGOGA. Χολαγωγὰ, among the *Greeks*, correſponded to what we call *Cholagogues* in *Engliſh*. The Medicines of this Claſs were ſo call'd from χολὴ, the Bile, and ἄγω, to drive out or evacuate. By Cholagogues the Antients meant no more than ſuch purgative Medicines as expel'd the internal Fæces, which reſembled the cyſtic Bile in their yellow Colour, and other Properties, ſuch as their Brightneſs, their Tenacity, and their Bitterneſs; but they ſeem to have err'd, firſt, becauſe by this means they excluded many things from the Claſs of Cholagogues, which really belong'd to it; for the hepatic Bile, before it is mixed with the cyſtic, in every reſpect reſembles Lymph. Secondly, becauſe they accounted ſome things Cholagogues, which were not really ſuch; becauſe many other Medicines diſcharge Fæces with the above-mention'd Properties, tho', at the ſame time, the ſmalleſt Quantity of Bile is not contain'd in them; ſuch as Caſſia, Manna, Aloes, and Tamarinds, by which the Fæces are tinged with a yellow Colour. It may juſtly be doubted, whether there really are ſuch purgative Medicines as act in a ſpecific and particular Manner upon the Bile; for, according to *Ettmuller*, Purgatives act as well upon the uſeful as the peccant Fluids of our Bodies, and one Purge is juſt as good as another: However, according to the various Circumſtances, we are taught by Experience to chooſe ſometimes one, ſometimes another; ſometimes one which is weak, and at other times one of a more ſtrong and draſtic Nature. Hence we underſtand, that not only Cholagogues, but alſo other Purgatives, evacuate Bile. We may, however, retain the Name Cholagogues for ſuch Purgatives as are generally uſed againſt Diſorders or Obſtructions of the Liver and biliary Ducts; in Students, for Inſtance, and Men of a ſedentary Life, in the Jaundice, ſometimes in Fevers, in a corroſive and burning Pain of the Inteſtines ariſing from an acrid Bile, and in Loſs of Apetite, ariſing from a pinguious Bile. *Actuarius*, in his *Meth. Medend.* tells us, that ſuch Subſtances as evacuate yellow Bile are to be uſed in Caſes where ſuch a Species of Bile is ſuſpected to be lodged in the Mouth of the Stomach, or diſperſed through the Syſtem of the Veins; in tertian Fevers alſo, and thoſe of the continued Kind, when decreaſing; in the Jaundice; and, in a Word, in all Diſorders in which a Redundance of yellow Bile

is ſuſpected. The Medicines evacuating yellow Bile are commonly reduc'd to two Claſſes. Under the firſt are contained ſuch things as, by attenuating the hepatic Blood, promote a more free and copious Secretion of the Bile; ſuch as the ſweetiſh acid Juices of ripe Fruits, the Juice of that Species of Lychnis call'd Saponaria, Caſſia, Honey, Tamarinds, Juice of white Roſes, Aloes, Scammony, Myrobalans, Rhubarb, Soaps, eſpecially thoſe conſiſting of a volatile alcaline Salt, and a volatile Oil, Elixir Proprietatis, moderately aromatic Syrups, ſuch as *Fernelius*'s Syrup of Mugwort, the Syrup of Jeruſalem Oak, that of the Five aperient Roots, that of Violets, the ſimple Syrup of Succory, the ſame with Rhubarb, the ſimple ſolutive Syrup of Roſes, the ſame with Sena. Theſe muſt be exhibited in Whey, Decoctions of Dandelion, or ſome other Decoction of a diluting Nature, in the Morning, upon an empty Stomach. Perhaps the beſt Cholagogue belonging to this Claſs is what is preſcrib'd by *Boerhaave* in his Chymiſtry, and which is prepared

Of two Drams of the Tincture of Scammony, well prepar'd with rectify'd Spirit of Wine, and mix'd with triple the Quantity of ſome of the above-mention'd Syrups.

The ſecond Claſs contains ſuch Subſtances, as, by giving a violent Concuſſion to the Abdomen and Diaphragm, derive both Species of Bile into the Inteſtines. This Effect is produced by the more draſtic Vomits and Purgatives, which ought not to be uſed till after the former have been try'd, and which are to be calculated for the Cure of Diſeaſes ariſing from black Bile.

There is ſome Reaſon to ſuſpect, that antimonial Medicines act more powerfully on the Bile than any other Remedies.

CHOLAS, χολὰς, rendered by *Gaza Cholago*, from *Ariſtotle*, *Hiſt. Animal. Lib.* 1. *Cap.* 13. ſignifies all the Cavity of the Hypochondria, or the Ilium, and is ſo call'd becauſe it contains the Liver, as the Strainer of the *Chole* or Bile, or from its Hollowneſs, *quaſi* κοιλὰς.

CHOLE, χολὴ. See BILIS.

CHOLEDOCHUS, χοληδόχος, from χολὴ, Bile, and δέχομαι, to receive, is a common Epithet for the Gall-bladder, the hepatic Veſſels, call'd the πόροι χοληδόχοι, "biliary Ducts," and the common Gall-duct, which communicates with the Duodenum. *Caſtellus.*

CHOLEGON, χολαγὸν, χολαῖον. The ſame as CHOLAGOGUM. See CHOLAGOGA.

CHOLERA, χολέρα. The Cholera. It is defin'd by *Paulus*, *Lib.* 3. *Cap.* 39. an immoderate Perturbation of the Belly, attended with a Diſcharge of Bile upwards and downwards, and proceeding from a continual Indigeſtion of Aliments. *Hippocrates*, *Lib. de R. V. I. A.* makes two Kinds of Cholera, the humid and the dry; but *Cholera* ſimply ſpoken, that is, without an Epithet, ſignifies the humid *Cholera* proceeding from acrimonious, bilious, and ſerous Humours, generated of a Corruption of acrimonious Food. Thus we are told, in the ſaid Book, that Goats Fleſh generates the *Cholera*, and that Swine's Fleſh is χολώδης *(Cholodes)*; that is, as *Galen* explains it, generates the *Cholera* by its Acrimony; for, as he ſays, in his *Comment.* this Diſorder proceeds from humid and acrimonious Aliment, which is ſoon corrupted, and by vellicating the Orifices of the Viſcera, which communicate with the Stomach, excites and attracts a Flux of Humours from the whole Body, which is diſcharged in bilious and acrimonious Stools and Vomitings. The dry *Cholera* proceeds from a Collection of acrimonious and flatulent Humours in the Stomach, by which the adjacent nervous Parts are vellicated and diſtended, in which reſpect it reſembles the humid *Cholera*. It is deſcribed by *Hippocrates*, in the Book before quoted, as attended with a Rumbling and Inflation of the Belly, a Pain of the Sides and Loins, and a Conſtipation of the Belly. In *Epid. Lib.* 5. this Diſeaſe is expreſs'd by τὰ χολικὰ πάθεα, "Choleric Affections;" and, in the ſame Book, and *Epid.* 7. ſimply by τὰ χολικά. *Celſus*, *Lib.* 4. *Cap.* 11. and *Lib.* 2. *Cap.* 1. calls this Diſeaſe *Cholera*, by Tranſlation from *Hippocrates*, *Aphor.* 30. *Lib.* 3. Χολέρα, *Lib. de Inſomn.* and *Coac.* ſignifies alſo a critical Diſorder of that Nature, as when we are told in the laſt-mention'd Treatiſe, that the Fever call'd *Lipyria* admits of no Solution but by a *Cholera*; and that Women, who, before their Lying-in, are afflicted τεῦτον χολερώδεα, after the Manner, or with the Symptoms, of a Cholera Morbus, have an eaſy Travail.

OBSERVATION I.

A certain Girl of twenty Years of Age died of a Cholera Morbus; and, diſſecting her Body, the mammary Veſſels were no-where to be found, tho' the moſt diligent Search was made for them. Many of the Parts contain'd in the Abdomen were changed; the Bottom of the Stomach, ſunk a Hand's Breadth below the ſpurious Ribs, was entirely deprived of the Benefit of the Omentum. Hence the Stomach being weaken'd, the Girl, whilſt alive, became ſubject to ſo violent Vomitings, that a preternatural Quantity of Blood was deriv'd to her Head, by which means the florid Colour of her Countenance remain'd after her Death. By the Violence of the Vomiting, the Ligaments of the Viſcera were alſo broken, and the Stomach was depreſſed, together with the Inteſtines. The Omentum reached below the Stomach to the Os Iſchium. The *Colon* was ſcaled preternaturally deep; and whereas, in a natural State, it is diſtinguiſh'd by various Gyrations and Circumvolutions, here, by ſmaller Inflexions, it reſembled the Teeth of a Saw. In the Inteſtines there was a reddiſh Worm found, which ſufficiently denoted the cacochymic Habit of the Patient's Body. The Spleen was ſwelled to double its natural Bulk, and appeared chang'd from its uſual Figure to that of an oblong Globe. The *Ductus Cholidochus* was divided into many ſmall Ramifications, which, on account of their Narrowneſs, produced a Regurgitation of a large Quantity of Bile. Hence the troubleſome and fatal Vomiting of bilious Matter had its Origin. *Th. Bartholinus*, *Cent.* 2. *Hiſtor.* 81.

OBSERVATION II.

In Patients who, in four Days time, have died of a *Cholera Morbus*, I have found the whole Bile of the Body evacuated, the Liver ſcorch'd and dry, and the Gall-bladder highly turgid; but when compreſs'd, the Bile neither flow'd, nor dropt out. The Duct reaching directly from the Liver to the Inteſtines was dilated to the Bulk of one's little Finger. By this Circumſtance I knew, that the Bile was convey'd immediately from the Liver to the Inteſtines. *Riolanus Anthropogr. Lib.* 2. *Cap.* 10.

OBSERVATION III.

The large Quantity of Bile evacuated in a *Cholera Morbus*, and the Diarrhœas of Children, is acrid, and generally æruginous or green. In Patients who have died of theſe Diſorders I always found a large Quantity of this Species of Bile in the Gall-bladder, and little or none at all in the Stomach, which is an infallible Proof, that the Bile is convey'd from the Gall-bladder to the Inteſtines and Stomach, in which it is not originally generated. *Diemerbrook Anat. Lib.* 1. *Cap.* 5. Such a tumid State of the Gall-bladder, produced by a greeniſh Bile of a deep Colour, I obſerved in a Boy of ten Years of Age, who died of a *Febris Lipyria*, attended with an Inflammation of the Liver, whoſe extreme Lobes were become blackiſh, in conſequence of a preceding *Cholera Morbus*. The Gall-bladder was as large as a Hen's Egg, and turgid with a greeniſh olive-colour'd Bile. With the ſame Species of Bile the biliary Ducts were alſo diſtended; and the whole concave Part of the Liver was covered with this ill-qualify'd Bile, which, on account of its Viſcidity and Toughneſs, had there remained.

OBSERVATION IV.

A certain Perſon was ſeized with a ſudden Vomiting, and had ten Stools. Upon diſſecting his Body ſeveral Pieces of white Arſenic were found impacted in the Coats of his Stomach.

OBSERVATION V.

In diſſecting a certain Perſon of Diſtinction, we found the Ductus Choledochus, which naturally diſcharges its Contents into the Duodenum, had an Opening near the Pylorus, by which means it convey'd the Bile to the Stomach, as well as to the Inteſtines. From this Circumſtance proceeded his Nauſeas, Vomitings, and Coſtiveneſs; for Nature being deprived of the Bile, her natural Clyſter, failed, in conſequence of her expulſive Faculty being deſtroyed. Hence a Cholera Morbus ſuddenly put an End to the Life of the Patient. *Barthol. Cabrollius Obſervat. Anat.* 6.

There is a near Affinity between a *Dyſentery*, and that Diſeaſe, which from the copious Diſcharge of bilious Sordes, both by the Mouth and Anus, the *Greeks* call *Cholera*, which *Cælius Aurelianus* calls *Felliflua Paſſio*, and which, by *Willis*, in *Pharm. Rat. Part.* 1. *Sect.* 3. *Cap.* 3. is denominated *Dyſenteria incruenta*, or an unbloody Dyſentery. It conſiſts in the periſtaltic Motion of the Stomach and Inteſtines being ſtimulated to a convulſive Contraction, by means of an highly acrid and cauſtic Matter, of various kinds, lodg'd in them; this Motion being in ſome meaſure inverted, and attended with an immoderate Diſcharge of bilious Sordes both by the Mouth and Anus.

But we muſt, in a particular Manner, take notice of the Difference between a *Cholera* and a dyſenteric Flux, ſince the former is juſtly claſs'd among the moſt acute Diſorders, and generally terminates in a few Days, at longeſt on the ſeventh; whereas a Dyſentery, unleſs highly malignant, is found to continue for a longer time. Nor is the dyſenteric Flux always attended with Vomitings, which only ſometimes happen in the Beginning or Height of the Diſorder, or when there is a concomitant Inflammation of the Stomach; whereas a Cholera is always accompany'd with a Vomiting; but it is not attended with

with ſo troubleſome a Teneſmus, or ſo frequent bloody Stools; nor, laſtly, does it, like a Dyſentery, prove contagious.

Nor is a Cholera leſs different from a bilious Diarrhœa; for tho' the Cauſes of theſe Diſorders are found to be nearly the ſame, they are, nevertheleſs, attended with different Symptoms, and afford different Prognoſtics; for as a bilious Diarrhœa is no more than a copious Diſcharge of bilious Sordes from the Anus, by the Force of the periſtaltic Motion of the Inteſtines ſpaſmodically conſtricted in its natural Courſe downwards; ſo, on the contrary, this Diarrhœa always attends a Cholera. But, beſides, in a Cholera there is a kind of Inverſion of the periſtaltic Motion, but more eſpecially of the Stomach and Duodenum, for which Reaſon this Diſorder is always accompany'd with Vomitings.

A Cholera is alſo to be diſtinguiſh'd into that which is dry, and that which is moiſt. The former is when the Stomach and Inteſtines are ſo diſtended with flatulent Vapours, that with the greateſt Uneaſineſs they diſcharge them copiouſly, either by the Mouth or the Anus. Of this Species of Cholera we have a remarkable Inſtance in *Act. Med. Berolin. Dec.* 2. *Vol.* 3. but this kind of the Diſorder does not at preſent come under our Conſideration. The moiſt *Cholera*, on the contrary, is ſuch a Diſorder as we have deſcribed above, and is either complicated with that Species of violent and inflammatory Fever, which the Phyſicians call *Cauſus*, or is found without a legitimate and regular Fever, tho' not without ſome Degree of Shivering, and irregular Returns of a hot Fit. This Species of the Diſeaſe is, for the moſt part, idiopathic, tho' it ſometimes alſo proves ſymptomatic, in the difficult Dentition of Children, according to *Sydenham*; in malignant Fevers, according to *Riverius*, in *Cent.* 3. *Obſ.* 78. and in that Species of Fever call'd *Leipyria*, which, according to *Hippoc.* in *Coac. Prænot.* 123. is not removed without a ſupervening Cholera. Theſe Diſorders are alſo frequently accompany'd with a bilious Flux.

Both theſe Diſorders are incident almoſt to the ſame ſort of Patients; that is, ſuch as are of a bilious, dry, and choleric Habit of Body; for Perſons of a more ſucculent, phlegmatic, and ſanguine Conſtitution, more frequently labour under a pituitous Flux. Thoſe Patients are in a particular manner ſubject to a Cholera, whoſe vital Juices are contaminated with a certain ſcorbutic Acrimony, or who have a Collection of acid Sordes lodged in the Primæ Viæ; ſuch as are generally hypochondriac, ſcorbutic, cachectic Patients, and ſuch as have the Misfortune of a fierce and wrathful Diſpoſition. This Diſeaſe principally rages in the Summer-time, and during ſultry Weather: It is alſo more frequent and violent in hot Climates, than in ſuch as are more mild and temperate. Hence *Bontius*, in his *Hiſt. Nat. Ind. Lib.* 4. *Cap.* 6. and *Thevenot*, in his *Itinerar. Part.* 2. *Lib.* 2. *Cap.* 20. inform us, that it is endemial among the Inhabitants of *India*, *Mauritania*, *Arabia*, and *America*.

As to the Hiſtory of the Diſeaſe, we muſt obſerve, that a Cholera generally ſeizes the Patient all on a ſudden; for tho' acid and nidorous Eructations, pungent Pains of the Stomach and Inteſtines, Cardialgias, and an Uneaſineſs of the Præcordia, frequently precede it, yet ſoon after the Patient is ſuddenly ſeiz'd with Vomitings, and a Diſcharge of the Excrements, at one and the ſame time. Firſt of all, the Remains of the Aliments are diſcharg'd; then bilious Humours, mix'd with a ſmaller or larger Quantity of Mucus, ſometimes yellow, ſometimes æruginous, ſometimes black, and generally highly acid, and almoſt corroſive, together with copious Eructations and Flatulences, and ſometimes Blood: Theſe are often, and at different times, diſcharged. Beſides, the moſt acute Pains, Contorſions, Corroſions, biting Pains, Inflations, and Rumblings, are perceived in the Inteſtines, eſpecially above the Navel, and the Patient is at the ſame time afflicted with a moſt violent Cardialgia. As the Diſorder increaſes, the Patient is ſeized with an inſatiable Thirſt; his Extremities become cold, his Heart begins to beat preternaturally, the Diaphragm is agitated by the Shocks of the Hiccough, the Diſcharge of the Urine is obſtructed, cold Sweats break out on the Body, violent fainting Fits, which often partake of the Nature of a Syncope, ſeize the Patient, and formidable Convulſions of the whole Body are brought on. This Diſorder ſoon terminates, for it generally ceaſes on the third, fourth, or, at moſt, on the ſeventh Day; nor does it ever continue longer, except when it degenerates into another Diſeaſe.

Among the Antients *Cœlius Aurelianus*, and *Aretæus*, have given the moſt diſtinct Account of the Cholera.

The firſt of theſe informs us, that the *Choleric Paſſion*, according to ſome, receives its Denomination from χολὴ, the Bile, and ῥοιὰ, or rather ῥοὴ, a Flux, as it conſiſts in a Diſcharge of the Bile from the Mouth and the Anus. Others will have its Name deriv'd from the Quantity of the Humours diſcharg'd, which, they ſay, are not real Bile, but certain Fluids, which aſſume the ſame Colour. This Diſtinction, however, is frivolous and trifling, ſince 'tis not worth while to diſpute about the Etymology of this Diſorder. *Aſclepiades*, in his Book *De Finibus*, has defin'd the choleric Paſſion *A quick and ſpeedy Diſcharge of Humours from the Stomach and Inteſtines, drawing its Origin from a certain Concourſe or Obtruſion of Corpuſcles, and, as it often happens, from Indigeſtion.* Some, when explaining this Definition, obſerve, that the Words *quick* and *ſpeedy* are added in order to diſtinguiſh the *Choleric* from the *Cœliac Paſſion*, the Patients labouring under which are alſo afflicted with a ſimilar Diſcharge of Humours, which, however, is not made ſo ſpeedily, but generally requires a longer Time. They alſo think it was neceſſary to add the Words, *from a certain Concourſe or Obtruſion of Corpuſcles*, ſince ſome Perſons, upon their firſt going to Sea, are afflicted with ſuch a Diſcharge of Humours, which, however, is not produc'd by a *Concourſe of Corpuſcles*. They are alſo of Opinion, that it was proper to ſpecify, that it was frequently produc'd by Indigeſtion, ſince the *choleric Paſſion* may alſo ariſe from other Cauſes. Some of our Sect (the Methodic) have given the ſame Definition of this Diſorder, cutting off the Words *Concourſe of Corpuſcles*, and adding in their ſtead the Words *Raritas Viarum*, or the Rarity of the Paſſages. But, in my Opinion, 'tis ſuperfluous to enumerate the Cauſes of this Diſorder, ſince 'tis of far more Importance to know the Effects produc'd by theſe Cauſes.

I alſo account it ſtill more ſuperfluous to ſwell the Definitions of this Diſorder by an Enumeration of the antecedent Cauſes, ſince the *Choleric Paſſion* is not the only Diſeaſe which ariſes from Indigeſtion; and ſince Indigeſtion alone does not produce this Diſorder, which alſo takes its Riſe from other Cauſes of a particular and oppoſite Nature, none of which are pointed at, or ſpecify'd, in the preceding Definitions. Hence the Diſcharge of Humours in the *Choleric Paſſion* proceeds from ſome Fault not only of the Abdomen and Inteſtines, but alſo of the Stomach: For this Reaſon *Soranus* aſſerts this Diſorder to be a *Solution of the Stomach, Abdomen*, and *Inteſtines, accompany'd with inſtantaneous and ſpeedy Danger.* The antecedent Cauſes of this Diſorder may be ſaid to be the drinking too much Wine, the Exhibition of bad Medicines, the Uſe of hot Waters, or the Toſſing of a Veſſel, which throws Perſons unaccuſtom'd to it into violent Commotions. But we are ſaid to increaſe theſe antecedent Cauſes in proportion as we protract the Indigeſtion, by uſing too large a Quantity of Aliments, to which we are either unaccuſtom'd, or which are delicately prepared. An Acquaintance with theſe Circumſtances may, indeed, contribute to ſatisfy the Mind with reſpect to the Cauſes of the Diſorder, but is not at all ſubſervient, much leſs abſolutely neceſſary to the right Conduct of the Phyſician, or the Relief of the Patient. A Diarrhœa and a Reſolution of the Stomach bear a near Reſemblance and Affinity to this Diſorder. But the Followers of *Aſclepiades* inſtitute a Difference between the Choleric Paſſion and a Diarrhœa: The former, ſay they, is attended with a Diſcharge of Humours from the Stomach, whereas the latter is a Flux from the ultimate Parts. But we affirm, that in a Solution of the Stomach the Patient is only afflicted with a Vomiting, unattended with a Flux. When, on the contrary, the Patient labours under a Flux, not accompany'd with a Vomiting, this Symptom only denotes a Solution of the Belly alone, which is call'd a Diarrhœa. But, in the Choleric Paſſion, both theſe Symptoms, a Vomiting as well as a Flux, concur, together with other additional Symptoms. They alſo aſſert, that there are different kinds of Indigeſtion; and that, according to theſe Differences, either a Diarrhœa or the Choleric Paſſion are produc'd. But, according to the Followers of *Aſclepiades*, theſe Diſorders ariſe from the different Degrees of the Concourſe of Corpuſcles, which in a Diarrhœa is but ſmall, in conſequence of the Indigeſtion, but conſiderably greater in the *Choleric Paſſion*. They alſo aſſert, that theſe Diſeaſes differ with reſpect to the Time and Order of their Symptoms, ſince Indigeſtion is previous to the Approach of the Choleric Paſſion. But the Diſtinction between theſe two Diſorders is obvious and eaſy; for Indigeſtion is produc'd by the Corruption of the Aliments, tho' the Patients neither vomit, nor labour under a Flux, which the *Greeks* call *Rheumatiſmos:* But the Choleric Paſſion is a Diſorder accompany'd with a Vomiting and a Flux, even when the Aliments are not corrupted; for it is eaſy to conceive, that it may alſo ariſe from other antecedent Cauſes.

The Choleric Paſſion is generally preceded by a Heavineſs and Tenſion of the Stomach, Anxiety, Toſſing, Watchings, Gripes of the Inteſtines, accompany'd with that Species of Noiſe which the *Greeks* call *Borboriſmos*, (a Rumbling of the Guts) a Pain of the Belly, and a Diſcharge of Wind from the Anus, which affords no Relief, nidorous Eructations, a Nauſea, a preternatural Diſcharge of the Saliva, a Senſe of Weight about the Thorax, accompany'd with a Wearineſs of the Members. Upon the Approach of the Diſorder itſelf the Patient is ſeized with a continual Vomiting at firſt, as it frequently happens, of the corrupted Aliments, and of a yellowiſh Humour and Bile. Then the Matter evacuated reſembles the Yolks of Eggs, and afterwards appears porraceous and æruginous, and laſt of all black. The Belly is alſo thrown into a Commotion, accom-

pany'd with Pain; whilſt, at the ſame time, the Excrements are, like the Matter diſcharged by Vomit, frothy, and highly acrid. The Patient is alſo afflicted with frequent Retchings to vomit. As the Diſorder increaſes, an aqueous and thin Liquor, which ſometimes reſembles the Waſhings of Fleſh, is diſcharg'd by Stool. Along with theſe Humours are alſo generally evacuated whitiſh pituitous Strigments, and a thick Pulſe enſues, together with a Coldneſs of the Limbs, and a blackiſh Colour of the Countenance, a preternatural Heat, and even an inſatiable Thirſt, a quick Breathing, and a Contraction of the Limbs, together with a Tenſion of the Nerves, Calves of the Legs, and Arms. The Patient is alſo afflicted with a Riſing of the Præcordia, accompany'd with a Pain reſembling the Iliac Paſſion. Sometimes the Excrements are bloody, the Countenance emaciated and ſlender, the Eyes red, and, laſt of all, the Patient is ſeized with a Hiccough. This Degree of the Diſorder was by the Antients thought to be ſo acute, that it kill'd the Patient before the ſecond Day. But when it begins to take a favourable Turn, and become leſs violent, the Cold of the Body and Joints is leſſen'd, the Pulſe becomes manifeſtly higher, the Stools are ſmaller, and diſcharged at longer Intervals, and the Patient is gradually more and more relieved. Particular Paroxyſms are to be prognoſticated from Circumſtances ſubſequent to the Diſorder itſelf; for when the Patient is ſeiz'd with an Uneaſineſs and Toſſing, a Congeſtion of Humours to his Stomach, and a Contraction of his Limbs, we then predict the ſudden Approach of a Paroxyſm: But if, after the Vomiting, the Patient finds himſelf eaſier, his Stomach relieved, the biting Pain of his Belly alleviated, and all other Symptoms leſſen'd, we prognoſticate a Ceſſation of the Paroxyſm. Generally the Choleric Paſſion is highly intenſe and acute, and ariſes ſometimes from Solution alone, and ſometimes from a Solution accompany'd with a certain Degree of Stricture, as is obvious from the Pains of the Stomach, Belly, and Inteſtines, together with the Contraction of the Joints. In this Diſorder the Stomach, Belly, and Inteſtines, are more ſeverely and immediately affected; but, at the ſame time, all the other Members of the Body are drawn into Conſent. *Cæl. Aurel. Acut. Morb. Lib.* 3. *Cap.* 19, 20.

Aretæus deſcribes the Diſorder thus:

The *Cholera Morbus* is a Reflux of Matter from the whole Body upon the Stomach, Belly, and Inteſtines, being a very acute Diſeaſe. The Patient diſcharges his Stomach of all its Contents upwards by Vomiting, and all the Humidities of his Belly and Inteſtines by Stool. The Vomitings are at firſt aqueous, and the Fæces of a liquid Conſiſtence, and fetid, the Diſeaſe proceeding from continual Indigeſtion; when the liquid Matters are evacuated, the Stools become pituitous, and afterwards bilious. At firſt theſe Diſcharges are made with Eaſe and Freedom, but are afterwards attended with Gripes of the Belly, and racking Pains of the Stomach.

If the Diſeaſe increaſes, the Gripes are more ſevere, there is a Lipothymy, Reſolution of the Members, Reſtleſſneſs, with an Averſion to all Food; or, if any be received, it is thrown up again, with much Noiſe and Nauſea, ſatiated with yellow Bile, and the Stools are of a like Quality. The Patient is ſeiz'd with Convulſions, and Contractions of the Muſcles in the Legs and Arms; his Fingers are bent; he becomes vertiginous, and moleſted with the Hiccough; his Nails turn livid, with a general Refrigeration, Coldneſs of the extreme Parts, and a Rigor of the whole Body.

If this Diſorder takes a fatal Turn, the Patient falls into a Sweat, and voids black Bile upwards and downwards; he labours under a Suppreſſion of Urine from a Convulſion of the Bladder; nor, indeed, is there any Urine collected, the Humidities being diverted upon the Inteſtines; his Voice fails him; his Pulſe is very ſmall and frequent, as in a Syncope; he is continually retching to vomit, but brings up nothing; and is perpetually deſirous of going to Stool, as in a Teneſmus, but voids only a dry Matter, deſtitute of all Humidity. The Diſeaſe ends at laſt in a painful and miſerable Death, attended with Convulſions, Strangulation, and fruitleſs Retchings to vomit.

The Cholera Morbus is moſt frequent in the Summer; next to that in the Autumn; the Diſeaſe is rarely known in the Spring, and leaſt of all in the Winter. Young Perſons, and thoſe who are in the Flower of their Age, are moſt ſubject to this Diſorder; old Age is leaſt liable to it, Children being more commonly ſeized with it than aged Perſons, but without Danger of Death. *Aretæus de Cauſ. et Sign. Acut. Morb. Lib.* 2. *Cap.* 5.

In diſſecting Subjects who have died of a *Cholera*, the ſmaller Inteſtines, eſpecially the Duodenum, with the Right Orifice of the Stomach, are generally found gangrened internally, cover'd with Bile, and yellow externally, and the biliary Ducts too much relaxed, as we find in the Writers of Medicinal Obſervations, among whom we ſhall only mention *Dolæus*, in his *Encyclop. Med. Lib.* 3. *Cap.* 4. and *Bartholin.* in his *Hiſt. Anat. Cent.* 2. *Obſ.* 81. *Riolanus*, in his *Anthropol. Lib.* 2. *Cap.* 20. takes notice of the Gall-bladder being preternaturally large, and the Ductus Cholidochus remarkably diſtended, in a Subject who died of this Diſorder; and, in the *Act. Med. Berol. Dec.* 2. *Vol.* 8. we have an Account of a fatal Cholera, in which the Duodenum and Pylorus were internally gangren'd, and filled with a browniſh-black Subſtance, like that thrown up by Vomit, and which, when examin'd, was found to be nothing but Bile mixed with Blood. The Veins of the Stomach were turgid with Blood, the Gall-bladder highly flaccid, and the Omentum purs'd up towards the Stomach.

Hence 'tis obvious to every one, that, as the Seat of a Cholera is to be ſought for in the Stomach and Inteſtines in general, ſo 'tis in a more particular Manner found in the Duodenum, and biliary Ducts. Hence the whole nervous Syſtem is often drawn into Conſent. Nor can we reaſonably aſſign any other Seat of this Diſorder, if we conſider its material Cauſe; for the Matter thrown up by Vomit, and diſcharged by Stool, is almoſt always bilious, tho' in every Caſe the Bile is not alike unmix'd. This Matter is alſo ſometimes mixed with acid, pituitous, ſaline, and other foreign Humours, as alſo with Blood: Hence it aſſumes various Colours, and is ſometimes yellow, ſometimes green, and ſometimes black. This Commixture of the Bile cannot happen in any other Part than the Duodenum, ſince it is adapted to producing and cheriſhing ſuch acrid Sordes, partly on account of its winding Situation and Flexures, and partly on account of the Afflux of the Bile and pancreatic Juice to it from the Ductus Cholidochus.

The Vellication of the nervous Coat, which lines the Stomach and Inteſtines, produced by this cauſtic Matter, is the immediate Cauſe of a Cholera, as this Vellication is immediately ſucceeded by a convulſive Conſtriction of the Viſcera, which conſtitutes the Diſeaſe itſelf: For this Conſtriction, in Conjunction with the corroſive Quality of the peccant Matter, produces racking, pungent, lancinating, corroding, and biting Pains, together with a Cardialgia. In the Stomach and Duodenum this Conſtriction is perform'd upwards, and againſt the Order of Nature, whereas in the other Inteſtines it is perform'd downwards: Hence Vomitings, and Diſcharges of the Excrements by Stool, are produced at one and the ſame time. But as it is to be laid down as an invariable Maxim, that a larger Afflux of Humours is promoted to any Part of the Body which is vellicated; ſo in a Cholera the vital Juices flow more copiouſly to the Veſſels of the Stomach and Duodenum, as being primarily affected. Whilſt theſe Parts are ſpaſmodically conſtricted, the Juices conveyed to them cannot freely return thro' the Veins; hence they ſtuff them, and firſt diſcharge into the Cavity of the Part affected their more ſubtile Particles, which are generally acrid, ſerous, ſulphureous, and bilious: Hence the large Quantity of Humours diſcharged in a Cholera is to be accounted for. By a longer Continuance of theſe Humours the Veſſels are either broken, and diſcharge by Drops Blood, which, in Conjunction with the bilious Sordes, coagulates into a blackiſh Maſs; or their Contents ſtagnate, and they themſelves are ſeiz'd with a fatal Inflammation and Gangrene. At the ſame time the Influence of the Spaſms is convey'd and propagated to the adjacent Parts, in conſequence of the Conſent and Communication of Nerves. By this means the biliary Ducts are in a particular manner irritated to diſcharge their Contents into the Duodenum, and, the Spaſms ceaſing upon the Death of the Patient, theſe Ducts are found flaccid and relaxed. Beſides, if theſe violent Motions are conveyed to the Heart, they produce a Palpitation of it; if to the Diaphragm, a Hiccough; if to the urinary Bladder, a Dyſury; if to the Surface of the Body, a Coldneſs of the Extremities; and if to the Membranes of the Brain and Spinal Marrow, epileptic and convulſive Motions.

Having given ſome Account of the immediate Cauſes of this Diſorder, we now come to inveſtigate thoſe more remote and ſecondary Cauſes, by which the Matter, capable of exciting ſuch Commotions, is produced. This Matter, whether in a ſmall or in a large Quantity, muſt nevertheleſs be of a highly acrid and cauſtic Quality. This Matter, then, is produced, firſt, by Poiſons, whoſe Effects on the Body are ſo like the Symptoms of a Cholera, that to die of a Cholera, and to be poiſon'd, are almoſt the ſame Things. But 'tis certain, that all Poiſons operate by a highly acrid cauſtic Salt, which, when it enters the Body in a very inconſiderable Quantity, often excites a highly violent Vellication and Convulſion of the Stomach and Duodenum, and conſequently of the other Inteſtines. Hence the ſerous Humours are not only invited to theſe Parts, from the Maſs of Blood, but the Gall-bladder, receiving violent Shocks, pours forth its bilious Contents, which produce Vomitings and Stools of different Colours, according to the Humour before lodged in the Primæ Viæ. This melancholy and generally fatal Effect is produced principally by Arſenic; as alſo by ſublimate Mercury; Inſtances of which may be met with in *Hildanus*, *Decker*, *in not. ad Barbette*, and *Salmuth. Cent.* 1. *Obſ.* 10. I am alſo of Opinion, that all the Caſes of Dyſenteries, obſerved to be excited by Poiſons, ought to be aſcrib'd to a Cholera.

Of

Of the like Quality with Poiſons are the more acrid Purgatives and Emetics, exhibited unſeaſonably, or in too large Doſes, ſince they alſo contain a highly acrid Salt. Their pernicious Effects are generally expreſs'd by the Names Hypercatharſis, or Hyperemeſis; which, when they meet together, as they generally do, conſtitute a perfect Cholera. Among theſe Subſtances are the greater and leſſer Spurges, the Seeds of Mezereon, and Glaſs of Antimony. *Rhodius*, *in Cent.* 2. *Obſ.* 73. obſerved a violent Cholera excited by the Exhibition of ill-prepared Antimonials; and *Foreſtus*, *in Lib.* 28. *Obſ.* 44. takes notice of the ſame Diſorder excited by Coloquintida.

Beſides, Aliments too ready to ferment, ſuch as are ſweet, pinguious, and eaſily corrupted, may excite a Cholera, if thick Ale, or Water, are drank after them; or if they are uſed by a Perſon of an impure Habit, in whoſe Stomach there is a Collection of bilious Sordes already lodged; for theſe Subſtances, uniting and fermenting with the Bile, generate an Acrimony of a more cauſtic Nature than Poiſon itſelf. To this Species of Aliments belong Melons, Pumpions, Cucumbers, Pine-apples, Peaches, Prunes, Grapes, Cherries, Cakes prepared with much Butter, Sweet-meats, Funguſes, the Spawn of the Barbel-fiſh, Muſt, new Wine, and Ale, and too fat Fleſhes: Thus *Fantanus*, *in Analect. Cap.* 21. *Exempl.* 12. informs us, that he knew an old Woman, who died of a Cholera, by drinking Ale after Cucumbers. *Guldenklee*, *in Lib.* 3. informs us, that the ſame Diſorder was produced by Peaches. And *Henricus ab Heer*, in his fifteenth Obſervation, tells us, that it was produced by an unſeaſonable Uſe of Milk.

Nor are we to exclude, from the Cauſes of a Cholera, violent Paſſion, which has a ſtrong Tendency to produce it, eſpecially if one flies into a Paſſion at Meals, or after eating Food which is ſubject to ferment; or if the Patient eats or drinks, or, which is worſt of all, takes an Emetic, or a Purgative, immediately after a Fit of Paſſion; for 'tis obvious to every one, that the Influence and Efficacy of Paſſion are highly prejudicial to the Primæ Viæ, and biliary Ducts, ſince they not only throw theſe ſolid and moving Parts into a Commotion, but by that means lay an effectual Foundation for an Efferveſcence of the Bile with any other Sordes, that may happen to be lodged there.

In the *Act. Med. Berol. Dec.* 2. *Vol.* 1. we have an Account of a Cholera produced by eating Cabbage, after a Fit of Paſſion. In the ſame Work, *Vol.* 8. we have an Account of a fatal Cholera produced by Paſſion. *Platerus* alſo, in his *Obſer. Lib.* 3. and *Borelli*, in *Cent.* 2. *Obſ.* 27. give us Inſtances of the ſame Kind. 'Tis no other Diſorder than a *Cholera* under which tender Infants often labour, not without Danger of loſing their Lives, upon their Mothers giving way to the Tranſports of Paſſion. This Diſorder proceeds from the Milk of the Mother, which aſſumes an Orgaſm by the Paſſion, produces an Efferveſcence with the Bile in the delicate Stomach of the Infant, corrodes the Inteſtines, and generally gives Occaſion to a fatal Inflammation.

The Cauſes already enumerated, if the Acrimony is not very great, and deeply ſeated in the Inteſtines, will only produce a bilious Diarrhœa; which may alſo be produced by other Cauſes, that generally do not excite a Cholera. We muſt, in a particular manner, obſerve, that a bilious Flux is ſometimes critical in bilious Patients, if a ſlight Error in Regimen, a Tranſport of Paſſion, or an Obſtruction of Perſpiration, have preceded. It alſo frequently ariſes ſpontaneouſly, eſpecially in the Summer-time, and, if duly treated, proves ſalutary. It alſo frequently happens, that this Species of bilious Diarrhœa proves critical in intermittent bilious Fevers, as are moſt of the tertian Kind, and affords conſiderable Relief.

There are alſo ſome procatarctic Cauſes, which, if they concur with theſe of the ſecondary and remote Kind, will the more certainly produce both a Cholera, and a bilious Diarrhœa. Among the procatarctic Cauſes of this Kind, is a hot and ſultry Conſtitution of the Atmoſphere, which, as it is able to throw the whole Juices of the Body into a violent Commotion, ſo it produces this Effect, in a particular manner, upon the Bile: Hence, in my Opinion, it is to be accounted for, why a Cholera is endemial among the *Indians* and *Arabians*, eſpecially in thoſe Parts where the Fruit call'd the Pine-apple is much uſed, which abounds with a fermenting and highly noxious Juice. Beſides, too great a Refrigeration of the Body, by repelling the acrid bilious Serum, diſpoſes to a Cholera. Hence *Schenckius*, in the third Book of his Obſervations, makes mention of a Cholera, which was produced by a Refrigeration of the Feet, in Conjunction with the Uſe of Muſt and Funguſes. We muſt alſo acknowledge, with *Sydenham*, that frequent Surfeits of Wine or Ale prove the Cauſes of a Cholera, in choleric Patients; ſince, in theſe, the Strength of the Stomach and Inteſtines is weaken'd, and various Crudities are generated in the Primæ Viæ, which, upon every ſlight Commotion of the Bile, excite the moſt terrible Diſorder in the Animal Œconomy.

It is to be remark'd, that, when vegetable Juices ferment in the Stomach and Inteſtines, or when Liquors, procured by Fermentation, renew their Fermentation in the ſame Organs, the Gas Sylveſtris, or incoercible Spirit, taken notice of under the Article ALCOHOL, is capable alone of ſtimulating theſe and the adjacent Viſcera, ſo as to produce a Cholera.

As for the Prognoſtics of the above-mention'd Diſorders, a Cholera is generally fatal; for, if we except a Plague, and peſtilential Fevers, no Diſeaſe is more acute, or kills the Patient ſooner, than a Cholera; eſpecially when it ſeizes either old Men, Children, or ſuch as are weaken'd by chronical Diſorders. The more cauſtic the Matter evacuated is, and the more intenſe the Thirſt and Heat, the greater the Danger is. And, according to *Hippocrates*, *in Lib.* 4. *Aph.* 22. if black Bile, mix'd with black Blood, be diſcharged, inevitable Death is prognoſticated. Death is alſo preſaged by Faintings, Convulſions, Hiccoughs, Coldneſs of the Extremities, together with cold Sweats. Nor is a happy Termination of the Diſeaſe to be expected, if, when the Excretions are ſuppreſs'd, the Symptoms continue. But there are ſome Hopes of a Recovery left when the Vomitings ceaſe, with ſubſequent Sleep and Relief, and if the Diſeaſe is protracted beyond the ſeventh Day. When a bilious Diarrhœa is ſhort, and not attended with violent Gripes, it proves ſalutary; and the Eruption of Flatulences prognoſticate, that it is near to a Termination. The Patient alſo, who, under this Diſeaſe, is free from Thirſt, and a preternatural Heat, is generally in no Danger. On the contrary, it is a bad Sign when the Appetite is loſt, whilſt at the ſame time the Body is preternaturally ſoluble; as alſo, when the Patient is afflicted with ſevere Gripes, deprived of Sleep, and his Strength greatly impair'd. When a ſemitertian Fever, which is by the *Greeks* call'd *Hemitritæa*, and is compounded of an acute inflammatory Fever, and an intermitting Tertian, the Paroxyſms happening thus alternately, is joined either to a Dyſentery, a Cholera, a bilious Diarrhœa, or bilious Vomitings, theſe Diſorders are accompanied with the higheſt Danger; but the beſt Sign is an Eruption of Flatulences from the Anus, by which we may pretty ſafely conclude, that the periſtaltic Motion of the Inteſtines is in ſome meaſure reſtored. In a Dyſentery *Hippocrates*, in his Days, obſerved, that an Eruption of Flatulences was a Sign of Recovery.

The Method of Cure, recommended by *Aretæus*, is thus.

In the Cholera Morbus it is not adviſeable to ſuppreſs the Evacuations, becauſe Crudities are diſcharged by them. We ought, therefore, if they proceed eaſily and ſpontaneouſly, to attempt nothing; if otherwiſe, to promote them by continual Exhibitions of warm Water, but in ſmall Draughts, to avoid fruitleſs [κενὰι] ſpaſmodic Diſtentions of the Stomach. If the Patient be afflicted with the Gripes, or Coldneſs of the Feet, the Belly is to be fomented with hot Oil, in which Rue and Cumin have been boil'd, for the Diſcuſſion of Flatulences, and Wool is to be apply'd to the Part. The Feet alſo, being bath'd in the Oil, muſt be gently rub'd, and rather lightly ſtroked than hard preſs'd; and this Friction is to be extended up to the Knees, in order to recal the Heat into the Parts. This Method is to be follow'd as long as the bilious Vomitings and Purgings continue.

If the Belly has diſcharged all the Reliques of the old Food, and Bile comes to be voided, and there be alſo bilious Vomitings, with a Diſtention, Loathing, Reſtleſſneſs, and Imbecillity, give the Patient about a Quarter of a Pint [κυάθους δύο ἢ τρεῖς] of cold Water, to ſtop the Looſeneſs of the Belly, reſtrain the Flux of the Humours, and cool the ardent Heat of the Stomach; and this is to be done as long as he continues to vomit up what he drinks; for the cold Water is ſoon heated in the Belly; and the Stomach, oppreſs'd with both Heat and Cold, diſcharges itſelf of the Water, but is perpetually thirſting for a cool Draught.

If the Pulſe be very low and languid, as well as quick and frequent, and Sweat appears in Drops upon the Forehead, Neck, and all over the Body; if the Flux of the Belly be not ſtopt, and the Vomitings continue, attended with Spaſms and Faintings, it will be convenient to mix, with the cold Water, a little ſweet-ſcented and aſtringent Wine, which, by its Fragrancy, may recal the Patient to his Senſes, corroborate him by its Strength, and yield Support to his Body by its nutritive Faculty; for Wine directly aſcends to the upper Parts, ſo as to put a Stop to Defluxions, and is of fine Parts, ſo as eaſily to diffuſe itſelf, and fly to the Aſſiſtance of oppreſs'd Nature, and by its Spirits recruits the decay'd Strength; for the better anſwering of this Purpoſe, ſome recent Flower [ἀλφίτων] of a delicious Flavour, may be mix'd with it. If the Symptoms be very preſſing, ſuch as a Sweat, with ſpaſmodic Affections, not only of the Stomach, but of the Nerves, a hollow Hiccough, Contraction of the Feet, a violent Flux of the Belly, with a Failure of the Sight, and a Pulſe ſcarce perceptible, in ſuch a State the Patient requires our utmoſt Aſſiſtance; and we are to let him drink freely of cold Water, mix'd with Wine, tho' not with too much of it, for fear of Inebriation, and injuring the

the Nerves, but with Crums of Bread ſopt in it. Beſides this, other Sorts of Aliment may be given, ſuch as aſtringent Apples, Services, Medlars, Quinces, and Grapes.

If the Patient vomits up every thing, and his Stomach can hold nothing, recourſe is to be had again to hot Meats and Drinks, for ſuch a Change has ſometimes ſuppreſs'd the Vomiting; but what is hot, ought to be ſo in an extraordinary Degree. If none of theſe Remedies give Relief, apply Cupping-glaſſes between the Shoulder-blades, and below the Navel; but continually change them, for, if they adhere long, they excite a Pain, and endanger the Raiſing of a Bliſter. Sometimes Geſtation, in a mild and temperate Air, has been of Service for reviving the Spirits, for retaining the Food in the Stomach, and for reſtoring a good Pulſe, and free Reſpiration.

If the Diſorder ſtill increaſes, let Epithems be apply'd to the Belly and the Breaſt, as it is uſual in a Syncope, particularly Dates ſoak'd in Wine, Acacia, and Hypociſtis, which may be mix'd with Cerate of Roſes, and then ſpread upon Linen, and apply'd to the Belly. And, for the Breaſt, a Plaiſter may be prepared of Maſtich, Aloes, the bruiſed Tops of Wormwood, with Cerate of Nard or Oenanthe, which is to cover all the Part. If the Feet and Muſcles be affected with a Rigor, anoint them with *Oleum Sicyonium*, *Unguentum Gleucinum*, [ſee SICYONIUM, GLEUCINUM] or old Oil, and ſprinkle them with Caſtor. If the Feet be cold, anoint them with Ointment of Limneſtis [*Adarces*] and Euphorbium, and wrap them in Wool, rubbing and ſtretching them out with your Hands. Uſe the ſame Ointment about the Spine of the Back, the Tendons, and maxillary Muſcles.

If, upon the Uſe of theſe Remedies, the Sweating and Flux of the Belly be ſtopt, the Stomach retains the Food, the Pulſe becomes full and regular, the ſpaſmodic Affections ceaſe, a kindly Heat diffuſes itſelf over all the Parts, extending even to the Extremities, and the Patient falls into a Sleep, the general Concoctor of all Crudities, the ſecond or third Day he may bathe, and return to the Duties of his Calling. But if he continues to vomit up every thing that he takes, if his Sweating cannot be reſtrain'd, if his Body grows cold and livid, his Pulſe is almoſt gone, and he ſinks into a fainting Fit, the beſt Way for the Phyſician, in ſuch a Caſe, is to find ſome decent Pretence for a Retreat. *Aretæus de Curat. acut. Morb. Lib.* 2. *Cap.* 4.

As in all Diſeaſes, ſo more particularly in a Cholera, Delays are dangerous; for, according to *Celſus*, in the ſecond Chapter of his fourth Book, no Diſeaſe requires more ſpeedy Remedies; and, according to *Trallian*, in the fourth Chapter of his ſeventh Book, the ſmalleſt Delay is of the worſt and moſt fatal Conſequence. The ſooner, therefore, a proper Attempt is made to cure a Cholera, the Cure ſucceeds the more happily, which conſiſts principally in theſe three Intentions: Firſt, to correct and attemperate the peccant Matter, to diſpoſe it for an Evacuation, and, if neceſſary, to eliminate it by proper Methods. Secondly, to allay and ſooth the irregular and diſorderly Motions, by ſuitable Medicines. And, thirdly, to reſtore the impair'd and weaken'd Strength of the nervous Parts.

The firſt Intention of Cure, then, is to correct the peccant Humours, and aſſiſt their Excretion. But as theſe are various, and as either a large Quantity of bilious Crudities, or a ſmall Maſs of ſubtile and cauſtic Matter, are found to prove the Cauſes of ſo violent Diſorders, ſo the different Caſes require ſomewhat different Methods of Cure. When the Diſorder ariſes from eating too large a Quantity, or from the Uſe of ſuch Aliments as readily ferment, and are converted, with the Bile, into an highly acrid Mixture, Evacuation, when ſlow, is to be promoted; and we muſt be highly careful, not to ſuffer the Patient's Strength to be too much impair'd. Nor, in this Caſe, is it proper to exhibit actual Emetics and Purgatives; but to provoke a Vomiting by liberal Draughts of warm Water, mix'd with a conſiderable Quantity of freſh Butter, or any oleous and mucilaginous Subſtance. But 'tis proper to render the Body ſoluble by the Injection of an oleous and emollient Clyſter; for which Purpoſe, Whey is very proper. Broths made with young Fowls, liberally drank, are excellent for this Intention, and highly recommended by *Sydenham*. To theſe are to be added Abſorbents, earthy Subſtances, and ſuch as correct the peccant Acrimony, as the Powders of Crabs-eyes, of Sea-ſhells, Mother of Pearl, ſealed Earth, prepared Coral, Amber, the Species de Hyacintho, the bolar Earths, calcin'd Hartſhorn, and Mountain Cryſtal, which ſome recommend as a Specific, with the Addition of a ſmall Quantity of the *Theriaca Cæleſtis*. Whey is alſo poſſeſs'd of a ſingular Power of correcting the Acrimony, and extinguiſhing the Thirſt, with which the Patients are often cruelly tormented. The Antients alſo, eſpecially *Cælius Aurelianus*, *in Morb. acut. Lib.* 3. *Cap.* 21. and *Trallianus*, *in Lib.* 7. highly extol the Drinking of Water, moderately cold; of the Efficacy and Uſe of which, *Borelli*, *in Cent.* 2. *Obſ.* 27. gives us an Inſtance; and I myſelf, ſays *Hoffman*, am convinced of the Truth of this from many Obſervations.

But when, in a Perſon otherwiſe ſound, a Cholera is produced by taking Poiſon, or by a Hypercatharſis or Hyperemeſis, and when the Cauſe of the Cholera conſiſts in a ſmall Quantity of highly acrid Matter, adhering to the nervous Fibres of the Stomach, Evacuations are neither to be ſtopt nor promoted; but the principal Buſineſs of the Phyſician is rather, in this Caſe, to attempt the Sheathing up the thin and cauſtic Humour; for anſwering which Intention, large Quantities of oleous, mucilaginous, and pinguious Subſtances are to be exhibited, ſuch as Oil of ſweet Almonds, Decoctions of Oats and Barley, with Shavings of Hartſhorn; as alſo Milk, which, in this Caſe, proves ſtill more efficacious when mix'd with ſome proper Abſorbent. The abſorbent Powders may alſo be exhibited alternately with acidulated Medicines, which ſurpriſingly contribute to break and blunt the Force of the Poiſon: Of this laſt Kind the principal are the Mixtura Simplex, the Spiritus Vitrioli dulcis, and the Spiritus Nitri dulcis.

After the Evacuation of the peccant Matter, to theſe are to be join'd, eſpecially if the Patient's Strength ſeems too much impair'd, antiſpaſmodic Medicines, and analeptic Specifics, obtain'd principally from the animal Kingdom; ſuch as the Liver of the Wolf dried, the Raſpings of the Stag's Penis, of the human Cranium, and of the Elk's Hoof; calcin'd River-crabs, and calcin'd human Bones; which, by the Obſervations of the moſt ſkilful Phyſicians, are known to be of ſingular Advantage for allaying the convulſive and ſpaſmodic Conſtrictions of the nervous Fibres, both in a Cholera and a Dyſentery; theſe, however, ſeem to act principally as Abſorbents. And as in moſt painful Diſeaſes, ſo more eſpecially in this, Anodynes are moſt ſafely us'd in Conjunction with Evacuants. Of this Kind are the Pilulæ de Styrace, the Pilulæ de Cynogloſſo, and the Pilulæ Starckianæ: And if there is any Suſpicion of a peccant Matter ſtill remaining, and if the Motions are exceſſively violent, the above-mentioned Pills may be mix'd with the Pilulæ Aloephanginæ, or with ſome other gentle Evacuant. To the abſorbent Powders, the Theriaca Cœleſtis, and the Extract of Caſtor, and Cinnabar, may be juſtly added. But my Anodyne Liquor, mix'd with the Oil of Mace, or the Tincture of Caſtor, is beneficial above all other Medicines, and deſerves uncommon Praiſes: Nor are external Paregories and Anodynes to be depriv'd of the Encomiums which are juſtly due to them. Of this Kind the principal are, the Ceratum Stomachale Maſtichinum Galeni, the Balſamum Embryonum, the Spiritus Theriacalis; Liniments prepar'd of the nervous Oils of Nutmeg, Wormwood, and Mint, *Peruvian* Balſam, Caſtor, and Camphire; Cataplaſms of Leaven, Vinegar of Rue, and Spirit of Wine, as alſo diſcutient and paregoric Bags. But when the ſpaſmodic Motions are very violent, and not at all proportion'd to the Bulk of the peccant Matter, there is not a more valuable or more efficacious Medicine for ſtopping them gently, and facilitating the remaining Part of the Cure, than expreſs'd Oil of Nutmegs, together with nervous Liniments apply'd to the Region of the Stomach. My Balſamum Vitæ alſo, apply'd to the Part affected, with folded Linen Cloths, is in this Caſe highly effectual.

When, by means of theſe Medicines, the peccant Matter, which nouriſh'd the Diſeaſe, is evacuated, and the ſpaſmodic Motions ſooth'd, we may with the greater Succeſs corroborate by proper Medicines the Parts weaken'd under this Diſeaſe, becauſe their Tone and Elaſticity are generally much impair'd. This Intention is anſwer'd by the Root of Caſcarilla, exhibited in Eſſence, in Powder, or in Extract; or by the *Peruvian* Bark reduc'd to an Electuary, with the abſtergent and corroborating Extracts, Eſſence of Orange-peel, mix'd with Eſſence of red Gentian and Amber. No inconſiderable Advantage is, alſo, to be reap'd from the external Uſe of rectified Spirit of Wine, or Hungary-water, or the Spirit of the Flowers of Roman Chamomile, mix'd with the diſtil'd Oil of Mint. But, when the Force of the Diſeaſe is ſubdued, the Patient is above all Things to obſerve a ſtrict Regimen, and guard againſt the Sallies of Paſſion; leſt by that means he ſhould again relapſe into a Cholera, in conſequence of the weak Tone of his Viſcera. Broths prepar'd with Veal, Fowls, the Roots of Succory, Parſley, Sparrow-graſs, Chervil, bruis'd Crab-fiſh, and Lemon-juice, are, of all others, the moſt proper Food; with theſe, alſo, chalybeate Tinctures may be uſed, in order to corroborate the Patient.

As for a bilious Diarrhœa, when it is moderate, and the Strength of the Patient entire, Medicines are ſcarcely neceſſary for its Cure. If it continues for any conſiderable Time, Clyſters are to be injected, and Preparations of Rhubarb us'd internally. When it happens to be exceſſively violent, the abſorbent Powders, in Conjunction with Mountain Cryſtal, are to be exhibited, in order to correct the Acrimony; my Anodyne Liquor is to be taken in Mint-water, to allay the Spaſms, and externally my Balſamum Vitæ is to be apply'd to the Abdomen.

Practical Cautions.

The hotter the Seaſon, the Climate, and the Conſtitution of the Patient are, the more ſalutary the drinking cold Water proves in a Cholera; but, beſides its internal Uſe, its external Application to the Stomach, a Practice follow'd by ſome of the Antients, we think unſafe, and full of Danger; becauſe, by this means, a ſudden Obſtruction of the Evacuations may be brought on. Hence we are alſo to account for the Virtues of medicinal Waters, when drank for the Cure of a Cholera.

As in a Cholera ariſing from the taking Poiſon, or an acrid Purgative, Milk is of ſingular Service, by ſheathing up the cauſtic Principle, and carrying it off with it; ſo when a Collection of too acid Sordes is preſent, or when its Excretion is too ſlowly carry'd on, Milk ought to be cautiouſly exhibited, or at leaſt it ought to be mix'd with ſome Abſorbent. Whey, on the contrary, will excellently anſwer the Purpoſe of common Drink; ſince it is of ſingular Uſe, not only in extinguiſhing the Thirſt, but alſo in correcting the Acrimony.

Laxatives, exhibited internally, are very rarely proper in the Cure of a Cholera: But if Evacuation by Stool is indicated, this Intention is beſt anſwer'd by Clyſters, or by Preparations of Rhubarb exhibited internally; for ſweet Subſtances, Preparations of Manna, and laxative Syrups, however mild and gentle in other reſpects, are yet far from being proper in a Cholera: Corroborative and ſpirituous Liquors, exhibited before the peccant Matter is ſufficiently evacuated, with an Intention perhaps to ſuppreſs the Vomitings, fruſtrate the Expectation of the Phyſician, ſince they are ſo far from producing this Effect, that they increaſe not only the Vomiting, but alſo the other Symptoms. With reſpect to Anodynes, and more particularly Oil of Henbane, we muſt obſerve, that they are by no means to be us'd when the Strength of the Patient is too much impair'd, or when he labours under an Inflammation of the Viſcera, becauſe in theſe Caſes they may induce a fatal Sleep, and a Mortification.

As in dyſenteric Patients, who are at the ſame time plethoric, Veneſection contributes very much to prevent an Inflammation, and mitigate the Symptoms; ſo in the like Circumſtances it is to be us'd in a Cholera, eſpecially if the Patient's Strength is not exhauſted. *Riverius*, in his *Prax. Med. Cap.* 9. highly recommends Veneſection in this Diſorder.

Neither a bilious Diarrhœa, nor one of any other kind, ought to be immediately and ſuddenly ſtopt, but the Humours are to be ſlowly and gradually corrected; for which Intention, a Scruple or half a Dram of gently toaſted Rhubarb, with a few Grains of Nitre, is very proper, as it gently evacuates the peccant Humours, and afterwards corroborates the Viſcera by ſlightly conſtricting their Coats; for by its more ſubtile Parts it opens, and by thoſe of a more earthy Quality it contracts, both of which Properties it poſſeſſes when toaſted.

In a Cholera, as well as a bilious Diarrhœa, half a Dram of the expreſs'd Oil of Nutmegs, either by itſelf, or mix'd with one Grain of *Helmont*'s Laudanum Opiatum, and exhibited in Broth, is of ſingular Efficacy for correcting the Acrimony of the Humours. Weak Emulſions alſo, prepar'd of Almonds and white Poppy-ſeeds, with an Addition of the Syrup of white Poppies, and pure Spring-water, excellently anſwer this Intention.

When the Diarrhœa is highly obſtinate, after the Uſe of toaſted Rhubarb for ſome Days, it is proper to exhibit a Sudorific, conſiſting of one Grain of recent Theriaca, together with calcin'd Hartſhorn, and of diaphoretic Antimony, and purify'd Nitre, each twelve Grains: A Cataplaſm of Leaven, Vinegar, and Spirit of Wine, with an Addition of a few Drops of the Oils of Mint and Cloves, apply'd warm to the Præcordia, not only excellently corroborates the ſubjacent Parts, but alſo determines the Courſe of the Humours to the Circumference of the Body, and promotes the cutaneous Evacuation.

When a Cholera is excited by Arſenic, we muſt, with all Expedition, exhibit pinguious Subſtances, ſuch as Oil of ſweet Almonds, Linſeed-oil, freſh Butter, and Oil of Olives, with moderately warm Water; for theſe Subſtances afford the moſt ſpeedy Relief, not only becauſe they excite a Vomiting, by which the greateſt Part of the Arſenic is thrown up, but alſo becauſe, by their means, the cauſtic Acrimony, which vellicates the nervous Fibres of the Stomach, is obtunded, and the ſpaſmodically-conſtricted Parts relax'd.

When the Force of the Cholera or bilious Diarrhœa is ſubdued, it is ſtill expedient for ſome time to uſe an emollient Diet, that, by this means, the vellicated and injur'd nervous Fibres of the Stomach and Inteſtines, may be in ſome meaſure ſooth'd and render'd eaſy: For this Purpoſe ſweet Milk, recent Butter, excorticated Barley, boil'd with Broth of Fowls or Milk, as alſo ſweet Whey, are very proper.

When a Cholera is complicated with a Fever, Milk is not in that Caſe properly exhibited, ſince, in conſequence of the Heat, it runs into a Coagulum; by which means greater Pains, Tenſions of the Viſcera, Head-achs, and Loathing of Ailments, are excited. For this Reaſon, that it may be ſafely exhibited to feveriſh Perſons, eſpecially Children, and young Perſons, rather than thoſe advanc'd in Years, *Trallian* orders a large Quantity of Spring-water to be mix'd with it, after which it is to boil up three or four times, and then be taken off the Fire. He alſo affirms, that Milk, when thus prepar'd, does not prove prejudicial to dyſenteric Patients, even when labouring under a Fever.

In a Cholera and bilious Diarrhœa, eſpecially that Species of it which is excited by the Tranſports of Paſſion, we are carefully, but more particularly about the Beginning, to abſtain from Sudorifics, and a ſudorific Regimen; ſince, by their means, violent rheumatic and arthritic Diſorders are generally produced.

Riverius, in the thirty-third Obſervation of his firſt Century, gives us a very memorable Caſe in the following Words: "A certain Man, of a robuſt and bilious Habit of Body, was "ſeiz'd with a pretty violent bilious Diarrhœa, accompany'd "with a highly intenſe Thirſt. Being call'd, I preſcrib'd for "him Sal Prunellæ in his ordinary Drink, as alſo in Julaps, "prepar'd of the Waters of Lettuce and Purſlain, and to be "taken thrice a Day, by which means he was recovered in "twenty-four Hours time." In Diſorders of this kind, the Efficacy of Nitre or Sal Prunellæ is very conſiderable, as it not only corrects the Heat, but prevents Inflammation. *Frederic Hoffman.*

As *Sydenham*'s Method of treating a Cholera is excellent, and more frequently attended with Succeſs than any other, I ſhall ſubjoin his entire Account of this Diſtemper.

This Diſeaſe was more epidemic in the Year 1669. than I ever remember to have known it in any other. It comes almoſt as conſtantly at the Cloſe of the Summer, and towards the Beginning of Autumn, as Swallows in the Beginning of Spring. There is alſo an Indiſpoſition cauſed by a Surfeit, which happens at any time of the Year, which, with reſpect to its Symptoms, reſembles the Cholera Morbus, and yields to the ſame Treatment, and yet it is of a different Kind. The Cholera Morbus is eaſily known by the following Signs: 1. Immoderate Vomiting, and a Diſcharge of vitiated Humours by Stool, with great Difficulty and Pain; 2. Violent Pain and Diſtention of the Abdomen and Inteſtines; 3. Heartburn, Thirſt, quick Pulſe, Heat and Anxiety, and frequently a ſmall and irregular Pulſe; 4. Great Nauſea, and ſometimes colliquative Sweats; 5. Contraction of the Limbs; 6. Fainting; 7. Coldneſs of the Extremities, and other like Symptoms, which greatly terrify the Attendants, and often deſtroy the Patient in twenty-four Hours. There is likewiſe a dry Cholera, occaſioned by a Flatus, which paſſes upwards and downwards, without Retchings or Stools; but I remember to have ſeen only a ſingle Inſtance of it, at the Beginning of the preſent Autumn, whereas the former Species was very common.

Much Conſideration and Experience have taught me, that to endeavour, on the one hand, to expel the ſharp Humours which feed this Diſeaſe by Purgatives, would be like attempting to extinguiſh Fire with Oil, as the moſt lenient Cathartics would increaſe the Diſturbance, and raiſe new Tumults. And, on the other hand, to check the firſt Effort of the Humour in the very Beginning, by Opiates and other Aſtringents, whilſt I prevented the natural Evacuation, and forcibly detained the Humour in the Body, would doubtleſs deſtroy the Patient by an inteſtine Commotion, the Enemy being pent up in the Bowels.

Let a Chicken be boil'd in about three Gallons of Spring-water, ſo that the Liquor may ſcarce taſte of the Fleſh. Several large Draughts of this are to be drank warm, or, for want of it, Poſſet-drink. At the ſame time, I order a large Quantity of the ſame to be given at ſeveral times, ſucceſſively, by way of Clyſter, till the Whole be taken in, and diſcharg'd by Vomiting and Stool. An Ounce of the Syrup of Lettuce, Violets, Purſlain, or Water-lily, may be added to the Draughts and Clyſters; but the Liquor will anſwer the End pretty well alone. The Stomach in this manner being often loaded with a large Quantity of Liquor, and its Motion, as it were, inverted thereby, and Clyſters being frequently thrown in, the ſharp Humours are either evacuated, or, their Acrimony being blunted, reſtored to their due Temper and Mixture.

When this Buſineſs is over, which requires three or four Hours, an Opiate completes the Cure. I frequently uſe the following; but any other may be ſubſtituted in its ſtead.

> Take of Cowſlip-flower-water, an Ounce; Aqua Mirabilis, two Drams; Liquid Laudanum, ſixteen Drops; Mix them together.

This Method of diluting the Humours is abundantly ſafer and quicker, than the ordinary one of treating this dangerous Diſeaſe, either by Evacuants, or Aſtringents; for Evacuants increaſe the Diſturbance and Commotions, and Aſtringents detain the Enemy in the Bowels; ſo that, not to mention the

Trouble occaſion'd by prolonging the Diſeaſe, there is Danger, leſt the vitiated Humours get into the Blood, and cauſe a Fever of a bad kind.

But it muſt be carefully noted, that if the Phyſician be not call'd, till the Patient is exhauſted by the Vomiting and Looſeneſs having continued, for Inſtance, ten or twelve Hours, and the Extremities are become cold, he muſt then, omitting all other Remedies, have immediate Recourſe to Laudanum, the laſt Refuge in this Diſeaſe, which is not only to be given during the Urgency of the Symptoms, but repeated every Morning and Night, after the Vomiting and Looſeneſs are gone off, till the Patient recovers his former Strength and Health.

Tho' this Diſeaſe be epidemic, as we remark'd above, yet it very rarely laſts longer than the Month of *Auguſt*, wherein it began; whence one may take Occaſion to conſider the elegant and ſubtile Contrivance Nature uſes in producing epidemic Diſeaſes: For tho' the ſame Cauſes entirely remain, which may occaſion this Diſtemper in ſeveral Perſons towards the End of *September* as well as in *Auguſt*, namely, a Surfeit of Fruit, yet we find the ſame Effect does not follow; for whoever carefully attends to the Appearances of a legitimate or true Cholera Morbus, of which only we now treat, muſt acknowledge, that the Diſeaſe occaſionally happening at any other time of the Year, tho' proceeding from the ſame Cauſe, and accompany'd with ſome of the ſame Symptoms, totally differs from that juſt mention'd; as if there lay conceal'd ſome peculiar Diſpoſition in the Air of this particular Month, which is able to impregnate the Blood, or Ferment of the Stomach, with a kind of ſpecific Alteration, adapted only to this Diſeaſe. *Sydenham.*

Hoffman, in his Account of a Cholera, having taken notice of one Sort caus'd by Poiſon, I muſt give the following remarkable Caſe from *Sydenham*, as it appears to inſinuate a better Method of curing it, than that laid down by the former of theſe Authors.

About two Months ſince, a Perſon in my Neighbourhood deſired me to viſit his Servant, who had taken a large Quantity of Mercury Sublimate, being melancholy mad for Love, as I afterwards heard. The Poiſon had been ſwallow'd near an Hour when I came, and his Mouth and Lips much ſwell'd; he was extremely ſick, had a burning Pain in the Stomach, and was almoſt kill'd with Heat. I order'd him to drink three Gallons of warm Water as quick as poſſible, and to take a large Draught of the ſame after each Time of Vomiting; and as ſoon as it appear'd, from the Gripings, that the Poiſon was going downwards, I likewiſe directed warm Water, alone, to be plentifully thrown up by way of Clyſter, in order to waſh his Bowels. The Wretch complied, being now very deſirous to live, and drank ſeveral Pints of Water more than I had directed. He told his Friends that were by, that the Water which firſt came up was very acrid, by reaſon of its being ſaturated with the poiſonous Salt; but that it was leſs acrid after every Vomiting, till it length it became inſipid; and the Gripes that ſucceeded, were remedied by injecting Water alone Glyſterwiſe. By this ſingle Method the Patient was recovered in a few Hours; only the Swelling of his Lips did not immediately fall, and his Mouth remain'd ulcerated; occaſioned by the Particles of the Poiſon, which came up with the Water by vomiting; but theſe Symptoms yielded in four Days to a Milk Diet. I preferred Water to Oil, (which is generally uſed by the leſs Knowing without Succeſs) and all other Liquors, becauſe, being thin, it ſeem'd fitter to abſorb the Particles of this poiſonous Salt, than any other Liquor that was thicker, or already impregnated with the Particles of ſome other Body. *Sydenham.*

CHOLERICUS, χολερικὸς, ſignifies either a Perſon of a choleric Conſtitution, whoſe Humours abound with Bile, or one who labours under the Cholera Morbus. *Caſtellus.*

CHOLOBAPHINON, χολοβάφινον, is an Epithet of Copper, which reſembles Gold in Colour. *Libavius*, *Art. Chym.* calls it *Æs Coronarium.*

CHOLOMA, χώλωμα, from χωλὸς, lame, maimed, *in Hippocr.* περὶ ἄρθ. ſignifies, according to *Galen*, any Diſtortion of a Member, or Depravation of it with reſpect to Motion. It is taken alſo in a particular Senſe for Halting or Lameneſs of a Leg, as appears from 6 *Aph.* 80.

CHOLOS, χωλὸς, lame, like the preceding Word, has a general as well as particular Senſe; hence χωλὴ χεὶρ, "a lame "Hand." *Hip. Prorrhet.* 2.

CHONDRILLA.

The Characters are,

The Root is perennial, and the Leaves are very finely jagg'd.

Boerhaave takes notice of four Sorts of Chondrilla.

1. CHONDRILLA PRIMA, Offic, Dioſc. *Chondrilla cærulea*, Ger. 224. Emac. 286. Buxb. 71. *Chondrilla cærulea altera Cicborei ſylveſtris folio*, C. B. 130. Buxb. Ind. A. 83. *Cærulea ſive purpurea*, Park. 785. *Chondrillæ vel Chondrilla*, Chab. 317. *Chondrillæ vel Chondrilla cærulea*, J. B. 2. 1019. Raii Hiſt. 1. 227. *Lactuca ſylveſtris perennis purpuro-cærulea, laciniato longo folio*, Hiſt. Oxon. 3. 59. *Lactuca perennis humilior flore cæruleo*, Tourn. Inſt. 473. Elem. Bot. 376. GUM SUCCORY. *Dale.*

It grows in uncultivated Places in *Germany* and *Italy*, and flowers in Summer, according to *Dioſcorides.*

Dale ſuppoſes this Herb to be the *Chondrilla prima* of *Dioſcorides.*

There is a Gum found about the Branches like Maſtich, of the Bigneſs of a Bean, which, bruiſed with Myrrh, and apply'd in Linen to the Quantity of an Olive, provokes the Menſes. The Herb, with the Root, is bruiſed, and, with an Addition of Honey, made into Troches, which, diluted and mixed, will deterge the Alphi. This Gum alſo glutinates Hairs, and the freſh Root has the ſame Effect, if a Bodkin be wet with its Juice, and afterwards uſed about the Hair. Drank in Wine, it cures the Bite of a Viper; and the Juice boil'd, and drank with Wine, or alone, ſtops a Looſeneſs. *Dioſcorides*, *Lib.* 2. *Cap.* 161.

2. Chondrilla; altera; Cichorei ſylveſtris folio; flore albo. *C. B. P.* 130. *Lactuca, perennis, humilis, flore albo.* T. 474.

3. Chondrilla; altera; Cichorei ſylveſtris folio; flore carneo. *Lactuca, ſylveſtris, majore flore incarnato.* Flor. 2. 26. *Chondrilla, latifolia, laciniata, flore incarnato.* H. L.

4. Chondrilla; cærulea; laciniata; latifolia. *C. B. P.* 130. *Lactuca, perennis, humilior dentata.* Niſſole. BLUE FLOWER'D GUM-SUCCORY, WITH BROAD CUT LEAVES. *Boerhaave's Index alter Plantarum, Vol.* 1.

Boerhaave takes notice of a Chondrilla, to which he attributes different Characters, which are,

The Seeds are oblong, narrow, and the Calyx in a manner fiſtular and cylindrical.

Boerhaave mentions five Species of this Plant.

1. Chondrilla; Sonchi folio; flore luteo-palleſcente. T. 475. *Sonchus, lævis, laciniatus, muralis, parvis floribus.* C. B. P. 124. *Lactuca, ſylveſtris, murorum, flore luteo.* J. B. 2. 1004. Flor. 2. 26. a.

2. Chondrilla; Sonchi folio; flore purpuraſcente; major. T. 475. *Lactuca, montana, purpurocærulea, major.* C. B. P. 123. *Lactuca, ſylveſtris, purpurea*, J. B. 2. 1005. Flor. 2. 26. *Sonchus montanus, purpureus,* τετραπίταλος. Col. 1. 245. H.

3. Chondrilla; hieracii folio; annua. T. 475. THE ANNUAL GUM-SUCCORY, WITH HAWKWEED-LEAVES. *Hieracium, pulchrum.* J. B. 2. 1025. *Hieracium, montanum, alterum,* λεπτομακρόκαυλον. Col. 1. 248. a, b.

This Plant is annual, not bitter; the Leaves are very ſoft and glutinous; the Stalk is fiſtulous; the Semiflorets are yellow, and indented at the Extremity. It flowers about the End of *May*, and in *June*. *J. Bauhine's* Figure is preferable to that of *Columna*. *Martyn's Tournefort.*

4. CHONDRILLA ALTERA, Offic. *Chondrillâ viminea*, J. B. 2. 1021. Chab. 317. *Chondrilla (rectius Lactuca) viminea*, Raii Hiſt. 1. 223. *Chondrilla Cichoroides*, Dill. Cat. 119. *Chondrilla juncea*, Ger. 226. Emac. 288. *Chondrilla juncea viſcoſa arvenſis, quæ prima Dioſcoridis*, C. B. 130. Tourn. Inſt. 475. Elem. Bot. 377. Boerh. Ind. A. 84. Buxb. 71. *Chondrilla viminalibus virgis*, Park. 788. *Lactuca ſylveſtris perennis lutea, juncea, viminalibus virgis*, Hiſt. Oxon. 3. 85. GUM-SUCCORY, WITH YELLOW FLOWERS. *Dale.*

It grows in ſandy Places in *Germany*, *Italy*, and other Countries, and flowers in *July*. The Herb is uſed; and the Stalks and Leaves thereof, according to *Dioſcorides*, are endu'd with the Virtue of Concoction, and the Juice reduces the diſorder'd Hairs of the Eyelids to their proper and convenient Situation.

Dale takes this to be the Chondrilla Secunda of *Dioſcorides* from his Deſcription of it, as bearing an oblong Leaf, eaten about the Edges, ſpread upon the Ground, a Stalk full of Juice, with a ſlender, round, freſh, ſmooth, yellowiſh, and juicy Root; which Characters, he thinks, agree better with this Herb than with the bulbous Chondrilla of *C. Bauhine.*

5. Chondrilla; viminea; viſcoſa; Monſpeliaca. *C. B. P. Prodr.* 68. *H. Boerhaave's Index alter Plantarum, Vol.* 1.

CHONDRILLOIDES.

The Characters are,

The Leaves are thoſe of the Chondrilla, *C. B. P.* the Stalks ſpread themſelves into numerous Branches, and the Calyx is ſquamous, and almoſt cylindrical. *Boerhaave's Index alter, Vol.* 1.

Boerhaave mentions but one Species of this Plant.

Chondrilloïdes; perennis; lutea. *Vaill. Boerhaave's Index alter Plantarum, Vol.* 1.

CHONDROS, χόνδρος. The ſame as ALICA, which ſee. It ſignifies alſo any grumous Concretion, as of Maſtich or Frankincenſe; and is, beſides, the *Greek* Word for a Cartilago; in *Hippocrates* particularly the *Cartilago Xiphoides.*

CHONDROSYNDESMUS, χονδροσυνδεσμος, from χόνδρος, a Cartilage, and σύνδεσμος, a Ligament, is a cartilaginous Ligament. *Galen, de Temper. Lib.* 1. *Cap.* 9.

CHONE, χόνη. See CHOANA.

CHOPINO, CHEOPINA, a Chopine. A liquid Meaſure at *Paris*, containing, according to *Lemery*, fifteen Ounces and a half of Water; but *Penicher* and the *Dict. Trev.* make it to conſiſt of ſixteen Ounces. *Rieger.*

CHORA, χώρα, a Region, is by *Galen*, *de Uſu Partium*, *Lib.* 8. *Cap.* 6. ſpoken particularly of the Cavities of the Eyes. The ſame Author frequently uſes it to ſignify a void Space.

CHORDA, χορδὴ, properly a muſical String or Cord, metaphorically ſignifies ſometimes a Tendon; and by the Poets the Inteſtines are commonly called Chordæ. *Paracelſus*, *Lib.* 7. *de Orig. & Cur. Morb. Gal.* calls the Pudenda by the Name of *Chordæ*. A painful Tenſion of the Penis, in the Lues Venerea, goes alſo by this Name. See CHORDE.

CHORDAPSUS, χορδαψὸς, from the preceding Word, and ἅπτομαι, to touch, becauſe the Inteſtines, in this Affection, feel to the Touch like ſtretched Cords, is the ſame as the *Ileus*, or Iliac Paſſion. See ILIACA PASSIO.

CHORDATA *Gonorrhœa*, is a Gonorrhœa attended with a painful Tenſion of the Penis. *Blancard.*

CHORDE, or CORDE. This is a Symptom attending a Gonorrhœa. It conſiſts in a violent Pain during the Erection of the Penis, which on theſe Occaſions is very frequent and involuntary. The Pain is perceived principally under the Frænum, and along the Duct of the Urethra; and the Penis is incurvated downwards.

Dr. *Cockburn*, in his Treatiſe of a *Gonorrhœa*, ſays, that this binding Pain, in the time of Erection, is a Symptom of ſuch Difficulty, that Phyſicians have never attempted to explain it; and moſt of them have thought it the ſame with an Inflammation of the Frænum, contrary to all Experience, and antient Deſcription. *Jodocus Lommius*, and ſome other good Authors, ſpeaking of an Ulcer in the Urethra, ſay the Pain in Erection ſhews this Ulcer to be already form'd, which Pain affects the Penis in ſuch a manner as if it were hard bound with a Cord (*ut veluti fune ſubſtringi videatur*). Now this Deſcription agreeing perfectly well with the Chordé in *French*, and Corded in *Engliſh*, it muſt be a great Impropriety, in either of theſe Languages, to ſay, that one has a Cordee. But the Injury done to Practice is far greater, by ſuppreſſing ſo ſenſible and obvious a Symptom, and tranſlating it to another Part; for hereby this proper Symptom is concealed, merely to avoid a Difficulty it were far better to confeſs; and Experience is forced to give way to Speculation, which ought not to be done upon any Account whatſoever.

Perhaps there is not a more ſurpriſing Phænomenon, than that any Part, having a Sore or an Ulcer in its very Subſtance, ſhould give ſuch a Feeling and Senſation, as if it were ty'd round with ſomething, while its Parts are drawn from one another, as they are when its Bulk is increaſed. In Reaſon the contiguous Parts receding from one another ſhould rather affect us with a tearing Pain, than with that of being bound round with a Cord.

But to increaſe the Paradox, the Sore is really inward in the very Urethra; but the Binding, the compreſſing Cauſe which hurts this ſore Urethra, is really without, and therefore the Myſtery is out. This Aſſertion is evident from the Courſe and Situation of the Urethra; for as it runs between the cavernous Subſtances of the Penis, and of its own outward Coat, it is always compreſs'd by them when they are inflated, more or leſs according to the Degree of their Inflation: Wherefore the ſore and hurt Urethra is every-where compreſs'd on all Sides, and cannot give any other Senſe of Pain than that of being hard bound round with a Cord. This Compreſſion of the Urethra has already been obſerv'd to be ſo great, that it is with ſome Difficulty the Seed and Urine are expreſs'd in times of a rigid Erection.

Hence we may know the Place of the Hurt, and how far it reaches, by this Pain in Erection.

The binding Pain in Erection, or the Cording of the Penis, being really a Squeezing of the corroded Urethra between the cavernous Bodies, and the Erection itſelf being often excited by the Stimulating of the Matter of a Gonorrhœa, the Cure of this Cording muſt be had by preſerving the Urethra from being corroded, or by ſuppreſſing the Erection, whereby the Preſſure of the Urethra will be prevented.

The firſt may be effected by mild Diuretics, ſoftening Emulſions, and cooling Injections; but the laſt can only be perform'd by thoſe means that give the moſt ſudden Check to the Swelling of the Penis. If Men therefore recollect what happens to them in immerging themſelves in cold Water, a River, the Sea, and far more in a cold Bath, they cannot be in any want of a ready Remedy on ſuch Occaſions. Cold Water thus infallibly anſwering our Expectations, we muſt not think of loſing Time, when ſo ſpeedy and effectual Means are at hand, in our Parts of the World eſpecially. A Lady of Snow, St. *Francis*'s Miſtreſs, is a certain Relief. However, to keep up to the Rule of our Method, I ſhall relate ſome of the Forms, which Authors recommend, though all of them tend to the ſame Purpoſe.

Though Women have no Glans or Frænum to be affected with the ſharp Running, yet the Sphincter of the Vagina, Clitoris, and Lips themſelves, are inflamed with the ſharp Matter, after the ſame manner as are the mentioned Parts; and therefore the Method of their Cure muſt be the ſame, which is by ſuch Medicines as allay the preſſing Inflammation, and ſecure the Parts againſt their being corroded with the Sharpneſs of the Corruption; both which are to be attained by the following Medicines.

Take of tepid Milk, and the Water of red Roſes, each one Ounce; of Sugar of Lead, one Dram and an half; and foment the Glans and adjacent Parts with the Mixture.

Take of Elder-flowers, and Bran, each one Handful; of white Lily-root, one Ounce; boil theſe in Frog-ſpawn-water, and new Milk, of each one Pint: To the ſtrain'd Liquor, when tepid, add one Dram of the Balſam of Lead: Mix, and with the Mixture foment the ſwelled Parts.

Take of the Leaves of Sorrel and Elder-flowers, each an Handful; and of Wheaten Bread, two Ounces: Mix together, and with freſh Butter-milk make into a Cataplaſm, to be apply'd to the inflamed Glans. *Cockburn, Of a Gonorrhœa.*

Turner, an Author ſo highly orthodox in Phyſic, that he ſeems to conſider every Attempt to improve Medicine as an Injury done to himſelf, or his Profeſſion, reaſons much againſt this Account of a Chordé. With reſpect to Practice, ſpeaking of the Application of cold Water, he ſays, "Yet how far ſuch a "ſudden Conſtriction of the Pores may contribute to the Shut-"ting in of the Poiſon, and fixing the malign Humour, we "are not ſurely appris'd; beſides the Danger of Gangrene, in "caſe of very great Fluxion upon the Part, by retarding, if "not entirely checking, the Circuit of the Blood; ſo that if "any ſuch Experiment were try'd to remove this Complaint, "I ſhould prefer an Epithem dipt in Oxycrate, and apply'd to "the Pubes or Teſticles of the Patient. But, indeed, I think "it better to forbear either, and purge off the Virulence, which "gave Riſe thereto, by ſome briſk Mercurial Cathartic, "making Revulſion alſo between whiles with a Doſe or two of "the Turpeth Mineral, and, on the intermediate Days, di-"recting ſome proper refrigerating and attemperating Emul-"ſions, together with the nitrous, ſaturnine, or camphorate "Solutions." *Turner's Syphilis.*

It has been found by Experience, that rubbing a Mercurial Ointment into the Part affected, and along the Duct of the Urethra, has done conſiderable Service in this Complaint.

CHOREA SANCTI VITI. St. Vitus's Dance.

G. Horſtius ſays, that he talked with ſome Women, who once every Year paid a Viſit to the Chapel of St. *Vitus*, near *Ulm*, and there exerciſed themſelves Day and Night in Dancing, being diſordered in Mind, till they fell down like thoſe in an Ecſtaſy. By this means they ſeem'd to be reſtored to their Health for a whole Year till the Return of *May*, when they were again ſeized with a Reſtleſſneſs, and diſorderly Motions of their Limbs, ſo as to be obliged, at the anniverſary Feaſt of St. *Vitus*, to repair again to the ſame Chapel for the ſake of Dancing. *Horſt. Epiſt. Med. S.* 7. *de admirandis Convulſionibus.*

From this Tradition a ſort of Convulſion, to which Girls are principally ſubject before the Eruption of the Menſes, took its Name; tho', as it ſhould ſeem, improperly, becauſe the Diſorder mentioned by *Horſtius*, and what we call St. Vitus's Dance, appear to be very different.

Sydenham ſays, that St. Vitus's Dance is a kind of Convulſion, which principally attacks Children of both Sexes, from ten to fourteen Years of Age. It firſt ſhews itſelf by a certain Lameneſs, or rather Unſteadineſs of one of the Legs, which the Patient draws after him like an Idiot; and afterwards affects the Hand on the ſame Side, which, being brought to the Breaſt, or any other Part, can by no means be held in the ſame Poſture for a Moment, but is diſtorted, or ſnatched by a kind of Convulſion, into a different Poſture and Place, notwithſtanding all poſſible Efforts to the contrary. If a Glaſs of Liquor be put into the Hand to drink, before the Patient can get it to his Mouth, he uſes a thouſand odd Geſtures; for, not being able to carry it in a ſtrait Line thereto, becauſe his Hand is drawn different Ways by the Convulſion, as ſoon as it has reached his Lips, he throws it ſuddenly into his Mouth, and drinks it very haſtily, as if he only meant to divert the Spectators. As this Diſorder appears to me to proceed from ſome Humours thrown upon the Nerves, which, by their Irritation, excite preternatural Motions, I conceive, that the curative Indications are to be wholly directed, firſt, to leſſen thoſe Humours by Bleeding and Purging; and, ſecondly, to ſtrengthen the nervous Syſtem.

And,

And, to anſwer theſe Ends, I uſe the following Method: Firſt, I order ſeven Ounces of Blood to be taken away from the Arm, or ſuch a Quantity, whether more or leſs, as beſt ſuits the Age of the Patient: The next Day I exhibit half the Quantity, or a little more, of my uſual lenitive Purge, of Tamarinds, Sena, Rhubarb, Manna, and Syrup of Roſes (ſee CATHARTICA); and in the Evening I give the following Paregoric.

Take of Black-cherry-water, an Ounce; compound Piony-water, three Drams; Venice Treacle, a Scruple; liquid Laudanum, eight Drops: Mix them together for a Draught.

I order the Purge to be repeated thrice, with the Interpoſition of a Day between each Purgation, and the Opiate to be given always in the Evening after the Operation. Afterwards I preſcribe Bleeding and Purging, as before; and thus I bleed and purge alternately, till the Patient has been blooded three or four times, and purged after every Bleeding, as often as the Strength will admit; for it is to be carefully obſerved, that there muſt be a ſufficient Interval allowed between thoſe Evacuations, to prevent the miſchievous Effects therefrom. On the intermediate Days I preſcribe the following Remedies:

Take of the Conſerve of Roman Wormwood, and Orange-peel, each one Ounce; Conſerve of Roſemary, half an Ounce; Venice Treacle, and candy'd Nutmeg, each three Drams; candy'd Ginger, a Dram; Syrup of Citron-juice, enough to make them into an Electuary, of which the Quantity of a Nutmeg is to be taken in the Morning, and at Five in the Afternoon, drinking after each Doſe five Spoonfuls of the following Infuſion:

Take of the Roots of Piony, Elecampane, Maſterwort, and Angelica, each an Ounce; the Leaves of Rue, Sage, Betony, Germander, white Horehound, and the Tops of the leſſer Centaury, each an Handful; Juniper-berries, ſix Drams; the Peel of two Oranges: Slice and infuſe them without Heat in ſix Pints of Canary, and ſtrain it off as you uſe it.

Take Rue-water, four Ounces; compound Piony, and compound Briony-water, each an Ounce; Syrup of Piony, ſix Drams: Mix them for a Julap, of which let four Spoonfuls be taken every Night going to Bed, with eight Drops of Spirit of Hartſhorn. Apply a Plaiſter of Gum Caranna, ſpread on Leather, to the Soles of the Feet.

According as the Recovery advances, the Foot and Hand grow more ſteady, inſomuch that the Patient can bring the Glaſs in a more direct Line to his Mouth, which certainly ſhews how much better he is. But though, in order to finiſh the Cure, I do not adviſe Bleeding more than three or four times at moſt, yet purgative and alterative Medicines are to be uſed till the Patient is quite well. And, becauſe ſuch as have once had this Diſeaſe are ſubject to a Relapſe, it is proper to bleed and purge them for ſome Days, about the ſame Seaſon the next Year, or a little earlier than it firſt began.

Sydenham informs us, he cured five Patients of this Diſtemper by the preceding Method.

Dr. *Cheyne* gives a ſomewhat different Method of Cure in St. Vitus's Dance. His curative Intentions are, firſt, to evacuate; ſecondly, to attenuate the Juices; laſtly, to brace the relaxed Fibres.

St. Vitus's Dance is certainly a Mixture of paralytic and convulſive Diſorders. It very often ariſes out of an Epilepſy, eſpecially in young People, when the original Diſtemper is overcome, and a greater Degree of Strength is obtained; tho' ſometimes it is only a Prelude to that ſevere Diſtemper, and may itſelf ſometimes be an original Diſeaſe. *Cheyne's Engliſh Malady.*

When I treated this Diſtemper, ſays our Author, after the following Method, I never fail'd of a ſtanding Cure, in all thoſe that came under my Care, as ſome now living can witneſs. The Party being young, and otherwiſe healthy, (elſe a proper Method for a Cure of a Cachexy was premiſed) to anſwer the firſt Intention of the general Cure, I ordered a Vomit (generally I combin'd either the emetic Wine with an Infuſion of the Ipecacuanha, or the emetic Tartar with the Powder of the Root, wherein the latter adds Certainty and Expedition, the former Force and Strength, to the Operation) to be repeated regularly on the ſame Day of the Week, for a conſiderable time, till the Diſtemper began to decline, and then I lengthen'd its Intervals, together with an anticachectic Diet, already explained. To anſwer the ſecond Intention, I preſcribed, for a Month or ſix Weeks, on all the intermediate Days, a large Doſe of Æthiops Mineral, with *Bath* Waters to waſh it down. And laſtly, after this Courſe finiſhed, to anſwer the third Intention, I gave an Electuary of the Bark, Orange-peel, Powder of Acorns, and Crocus Martis Aſtringens, to brace the Nerves inwardly; and ordered cold Bathing every other Day, for producing the ſame Effect outwardly; and the Cure ſeldom exceeded three Months. *Cheyne on the Gout and Bath Waters,*

CHOREGIA, χορηγία, from χορὸς, a Company of Dancers and Singers, and ἄγω, to lead, is properly the Office of the Maſter of the Plays or Revels, but is metaphorically uſed by *Hippocrates*, ἐν παρεργῳ. to ſignify all the Apparatus neceſſary to a Phyſician.

CHORION, χόριον, χόειον, χωρίον. The external Membrane of the Fœtus. See AMNIOS.

The Chorion is a pretty thick, ſtrong, whitiſh Membrane, covered with a Multitude of Branches of Veins and Arteries. It is diviſible into two Lamellæ, whereof the outermoſt is thick and opake, the inner thin and tranſparent. Thoſe that deny the urinary Membrane, divide it into three. See AMNIOS. *Drake's Anat. Vol.* I.

CHOROIDES, χοροειδὴς, from χόριον, the Chorion, and εἶδος, Likeneſs, is an Epithet of ſeveral Membranes, which, on account of the Multitude of their Blood-veſſels, reſemble the Chorion. Thus the Plexus Choroides is a Convolution of the Membranes of the Brain, conſiſting of an Aſſemblage of Veins and Arteries. It is alſo apply'd to a Portion of the Pia Mater, and the interior Coat of the Eye under the *Sclerotica*. See CEREBRUM, and OCULUS.

CHOSNOS, χῶσνος, in *Hippoc.* περὶ καρδίης, ſignifies a Funnel; but *Hen. Steph.* rightly conjectures, that it ought to be read χῶνος, and ſo it is the ſame as χόανος, CHOANOS, which ſee.

CHOUAN. A *French* Name for a ſmall Seed of a yelloviſh-green Colour, pretty much reſembling Worm-ſeed, but a little bigger and lighter, and in Taſte a little ſalt and biting. It grows on an exotic low Plant, whoſe Flowers are cluſter'd on the Top; and is brought from the *Levant*. It enters the Compoſition of the Carmine. See CARMIN. *Lemery des Drogues.*

CHOYNE. An *American* cucurbitiferous Plant, with Leaves like the Bay-leaves, and bearing a Fruit of the Bigneſs of a moderate Citrul, beautiful, but not eatable, of the Figure of an Oſtrich's Egg, of which the *Indians* make Drinking-cups. *Ray, Hiſt.* 1732.

CHREMA, χρῆμα, in *Hippocrates*, ſignifies the ſame as πρᾶγμα, that is, *Res*, or Thing.

CHRESTOS, χρηστὸς, from χράομαι, to uſe, in *Hippocrates* ſignifies uſeful, good, wholſome, fit. It is an Epithet in common Uſe, and applied upon every Occaſion: χρηστῶς, in *Erotian*, is expounded καλῶς, "well."

CHRISIS, χρίσις, from χρίω, to anoint. An Anointing, or Inunction. See INUNCTIO.

CHRISTI MANUS, literally the *Hand of Chriſt*, is depurated Sugar, boil'd with Roſe-water, and caſt into Troches, with or without an Addition of prepared Pearls. *Caſtellus.*

CHRISTOPHORIANA. *Herb-Chriſtopher.*

The Characters are,

The Flowers are naked, roſaceous, pentapetalous, ſtellated; the Petals very ſubject to fall off, ſurrounding the Baſe of the Ovary, and furniſhed with thirty Stamina. The Ovary is ſoft, like a Berry, almoſt oval, and full of a double Row of Seeds, which, for the moſt part, adhere to one another. *Boerhaave, Index alter, Vol.* 2.

Boerhaave takes notice of four Species of this Plant.

1. Chriſtophoriana vulgaris; noſtras; racemoſa & ramoſa. *H. M.* 2. 8. *Aconitum racemoſum, an Actæa Plinio?* C. B. P. 183. J. B. 3. 55. 660. *Chriſtophoriana*, Dod. p. 402. H. Eyſt. Æſt. o. 10. F. 3. Fig. 1. COMMON HERB-CHRISTOPHER, or BANE-BERRIES.

2. Chriſtophoriana; Americana; racemoſa; baccis rubris. *M. H.* 2. 8. *Aconitum baccis rubris*, Corn. 77. AMERICAN HERB-CHRISTOPHER, WITH RED BERRIES.

3. Chriſtophoriana; Africana; ranunculoides; foliis rigidis. *Herm. M. St. Ranunculus Æthiopicus, foliis rigidis, floribus ex luteo vireſcentibus.* H. A. 1. 1. *Sphondylii, ſive Panacis, rigido hirtoque folio, planta Afra cauſtica.* Par. B. Prodr. 378. *Imperatoria, ranunculoïdes, Africana, enneaphyllos, Laſerpitii lobatis foliis rigidis, margine ſpinoſis.* Plukn. Phyt. T. 95. Fig. 2. Alm. 198. *Imperatoria, ranunculoïdes, Sphondylii hirſuto folio, minor.* Mantiſſ. 108. H.

4. Chriſtophoriana; arbor aculeata, Virginienſis. Plukn. Phyt. T. 20. Fig. 1. *Angelica arboreſcens, ſpinoſa.* H. A. 1. 89. *Arbor, Indica, Fraxini folio, cortice ſpinoſo*, Raii H. 1798. *Angelica, arbor.* Vulgo. H. *Boerhaave's Index alter Plantarum, Vol.* 2.

CHRISTOS, χριστὸς, from χρίω, to anoint, ſignifies whatever is applied by way of Inunction. *Caſtellus.*

CHROMA, χρῶμα, in *Hippocrates*, ſignifies both the Colour of the Body or Skin, and the Superficies of the Body or Skin itſelf.

CHROMATISMUS, χρωματισμὸς, from the preceding Word, is a Colouring, or a natural or artificial Way of communicating a Colour. *Caſtellus.*

CHROMIS, χρόμις, χρόμυς. The Name of a Rock-fiſh good to eat, deſcribed by *Aldrovandus, de Piſc. L.* 2. *C.* 11.

CHRONICUS, or *Chronius*, χρονικὸς, χρόνιος, from χρόνος, Time. Chronical. Diſeaſes which continue a long time, generally without a Fever, are called by this Appellation, in order to diſtinguiſh them from thoſe which proceed with Rapidity, and terminate ſoon, which are call'd *Acute*.

If Health conſiſts in a free and uninterrupted Circulation of the vital Juices thro' the Veſſels, and a Diſeaſe in an Interruption of this Circulation, we may conceive, that an acute Diſtemper ariſes, when many and extenſive Obſtructions occupy a great Number of the Veſſels all on a ſudden; for then the uſual Quantity of Blood is impel'd thro' a ſmaller Space, and returns ſooner to the Heart; in conſequence of this the Contractions of the Heart are more frequent, the Velocity of the circulating Juices is greater, the reciprocal Action betwixt the Solids and Fluids is increaſed, and conſequently the Heat of the Body.

But when Obſtructions are form'd by Degrees, and by little at a time, however extenſive they may become ultimately, no ſuch ſudden Alteration is induced; but the vital Powers, perhaps, by diſcharging out of the Body a Portion of the ſuperfluous Juices, find a way of preſerving the Equilibrium betwixt the Solids and Fluids, and of adapting the circulating Fluids to the Capacity of the pervious Veſſels, without raiſing a Degree of Fever, ſufficient to impart the Name of Acute to the Diſorder.

Chronical Diſeaſes, then, may be ſaid to be produced in the Body, by ſome Peccancy in the Juices, either contracted inſenſibly, and by degrees, or elſe left by ſome acute Diſtemper ill cured.

This Peccancy, contracted inſenſibly, and by degrees, ariſes,

Firſt, from Things taken into the Body, as Air, Meat, Drink, Spices, Medicines, or Poiſons, which are of a Nature different from that of our Juices, and ſo ſtrong, as not to be capable of a due Aſſimilation by the Force of the vital Powers. This Peccancy of the Humours conſiſts,

1. In Acidity. See ACIDA.

2. In Auſterity, form'd by the Union of an Acid with terreſtrial Particles; ſuch as is diſcover'd in unripe Fruits, aſtringent Juices, auſtere Wines, and Things of the like Nature, which, by coagulating the Juices, and contracting the Diameters of the Veſſels, create Obſtructions. The Diſorders hence produced are to be cured by diluting Remedies, fix'd Alcalis, and ſaponaceous alcaline Medicines, perſiſted in for a long time, and exhibited with due Caution.

3. A pinguious aromatic Acrimony, produced by Meats, Drinks, or Spices, which are hot to the Taſte and Smell. Theſe produce Heat and Attrition, and injure the fine Capillary Veſſels: Hence alſo burning Pains, and Attenuation, Putrefaction, and Extravaſation of the Juices, with many other ſimilar Effects. This Species of Acrimony is cured by aqueous, farinaceous, gelatinous, and acid Medicines.

4. In a pinguious inert Acrimony, ariſing from a too liberal Uſe of the Fat of Land Animals, of Fiſh, or of oleous Vegetables. Hence Obſtructions, a bilious Rancidity, Inflammation, Corroſion, and the very worſt Sort of Putrefaction. This is cured by diluting, ſaponaceous, and acid Remedies.

5. In a ſalt muriatic Acrimony, generated by Sea-ſalt, and ſalted Aliments. This deſtroys the Veſſels, diſſolves the Fluids, and renders them acrid: Hence Atrophies, Diſſolutions of the Veſſels, and Extravaſations of their Fluids, which are, by means of the Salt, preſerved from a ſpeedy Putrefaction; but, inſtead of this, appear in Blotches, and other ſcorbutic Appearances. This Acrimony is cured by freſh Water, vegetable Acids, or a Lixivium of Quick-lime.

6. In an alcaline Acrimony. See ALCALI.

7. In a Viſcidity, or Glutinouſneſs.

Secondly, A Peccancy in the Humours may ariſe from too ſtrong an Action of the vital Powers upon the Things taken into the Body. See STRICTURA.

Thirdly, Such a Peccancy may ariſe from a ſpontaneous Degeneracy of our Humours, which generally happens, when they ſtagnate by any Cauſe, whatever. See ACIDA, and ALCALI.

The Humours, in any Part of the Body, may be vitiated by acute Diſtempers ill cured. Thus,

1. Purulent Matter may be communicated to the Humours from an Abſceſs, and cauſe purulent and hectic Fevers, and other Diſorders. See ABSCESSUS.

2. Ichor may be communicated to the Humours from Ulcers, which may corrode and conſume the Solids, and affect the Fluids.

3. Putrefactions of the Viſcera may lay a Foundation for chronical Diſorders.

Acute Diſeaſes, ill cured, may alſo affect the ſolid and compound Parts of the Body, and produce chronical Diſtempers, by leaving Abſceſſes, Fiſtulas, Empyemas, Scirrhuſes, Cancers, and Caries, which, as they affect different Parts, produce various chronical Diſorders.

Many of theſe Cauſes, above recited, may concur to produce complicated chronical Diſeaſes, which are much more difficult of Cure as they are more complex. If, however, we are well acquainted with the particular Cauſes which lay a Foundation for the Diſtemper, the Method of Cure will be leſs intricate; and it will be found, that a leſs Variety of Medicines, than is generally apprehended, is ſufficient for the Cure of chronical Diſtempers, when they are by any means to be relieved, notwithſtanding the infinite Variety of Symptoms, which ariſe from the original Cauſe, tho', in itſelf, not very complex.

As particular chronical Diſtempers are treated of under their Names, it would be ſuperfluous to ſay more on theſe Diſorders in general.

CHROS, χρώς. The *Ionians*, as *Galen* ſays, *Com.* 2. *in Lib. de Tract.* by this Term χρώς, underſtood whatever is carnous in the Body, of which Kind are principally the Skin and Muſcles, and after them the Membranes and Viſcera; but they never call the Bones by this Name, nor the Cartilages, nor Ligaments.

CHRYSALIS, AURELIA, NYMPHA, are Names by which Naturaliſts call the Worm or Maggot, while it lies hidden under a pretty hard Pellicle; which is, for the moſt part, of a bright Yellow, or Gold Colour, (whence the Names *Chryſalis* and *Aurelia*) almoſt without Motion, till it comes forth a Butterfly, or ſome other winged Inſect. *Rieger.*

CHRYSALITES. A figured Stone, of a glittering Gold and Iron Colour, like the Ammonis Cornu, hard, and rough, with Multitudes of circular Striæ, and furniſh'd with three or four Circumgyrations, reſembling in ſome meaſure the *Chryſalis. Rieger.*

CHRYSANTHEMOIDES, Hard-ſeeded *Chryſanthemum*, and CHRYSANTHEMOIDES.

The Characters are;

The Leaves grow ſcattering; the Flower is like that of the ſmall Sun-flower. The Calyx is ſimple, divided at the Baſe in one of the Species, and ſquamous in the other. The Ovary becomes a Stone, containing a hard Kernel, each Flower producing an Ovary, as in others of a like Kind. *Boerhaave's Ind. alter, Vol.* 1.

Boerhaave mentions three Species of this Plant.

1. Chryſanthemoides; oſteoſpermon; Africanum; odoratum; ſpinoſum; & viſcoſum. *H. A.* 2. 85. *Chryſanthemi flore planta Afra, Baccifera, ramis in aculeum abeuntibus.* Par. Bat. App. *Chryſanthemum Africanum, fruteſcens, ſpinoſum.* Volk. 105. *Huic Calix ſimplex.* H. R. D. AFRICAN SWEET-SCENTED HARD-SEEDED CHRYSANTHEMUM, WITH PRICKLY BRANCHES, AND VISCOUS LEAVES.

2. Chryſanthemoides; oſteoſpermon; Africanum; arboreum; foliis populi albæ. *Chryſanthemum arboreſcens, Æthiopicum, foliis populi albæ.* Breyn. Cent. 156. M. H. 2. 23. *Chryſanthemoides Africanum, populi albæ foliis.* T. Mem. Ac. Reg. 1705. *Chryſanthemum bacciferum, populi folio, Africanum.* Ind. 278. *Huic Calix ſquamoſus triplici ſerie.* H. R. D. AFRICAN HARD-SEEDED TREE CHRYSANTHEMUM, WITH LEAVES LIKE THE WHITE POPLAR.

3. An Chryſanthemoides? quod Chryſanthemum ex Inſulis Caribæis Leucoji incanis & ſericeis foliis, argenteis, craſſis. *Pluk. Phyt.* 115. 4. *H. R. D.* HARD-SEEDED CHRYSANTHEMUM, FROM THE CARIBBEE ISLANDS, WITH THICK WHITISH LEAVES. *Boerhaave's Ind. alter Plantarum, Vol.* 1.

CHRYSANTHEMUM.

The Characters are;

The Root periſhes every Year. The Calyx is hemiſpherical and ſquamous; and the Rays of the Flower are, for the moſt part, of a Gold Colour. *Boerhaave, Index alter, Vol.* 1.

Boerhaave mentions ſeven Species of this Plant.

1. CHRYSANTHEMUM, Offic. *Chryſanthemum foliis Matricariæ*, C. B. 134. Raii Hiſt. 1. 340. Tourn. Inſt. 491. Elem. Bot. 393. Boerh. Ind. A. 105. *Chryſanthemum veterum ſeu majus folio valde laciniato*, Chab. 359. *Chryſanthemum majus folio valde laciniato flore croceo*, J. B. 3. 104. DIOSCORIDES HIS CORN-MARYGOLD.

It is cultivated, tho' but rarely, in Gardens; and flowers in Summer. The Flowers are uſed in Medicine; and, being bruiſed with Cerate, are ſaid to diſcuſs a Steatoma. *Dale* from *Dioſcorides.*

2. Chryſanthemum; folio Matricariæ; flore luteo, pleno. THE DOUBLE YELLOW CHRYSANTHEMUM, OR CORN-MARYGOLD.

3. Chryſanthemum; flore partim candido, partim luteo. *C. B. P.* 134. WHITE CORN-MARYGOLD, OR CHRYSANTHEMUM.

4. Chryſanthemum; folio Matricariæ; flore albo, pleno. *H. C. a.* THE DOUBLE WHITE CHRYSANTHEMUM, OR CORN-MARYGOLD.

5. Chryſanthemum; folio Matricariæ; floris radiis ſulphureis, diſco aureo. *a.*

6. Chryſanthemum; folio Matricariæ; flore magno, bullato, ferè nudo. *Chryſanthemum, Creticum, apetalon.* Bobarl. *An Chryſanthemum, Creticum, petalis florum fiſtuloſis.* T. 491. a. THE QUILL-LEAVED CHRYSANTHEMUM, OR CORN MARYGOLD.

7. Chryſanthemum; folio latiori Matricariæ; flore magno, ſulphureis radiis, diſco aureo. *a.*

8. Chryſanthemum; folio latiori Matricariæ; flore aureo. *a.*

9. Chryſanthemum; ſegetum; facie bellidis ſylveſtris; foliis glaucis, papaveris hortenſis inſtar profundè inciſis. *H. L.* 145.

CHRYSANTHEMUM SEGETUM, Ger. deſcript. 604. Emac. 743. Raii Synop. 3. 182. Hiſt. 1. 339. *Chryſanthemum ſegetum vulgare glaucum*, Hiſt. Oxon. 3. 15. *Chryſanthemum ſegetum noſtras*, Park. Theat. 1370. *Chryſanthemum folio minus ſecto glauco*, J. B. 3. 105. Tourn. Inſt. 492. *Chryſanthemum arvenſe folio glauco dentato*, Rupp. Flor. Jen. 136. *Bellis lutea foliis profunde inciſis majus*, C. B. Pin. 262. CORN-MARYGOLD.

It is frequent among the Corn: The Flowers are in Uſe, which are extol'd by the *Germans*, as an extraordinary Remedy for the yellow Jaundice. *Dale.*

10. Chryſanthemum; ſegetum; facie bellidis ſylveſtris; foliis glaucis, papaveris hortenſis inſtar profundè inciſis; minus. *H. L.* 145. *Bellis lutea, foliis profundè inciſis, minus.* C. B. P. 262. a.

11. Chryſanthemum; folio glauco, minus ſecto; flore ex albo & luteo variegato. *a.*

12. Chryſanthemum; Bellidis majoris folio viridi. *Flor.* 1. 34. *Bellis, lutea, foliis ſubrotundis*, C. B. P. 262. *Chryſanthemum Myconi.* Lugd. 873. *Chryſanthemum, latifolium.* J. B. 3. 105. a.

13. Chryſanthemum; Bellidis majoris folio viridi; minus. *a.*

14. Chryſanthemum; pallidum; minimis imiſque foliis inciſis, ſuperioribus integris & capillaribus. *Barr.* 1. 421. *Obſ.* 1093. *a. Boerhaave's Index alter Plantarum, Vol.* 1.

CHRYSATTICUM. An Epithet of a ſort of *Paſſum*, recommended by *P. Ægineta, Lib.* 3. *Cap.* 50. to be drank, with the Seed of Atriplex, for the Icterus, or yellow Jaundice.

CHRYSE, χρυσὴ. The Name of a Plaiſter in *P. Ægineta, Lib.* 7. *Cap.* 17. for recent Wounds. It conſiſts of Frankincenſe, and plumous Alum, each two Ounces; Colophony, Rozin, each one Pound; Oil, three Ounces; Orpiment, two Ounces. The Orpiment to be triturated in Vinegar.

CHRYSISCEPTRUM. A Name, in *Blancard*, for the white *Chamæleon.*

CHRYSITIS SPODOS, χρυσῖτις σποδὸς, in the ſpurious Additions to *Hippocr.* περὶ γυναικ. *Lib.* 1. is the Aſhes of Spuma Argenti, and recommended in ophthalmic Caſes. *Chryſitis*, χρυσῖτις, in *Dioſcorides, Lib.* 5. *Cap.* 102. is one of the three Species of *Spuma Argenti*, or Litharge, ſo call'd from its yellow Colour, reſembling that of Gold.

CHRYSOBALANUS, χρυσοβάλανος. A Drug mention'd by *Galen, de C. M. S. L. Lib.* 8. *Cap* 3. but not certainly known to the Moderns. *Bauhine*, in his *Pinax*, ſuppoſes it, after others, to be the Nutmeg.

CHRYSOCALLIA. A Name in *Dioſcorides*, as *Oribaſius* reads it, inſtead of the vulgar *Chryſocome*, for the *Anthemis*, or *Chamæmelum.*

CHRYSOCERAUNIUS, χρυσοκεραύνιος. The ſame as CERAUNIOCHRYSOS, or *Aurum fulminans.*

CHRYSOCHALCOS, χρυσοχαλκὸς. The ſame as *Aurichalcum. Rulandus. Johnſon.* It is alſo called *Orichalcum.*

CHRYSOCOLLA. The ſame as BORAX, which ſee.

CHRYSOCOME, χρυσοκόμη, from χρυσὸς, Gold, and κόμη, Hair, is a Name for many Species of the HELICHRYSUM, which ſee.

CHRYSODENDRON. See CONOCARPODENDRON.

CHRYSOGONIA, χρυσογονία, from χρυσὸς, Gold, and γίνομαι, to be made or generated of, is the aurific or Gold-making Seed, moſt perfectly concocted from a Solution of Gold; or the aurific Tincture, of a red Colour, endued with an admirable Fineneſs of Subſtance, and with a natural aurific Virtue, as the *Argyrogonic* is with an argentific one. *Theat. Chym. Vol.* 2.

CHRYSOGONUM, Offic. Park. Theat. 683. Raii Hiſt. 2. 1326. Hiſt. Oxon. 2. 285. *Chryſogonum Dioſcoridis quibuſdam*, J. B. 3. 489. Chab. 486. *Chryſogono di Dioſcoride*, Pon. Ital. Bald. 141. *Leontopetalo affinis foliis Quernis*, C. B. Pin. 324. *Leontopetalon foliis coſtæ ſimplici innaſcentibus*, Tourn. Coroll. 49. RED TURNEP.

It grows in *Syria*; and the Root, which is the Part uſed in Medicine, is good againſt the Bites of Serpents, being endued with a digeſtive, drying, and heating Quality. *Dale.*

CHRYSOLACHANON. A Plant mention'd by *Pliny. Rieger* ſuſpects it to be Mercury.

CHRYSOLITHUS, Offic. Charlt. Foſſ. 39. Mont. Exot. 14. *Chryſolithus Modernorum*, Worm. 106. *Topazius Veterum, quem recentiores perperam vocant Chryſolithon*, De Laet. 46. *Topaſius Veterum*, Boet. 207. *Topazius*, Aldrov. Muſ. Metall. 976. *Topaſius, ſive Chryſolithus*, Geoff. Prælect. 82. THE CHRYSOLITE.

This is a green diaphanous Gem, of a glittering Splendor, like Gold. It is found in *India*, and other Countries; and is endued with the Virtue of ſtopping Hæmorrhages, and of mitigating Bile, Anger, and Phrenſies. *Dale* from *Boet.*

CHRYSOPASIUS.

Topaſius, & Chryſopaſius, Offic. *Topaſius*, Charlt. Foſſ. 39. *Topazius Neotericorum; Veterum Chryſolithus*, Worm. 106. *Topazius*, Schw. 406. Kentm. 47. *Chryſolithus Veterum*, Boet. 210. De Laet. 49. Mont. Exot. 14. *Chryſolithos*, Schrod. 327. *Chryſolithos, ſive Topaſius*, Geoff. Prælect. 82. *Chryſolithus*, Vet. THE TOPAZ.

It is a diaphanous and pellucid Stone, of the Colour of Gold, and is ſuppoſed to be of a ſolar Nature from its Signature; for which Reaſon it is believed to ſtrengthen the Mind againſt nocturnal Fears, to diminiſh Melancholy, to prevent troubleſome Dreams, and to work other ſuch good Effects. *Dale* from *Schroder.*

Theſe Virtues are utterly ſuperſtitious.

CHRYSOPLYCIUS PULVIS. A ſort of Powder mention'd by *Helmont, Nat. cont. Neſc. Tit.* 40. which, he ſays, procures Hardneſs to Lead, and Difficulty of Liquefaction to Tin and Mercury, but deprives Iron of both theſe Qualities.

CHRYSOPŒIA, χρυσοποιία, from χρυσὸς, Gold, and ποιέω, to make, is that Part of the ſpagirical or chymical Art, which teaches the making of Gold out of more imperfect Metals, by Help of the *Mercurius Philoſophorum.*

CHRYSOPUS, χρυσωπὸς. A Name for the *Indian* purging Juice, otherwiſe call'd *Gummi Gotta. Caſtellus.*

CHRYSOS. See AURUM.

CHRYSOSPLENIUM, *Golden Saxifrage.*

It has a fibrous perennial Root: The Leaves are ſemiorbicular; the Cup of the Flower, which, according to *Tournefort*, is to be taken for a Flower, is divided into four, ſeldom into five Lobes. The Flower is apetalous, and furniſh'd with eight Stamina, which grow round the Margin of the Ovary. The Fruit is a bivalve, fork'd, membranaceous Capſule, with only one Cell, containing many Seeds.

Boerhaave mentions two Species of this Plant.

1. Chryſoſplenium; foliis amplioribus, auriculatis. T. 416. *Saxifraga, rotundifolia, aurea.* C. B. P. 309. *Saxifraga, aurea.* Dod. p. 316. J. B. 3. 707. H. Eyſt. Hyem. F. 6. Fig. 5. *Alchimilla, rotundifolia, aurea, hirſuta.* H. L. 14. H. GOLDEN SAXIFRAGE, WITH LONG-EAR'D LEAVES.

2. Chryſoſplenium; foliis minoribus, ſubrotundis. T. 146. *Saxifraga, rotundifolia, aurea, minor, montis aureti.* H. R. Par. H.

Boerhaave's Index alter Plantarum, Vol. 2.

CHRYSULCA. An Epithet in *Helmont*, and ſome others, for Aqua Stygia, or Aqua Regia.

CHRYSUN, χρυσὸν, from χρυσὸς, Gold. An Epithet of two Collyria for the Eyes, and alſo of two Peſſaries for the Uterus, in *Aetius.*

CHU, CHUS. A Meaſure. The ſame as CHOA, which ſee.

CHYBUR, CHIBUR, in the Language of *Paracelſus*, is Sulphur. *Caſtellus.*

CHYLARION, χυλάριον. A Dimiutive of χυλὸς, *Chylus*, Juice, or Liquor, and render'd by *Foeſius*, in *Hippocr. de intern. Affect. Succatiuncula*, where he obſerves, that all the Copies, inſtead of χυλαείῳ, by a groſs Miſtake, read χαλαείῳ.

CHYLIFICATIO, CHYLOSIS, χύλωσις, χυλοποίησις. The Act of reducing the Aliment in the Stomach to Chyle. It is commonly call'd *Coctio prima*, "the firſt Concoction." See CHYLUS.

CHYLISMA, χύλισμα, from χυλίζω, of χυλὸς, Juice, in *Dioſcorides, Lib.* 3. *Cap.* 125. ſignifies expreſs'd Juice.

CHYLOSTAGMA *Diaphoreticum Mindereri*, call'd alſo *Aqua Theriacalis Bezoardica* in the *Auſburg* and *Straſburg* Pharmacopœias, is a Liquor diſtil'd from the *Theriaca Andromachi*, the *Mithridate* of *Damocrates*, and a pretty many other heating Vegetables, commonly call'd Alexipharmacs, with the Root of Tormentil, the Bark of Aſh, the middle Rind of Elder, the Juices of unripe Walnuts, Limes, and Sorrel, and the Vinegars of Raſpberries, Elder, Roſes, and Rue. In the *Brandenburgh* Diſpenſatory, you have it under the Title of *Aqua Theriacalis compoſita ſeu Bezoardica*, but with ſome Alterations.

The

The *Aqua Theriacalis Bezoardica* of the *Copenhagen* Diſpenſatory ſeems deſign'd for an Emendation of the ſame. *Rieger.*

CHYLUS, χυλὸς, in general, ſignifies a Juice and Humour incraſſated by Heat, and of a middle Conſiſtence between humid and dry. But χυλὸς, in *Hippocrates*, is uſed ſimply to ſignify the Juice and ſorbile Liquor of Ptiſan or Barley, which Liquor they call ſtrain'd Ptiſan, being the expreſs'd Subſtance of the Barley; not what the *Latins* call *Cremor*, which is only the expreſs'd Water of the Barley. To χυλὸς is oppoſed *whole* and *entire*, that is, not ſtrain'd Ptiſan. See our Tranſlation of *Hippocrates de Rat. Vict. in Morb. acut.* under the Article ALCALI.

CHYLUS. The Chyle.

Aliments of every Kind, whether ſolid or fluid, are, not only in the Stomach, but alſo in the Duodenum, which is a Kind of ſuccedaneous Stomach, and in the Whole of the ſmall Inteſtines, by the Warmth of the Parts, and the Aſſiſtance of the gaſtric Lymph and Bile, diſſolv'd and converted into an alimentary Liquor called *Chyle*, which being ſecreted thro' the Inteſtines, from the recrementitious Maſs of Aliments, to be diſcharg'd by way of Excrements, is by a peculiar Mechaniſm convey'd to the Maſs of Blood.

That the Duodenum is a ſuccedaneous Stomach, is obvious from this, that it is ſufficiently large, and has a Flexure like that of the Stomach, by means of which, the Maſs of Aliments may be the longer retain'd in it. It is alſo furniſhed with Menſtruums, or ſolvent Liquors peculiar to itſelf; ſince not only a large Number of ſmall Glands detected by *Brunnerus*, and which diſcharge a menſtruous Lymph, are ſituated in it, but alſo becauſe the pancreatic Juice, mixing with the Bile, accompliſhes the farther Elaboration and Rectification of the Chyle.

The Chyle itſelf is a milky inſipid Liquor, conſiſting of oleous and mucilaginous Parts, and extracted from the diſſolv'd Aliments.

The Chyle is, as it were, a natural Emulſion; and as, in order to conſtitute this, a Mixture of oleous and aqueous Parts is requiſite; ſo, that Chyle conſiſts of the ſame Ingredients, is obvious from thoſe Parts, which in Milk, which is nothing but Chyle, are converted into Butter, Cheeſe, and Serum: And as every artificial Emulſion, prepar'd with Water and oleous Seeds bruis'd, is of a whitiſh Colour, which ariſes from the Oil reduc'd to ſmall Globules reflecting the Rays of Light; ſo alſo the Whiteneſs of the Chyle can hardly be aſcrib'd to any other Cauſe than this.

Boerhaave has ſet the Analogy betwixt Emulſions of Vegetables and Chyle in a very clear Light. He ſpeaks only of vegetable Subſtances; but if we reflect, that Animal Subſtances, taken by way of Aliment, are originally form'd from Vegetables, and, like them, conſiſt of Oil, Earth, Water, and Salts, (the laſt Volatile) we ſhall readily conceive, how the Organs of Digeſtion convert, alſo, Animal Subſtances into Chyle, or a ſort of Emulſion.

The Paſſage hinted at in *Boerhaave* runs thus.

1. If the oleaginous Vegetable Subſtances are reduc'd to a Powder, or bruis'd, and ground in a Marble Mortar with a Wooden Peſtle, and a little Water ſlowly and ſucceſſively poured upon them in the Grinding, that they may then come into a well-wrought Paſte, they will change into a white Maſs; which the longer it is ſo ground, the more uniform it becomes, and the better fitted for this Proceſs. 2. Then gradually add more fair warm Water, ſo as to make the Whole fluid, and continue the Triture without Intermiſſion, as before; whereby the Liquor, floating above the Matter, will begin to grow milky and unctuous: Let the Liquor now reſt a little, then pour it off by a gentle Inclination of the Mortar upon a thin Linen Strainer, that the finer Part may paſs thro' into a clear Veſſel. 3. To the groſs Part remaining behind in the Mortar, and in the Strainer, again add freſh Water, and grind and ſtrain as before, adding this ſecond Liquor to the former, and repeat this for ſeveral times, till the Liquor poured off gradually becomes leſs white, leſs thick and unctuous, and at length perfectly aqueous; at which Time but a very little of the Subject will remain in the Mortar, and that chaffy, poor, exhauſted, and inſoluble in Water, tho' aſſiſted by long Triture, appearing almoſt merely terreſtrial, without Salt, or the leaſt Signs of Oil: Whence, by this means, the Parts of Vegetables, fill'd with Oil, are divided into two diſtinct Kinds; the one diſſolvable by Water, the other not.

The Liquor, thus prepar'd, reſembles in many reſpects the Chyle of Animals, which is itſelf prepar'd from Vegetables in their Bodies, by chewing, ruminating, and the Action of the Stomach, before it is mix'd with the Bile in the Duodenum. The Thing appears plain from the white Colour, the mild Odour, the ſweet Taſte, the thick Unctuouſneſs, and the great Diſpoſition they both have to turn ſour. So likewiſe, if the Liquor, thus prepar'd, ſtand ſome time in a tall cylindrical Veſſel, it ſpontaneouſly ſeparates into a white, thick, and almoſt totally oily Part, which floats at Top, and into a thinner, tranſparent, bluiſh Liquor, which remains below, wherein it perfectly reſembles Milk, as dividing itſelf into Cream, and thin Milk. Again, if this Liquor be kept for ſome time in a warm Air, it turns ſour, and afterwards conſiderably ſharp, tho' without acquiring the proper Rancidneſs of an expreſs'd Oil, in which reſpect alſo it perfectly agrees with Milk, which acquires the like Acidity in ſuch an Air, without becoming rancid like pure Oil: Whence this farther Remark ſhould be made, that in acute Diſtempers Emulſions may be given with greater Safety than expreſs'd Oils. But I could never, by any Art of Coagulation I have us'd, obtain a Curd from this Liquor, as Milk affords; whence there is this Difference betwixt the Milk of Vegetables and Animals. The Reaſon of the Difference betwixt expreſs'd Oils and Emulſions ſeems principally this, that the mealy Part in the Grinding being conſtantly in fine Particles interpoſed betwixt the pure Oil, the Parts of this Oil are ſo broke and ſeparated from one another, that its Tenacity being chang'd, it becomes miſcible with Water, and thence appears in the Form of Milk, which alſo conſiſts of a fat Subſtance diſſolv'd in Water; whereas, when a pure Oil is obtain'd by Expreſſion, the Parts thereof, being in Contact with each other, do not admit of Water, nor ſuffer it to be mix'd among them. Again, the large Quantity of Meal, intermix'd amongſt the Oil in the Emulſion, cauſes it to turn ſour, not rancid; and hence appears the Reaſon why the Liquor is white; for Whiteneſs always enſues, as often as Oil is intimately divided and mix'd with Water. If Oil be poured upon a Glaſs of Water, the two Liquors will remain tranſparent and ſeparate; but if ſhook briſkly together, they will unite in ſome meaſure, and, during that Union, the Mixture will appear perfectly white; but if now ſuffer'd to reſt, the Oil collects at the Top, the Water ſinks to the Bottom, and the Whiteneſs immediately vaniſhes: And the ſame Thing frequently happens in Animal Milk, diſtilled oleaginous Waters, and theſe Emulſions. It is alſo certain, that the Whiteneſs becomes greater, the larger the Quantity of Oil; and, in this Caſe, the Liquor ſooner grows rancid; but the leſs the Oil, the leſs white the Liquor, and the ſooner it turns ſour. In the Summer Emulſions will ſcarce keep ten Hours, but in the Winter longer. To conclude, this Method of making Emulſions gives Light to the Action of Maſtication; for all the Foods prepar'd from Corn, abounding with a latent Oil, and being ground by the Teeth in chewing, and mix'd with the Saliva, the longer they are thus acted upon in the Mouth, the nearer they approach to theſe Emulſions, and at length always turn white, when the Saliva, Salt, and Oil, are well ground together. The Operation, thus begun in the Mouth, is carry'd on in the Stomach, and more perfected in the Inteſtines, where the Matter ſtill retains the ſame Nature, except that new Juices are perpetually mixing themſelves therewith, and communicating their Properties; whereas, in our pharmaceutical Operations, there is no Addition but of Water alone. And hence we may underſtand the artificial Diſtinction between the firſt Chyle, and the Milk of Animals.

Hence we alſo learn the Origin of the Fat in Animals, which feed upon Vegetables; ſince Vegetables conſtantly abound with Oil, which may be prepared and extracted from them by chewing, ruminating, and the Power which the Body has of making the Chyle. 2. We hence ſee the Nature and Uſe of this Oil in Plants. 3. So likewiſe we learn the Manner, whereby a Liquor, extremely like Chyle and Milk, may be produced from Oil and Water mix'd and ground together in a certain manner, and hence perceive how the human Body acts in producing Chyle and Milk. 4. Hereby we are orderly led to conſider thoſe Oils call'd eſſential. 5. Phyſicians acquainted with theſe Particulars will not wonder, whence Men in Health, who uſe little Exerciſe, ſhould abound in Fat, even tho' they often uſe nothing but vegetable Food; ſince Expreſſion and Emulſion can ſo eaſily extract a large Quantity of Oil from Vegetables not apparently oily. 6. Hence we ſee the Origin both of Chyle and Milk; and, 7. The Nature of thoſe Principles which conſtitute them both; which are the Animal Juices, conſiſting of the Saliva, the fine anterior Dew, the Mucus of the Mouth, Jaws, Gullet, Stomach, and Inteſtines; and again, of thoſe aqueous, ſaponaceous, oily, and ſpirituous Matters, in the Liquors enumerated, which may be brought into the Form of an Emulſion, and expreſſed from the groſſer Parts, by the means of Maſtication, Deglutition, the Action of the Stomach, and the periſtaltic Motion. 8. Hence alſo may be eaſily deduced the phyſical Reaſon, why the Milk of Animals, prepared entirely from vegetable and tartiſh Food, is ſo ſubject to turn ſour, when out of the Body. Recent verdant Graſs, by being long maſticated, or ruminated, with a large Proportion of Saliva, begins even in the Mouth to aſſume the Form of Milk, and promote the Production of Fat: Whence Men uſually grow fat with Bread and Water, and Cattle with Water and Graſs.

Since the principal Element of the Chyle is an Oil, blended with a mild, gelatinous, and mucilaginous Subſtance, 'tis obvious that thoſe Subſtances afford the moſt copious and laudable

able Chyle, which are furniſhed with a mild, oleous, and mucous Juice, ſuch as the Fleſhes of Animals, and, in the Vegetable Kingdom, all the farinaceous Seeds.

Hence the Reaſon is plain, why a Man may live upon Water and Bread alone; for theſe Subſtances include, in a due Degree and Proportion, all the Ingredients of the Chyle and Blood. From this it alſo appears, why, in the Eaſtern Countries, Rice ſerves the Inhabitants inſtead of Bread, and why by the Uſe of Barley, Wheat, Oats, Peaſe, Beans and Cheſnuts, not only Men, but every other Species of Animals, become fat. Hence alſo the Reaſon is obvious, why thoſe Aliments which are not of a temperate Quality, ſuch as acid, ſpirituous, and ſaline Subſtances, the Juices of many Vegetables, Herbs, Roots, with acrid and aromatic Subſtances, are improper for producing Chyle, and carrying on the Work of Nutrition.

The Chyle, extracted from the diſſolved Aliments, is ſtrained thro' the villous Coat of the ſmall Inteſtines, convey'd to the ſmall Mouths of the lacteal Veſſels, and poured into them.

This villous Coat, which is moſt conſpicuous in the Jejunum, is no more than a Congeries of a large Number of villous Subſtances, or ſmall Tubes variouſly interwoven with each other; and this Congeries is the Source and Origin of the lacteal Veſſels.

That the *Villi* of the Inteſtines are furniſh'd with Cavities obſervable by Microſcopes, is excellently demonſtrated by *Brunnerus*, in his Treatiſe *de Glandulis Inteſtinorum*. From the ſame Author we learn, that where there are inteſtinal *Villi*, there are alſo lacteal Veſſels; and that where the former of theſe are not to be ſeen, as in the Stomach for Inſtance, there the lacteal Veſſels are inviſible.

The villous Coat of the Inteſtines is not merely paſſive, but, in conſequence of the Afflux of the nervous Fluid and Blood, is furniſh'd with a certain Degree of Strength and Tone, or a Motion by which it is contracted and dilated; ſo that theſe ſmall villous Canals, and the Orifices of the lacteal Veſſels, may be either too much contracted, or too much relaxed.

In Spaſms and Gripes of the Inteſtines, as alſo upon the Uſe of acrid Purgatives, or corroſive Poiſons, this villous Coat is highly conſtricted; ſo that nothing, except a fine thin Fluid, is paſs'd thro' it, as is ſufficiently evinced by the Symptoms common to hypochondriac Patients, and by the Flatulences and Congeſtions of peccant Humours uſual in ſuch a Caſe.

The villous Coat, with which the ſmall Inteſtines eſpecially are furniſh'd, is that common Strainer, thro' which all the Liquor is convey'd from the *Primæ Viæ* to the Blood, and all the other Parts of the Body; Hence 'tis of the utmoſt Importance, that this villous Coat ſhould be in its due and natural State; for if the Mouths of the Veſſels are too wide and pervious, the groſs, feculent, and recrementitious Parts of the Chyle are convey'd to the Blood. If, on the contrary, they are too much contracted, the thin and watery Part of the Chyle is only convey'd to the Blood, whereas the more uſeful and alimentary Parts of it are kept back.

Since all the Chyle, and every other Fluid, muſt paſs to the Maſs of Blood thro' the minute capillary Veſſels of this villous Coat, and thro' the lacteal Veſſels, hence theſe Ducts, and other Orifices, ought to be open and pervious, but not obſtructed with any mucous Subſtance.

To obſtruct theſe ſmall Ducts of the villous Coat, thoſe Aliments greatly contribute, which are converted into a viſcid Coagulum, ſuch as hot Bread, farinaceous Subſtances, and Cakes not ſufficiently fermented, coagulated Milk, viſcid and compact Aliments, Fats, which eaſily run into a Coagulum, ſuch as that of Sheep; together with all Aliments and Medicines poſſeſſed of an aſtringent Quality.

Bountiful Nature has therefore wiſely appointed, that the Bile, in conſequence of its ſaponaceous and abſtergent Quality, and the Lymph, in conſequence of its being inceſſantly diſcharg'd from the Glands and glandular Coats, ſhould preſerve this villous Coat from being obſtructed by a thick and viſcid Mucus.

Hence the Reaſon is plain, why the drinking good Waters, warm Infuſions of Tea and Coffee, together with Decoctions of Herbs, is ſo highly beneficial, ſince the principal Advantage, attending the Uſe of theſe Liquors, conſiſts in this, that they keep this Coat free from Obſtructions, and preſerve its Ducts open and pervious. Hence alſo the Reaſon is obvious, why theſe Liquors, or any wholſome Water, drank copiouſly, when, in conſequence of the obſtructed Veſſels, they cannot find a free and eaſy Paſſage, excite Commotions, Flatulences, Uneaſineſs, and ſometimes Vomitings. Warm Fluids, however, drank in too large Quantities, and too frequently repeated, will relax the villous Coat, and prove highly prejudicial.

Thro' the villous Coat of the Inteſtines there is, firſt of all, ſecreted from the Aliments, a highly fine Fluid, which eaſily enters and paſſes thro' the ſeveral Ducts. Hence, after Meals, or drinking liberally, even of good Water, the Urine is firſt diſcharged purely aqueous and inſipid, but afterwards aſſumes a deeper Colour.

The more groſs and coarſe Parts of the Aliments, which are not adapted to the Mouths of the lacteal Veſſels, are not conveyed to the Blood, but, being retain'd in the Inteſtines, in conſequence of the Narrowneſs of the Lacteals, are diſcharged by way of Excrement.

If, in conſequence of the coſtive State of the Patient, the more groſs Parts of the Aliment remain for a conſiderable time in the Inteſtines, the more groſs ſaline and terreſtrial Parts, alſo, by the ſtrong Compreſſion of the Inteſtines, penetrate into the Blood.

But a Liquor is not only ſecreted in the ſmall, but alſo in the large Inteſtines, and convey'd into the Maſs of Blood thro' the abſorbent Veſſels.

When any one is preternaturally coſtive, the Fæces which were before diſcharged liquid, and of a fetid Smell, are now deſtitute of Moiſture, dry, and free from an ungrateful Smell; which is a ſatisfactory Proof, that this fetid Liquor has been ſeparated from them.

From what has been ſaid we may eaſily aſſign a Reaſon, why a coſtive State ſhould produce a Cacochymy, and render the Humours highly impure. That there is alſo a Secretion made in the large Inteſtines, is ſufficiently obvious from what we call nutritive Clyſters, prepared of *Peruvian* Bark; as alſo from antiſpaſmodic and corroborating Clyſters, prepared of nervous and cephalic Herbs, and calculated for Diſorders of the Head.

The Stomach and Inteſtines have a particular Motion, by which they are contracted and dilated. This Motion proceeds gradually from the ſuperior to the inferior Parts, and is by the *Greeks* called the periſtaltic Motion.

The principal Inſtruments, by which this Motion is carried on and performed, are the annular Fibres, with which the whole Inteſtines are ſurrounded, and wrapt up in a ſpiral Form: So that theſe Fibres are continued in an uninterrupted Courſe from the Oeſophagus to the Anus.

This Aſſertion may be confirmed by the following Experiment. Boil the Inteſtine of any Animal, and, after ſeparating the longitudinal Fibres along with the exterior Coat, the annular Fibres, in one continued and uninterrupted Series, may be ſeparated from the Inteſtine like a long Thread. Theſe annular Fibres, with the Aſſiſtance of the longitudinal, are the principal Inſtruments, by means of which the Contraction of the Inteſtines is produc'd.

The periſtaltic Motion of the Inteſtines, when in its natural State, is highly eaſy, gentle, and, as it were, of the undulatory Kind.

This eaſy and gentle Motion may be juſtly look'd upon as the wiſe and bountiful Appointment of Nature, leſt the Aliments, when concocted, ſhould be with too much Precipitation hurried into the Inteſtines, and too ſpeedily diſcharged, which happens in a Diarrhœa. Beſides, in conſequence of the gentle Contraction and Dilatation of the Inteſtines, only the finer and more ſubtile Portion of the Chyle is ſeparated from the Maſs of digeſted Aliments, and poured into the villous Ducts of the Inteſtines, and the Mouths of the lacteal Veſſels; whilſt, at the ſame time, the more groſs and feculent Parts are left, juſt as happens in all Percolations, where the Strainer, upon a gentle Compreſſion, only tranſmits the finer Parts of the Liquor, whereas, by a ſtronger and more forcible Compreſſion, its thick and turbid Parts are at the ſame time paſſed thro' it. But this Motion of the Inteſtines, ſubſervient to the progreſſive Motion and Expulſion of their Contents, is ſo eaſy and gentle, that it is not perceptible, except in the larger Animals, ſuch as Oxen and Horſes, when diſſected alive.

As every Impulſe, and progreſſive Motion of Humours, require a Cauſe or Principle ſufficiently qualified for producing a due Degree of Motion, ſo, with reſpect to the periſtaltic Motion of the Stomach and Inteſtines, we find a threefold Cauſe, the firſt of which is lodged in the Pharynx, the ſecond in the Pylorus, and the third in the Beginning of the Inteſtinum Colon.

By a ſtrong Contraction of the Pharynx, the Aliments taken are thruſt into the Cavity of the Stomach, thro' the Oeſophagus. Then by the right and inferior Parts of the Stomach, and by the Action of the Pylorus, the Contents of the Stomach are propelled thro' the ſmall Inteſtines, till they arrive at ſuch as are larger and more capacious, where, about the right Ileum, is the Beginning of the Colon, which conſiſts of very ſtrong, nervous, muſcular, and fibrous Membranes, and by whoſe Motion and Impulſe the Excrements are forced thro' the various Convolutions of the Inteſtines to the very Sphincter Ani.

The Motion of the Inteſtines, by means of which their Contents are propelled, or carried forwards, is ſufficiently ſtrong, ſince it overcomes a conſiderable Reſiſtance, and forces Quickſilver, almoſt the heavieſt of Mineral Subſtances, up and down, thro' all their various Convolutions and Windings, till it is diſcharg'd by the Anus; which we obſerve in thoſe afflicted with the

the Iliac Paſſion, who often receive conſiderable Relief by taking large Quantities of this metalline Fluid.

This Motion, whereby the Inteſtines are contracted and dilated, is ſucceſſive and reciprocal; for whilſt one Part of the Inteſtine is contracted, and render'd narrower, the Subſtance contain'd in it is puſh'd forward to the adjacent Part, which by that means is dilated, and, upon the Ceſſation of that Dilatation, is forthwith contracted again.

As, in order to preſerve the continual Circulation, and progreſſive Motion, of the Blood and Humours, ſuch is the Conſtruction of the moving Fibres in the Heart and Arteries, that their Dilatation or Diaſtole becomes the Cauſe of their Syſtole, which again produces their Diaſtole; ſo alſo the like Condition of moving Membranes and Fibres is obſerv'd in the Structure of the Inteſtines, ſo that their Dilatation produces their Contraction, and, *vice verſa*, their Contraction proves the Cauſe of their Dilatation.

If then the Contraction of the Inteſtines is the Cauſe of their Dilatation, and if, on the contrary, their Dilatation gives Birth to their Contraction, it follows, that by producing either a ſtronger Dilatation or Contraction, only in one Part of the Stomach and Inteſtines, the periſtaltic Motion in general muſt by that means be accelerated, and the Fæces of courſe the more ſpeedily evacuated.

Hence the Reaſon may be eaſily underſtood, why by a purgative Medicine, which is frequently lodg'd in one Part of the Inteſtine, and excites a painful Conſtriction, the Contents of the Inteſtines are as ſpeedily and forcibly diſcharged, as we obſerve them to be by acrid Humours in bilious Diarrhœas. Hence the Reaſon is alſo obvious, why, by drinking copiouſly of any Liquor which is impregnated with a ſtimulating, and eſpecially a ſaline Principle, the Contents of the Inteſtines are ſoon expel'd, as we obſerve in drinking hot and acidulated Waters.

As the Strength, Tone, and contractile Force of all the moving Parts of the human Body depend upon a free and uninterrupted Influx of the fine nervous Fluid, and the purer Part of the Blood, ſo the periſtaltic Motion of the Stomach and Inteſtines depends upon the ſame Cauſe.

All thoſe Medicines, which increaſe the Strength, which augment and reſtore the Vigour and Tone of the Parts, ſuch as Subſtances impregnated with a highly ſubtile, fragrant, oleous, and aromatic Oil; or ſuch as contain a ſubtile volatile Salt, or ſuch as abound with a mild and balſamic Reſin, are excellent Preſervatives of the Motion of the Inteſtines, and reſtore it when become too languid; whereas, on the contrary, Subſtances which impair the Strength, ſuch as fetid Medicines, Opiates, too powerful Refrigerants, Acids, and Aſtringents, greatly impair the Vigour of theſe Parts. But that the nervous Fluid is ſubſervient to the Motion of the Inteſtines, is, I think, obvious, becauſe the Paſſions of the Mind, which principally act upon this Fluid, may alſo alter, increaſe, or deſtroy the natural Motion of the Stomach and Inteſtines.

The periſtaltic Motion, therefore, of the Inteſtines is the principal Cauſe, both of the Secretion of the Chyle, and of its Conveyance thro' the Lacteal Veſſels.

Beſides, the progreſſive Motion of the Chyle to the Maſs of Blood is not a little aſſiſted, firſt, by what we call the Valvulæ Conniventes, large Numbers of which are obſervable in the ſmall Inteſtines, which, when a Compreſſion of the Parts is made, hinder the Chyle from ſlipping inſtantaneouſly by the Orifices of the Lacteals, and the inteſtinal Villi; for in theſe the Maſs of digeſted Aliments ought to remain for ſome time, that the Chyle may be the better expreſs'd from it, and convey'd purer and better into the Lacteal Veſſels. Secondly, to the more eaſy Reception of the Chyle into the ſmall Lacteal Veſſels, and Inteſtinal Villi, the Narrowneſs of their Diameters contributes not a little, which is illuſtrated by that Experiment, wherein we ſee, that ſubtile Fluids ſpontaneouſly enter ſmall and capillary Glaſs Tubes. Thirdly, the progreſſive Motion of the Chyle, and its Aſcent thro' the Lacteal Veſſels, and Thoracic Duct, is much aſſiſted by the ſemilunar Valves, with which they are furniſh'd; for theſe Valves conſiſt of ſlender and moving fleſhy Fibres, by whoſe Motion the Fluid is carried from one Valve to another. Theſe Valves are alſo ſo ſituated, that the Chyle and Lymph may be carried upwards in a progreſſive Motion; but cannot regurgitate, or have a retrograde Motion. Fourthly, the Progreſs of the Chyle is alſo aſſiſted and promoted by the Impulſe of the Fibres, of which thoſe remarkable conglobate Glands, ſituated in the Centre of the Meſentery, conſiſt.

The Progreſs of the Chyle thro' the Thoracic Duct, and Lacteal Veſſels, to the Blood, is conſiderably promoted by Reſpiration; in which there is a continual and ſucceſſive Compreſſion and Dilatation of the Muſcles of the Abdomen.

Since, in Inſpiration and Expiration, the ſtrong Compreſſion and Dilatation of the Abdominal Muſcles not only forces the Aliments from the Stomach and Inteſtines, but alſo promotes the Expreſſion of the Chyle, it is for this Reaſon prejudicial both to Digeſtion and to Health, after a liberal Meal, to talk too loud, or to uſe too violent Exerciſe. But, four or five Hours after, when the Digeſtion is finiſh'd, Motion and Exerciſe are ſo far from being hurtful, that they are rather beneficial, as, by increaſing Reſpiration, the Secretion and progreſſive Motion of the Chyle are more effectually promoted. *Hoffman, Tom.* 1.

The Courſe of the CHYLE *into the* BLOOD.

The Chyle being thus ſeparated from the Aliments, it is immediately propel'd into the Lacteal Veſſels, and by them convey'd to the Meſenteric Glands. Theſe Glands lie ſcatter'd thro' the Cellular Subſtance. In the natural State, theſe Glands are ſomething of the Figure of Lentils, or little round Beans; ſome of them being orbicular, others oval, but all of them a little flatted; and, in corpulent Subjects, we find them ſurrounded with Fat.

Theſe Glands are of the Number of thoſe that Anatomiſts call Glandulæ Conglobatæ, the Structure of which is not as yet ſufficiently known. They ſeem to be of a cellular Subſtance, ſurrounded by a very fine Membrane or Coat; on which, by the Help of Microſcopes, we diſcover an Intertexture of particular Filaments, which *Malpighi* believed to be fleſhy Fibres.

The niceſt Anatomical Injections have not hitherto given us any Satisfaction about theſe Particulars; for tho' they be made with all poſſible Care, they always fill the folliculous Texture of theſe Glands: And tho', by means of theſe Injections, we may diſcover a great many Veſſels, which were before inviſible, we are not a whit the nearer our Purpoſe; becauſe we cannot, by this Method, diſtinguiſh the Secretory, Excretory, and Blood-veſſels, from each other.

Beſides the Blood-veſſels, which are diſtributed in a reticular manner in the Meſenteric Glands, and beſides many nervous Filaments ſpread thro' them, we diſcover an infinite Number of ſmall Veſſels, of another Kind, running from Gland to Gland.

Theſe Veſſels are extremely thin and tranſparent, and furniſh'd on the Inſide with numerous Valves, which appear on the Outſide like little ſmall Knots, very near each other. They go out from each Gland by Ramifications, as by ſo many Roots, and, having form'd a ſmall Trunk, they are again divided, and enter ſome neighbouring Gland, by the ſame kind of Ramifications by which they went out from the former.

They are term'd Lymphatic Veſſels, becauſe, for the moſt part, they contain a very clear limpid, tho' mucilaginous Serum, call'd Lymph by Anatomiſts. But as they have likewiſe been obſerved to be fill'd with a white milky Fluid call'd Chyle, they have been call'd Vaſa Chylifera, or Venæ Lacteæ. They have the Name of Veins, becauſe their Valves are diſpoſed as thoſe of the ordinary Blood-veins; and becauſe the Fluid, which they contain, runs from ſmaller into larger Tubes.

I have always divided the Lacteal Veſſels into three Claſſes in the human Body, and ſometimes into four.

They derive their firſt Origin from the Tunica Villoſa of the Inteſtines, and chiefly from that of the ſmall Inteſtines, by a great Number of ſmall capillary Roots. From theſe Roots there ariſes, between the Coats of the Inteſtines, a Rete Mirabile, which ſurrounds almoſt the whole Circumference of the Inteſtinal Canal, between the muſcular and external Coat.

This reticular Texture of Lacteal Veſſels keeps cloſe to the external Coat, and leaves the Canal along with it, on the Side of the Meſentery, where it forms two Planes of Ramifications, plainly diſtinguiſh'd from each other by the cellular Subſtance, and adhering cloſely to the Inſide of the two Membranes of the Meſentery. In this ſeparate State they run on the Laminæ of the Meſentery, as far as the firſt Meſenteric Glands, where they unite again into one Plane. All this I reckon the firſt Claſs of Lacteals.

After this Union, the Lacteal Veſſels are diſtributed almoſt uniformly thro' the whole Extent of the Meſentery, from its Circumference to its Origin, or Adheſion to the Vertebræ of the Back, between the Meſenteric Glands, which they join, and form frequent Anaſtomoſes or Communications. This is the ſecond Claſs.

Having paſs'd thro' the Meſentery in this manner, the Ramifications begin to unite as they approach the Spina Dorſi; and conſequently their Number is leſſen'd, and their Size increaſed; and, having paſs'd the laſt Meſenteric Glands, they terminate about the Middle of the Adheſion of the Meſocolon in ſmall common Trunks, which receive a great Number of Lymphatic Veſſels from the Glandulæ Lumbares, and others below theſe. This is the third Claſs.

A fourth Claſs may be made of the Lacteal Veſſels of the great Inteſtines; of which I demonſtrated ſeveral, very full of Chyle, to the Royal Academy, in an human Colon. The late M. *Mery*, a Member of the ſame Academy, who was not eaſily convinced of any thing from Obſervations made by others, having ſeen that, with the End of my Finger, I could puſh the white Liquor uniformly into the Colon in ſeveral Places,

Places, ſeem'd at firſt to be ſatisfied; but, for his farther Conviction, he deſired me to open one of theſe Veſſels before him, with the Point of a Lancet, and to take out a Drop of the Liquor, which having laid upon the Nail of my Thumb, he was intirely convinced.

The Lacteal Veſſels are not always apparent in human Subjects; but we may ſee them in thoſe that die either a violent or ſudden Death, ſoon after a Meal; and they remain viſible, even in the Inteſtines, for a long time after Death, when a great Number of the Meſenteric Glands have become ſcirrhous, eſpecially in Children.

It is the common Cuſtom to demonſtrate the Lacteals in living Animals, open'd about three Hours after a full Meal, eſpecially of Milk. This is a very troubleſome Way, and very often hinders us from ſeeing a great Part of this beautiful Phænomenon. It is much eaſier and better to kill the Animal, about an Hour after it has fill'd its Belly, or ſooner, if the Food be liquid; and this is the Method which I have always uſed, with Succeſs, in my private Courſes.

The Lacteal Veſſels of the third Claſs, or thoſe that lie between the Meſenteric Glands and middle Adheſion of the Meſocolon to the Spina Dorſi, run down on the Body of the inferior Aorta, between the Extremities of the ſmall Muſcle of the Diaphragm, and terminate in a kind of Ciſtern, call'd by ſome *Receptaculum Pecqueti*, from M. *Pecquet*, a Phyſician at *Dieppe* in *Normandy*, who firſt demonſtrated, by inconteſtable Experiments, this Receptacle, which had been long before diſcover'd by *Euſtachius*.

The greateſt Part of the Receptaculum Chyli lies behind the Right Portion of the inferior Muſcle of the Diaphragm, on the Right Side of the Aorta, at the Union of the laſt Vertebra of the Back with the firſt of the Loins. It is a Kind of membranous Veſicle, the Conformation of which is various in human Subjects. Sometimes it is of an uniform long oval Figure, like the Veſicula Fellis: Sometimes it is divided by Strictures into ſeveral ſmall roundiſh Bags, more or leſs flatted; and ſometimes it ſurrounds the Trunk of the Aorta, like a Collar.

It is compoſed of very thin Coats, and its Cavity is divided by ſmall Pelliculæ, or membranous Septa, the Diſpoſition of which is irregular. It is principally round the lower Part of this Receptacle that the laſt Lacteal Veſſels are inſerted, ſome on the Sides, and ſome behind the Aorta; and they are accompanied by numerous Lymphatic Veſſels. The upper Portion is contracted between the Aorta and Vena Azygos, and forms a particular Canal, which runs up thro' the Thorax, by the Name of Ductus Thoracicus. *Winſlow*, *Sect.* 8. *Numb.* 208.

Ductus Thoracicus.

The Thoracic Duct is a thin tranſparent Canal, which runs up from the Receptaculum Chyli, along the Spina Dorſi, between the Vena Azygos and Aorta, as high as the fifth Vertebra of the Back, or higher. From thence it paſſes behind the Aorta toward the Left Hand, and aſcends behind the Left Subclavian Vein, where it terminates, in ſome Subjects, by a kind of Veſicula; in others, by ſeveral Branches united together; and opens into the Back-ſide of the Subclavian Vein, near the Outſide of the internal Jugular.

This Canal is plentifully furniſh'd with ſemilunar Valves, turn'd upward. Its Opening into the Subclavian Vein, in the human Body, is, in the place of Valves, cover'd by ſeveral Pelliculæ, ſo diſpoſed as to permit the Entrance of the Chyle into the Vein, and hinder the Blood from running into the Duct. It is ſometimes double, one lying on each Side; and ſometimes it is accompanied by Appendices, call'd *Pampiniformes*. *Winſlow*, *Sect.* 9. *Numb.* 164.

CHYMATION. The Name of an *Oxyporium* (a penetrating Medicine of quick Paſſage) in *Marcellus Empiricus*, *Cap.* 20.

CHYMIA. The ſame as Chemia, which ſee.

CHYMIATRIA, χυμιατρεία, from χυμία, Chymiſtry, and ἰατρεία, healing, is the Art of curing Diſeaſes by chymical Medicines. *Blancard.*

CHYMICOPHANTA, χυμικοφάντης, from χυμικὸς, a Chymiſt, and φαίνω, to appear, is a pretended Chymiſt. *Blancard.*

CHYMOLEA. See Kymolea.

CHYMOSUM, in *Paracelſus*, *Lib.* 2. *Paragraph.* 2. is a Term importing the ſame as *Chylus*.

CHYMUS, χυμὸς, Humour, Juice, and, in the common Signification of the Word, every Kind of Humour which is inraſſated by Concoction; under which Notion it comprehends all the Humours fit or unfit for preſerving and nouriſhing the Body, whether good or bad. It alſo ſometimes imports the fineſt Part of the Chyle, when ſeparated from the Fæces, and contain'd in the Lacteals and Thoracic Duct. In *Galen* it ſignifies the Guſtatory Faculty or Quality in Plants and Animals.

CHYSIS, χύσις, from χύω, to fuſe, or pour out. Fuſion.

CHYTLON, χύτλον, according to *Erotian* on *Hippocrates*, is a plentiful Inunction with Oil and Water. *Foeſius.*

CHYTRA, CHYTRINOS, CHYTRIDION, χύτρα, χύτρινος, χυτρίδιον, in *Hippocrates*, ſignify a Pot of Earth.

CIBAGE, *Pino ſimilis orientalis*, C. B. *Pini Forma Cibage*, J. B. A Tree growing in the Eaſtern Countries, and reſembling a Pine-tree. I find no Virtues aſcrib'd to it. *Raii Hiſt. Plant.*

CIBARIUM. The ſame as *Cibus*, or Alimentum, which ſee.

Cibarius Panis, in *Celſus*, is coarſe houſhold Bread.

CIBATIO, in Chymiſtry, is the ſame as *Corporatio*, which ſee. *Caſtellus.*

CIBOULS, or CHIBOULS, are nearly ally'd to the Scallions, being a Sort of Onion, which forms no Bulb at the Root, and which is cultivated in Kitchen-gardens.

CIBUR, CHYBUR. Sulphur. *Rulandus.*

CIBUS. See Alimentum.

Cibus Albus.

The *Cibus Albus*, or white Aliment, is a Species of Jelly, which, in *Fuller's Pharmacopœia*, is prepared in the following manner:

> Take four Pints of Milk, the Breaſt of a boil'd Capon, and blanch'd ſweet Almonds, two Ounces; let them be beat, and a ſtrong Expreſſion made. Then let them boil over a gentle Fire, adding three Ounces of Rice-meal; and, when they begin to coagulate, add eight Ounces of white Sugar, and ten Spoonfuls of the Water of red Roſes: Mix all well together.

This is a highly beneficial Aliment in Conſumptions, Gonorrhœas, and all other Caſes, where the Intention is to correct and allay the Acrimony of the Humours.

The *Spaniards* alſo give the Name of *Cibus Albus* to a certain *American* Fruit.

CICADA, Offic. Schrod. 5. 340. Aldrov. de Inſect. 307. Jonſ. de Inſect. 22. Mouff. 127. THE BAULM CRICKET.

This Inſect is common in *Italy*, but unknown in *England*. It is furniſh'd with Wings, and is ſomewhat like a Cricket, very noiſy, and living only on Dew. In the Kingdom of *Naples* innumerable Multitudes of theſe Inſects are continually ſucking and feeding upon the Ornus, or Dwarf Aſh, with the rounder Leaf, from whoſe Wounds, by Exſudation, proceeds Manna. Theſe Inſects are uſed, when dry'd, in Colics; and are recommended to be eaten, roaſted, in Diſorders of the Bladder. The Aſhes of theſe, burnt, are ſaid to wear away the Stone.

CICATRICULA is a little white Speck, or Veſicle, in the Coat of the Yolk of an Egg, wherein the firſt Changes appear toward the Formation of the Chick.

CICATRISANTIA. See Epulotica.

CICATRIX, οὐλὴ, is a Seam or Elevation of callous Fleſh, riſing on the Skin, and remaining there after the Healing of a Wound or Ulcer, and is commonly call'd a *Scar*.

CICCUS, κίκκος, in *Heſychius*, is a kind of ſmall Graſſhopper, contemptible enough to give Occaſion for a Proverb. Alſo a Species of wild Gooſe in *Aldrovandus's Ornithology*, *Lib.* 19. *Cap.* 10.

CICER ALBUM, Offic. *Cicer ſativum*, C. B. Pin. 347. Ger. 1047. Emac. 1222. Raii Hiſt. 1. 917. Hiſt. Oxon. 2. 75. Elem. Bot. 309. *Cicer ſativum album*, Park. Theat. 1075. *Cicer arietinum*, J. B. 2. 292. *Cicer*, *Cicer arietinum*, Chab. 143. WHITE CHICHES.

The Cicer is a kind of Pulſe, which grows to be about a Foot and a half, or two Foot high, with round hairy Stalks, on which are ſet, in an alternate Order, long hairy pinnated Leaves, conſiſting of ſeven or nine ſmall oblong round pinnated Pinnæ, ſerrated about the Edges, with an odd one at the End; but theſe Pinnæ do not always ſtand directly oppoſite. From the Boſom of the Leaves ariſes a ſingle Flower, and ſometimes two, which are ſmall and white, leſs than Pea-bloſſoms, on long Foot-ſtalks, and are ſucceeded by ſhort thick hairy Pods, each containing one or two Chiches, of a white Colour, bigger than Peas, but round like them, only ſomewhat ſharp-pointed at one Side. They are ſown in *Italy*, *France*, and other warm Countries, whence the Seed is brought to us. They flower in *June*, and the Peas are ripe in *July*.

The *Cicer nigrum* and *rubrum* differ in nothing from the white, but in the Colour of the Flower, which is purpliſh, and the Seed of a reddiſh Brown.

This is uſed to make up the Troches of Squills for the *Theriaca Andromachi*. *Miller's Bot. Off.*

They are cultivated in the Gardens of the Curious, and the Seeds are uſed in Phyſic. *Dale.*

White Chiches were much uſed in Food by the Antients, as they are at this Day by the *Italians*, who eat them both boil'd and crude, when green. They are eſteem'd a flatulent Aliment; but are ſaid to ſtimulate to Venery, to deterge, open, incide,

incide, digeſt, and to wear away the Stone; but are prejudicial when the Bladder or Kidneys are exulcerated. A Decoction of theſe is ſaid to be good in a Jaundice; to deſtroy Worms; to provoke the Menſes; to expel the Fœtus. In Cataplaſms they have the Reputation of curing Tetters, Ringworms, and Parotides; to diſcuſs inflam'd Teſticles, and conſolidate malignant Ulcers.

CICER RUBRUM & NIGRUM, Offic. *Cicer arietinum nigrum vel rubrum*, Park. Theat. 1075. RED AND BLACK CHICHES.

They grow in Gardens, and flower in *June*. The Seeds are uſed, and the Broth made of them helps the yellow Jaundice; the Decoction expels Worms, provokes the Menſes, brings away the Fœtus, and generates Milk. Applied in Cataplaſms, they cure the Pſora, Lichen, and Parotides, diſcuſs Inflammations of the Teſticles, and conſolidate malignant Ulcers. They are diuretic and lenitive, for which Reaſon a Decoction of them is accommodated to Diſorders of the Kidneys.

CICER SYLVESTRE, Offic. Ger. 1047. Emac. 1222. Raii Hiſt. 1. 935. *Cicer ſylveſtre majus*, Park. Theat. 1076. *Cicer ſylveſtre foliis oblongis hiſpidis majus*, C. B. Pin. 347. *Cicer ſylveſtre multiflorum*, J. B. 2. 294. *Cicer ſylveſtre multiflorum, radice craſſa, & folliculis brevibus ventricoſis hirſutis*, Chab. 143. *Aſtragalus; luteus; perennis; ſiliquâ gemellâ; rotundâ; veſicam referente*, Hiſt. Oxon. 2. 108. Boeth. Ind. A. 2. 54. Tourn. Inſt. 416. Elem. Bot. 329. *Glaux*, Rivin. Irr. Tetr. Rupp. Flor. Jen. 217. Buxb. 140. *Glaux altera perennis, folliculis turgidis*, R. H. p. 935. WILD CHICHES.

They grow wild in the Fields and uncultivated Places of *Italy*, and other Countries, and flower in the Summer. The Seed is uſed, which is of a heating, drying, deterſive, and aperitive Quality, and agrees in Virtues with the other Cicers.

Boerhaave makes this a Species of ASTRAGALUS.

CICERA TARTARI. Small Pills, compos'd of Turpentine and Cream of Tartar. *Blancard.*

CICERBITA, according to *Blancard*, is a Species of *Sonchus*.

CICERCULA. See LATHYRUS.

CICETHE, κιχήθη, in *Erotian* upon *Hippocrates*, is expounded by κακοήθη, (*Cacoethe*) that is, of a bad Quality or Diſpoſition; but *Foeſius*, with good Reaſon, thinks there is a Fault in the Copy, and that inſtead of κιχήθη, we ſhould read κακήθη, or κακήθεα.

CICHORIUM.

The Characters are,

The Flowers ſtand on ſhort Pedicles, proceeding from the Sides of the Stalks and Branches; and the Flower-cup contracts itſelf like a Capſula, containing angulated, wedglike, umbilicated Seeds.

Boerhaave takes notice of fourteen Species of this Plant, the eight firſt of which are annual, the reſt perennial.

1. Cichoreum; latifolium; ſive Endivia vulgaris. *Elem. Bot.* 381. *Tourn. Inſt.* 479. *Boerh. Ind. A.* 91. *Endivia, Scariola, Intybus*, Offic. *Endivia ſativa*, Park. 774. *Intybus ſativa*, Ger. 221. Emac. 282. Raii Hiſt. 1. 254. *Intubum*, Park. Parad. 495. *Intybus ſativa latifolia ſive Endivia vulgaris*, C. B. P. 125. Hiſt. Oxon. 3. 53. *Intybum ſativum latifolium*, J. B. 2. 1011. *Intybus vel Intybum*, Chab. 315. ENDIVE.

Garden Endive has pretty large, long, ſmooth, yellowiſh-green Leaves, broad and roundiſh at the End, and laciniated about the Edges, full of a bitteriſh Juice. The Stalk ariſes to be two or three Foot high, beſet with ſmaller and narrower Leaves; the Flowers are blue, and like thoſe of Succory, but ſmaller, growing on the Tops of the Stalks; and the Seed of it is pretty much like the Seed of Succory. The Root is long and ſlender, ſpreading but little. It grows in Gardens, flowering in *June*, the Root periſhing after the Seed is ripe.

Endive is much uſed as a Sallad-herb, eſpecially after the Leaves have been ty'd together, and blanched in the Earth. It is cooling and moiſtening, opening Obſtructions of the Liver and Spleen, and of Uſe againſt the Jaundice. It provokes Urine, and cools a hot Stomach. The Seed is one of the leſſer cold Seeds. *Miller's Bot. Offi.*

2. Cichorium; latifolium; ſive Endivia vulgaris; floribus candidis. *T.* 479. *a.*

3. Cichorium; latifolium; ſive Endivia vulgaris. *T.* 479. *Intybus ſativa, anguſtifolia.* C. B. P. 125. M. H. 3. 53. *Intybum ſativum, anguſtifolium.* J. B. 2. 1011. *Flore cæruleo.* a.

4. Cichorium; anguſtifolium; ſive Endivia anguſtifolia; flore albo. *T.* 479. *a.*

5. Cichorium; criſpum. *T.* 479. *Intybus criſpa.* C. B. P. 125. M. H. 3. 53. *Intybum ſativum, criſpum.* J. B. 2. 1011. *Latifolium.* a.

6. Cichorium; criſpum; anguſtifolium. *a.* NARROW-LEAV'D CURL'D ENDIVE.

7. Cichorium; ſpinoſum; Creticum. *C. B. Prodr.* 62. *Cichorium ſpinoſum.* C. B. P. 126. J. B. 2. 1013. M. H. 3. 55. *Chondrillæ genus, elegans, cæruleo flore.* Cluſ. H. 145. 6. H.

8. Cichorium; degener; ex ſemine Cretici. *T.* 479. *a.*

9. Cichoreum; ſylveſtre; ſive Officinarum. *C. B.* 125. *Hiſt. Oxon.* 3. 55. *Tourn. Inſt.* 479. *Boerh. Ind. A.* 91. *Buxb.* 72. *Cichoreum agreſte ſylveſtre*, Offic. *Cichoreum ſylveſtre*, Raii Hiſt. 1. 255. Synop. 77. Ger. 222. Emac. 284. Park. 775. J. B. 2. 1007. Chab. 315. Dill. Cat. 159. WILD SUCCORY.

The main Difference between this and the *Garden Succory* is, its growing wild, and not riſing ſo tall, but having the Stalks more ſtubbed and twiſted. It grows in Lanes, and by Hedge-ſides, and flowers rather later than the *Garden Succory*.

The Virtues of the Wild are much the ſame with the Garden; ſome commend the diſtil'd Water of the Flowers to cool the Inflammations of the Eyes. *Miller's Bot. Off.*

Its Leaves and Roots are very bitter, full of Milk, and give a faint-red Colour to blue Paper: The Leaves ſtain it a little more; they are leſs bitter, and of a glutinous Taſte. The Salt which is in the Succory does not ſeem to differ from the natural Salt in the Earth, but is joined with a conſiderable Quantity of Sulphur and terreſtrial Parts.

Being analyſed, it yields a great deal of Oil and Earth, ſome acid Liquors, a little urinous Spirit, and ſome concreted volatile Salt.

The Dandelion yields much the ſame Principles; but it affords no concreted volatile Salt: Nevertheleſs their Virtues are pretty much alike.

Succory-roots and Leaves are aperitive, diuretic, and cooling: They ſeem to cool only by removing the too long obſtructed Humours in the Bowels. They are preſcribed in Broths, Ptiſans, Apozems, and Clyſters. The Juice procures Expectoration in Defluxions of the Breaſt. The Extract has the ſame Virtues, and purifies the Blood. The ſimple or compound Syrup is a good Aperitive, eſpecially if two Drams or half an Ounce of Tincture of Steel be mixed with one Ounce of it. The Conſerve of its Flowers is uſed on the ſame Occaſions, in aperitive Boluſes and Opiates; theſe Opiates are of great Service in the Cachexy, Dropſy, hypochondriac Diſorders, intermitting Fevers, and troubleſome Heats of the lower Belly. *Martyn's Tournefort.*

The famous *Eraſiſtratus* had a great Opinion of this Plant.

10. Cichorium; ſylveſtre; flore cæruleo; caule purpureo.

11. Cichorium; ſylveſtre; flore albo. *C. B. P.* 126.

12. Cichorium; ſylveſtre; flore roſeo. *C. B. P.* 126.

13. Cichorium; ſylveſtre; minus; folio magis laciniato; flore cæruleo tenuiter diſſecto; Jamaicenſe; caule & nervo folii viridi.

14. Cichorium; idem (13.); caule & nervo folii rubro. *Boerhaave's Index alter Plantarum, Vol.* 1.

CICHOREUM SATIVUM VERIS, Offic. *Cichoreum*, J. B. 2. 1007. C. B. 125. Ger. 220. Emac. 280. Parad. 497. Hiſt. Oxon. 3. 55. Buxb. 73. Raii Hiſt. 1. 255. GARDEN SUCCORY.

This has a thick taper Root, brown on the Outſide, and white within, full of bitter Milk. It grows deep in the Ground. The lower Leaves much reſemble thoſe of Dandelion in their Shape, and tooth-like Section; but they are much larger, and hairy. The Stalk ariſes to be a Yard or more in Height, ſtriated, hairy, and angular; having the Leaves ſet on without Foot-ſtalks, almoſt encompaſſing the Stalk, being ſharp-pointed at the End. Among theſe grow the Flowers, ſet on cloſe to the Stalk, ſeveral together, of a lively blue Colour, compoſed of ſeveral Rows of flat Petala, indented at the Ends. The Seed is brown and longiſh, and grows not in Down, like the Seed of Dandelion. It is planted in Gardens, and flowers in *June*. The Root, Leaves, Flowers, and Seed, are uſed. The Seed is one of the four ſmaller cold Seeds.

The antient Botanic Writers generally affirm, that Succory is cold; but its Bitterneſs manifeſtly ſhews it to be hot. However, it is aperitive and diuretic, opening Obſtructions of the Liver, and is good for the Jaundice. It provokes Urine, and cleanſes the urinary Parts of ſlimy Humours, that may ſtop their Paſſage.

The only officinal Preparation, taking its Name from Succory, is the *Syrupus de Cichorio cum Rhabarbaro. Miller's Bot. Off.*

Syrupus de Cichorio cum Rhabarbaro.

SYRUP *of* SUCCORY *with* RHUBARB.

Take of whole Barley, of the Roots of Smallage, Fennel, and Aſparagus, each two Ounces; of the Leaves of Succory, Dandelion, Endive, and Sow-thiſtle, each two Handfuls; of Lettuce, Liverwort, Fumitory, and the Tops of the Hop-tree, each one Handful; of Maidenhair, Wall-rue, Ceterach, Liquorice, Winter-cherries, and Dodder, each ſix Drams: Boil them in twelve Pints of Spring-water to eight Pints, and in the ſtrained Liquor diſſolve

diſſolve and boil ſix Pounds of white Sugar, till it is of a Conſiſtence for Syrup. S. A. Adding, towards the latter End, twelve Ounces of Rhubarb, and ſix Drams of Spikenard.

This continues the ſame as the College firſt received it into their Diſpenſatory. *Quincy's London Diſpenſatory.*

CICILIANA *ſeu* SICILIANA *Planta.* See ANDROSÆMUM.

CICINDELA, λαμπυρὶς.

Cicindela, Offic. Schrod. 5. 340. Mouff. Inſect. 108. Charlt. Exer. 48. Mer. Pin. 201. Jonſ. de Inſect. 80. Aldrov. de Inſect. 492. *Noctiluca terreſtris*, Col. Ecphr. 1. 38. *Scarabæus* λαμπυρὶς *ſordidè nigricans, corpore longo & anguſto, ſeu Cicindela mas*, Raii Inſect. 78. *Cicindela impennis ſeu fœmina*, Ejuſd. 79. THE GLOW-WORM. *Dale.*

The whole Inſect is uſed in Medicine, and recommended by ſome againſt the Stone. *Cardan* aſcribes an anodyne Virtue to it.

Authors diſagree much about Glow-worms, ſome affirming, that the flying Glow-worm differs from the reptile only in Sex, others aſſerting, that they differ in Species: Of the latter are *Julius Scaliger*, in his *Exercitations*, and Dr. *Richard Waller*, in *Philoſ. Tranſ. Numb.* 167. who ſay they have found flying Glow-worms to be of both Sexes, by ſeeing them in Coition. We cannot, indeed, doubt the Veracity of theſe Authors; however, the Experiments lately made by Mr. *Benj. Allen*, M. B. confirm the Opinion of *Vintimiglia*, in *Fab. Colomna*, and *Mouffet*, that the flying Glow-worms are Males, and the reptile Females; for that Gentleman, living at *Braintre*, often obſerved the flying Glow-worms in Coition with the reptile ones, but never could diſcover either flying or reptile in Coition with one another: Hence he juſtly concludes, as *Dale* alſo does, being convinc'd by his Experiments, that the flying Glow-worms are the Males, and the reptile ones the Females. *Dale.*

CICINUM *Oleum.* The Oil call'd *Cicinum* is thus prepared:

They take a convenient Quantity of ripe Seeds of the Palma Chriſti, (κεγκώνων, *Ricinorum*) and dry them, like Grapes, upon Hurdles, in the Sun, till the Huſks break, and fall off: Then, collecting the naked Seeds, they put them in a Mortar, pound them well, and afterwards remove them into a tin'd Pot, with Water, and boil them. When all their Juice is exhauſted, remove the Pot off the Fire, and with a Shell take up the Oil, which ſwims at Top, and repoſit the ſame for Uſe.

In *Egypt*, where they make great Uſe of it, they prepare it after a different manner; for, after cleanſing the Seeds, they put them into a Mill, and grind them carefully; then removing the Meal in Baſkets, they commit it to the Preſs. The Seeds are in their Prime, when they are juſt fallen out of their Huſks.

CICINUM is good for Achors, Pſora, and Inflammations of the Anus, for Obſtructions and Diſtortions of the Uterus, to take off unſeemly Scars, and to eaſe Pains in the Ears. It adds Efficacy to Plaiſters; and, taken inwardly, purges watry Humours, and expels Worms. *Dioſcorides, Lib.* 1. *Cap.* 38.

CICIS, κικὶς, in ſome Places of *Hippocrates* and *Theophraſtus*, is put for κνηκὶς, *(Cecis)* a Gall. *Foeſius.*

CICLA. See BETA ALBA.

CICONGIUS. A Meaſure, according to *Blancard*, containing twelve Sextaries, or Pints.

CICONIA, Offic. Schrod. 5. 315. Bellon. des Oyſe, 202. Aldrov. Ornith. 3. 291. Mer. Pin. 181. Geſn. de Avib. 230. Jonſ. de Avib. 100. Charlt. Exer. 108. *Ciconia alba*, Raii Ornith. 286. Ejuſd. Synop. Avib. 97. Will. Ornith. 210. THE STORK.

It is ſeldom found in *England.* The Parts uſed in Medicine, beſides the whole Bird, are the Gall, Fat, Dung, and Craw. The Stork is a remarkable Alexipharmic, being ſuppoſed a moſt excellent Remedy for all kinds of Poiſon, and eſpecially the Peſtilence; and alſo for Affections of the Nerves and Joints. The Gall is recommended for Diſeaſes of the Eyes; the Fat is good to anoint gouty and trembling Joints; the Dung, drank in Water, is ſuppoſed to cure the Epilepſy, and other Diſeaſes of the Head; and the Ventricle, or Craw, dry'd and pulveris'd, is accounted an extraordinary Secret in Caſes where Poiſon is concern'd. *Dale.*

CICUTA. Hemlock.

The Characters are,

The Root is fibrous, large, and thick; the Leaves are very ſmall, and much divided; the Petals are bifid, in the Shape of a Heart, and unequal; the Seed is ſhort, round, and much ſtriated.

Boerhaave takes notice of two Species of this Plant.

1. Cicuta; major, *C. B. Pin.* 160. *Tourn. Inſt.* 306. *Elem. Bot.* 255. *Boerh. Ind. A.* 56. *Buxb.* 73. *Rupp. Flor. Jen.* 229. *Mor. Umb.* 18.

CICUTA, Offic. Ger. 903. Emac. 1061. J. B. 3. 100. Dill. Cat. Giſſ. 116. Rivin. Irr. Pent. Raii Hiſt. 1. 451. Synop. 3. 215. Mer. Pin. 26. *Cicuta vulgaris*, Merc. Bot. 1. 29. Phyt. Brit. 27. *Cicuta major vulgaris*, Park. Theat. 933. Hiſt. Oxon. 3. 290. HEMLOCK. *Dale.*

Hemlock grows frequently to be a Yard and half or two Yards high, with ſmooth, round, hollow Stalks, ſpotted with black and purple Spots; it has many very large winged Leaves, which are divided into a great many ſmaller Fern-like Sections. On the Tops of the Branches grow large Umbels of white Flowers, of five ſmall Leaves apiece, after which come round, deeply-furrow'd, whitiſh Seed. The Root is thick and woody. The whole Plant has a ſtrong rank Smell. It grows in Fields, and by Hedge-ſides, and among Rubbiſh, and flowers in Summer.

Whatever noxious and poiſonous Qualities the *Hemlock* of the Antients was endued with, being that with which the *Athenians* uſed to put their Criminals to Death; 'tis certain, that the *Hemlock*, which grows in our Regions, (tho' it ſeems to agree well enough with the Deſcription that *Dioſcorides* gives of theirs) is of a leſs venomous and malignant Nature, ſeveral Perſons having been known to have eaten ſome Quantity of the Root and Stalk.

Hemlock is uſed outwardly in Swellings and Hardneſs of the Liver and Spleen; for which the *Emplaſtrum de Cicuta cum Ammoniaco* is very uſeful, and is the only officinal Preparation we have from it. *Miller's Bot. Off.*

This Plant has an herby ſaltiſh Taſte, ſmells of fetid Oil, and gives a very deep Tincture of Red to blue Paper; which makes us conjecture, that it contains a Salt reſembling Sal Ammoniac, involved by a great deal of Oil and Earth. Pretty near the ſame Principles are found in the Apium. Its Leaves are very lenifying and reſolvent; being boiled with Milk, they are apply'd with good Succeſs to the Piles, and the Parts affected with the Gout. The Cataplaſm of Hemlock-leaves, bruiſed with ſome Snails, and worked up with the four reſolvent Meals, is excellent for the Inflammation of the Teſticles, for the Gout, and Sciatica. The *Hemlock* Plaiſter is a good Reſolver of ſcirrhous Tumors. This Plant is an Ingredient in the *Diabotanum* of M. *Blondel*, which is a very good Plaiſter to reſolve Wens and ſcrophulous Tumors. *Martyn's Tournefort.*

Emplaſtrum è Cicuta cum Ammoniaco.

PLAISTER *of* HEMLOCK *with* AMMONIACUM.

Take of the Juice of Hemlock-leaves, four Ounces; of Vinegar of Squills, and Gum Ammoniacum, each eight Ounces: Diſſolve the Gum in the Juice and Vinegar, and, after due Time ſtanding together, ſtrain them, and reduce to the Conſiſtence of a Plaiſter. S. A. *Quincy's London Diſpenſatory.*

The *Cicuta Aquatica* is the PHELLANDRIUM, which ſee.

Hemlock taken internally, according to *Paulus Ægineta*, cauſes a Vertigo and Dimneſs of Sight, ſo that the Patient can ſcarcely ſee at all at any Diſtance. It alſo induces Hiccoughs, a ſort of Madneſs, and a Refrigeration of the Extremities: Convulſions ſucceed, and Death, by an utter Interception of Reſpiration.

The Method of Cure is, immediately to bring it up by Vomit, and then to carry off what may have paſſed into the Inteſtines by a Cathartic Clyſter. Then proceed to pure Wine, as the moſt effectual Remedy, which muſt be taken at Intervals, betwixt each Doſe of which exhibit Cows or Aſſes Milk, or Wormwood, with Pepper and Wine; or elſe Caſtor, Rue, and Mint, with Wine, may be taken, and a Dram of Cardamoms, or Storax, or Pepper, with Nettle-ſeeds, in Wine, or the tender Leaves of Laurel; as alſo Sylphium, and its Juice, in Wine and Paſſum (γλευκῷ); but ſweet Wine (γλεύκους) alone is ſufficient. *Paulus Ægineta, Lib.* 5. *Cap.* 41.

Tragus recommends a Draught of Vinegar, as an excellent Antidote againſt the Poiſon of Hemlock.

Notwithſtanding the Accounts which Authors give of the poiſonous Quality of Hemlock, *Ray* mentions twenty Grains of the Root in Powder as a moſt effectual Diaphoretic in malignant Fevers, and Quartans, exhibited before the Paroxyſm; but I ſhould not adviſe its Uſe.

CICUTARIA. Baſtard-hemlock.

The Characters are,

The Root is large and thick: The Stalks are thick, hollow, and jointed: The Leaves are like the greater Hemlock, but are thicker; The Seeds are long, thick, gibbous, and ſhap'd ſomewhat like a Half-moon, and very much chanel'd. *Miller's Dictionary, Vol.* 1.

Cicuta; minor; Petroſelino ſimilis. *C. B. Pin.* 160. *Hiſt. Oxon.* 3. 290. *Chom.* 781.

CICUTA MINOR, Offic. Mor. Umb. 18. *Cicuta minor ſive fatua*, Park. Theat. 933. *Cicutaria tenuifolia*, Ger. 905. Emac. 1063. Raii Hiſt. 1. 451. Synop. 3. 215. Mer. Pin. 26. *Cicutaria Apii folio*, J. B. 3. 179. Chab. 405. *Cicutaria fatua*, Mer. Bot. 29. Phyt. Brit. 28. *Cynapium*, Rivin. Irr. P. Rupp. Flor. Jen. 223. Dill. Cat. Giſſ. 124. Buxb. 91. THE LESSER HEMLOCK, OR FOOLS-PARSLEY.

This Sort is of a ſmaller Growth than the preceding, and ſo like Parſley, that ſome unſkilful Perſons have gathered it, and uſed it as ſuch, by which ſeveral have ſuffered in their Health, and ſome have been deſtroy'd thereby. *Miller's Dictionary.*

The Virtues agree with thoſe of the preceding.

Cicutaria; latifolia; fœtida. *C. B. Pin.* 161. *Tourn. Inſt.* 322. *Elem. Bot.* 273. *Boerh. Ind. A.* 56.

SESELI PELOPONNENSE, Offic. *Seſeli Peloponeſiacum recentiorum*, Park. Theat. 907. *Seſeli Peloponenſe Matthioli ſive Cicutaria quorundam*, J. B. 3. 184. *Cicutaria maxima fœtida*, Chab. 405. *Cicutaria latifolia fœtidiſſima*, Raii Hiſt. 1. 451. Umb. 18. Hiſt. Oxon. 3. 291. *Cicuta latifolia fœtidiſſima*, Ger. 903. Emac. 1062. GREAT BROAD-LEAV'D HEMLOCK, OR BASTARD-HEMLOCK.

It grows plentifully in the Country of the *Griſons*. The Root and Seed is in Uſe.

Dale ſays, that this Plant is poſſeſs'd of the ſame Virtues as the *Seſeli Maſſilienſe*, according to *Dioſcorides*; but as Botaniſts agree, that this Plant is erroneouſly taken for the *Seſeli Peloponenſe* of *Dioſcorides*, we muſt not attribute the Virtues of the former to this.

Mr. *Juſſieu* takes notice of another *Cicutaria*, which is the *Cicutaria fœtidiſſima, foliis atrorubentibus.*

CIDRA *ſeu* POMACEUM. Cyder. See POMUM and POMACEUM.

CIGNUS. A liquid Meaſure, mention'd by *Rhodius, de Pond. & Menſ.* from *Avicenna*, and containing, as he ſays, the Weight of two Drams. *Caſtellus.*

CILIA, ταρσοὶ, are the extreme Parts of the Palpebræ; they are ſemicircular and cartilaginous, with Hairs infixed in them, which by ſome are call'd CILIA. *Caſtellus.* See OCULUS.

CILIARE LIGAMENTUM, *ſive* PROCESSUS CILIARIS, is a Range of black Fibres, circularly diſpoſed, having their Riſe in the inner Part of the Uvea, and terminating in the prominent Part of the Cryſtalline, which they ſurround.

CILIARIS *Muſculus.* That Part of the *Muſculus Orbicularis Palpebrarum* which lies neareſt the *Cilia*, miſtaken by *Riolanus*, who gave it this Name, for a diſtinct Muſcle.

CILLO. A Name for one who is affected with a perpetual Trembling of the upper Eyelid; ſo call'd *à Cillendo*, i. e. *motitando*, from being in a continual Agitation. *Caſtellus.*

CILO, περικεφαλὼν, φοξός. One whoſe Forehead is prominent, and his Temples compreſs'd; that is, one who is beetle-brow'd. *Caſtellus.*

CIMENTATIO. The ſame as CÆMENTATIO, which ſee.

CIMEX, Offic. Schrod. 5. 341. Raii Hiſt. Inſect. 7. Charlt. Exer. 52. Aldrov. de Inſect. 534. Jonſ. de Inſect. 89. *Cimex domeſticus*, Mouff. de Inſect. 269. *Cimex lectularius quibuſdam. Cimices domeſtici impennes*, Mer. Pin. 202. THE WALL-LOUSE, OR BUG.

It is found in Beds, being a ſmall Inſect, of a rhomboidal Figure, and a dark-brown Colour, with ſix Feet, and a very tender Skin, ſo that it burſts with the leaſt Compreſſion, and emits a moſt offenſive Smell. *Dale.*

Given to the Number of ſeven, as Food, with Beans, they help thoſe who are afflicted with a quartan Ague, if they be eaten before the Acceſſion of the Fit; ſwallowed alone without Beans, they are good againſt the Bite of the Aſp; the Smell of them relieves under hyſterical Suffocations; drank in Wine or Vinegar, they expel Leeches; and pulveris'd, and introduc'd into the urinary Paſſage, they cure a Difficulty of Urine. *Dioſcorides, Lib.* 2. *Cap.* 36.

The Bites of Bugs are attended with ſo little Danger, that Phyſicians have not thought them of Importance enough to direct any Topic for their Cure. As they are very troubleſome, I ſhould apprehend, that anointing the Parts affected with Sallad-oil, or Spirit of Wine, would afford ſome Relief. *Ætius, Tetrab.* 4. *Serm.* 1. *Cap.* 44. informs us, that a Decoction of the black Chamæleon, (ſee CARTHAMUS) if Beds are waſh'd with it, prevents the Generation of Bugs.

CIMOLIA ALBA, Offic. Matth. 1392. *Terra Cimolia*, Tourn. Voya. ad Angl. 1. 113. *Argilla alba*, Charlt. Foſſil. 1. *Cimolia Terra*, Calc. Muſ. 127. *Creta Fullonica*, Worm. 3. *Creta Cimolia*, Aldrov. Muſ. Metal. l. 245. *Terra Candida Saponaria ſive Fullonica*, Kentm. 1. TOBACCO-PIPE CLAY. *Dale.*

Dioſcorides ſays the Terra Cimolia is ſometimes white, and ſometimes of a purple Caſt, which laſt has an innate Fatneſs, and feels cold to the Touch, and which is the beſt. Both of them, diluted in Vinegar, diſcuſs Parotids, and other Tumors. Rub'd immediately upon recent Ambuſtions, they prevent Puſtules from ariſing on the affected Part. They repreſs Hardneſs of the Teſticles, and Inflammations in all Parts of the Body, and are good againſt an Eryſipelas. Upon the Whole, ſays he, they are of very extenſive Uſe, provided they are genuine, and not ſpurious.

The Cimolia Alba was very famous among the Antients. It acquir'd its Name from *Cimolus*, an Iſland near *Crete*, now call'd *Sicandre*, where it was found in great Plenty.

Tourneforte deſcribes the Cimolia Alba as a white, heavy, inſipid Chalk, abounding with ſmall Grains of Sand, which he thinks the ſame as that got about *Paris*, except that the Cimolia is fattiſh and ſaponaceous, whence it is call'd Terra Saponaria. The Inhabitants, he ſays, make uſe of no other Soap for waſhing their Linen; whence the Virtues attributed to it by *Dioſcorides* may be accounted for. I apprehend the *Cimolia Alba* is different from the common Tobacco-pipe Clay; but *Dale* informs us, that in *Cornwall* a ſort of Clay is found, which he calls *Steatites*, and which is uſed as a Soap. In the Shops this Earth, with the Mark of a Seal upon it, is call'd *Terra Sigillata Alba*. It is alſo ſometimes ſold for the *Terra Samia*.

Dale farther informs us, that the *Cimolia Alba*, which he ſeems to think the ſame as Tobacco-pipe Clay, is drying and aſtringent, either apply'd externally, or taken internally; and farther, that it is an excellent Medicine in either continual or intermittent Fevers; and that it was the grand Secret of Sir *Theodore Mayern*, in curing theſe Diſorders.

Cimolia purpuraſcens, Offic. Matth. 1392. *Smectis ſeu Terra Fullonica*, Mer. Pin. 218. *Smectis ſeu Terra Saponaria Anglica*, Worm. 4. *Smectis ſeu Terra Saponaria & Fullonica*, Charlt. 2. FULLER'S-EARTH. See CIMOLIA ALBA.

Dale ſays it is ſeldom or never uſed internally; but that, applied as a Topic, it is drying and aſtringent.

CINA CINÆ, or *China Chinæ*. A Name for the *Peruvian* Bark.

CINABARIS. See CINNABARIS.

CINÆDUS, κίναιδος. The Name of a Bird, whoſe Gall *Galen (de Comp. Medic. S. L. Lib.* 4. *Cap.* 8.) recommends for rubbing the Eyelids, when the ſuperfluous Hairs, in a Trichiaſis, are pull'd off. It is a Sea Bird, very difficult to be taken.

CINARA. The Artichoke.

The Characters are,

The End of the Pedicle is expanded into a very ſquamous and compact Body, whoſe large Scales are afterwards expanded very wide, the inferior carnous Parts of which are eſculent; within theſe grows a carnous, thick, eſculent Diſk, upon which grow ſmall Calyxes, containing Ovaries, to the aculeated Apex of which grow monopetalous, tubulous Flowers; the external of which are large and barren; the internal monopetalous, tubulous, and furniſh'd with Stamina and a Tube.

Boerhaave mentions ſix Species of the Cinara.

1. Cinara; hortenſis; foliis non aculeatis. *C. B. Pin.* 383. *Buxb.* 74. *Tourn. Inſt.* 442. *Cinara Scolymus*, Offic. *Cinara maxima alba*, Ger. 991. Emac. 1153. *Cinara, ſativa alba*, Park. Parad. 519. *Carduus domeſticus, capite majore cum ſpaſmis diſpanſis viridibus*, Hiſt. Oxon. 3. 157. *Carduus ſive Scolymus maximus non ſpinoſus*, Chab. 350. *Carduus ſive Scolymus ſativus non ſpinoſus*, J. B. 3. 48. Raii Hiſt. 1. 299. *Artiſchocus lævis*, Schw. 235. *Scolymus maximus non ſpinoſus*, J. B. ARTICHOKE.

The *Artichoke* has ſeveral large long Leaves, of a hoary or whitiſh Colour, deeply cut into ſeveral Laciniæ, ſometimes prickly, and ſometimes not. The Stalk is thick, ſolid, ſtriated, bearing at the Top one large round Head, compoſed of a great Number of large, broad, tough Scales, ending in a broad Point, with a Prick or Thorn in the Middle: From among theſe, when they begin to ripen, ſpring a great Number of fiſtular Flowers, compoſing a large blue Thrum, which turn into Down, containing large corner'd Seed in a ſhelly Cover.

Artichokes are accounted a pleaſant, wholſome, and very nouriſhing Food. The Roots are reckoned to be aperitive, cleanſing, and diuretic; good for the Jaundice, and to provoke Urine. *Miller's Bot. Off.*

The *French* and *Germans* eat not only the Heads, but alſo the young Stalks boil'd, and ſeaſon'd with Butter and Vinegar. The *Italians* ſeldom boil the Heads, but eat them raw, when young, with Salt, Oil, and Pepper.

Artichokes have the Reputation of promoting Venereal Inclinations to a very great Degree. The Stalks, preſerv'd in Honey, are ſaid to be an excellent Pectoral; but they ſhould be firſt blanched like Celery.

The common Leaves, boil'd in White-wine Whey, are much commended in the Jaundice, as is the Juice of theſe Leaves.

2. Cinara; ſpinoſa; cujus Pediculi eſitantur. *C. B. Pin.* 383.

3. Cinara; hortenſis; non aculeata; capite ſubrubente. *H. R. Par.* GARDEN ARTICHOKE, WITHOUT PRICKLES, AND REDDISH HEADS.

4. Cinara hortenſis; aculeata. *C. B. P.* 383. *Tourn. Inſt.* 442. *Elem. Bot.* 351. *Boerh. Ind. A.* 139. *Volck. Flor. Nor.*

110. *Rupp. Flor. Jen.* 150. *Cinara*, Cod. Med. 25. *Cinara ſylveſtris*, Ger. 991. Emac. 1153. Park. Par. 519. *Carduus ſive Scolymus ſativus ſpinoſus*, J. B. 3. 48. Raii Hiſt. 1. 299. *Carduus hortenſis foliis ſpinoſis*, Hiſt. Oxon. 3. 158. THE PRICKLY ARTICHOKE.

This is cultivated in Gardens, and is by ſome eſteemed only a Variety of the firſt Species.

5. Cinara Bœtica.

6. Cinara; ſylveſtris; Bœtica. *Cluſ. Cur. Poſt. in Fol.* 35. *Carduus Tingitanus, flore magno cæruleo, foliis atractylidis diviſurâ ſubincano, ſpinis durioribus horridis*, Plukn. Phyt. 81. 2. M. H. 3. 458. THE WILD ARTICHOKE OF BOETICA.

Beſides theſe, there are ſome other Plants which go by the Name of *Cinara*; as the

COSTUS NIGRA, Offic. *Cinara ſylveſtris Cretica*, C. B. 384. Park. 972. Raii Hiſt. 1. 300. Tourn. Inſt. 443. *Carduus Agriocinara Cretenſium, ex quo Coſtus nigra Officinarum*, J. B. 3. 52. Hiſt. Oxon. 3. 158. *Agriocinara Cretenſium*, Chab. 350. Append. 630. CANDY ARTICHOKE.

This grows principally in *Crete*, where the Heads are eaten raw by the Peaſants, like the common Artichoke. The Roots, according to *Bellonius*, are ſold for the true *Indian Coſtus* by the *French* Apothecaries.

SCOLYMUS SYLVESTRIS, Offic. *Scolymus Dioſcoridis*, Park. Theat. 973. *Cinara ſylveſtris*, Ejuſd. Parad. 519. Ger. 992. Emac. 1153. Raii Hiſt. 1. 300. *Cinara ſylveſtris latifolia*, 384. Tourn. Inſt. 442. Cod. Med. 39. *Carduus Scolymus ſylveſtris*, J. B. 3. 51. *Carduus ſive Scolymus ſylveſtris; Scolymus Dioſcoridis*, Chab. 350. *Carduus ſive Cinara ſylveſtris latifolia*, Hiſt. Oxon. 3. 158. WILD ARTICHOKE, OR CARDONET.

This grows in *Italy* and *France*. The Part in Uſe is the Flower, which is thought by the Vulgar to prevent Sterility, and preſerve the Fœtus in the Womb to the juſt Period of Maturity. The Flowers coagulate Milk.

CINAROIDES. A Name for the LIPIDOCARPODENDRON, a Shrub which grows near the *Cape of Good Hope*.

CINCLISIS, or CINCLISMOS, κίγκλισις, and κιγκλισμὸς, from κιγκλίζω, to ſhake or wag, as a Sea Bird, call'd the Wagtail, (κίγκλος) does his Tail. Theſe, in *Hippocrates*, ſignify a ſmall and frequently repeated Motion. Thus, in his Treatiſe *De Articulis*, he ſays, that there is but a ſmall Agitation or Motion (κιγκλισμὸς) at the Articulation of the Breaſt.

CINEFACTIO. A Chymical Term, importing the Reduction of a Body to Aſhes.

CINERARIA. A Plant, the ſame as the *Jacobæa Maritima*, C. B. P. 131.

CINERARIUM. The Aſh-hole of a Chymical Furnace.

CINERATIO. The ſame as CINIFACTIO, or INCINERATIO.

CINERITIUM. A Cupel.

CINERULA. A Name for Spodium.

CINETUS. A Name for the Diaphragm.

CINGULUM SANCTI JOHANNIS, in Botany, is the *Artemiſia*, Mugwort.

CINGULUM SAPIENTIÆ.

This Species of Belt or Girdle was invented by *Rulandus*, and is no more than a Woollen Cloth ſufficiently impregnated with Quickſilver kill'd with Hogs-lard. This is ſewed up in a Linen Cloth, which is apply'd immediately to the Skin, about the Hypochondria. It is uſed in the Itch, the Phthiriaſis, Ulcers, and in Caſes where there is no abſolute Neceſſity for exciting a Salivation; tho' it ſometimes produces that Effect, but rarely, unleſs it is too long worn, or too richly impregnated with the Quickſilver. The Patient's Body muſt always be kept warm, and defended from the Cold of the external Air; otherwiſe the Belt, which is of itſelf highly ſafe, becomes very dangerous. *Ettmuller* informs us, that, during its Uſe, the Acceſs of the external Cold endangers a Salivation, and that he knew a Patient, who, after a prepoſterous Uſe of this Belt, was ſeized with a violent petechical Fever. Hence we ſee the Reaſon why *Juncker*, in his *Conſpectus Chemiæ*, calls it the *Cingulum Stultitiæ*, or the Girdle of Folly. The ſame Author, in his *Conſpectus Therapiæ generalis*, affirms, "That it excites "violent Gripes, and other formidable Symptoms." *Hoffman*, therefore, juſtly aſks, Whether the mercurial Girdle, apply'd for nine Hours, as it generally is, to an itchy Patient, with Juice of Apples, or other Liniments, is a ſafe Remedy? And he thinks the Queſtion can only be anſwered in the negative, when it is not duly prepared, and when Univerſals have not been previouſly uſed. Thus a Man, whoſe whole Body was over-run with the Itch, and who was of a Cacochymic and melancholico-pituitous Conſtitution, neglecting other Remedies, immediately uſed a Girdle, in which pure Mercury was mixed with Fat; upon which ſo violent a Ptyaliſm was excited, that he run a Riſque of being ſuffocated by the Swelling of the Parts: He was, however, freed from Danger by liberal Veneſection, and the Injection of an acrid Clyſter. *Bartholine* informs us, "That this Girdle proves mortal, when applied to Patients who "are either too young, weaken'd by a Diſeaſe, or of a cacochymic Habit of Body. Hence due Care muſt be taken not "to apply it to weak Patients, and ſuch as abound with impure "Juices, at the time that the Methods to be previouſly uſed "have been neglected." Hence, according to the ſame Author, a certain Countryman in *Denmark*, who, by the mercurial Girdle, happily cured ſeveral Patients, who, by the frequent Uſe of the Medicines preſcribed by their Phyſicians, had their Bodies ſufficiently purged, could not, at the ſame time, fail to deſtroy ſome others of weak and cacochymic Habits. This Country Quack kill'd his Mercury with Oil of Juniper, made it up into a Maſs, and ſecured it in a Piece of Leather made in the Form of a Girdle, which he tied about the Middle of the Body. This Girdle he recommended as effectual againſt all malignant Diſorders, Cancers, and inveterate and obſtinate Ulcers. Others make a mercurial Girdle in this manner: They mix the Mercury, kill'd by means of Saliva or Suet, with the White of an Egg, which they lay upon Cotton, and this Cotton they ſew up in the Form of a Girdle. Another *Cingulum Sapientiæ*, invented by *Rulandus*, and by him ſaid to be effectual in baniſhing Lice both from the Body, and from Clothes, is by *Hartman* ordered to be prepared in the following manner:

Take of the black Fæces of Mercury, prepared by ſhaking Mercury ſufficiently with Spirit of Wine, a ſufficient Quantity: Let this be mixed with the Pulps of roaſted Apples, to the Conſiſtence of an Ointment. Then take Shreds of Linen Cloth, cut in the Form of a Girdle; dip this Girdle pretty often in the liquid Extract of Saffron, and dry it. Upon two ſuch Girdles let this Ointment be laid, by way of Plaiſter. Then, to the exterior Side, apply a Piece of thin Leather, and apply the Girdle immediately about the Loins.

According to *Simon Paulli*, in his *Quadripartitum Botanicum*, a more eaſy Method of baniſhing Lice is, to rub the Part affected with ſuch Cloths as Tradeſmen uſe in cleanſing Silver, when they gild it; or with a Linen Cloth, ſoak'd in burnt Spirit of Wine, you may rub and wrap up the Part.

CINIFICATUM. Calcin'd; reduc'd to Aſhes.

CINIFLONES. A Name of Reproach given to the vain boaſting Chymiſts, who pretend to great Secrets in the Art.

CINIS. Aſhes of any kind. *Cineres Clavellati*, Pot-aſh. See ALCALI.

CINNABARIS, κιννάβαρι. Cinnabar. This Name ſeems to have been given, at one time or other, to almoſt all ſorts of concreted Subſtances, whether vegetable or mineral. Thus the *Sanguis Draconis* was call'd Cinnabar, and even the Root of the *Rubia Tinctorum*, Madder, was call'd by this Appellation, according to *Neophytus*. Ceruſs alſo, calcin'd to Redneſs, acquir'd the Name of Cinnabar. *Theophraſtus* and *Dioſcorides* give the following Account of the Cinnabar of the Antients.

There are two Kinds of Cinnabar, one native, the other factitious. The native Cinnabar is produced in *Spain*, and is very hard and ſtony; it is found alſo in *Colchis*, where, they ſay, it grows on inacceſſible Rocks, from which they ſtrike it off with Arrows. The factitious Cinnabar conſiſts of a bright-grain'd red Sand, found in a certain Place a little above *Epheſus*, which they pound very carefully in Stone Mortars to a fine Duſt, and afterwards waſh it a little in Copper Veſſels: What ſubſides to the Bottom is taken and pounded, and waſhed over again. This requires Art; for ſome obtain a good Quantity of Cinnabar, where others, of leſs Skill, can get little or nothing out of an equal Maſs of Sand. What ſubſides is the Cinnabar; what ſwims, which is the greater Part, is the Plyſma (the Waſhings). One *Callias*, an *Athenian*, is ſaid to be the firſt Inventor of factitious Cinnabar; for he, imagining the Sand, becauſe of its Glittering, to contain Gold, was very careful to collect it; but finding his Miſtake, and yet admiring the Beauty of the Colour, his Curioſity at laſt led him to this Invention. Nor is this Diſcovery of any great Antiquity, being but ninety Years before *Praxibulus* was Archon, or chief Magiſtrate of *Athens* (the Year of *Rome*, according to *Pliny*, 249.). *Theophraſtus de Lapidibus.*

The firſt-mention'd is our Native Cinnabar.

Pliny, who tranſlates the foregoing Account, renders the κιννάβαρι of *Theophraſtus* by *Minium*, *Lib.* 33. *Cap.* 7. He adds, that the *Greeks* call Minium *Miltos*, and ſome *Cinnabaris*; whence it comes to be miſtaken for the *Indian* Cinnabar, which is the Name they have for the Blood of the Dragon, cruſhed by the Weight of the dying Elephant falling upon him, the Blood of both Animals being mixed together. This Cinnabar is very uſeful in Antidotes and Medicines; but the Phyſicians, inſtead thereof, uſe Minium, which is poiſonous, becauſe it is alſo call'd Cinnabar.

Some take Cinnabar to be what is call'd *Ammion*; but they are miſtaken, for Ammion is prepared in *Spain* of a ſort of Stone, mixed with Silver Sands. They know this Stone only by the very florid and flame-like Colour which it aſſumes in the Furnace. While it is in the Furnace, it emits a ſuffocating Vapour;

Vapour; for which Reaſon the Workmen of that Country cover their Face with a Bladder, that they may be able to ſee, and yet have their Reſpiration free from the noxious Exhalations. The Ammion, thus prepared, is uſed by Painters in coſtly Ornaments of Walls; but Cinnabar, which is our preſent Subject, is imported from *Africa*, and ſold very dear, ſo as ſcarce to be purchaſed by the Painters in ſufficient Quantities for the Colouring of their Lines. It is of a very deep and ſaturated Colour, whence ſome have taken it for Dragon's-blood.

Cinnabar has the ſame Virtues as the Lapis Hæmatites, but is more effectual in ophthalmic Caſes, being more aſtringent, and of greater Efficacy in ſtopping an Hæmorrhage. A Cerate, prepared with it, cures Ambuſtions, and Efflorеſcences [Καρόμαλα]. *Dioſcorides, Lib.* 5. *Cap.* 109.

By the *Ammion*, *Dioſcorides* probably means the firſt Sort of Cinnabar of *Theophraſtus*, which both agree to be produced in *Spain*; and at this Day there is a celebrated Mine of Cinnabar at *Almaden*, a Town of *Eſtramadura*, of which Mr. *Juſſieu* gives a long Account, in the *Memoirs of the Royal Academy of Sciences* for 1719.

There are at preſent three Sorts of *Cinnabar* uſed in Medicine. The firſt is the

CINNABARIS NATIVA, Offic. Schw. 374. *Minium purum, ſeu Cinnabaris Nativa*, Worm. 126. *Lapis Minium*, Aldrov. Muſ. Metall. 637. *Cinnabaris*, Matth. 1355. *Minium*, Dioſc. *Argenti vivi Minera, Cinnabar foſſilis Dioſcoridis*, Calc. Muſ. 439. NATIVE CINNABAR.

The Native or Foſſil Cinnabar of the Shops, call'd *Minium* by the antient *Greeks*, and *Anthrax* by *Vitruvius*, is a foſſil, metallic, heavy Subſtance, not very hard, found ſometimes pure, and ſometimes mix'd with Stones. Of the pure Cinnabar there are ſeveral Kinds; one of a purple Colour, inclining to Red, but which, by grinding, turns to a very beautiful Red; another of a blackiſh or Liver Colour, reſembling the Lapis Hæmatites; and a third of a yellowiſh Colour, which is commonly ſo rich in Quickſilver, that, when heated in the leaſt Degree, the Metal drops ſpontaneouſly from it.

The other Kind of Native Cinnabar is found in a foſſile Stone, form'd of Laminæ, of an Aſh-colour. It has been likewiſe found in a white metalline Stone, and ſometimes in form of a Gold or Silver Pyrites, ſuch as was dug up ſome Years ago in ſeveral Places of *Normandy*.

Native Cinnabar is found in *Hungary*, *Bohemia*, *Italy*, *Spain*, and *France*, and every one knows of what Parts it is compoſed. Quickſilver is obtain'd from it, by diſtilling it with Quicklime, or Filings of Iron; and Sulphur may likewiſe be had, in a ſmall Quantity, by boiling it in ſtrong Lixivia, and then pouring diſtil'd Vinegar into the Decoction, the Quickſilver being firſt ſeparated. The Native Cinnabar, of which Painters of old were extremely fond, is now ſeldom uſed by them, becauſe the factitious Sort is cheaper, and anſwers all their Purpoſes equally as well. The Internal Uſe of it is recommended by ſome Phyſicians in the Epilepſy, Vertigo, Madneſs, and all ſpaſmodic Affections. In theſe Caſes they chooſe that of *Hungary* or *Carinthia*, which is of a ſparkling-red Colour, and free from all heterogeneous Particles; and reject the dark or yellowiſh Kind, as being more impure. Sometimes, however, Native Cinnabar, by means of ſome vitriolic, or even arſenical Particles aſſociated with it, happens to excite Nauſeas, Vomitings, Anxieties, and Heart-burns, which I have myſelf more than once, ſays *Geoffroy*, been a Witneſs to, even after the Cinnabar had been purged by frequent Waſhings; and therefore I always prefer either factitious Cinnabar, or that of Antimony, to the Native. *Geoffroy.*

Every Pound of good Cinnabar yields fourteen Ounces of Quickſilver.

The ſecond is the

CINNABARIS FACTITIA, Offic. Aldrov. Muſ. Metall. 642. *Cinnabaris artificialis*, Schw. 375. COMMON VERMILION, OR FACTITIOUS CINNABAR.

1. Take a tall earthen Veſſel, which widens upwards; put into it four Ounces of Flowers of Sulphur; then melt the Sulphur over a gentle Fire, the Make and Height of the Veſſel thus preventing it from taking Flame. Then take Quickſilver heated, but ſo as not to fume, and pour a little thereof into the melted Sulphur, which will thus preſently grow viſcous: Stir it continually with a thick Tobacco-pipe; and continue pouring and ſtirring, till thrice the Quantity of Quickſilver, in proportion to the Sulphur, be thoroughly mix'd in therewith. At this time there commonly ariſes a great Hiſſing, with thick red Fumes, and the Matter takes Flame with a Noiſe: Put a Tile upon the Mouth of the Veſſel, let all cool, and the Maſs will be found black. (2.) Put this Maſs into an *Heſſian* Cucurbit; cloſely lute on a Head with a Mixture of Clay and Lime; or elſe invert another Body on the former: Set it in a Sand-furnace, ſo as to touch the Bottom of the Iron Pot; bury the Veſſel in Sand, a little below the Matter; raiſe the Fire gradually to the utmoſt: At firſt a little inſipid Water will riſe, then a few whitiſh Flowers, and at laſt a black Matter. When the Fire has been continued at the greateſt Height for three Hours, let all cool: A compact Matter will be found ſticking to the Sides of the Body, and appearing black on its outward Surface: Bruſh off this Blackneſs with a Hare's Foot, grind the Maſs, and it will appear of a fine red Colour. It is call'd factitious Cinnabar. A little feculent Matter will remain at the Bottom of the Body.

REMARKS.

Cinnabar is a Mixture of Mercury and Sulphur, united by the Fire, in the Form of a ſimple Foſſil, which is found natural in many Mines, and is like factitious, without much Difference. It has nearly the ſame Virtue, in the Body, as Æthiops. *Crate* call'd it the Magnet of the Epilepſy, but I never ſaw it produce any great Effects. If it be mix'd with Purgatives, then, like Æthiops, it is driven quicker thro' the Inteſtines, with the uſual Succeſs of Æthiops. It is mix'd with red Coſmetics, in the form of Pomatum: It is uſed in Fumigations againſt Venereal Ulcers in the Noſe, Mouth, and Throat, with little, and often with bad Succeſs. The Mercury may be revived very pure from the Cinnabar, by grinding it with twice its Weight of Iron-filings, and diſtilling it in a Retort, with the ſtrongeſt Heat of a Sand-furnace, into Water. See ÆTHIOPS. *Boerhaave's Chymiſtry.*

Lemery ſays, that it is beneficial in Epilepſies, Aſthmas, and the Pox; as alſo in order to promote a Tranſpiration of the Humours. The Doſe is from two to twelve Grains, mix'd in ſome proper Conſerve, and ſwallow'd in form of a Pill. It is alſo uſed externally in Ointments for the Itch; and Fumigations are made of it, in order to excite a Salivation.

The Method of raiſing a Salivation with Cinnabar is thus:

The Patient, being firſt duly prepared, is placed naked in a proper Chair, or Stove; and ſmall Pieces of Cinnabar, to the Quantity of two or three Drams, being thrown upon live Charcoal, the Steam is received thro' the Pores of the Skin. The Patient grows ſoon very warm, and ſweats more or leſs, in proportion to his Strength. This Operation is repeated every Day, or every other Day, till the Gums begin to ſwell and ulcerate, and the Spitting riſes to a ſufficient Quantity.

Venereal Ulcers, in the Mouth and Fauces, are alſo frequently fumed with factitious Cinnabar, the Smoak being received into the Mouth by means of a Funnel.

The third is the Cinnabar of Antimony.

The Cinnabar of Antimony, as well as Native and Factitious Cinnabar, is compounded of Sulphur and Mercury, being prepared of Antimony and corroſive ſublimate Mercury; the Fire, after the Separation of the Butter of Antimony, being increaſed, that there may be a Sublimation of the fluid Mercury, ſeparated from the corroſive ſublimate Mercury, and of the Sulphur of Antimony, ſeparated from its metalline Parts, into that highly florid Body, which conſtitutes the Cinnabar of Antimony, a Subſtance of a moſt beautiful Vermilion-colour, when powder'd. See ANTIMONIUM. This is the common Way of preparing Cinnabar of Antimony, which is by the ſame Proceſs as that for making Butter of Antimony. But there are other Ways; as, for Example, let Sulphur, ſeparated from Antimony, be ſublimed with common Mercury. See *Tachenii Hippocrates Chymicus*. There are alſo other mercurial Preparations, which, being ſublimed with Antimony, produce the Cinnabar of Antimony. See the *Ephemerides Germanicæ*. Sometimes it happens, that, after the Antimony is put to the Sublimate for the Diſtillation of the Butter of Antimony, the Cinnabar is ſublimed in a ſhort time by a moderate Fire, while the Butter ſtays behind. See *Boyle's Tentamina*. But if the chymical Regulus of Antimony be choſen for the making of Butter of Antimony, no Cinnabar can be obtain'd, but a moſt pure Mercury, raiſed out of the corroſive Sublimate, which aſcends by itſelf; becauſe ſuch a Regulus is deſtitute of Sulphur, to which it ſhould join itſelf, in order to conſtitute this Cinnabar. Since it can be proved, that there is no Difference between Sulphur of Antimony and common Sulphur, with reſpect to their Nature and Virtues, we may juſtly conclude, that Cinnabar of Antimony, which is prepared with great Labour, and no ſmall Coſt, is no better for Uſe and Efficacy than common Cinnabar, which is eaſily and readily made of Quickſilver depurated, and common Native Sulphur, and, being equal to the other in Virtues, may therefore very well be ſubſtituted in its ſtead, as I am convinced by Obſervations, and the Experience of many Years; not to mention, that the common Cinnabar recommends itſelf by its Colour, which is more beautiful than that of the Cinnabar of Antimony. This Quotation is from the excellent *Frederic Hoffman*, in his *Obſervationes Phyſico-chymicæ*. What he ſays, is not at all invalidated by Dr. *Cheyne*,

Cheyne, de Fibra, where he makes Cinnabar of Antimony, very finely pulveriſed, the principal Medicine for cutting, attenuating, and rendering fluid, groſs, viſcid, and tenacious Humours; for it is certain, that Cinnabarine Subſtances, the more they are triturated, and the finer the Powder is, to which they are reduced, the more ſpeedy will be their Effects in attenuating and cutting the coagulated Lymph, in reſolving the thick, viſcid, and grumous Blood, and in opening Obſtructions, and other like Caſes. On the contrary, if the Buſineſs of Trituration be neglected, and the Cinnabar only broken in a groſs manner, it becomes not only the ſlower in Operation, but is frequently diſcharged, all of it, with the Fæces, which it tinges of a red Colour. Therefore, tho' a more accurate Comminution of this Cinnabar may conduce ſomething to the facilitating and promoting of its Operation, it does not, however, convert it into a Remedy of more Efficacy than the common Cinnabar, treated after the ſame manner. It may not be ungrateful to the Reader, if I ſhould here quote what *Johannes Jacobus Roek* ſays, concerning two Superſtitions, as he calls them, of Phyſicians, with reſpect to Cinnabar of Antimony, in his Treatiſe *de Chymiatria Superſtitioſa*. The firſt is in the Explication of the ſpecific Manner of its Operation; for Example, in the Epilepſy, which they imagine to proceed from its alcaline Nature; as, among others, I remember is aſſerted by *Morley* in his *Collect. Chymicis Leydenſibus*. Here are three Things ſuppoſed, which may reaſonably be doubted; firſt, that the proximate material Cauſe of an Epilepſy is an Acid; ſecondly, that the Cure is to be effected by Alcalies; thirdly, that Cinnabar of Antimony is an Alcali. The firſt of theſe Suppoſitions is overthrown, not only by the Account of the Cauſe of the Diſeaſe, drawn from its moſt genuine Hiſtory, but alſo by the Method of Cure uſed in the Epilepſy, eſpecially that of Children, of which we are now ſpeaking; for the Symptoms, produced by the Cauſe, ſufficiently inform us, that the Diſorder draws its Origin from a viſcid, tough, mucous, and tenacious Matter, lodged either in the Primæ Viæ, or in the other Parts deſtin'd for *the Conveyance of the Serum:* Hence this Species of Convulſion becomes neceſſary for eliminating and diſcharging ſuch a peccant Mucus from the Body. This Aſſertion is alſo evinced by the accidental Cauſes of an Epilepſy; ſince we frequently obſerve this Diſorder produced by repelling that Species of cutaneous Diſorder call'd *Cruſta Lactea*, or by an Induration of the Inteſtinal Fæces, which, in the very Nature of the Thing, require ſuch a powerful Commotion of Nature for the Relief of the Patient. This Theory is in a manner ſubjected to our Senſes, by Proofs *à Poſteriori*, drawn from the Cure of an Epilepſy, which is accompliſh'd by reducing the tenacious and viſcid Humours to a due Degree of Fluidity, by Medicines appropriated to Catarrhs, by Abſorbents, by Correctors, by Preparations of Myrrh and Amber; and, when they are corrected, by eliminating them, by means of purgative Preparations of Rhubarb, Mercurius Dulcis, and Orris-root; as alſo by perſpirative Medicines of the milder Kind; and, laſtly, by removing the Epileptic Motions by Preparations of Cinnabar, and other proper Remedies: Hence 'tis obvious, that an Epilepſy is produced rather by a mucous, viſcid, and tenacious Subſtance, than by one of a ſaline and acid Nature. From what has been ſaid, we may form a juſt Notion of the other Suppoſition, which is, that Epilepſies are cured by alcaline Subſtances; for, if an Epilepſy is produced by an Acid, it is of courſe to be removed by Alcalis. But the latter of theſe Aſſertions, as we have already ſeen, is contradictory to Experience; and the former muſt, of conſequence, be groundleſs. As for the laſt Suppoſition, which is, that Cinnabar of Antimony is of an alcaline Nature, it is by no means founded upon Experience; ſince this Subſtance neither poſſeſſes nor exerts either the eſſential or accidental Virtues of an alcaline Salt: For tho', by Accident, upon the Affuſion of a corroſive Acid, it produces the uſual Noiſe of an Effervescence, yet it is not, for that Reaſon, to be call'd an Alcali; ſince the ſame Effect is produced by other metalline and mineral Subſtances, which are neither of an alcaline nor of an acid Nature. But this Motion, or apparent Effervescence, is produced by an Attenuation, a minute Diviſion, and a Solution of Continuity among the ſolid Corpuſcles, and the conſequent Reception of the Fluid into their Pores. Another ſuperſtitious and uſeleſs Method of treating Cinnabar of Antimony, is the Tranſmutation of it into the Quinteſſence of Cinnabar, Panaceas, Specifics, and what is commonly call'd *Solar Cinnabar*, ſince theſe laborious Operations fruſtrate the Pains of the Undertaker, diveſt the Cinnabar of its genuine Qualities, and prove offenſive to Men of a juſt and correct Taſte in the chymical Way. Preparations of this Kind were long ago not only ridiculed, but treated with Contempt and Deteſtation by the celebrated *Ludovicus:* "For, ſays he, if any Virtue is produced by a long "Calcination, or a Cohobation of the Spirits, as happens in the "*Panacea Anwaldina*, which is prepared by a frequent Incorporation and Exſiccation of the Spirit of Vitriol and Spirit of "Wine with the Cinnabar of Antimony, this Virtue is by "no means ſuperior to that of other and more common Diaphoretics." This is, in a particular manner, obſervable in the above-mention'd Panacea. As for the volatile Tinctures of Cinnabar, or its Quinteſſences, extracted with any aromatic Oil, alcaline Salt, or hot Spirit, or other anomalous Preparations of it, which are alſo call'd Wines of Life, and ſolar and ſpiritual Eſſences, they are nothing but Tinctures of an antimonial and ſulphureous Nature. The uncommon Virtues aſcrib'd to them for prolonging Life, by expelling from the Body every thing of a peccant Nature, inſtantaneouſly reſtoring the languid and impair'd Strength, and, in a manner, recalling fleeting Life, are no more than Words of courſe, and ſo many quack Encomiums. In like manner the *Balſamum Cinnabarinum*, accounted a Specific in Diſorders of the Breaſt, and which, by previouſly diſſolving the Union between the Cinnabar of Antimony and the Mercury, by means of ſome Alcali, is extracted from the ſame Cinnabar of Antimony, with the aromatic Oils of Aniſe, Mint, Lemon-peel, and Turpentine, is, in Reality, a Subſtance of the ſame Nature with the Balſam of Antimony, which, by a known Proceſs, is extracted from what is commonly call'd the dry Tincture of Antimony, or that nitrous and ſulphureous Salt obtain'd from the Scoriæ of the Regulus of Antimony, and is of ſingular Uſe both internal and external, ſince it is of an anodyne, detergent, and conſolidating Nature. Beſides, a diligent Inquirer into the Natures of Things will eaſily find, that the common Balſam of Sulphur is equal, if not preferable, to either of theſe now mention'd. For this Reaſon I think it adviſeable not to be ſo prodigal of the Cinnabar of Antimony, but to uſe it ſparingly, ſince 'tis obtain'd by ſo much Labour and Expences, and ſince the Intention may be equally well anſwer'd by Things more eaſily procured. Theſe are the Sentiments of *Joh. Jac. Roek.* Cinnabar of Antimony, when infuſed in Wine, imparts emetic and purgative Qualities to it, which Effect is not produced by common Cinnabar. From what has been ſaid, we may reaſonably conclude, that the Largeneſs of the Price is the only Circumſtance, in which Cinnabar of Antimony differs from common Cinnabar duly prepared. *Rieger.*

The Doſe of this Cinnabar is ſaid to be from ten Grains to a Scruple. *Geoffroy* ſays fifteen Grains.

Cinnabar of Antimony has of late been introduced into Practice as a powerful Medicine, and capable of affording conſiderable Relief in Fevers, attended with Symptoms of an affected Brain; and the Uſe of it is attended with ſome Succeſs. But I am afraid its Operation is too ſlow, to exert itſelf ſoon enough to cure ſo acute Diſorders as thoſe above-mention'd, eſpecially as the Organs, employ'd in conveying it to the Blood, are, under theſe Circumſtances, in a very weak Condition. More active Preparations, therefore, of Mercury and Antimony, promiſe greater Relief. See ANTIMONIUM.

THE TRUE CINNAMON-TREE. *Dale.*

Cinnamomum, or Cinnamum, among the *Latins*, are the ſame with the κίνναμον and κινάμωμον, or κιννάμωμον, of the *Greeks*. This laſt Name is derived from κίνναμον and ἄμωμον, or from the *Hebrew* Word קינה or קנה which ſignifies a Cane or Reed, and the ἄμωμον of the *Greeks*. In the Writings of the Antients, it is not poſitively determin'd what this Subſtance is, ſince moſt of what they have ſaid concerning it is borrow'd from the Accounts of others. But in this they agree, that it is a certain precious and rare Production of the Vegetable Kingdom. According to *Pliny*, many fabulous Accounts were given of this Subſtance by the Antients; and *Herodotus* informs us, that it was obtain'd from the Neſts of Birds, eſpecially of the Phœnix, lodged in inacceſſible Rocks and Trees; and that it was forced thence, either by the Weight of the Fleſh the Birds convey to their Neſts, or by Arrows, with proper Quantities of Lead affix'd to them. *Theophraſtus* gives us an Account of another fabulous Opinion entertain'd in his Time, with reſpect to Cinnamon, in the following Words: "It is ſaid to be pro"duced in Valleys; and as theſe abound with Serpents, whoſe "Bites prove mortal, the Inhabitants deſcend into them with "their Hands and Feet properly defended, in order to gather "the Cinnamon." *Pliny*, from *Herodotus*, informs us, that the *Caſſia*, which, among the Antients, was our *Cinnamon*, was found about Marſhes; and that ſuch as gather'd it were expoſed to the Attacks of wing'd Serpents, and a fierce Species of Bats with formidable Claws. *Solinus*, in *Cap.* 30. informs

ns, that the *Ethiopians* gather Cinnamon, but that this Office is allotted to the Priests, who do not set about it till they have perform'd Sacrifice. Their Time of gathering it is confined between the Rising and Setting of the Sun; and when their Labour is at an End, the principal Man among them divides the Cinnamon into Heaps, with a kind of Spear appropriated to that Ceremony. Then a certain Portion of what they have gather'd is consecrated to the Sun; and if the Division is made in a just and equitable manner, this Portion takes Fire spontaneously. *Theophrastus* gives us the same Accounts, but looks upon them as palpably fabulous and absurd. The smallest Parts of the Twigs, about a Hand's-breadth in Length, are best; that which immediately succeeds them, next in Goodness, and that which is nearest the Roots worst, because there the smallest Quantity of Bark is found, in which the greatest Virtue, and most agreeable Taste, reside: For this Reason the Tops are preferable to the other Parts. The Wood itself, call'd Xylocinnamomum, is little esteemed, and loathsome on account of its acrimonious Quality, resembling that of Origanum. Immediately after, *Solinus* subjoins, that some had spoken of two Kinds of Cinnamon, the one white, and the other of a blacker Colour; that in former Times the white was prefer'd, whereas now the black is esteem'd best. *Dioscorides* and *Galen* also distinguish the Cinnamon into various Kinds, taking their Distinctions from the various Degrees of Goodness, and the Places where they are produced. To give the several Characteristics by which *Dioscorides* and *Galen*, *Pliny* and *Theophrastus*, distinguished the good Cinnamon from that which was bad, would be not only tedious, but in a great measure useless, since 'tis of more Importance to know the distinguishing Properties by which the Moderns judge of the Value of this Commodity; and these shall be afterwards laid down.

According to *Dioscorides*, Cinnamon of every Kind is of a heating, emollient, and concocting Quality. It provokes Urine. When drank in some proper Liquor, or exhibited with Myrrh, it expels the Fœtus, and promotes an Eruption of the Menses. It is proper against Poisons, and the Bites of venomous Animals. It removes Dimness of Sight, attenuates thick and viscid Humours. When mix'd up with Honey, and used by way of Ointment, it removes Freckles, and other cutaneous Defedations of the Face. It is effectual against Coughs, Defluxions, Anasarcas, Disorders of the Kidneys, and a difficult Discharge of the Urine. It is usually an Ingredient in precious Ointments, and is of very great, and almost universal Use. Some triturate it in Wine, dry it in a Shade, and lodge it under Ground, that it may remain good the longer. The same Author affirms, that Cassia, which is a Species of Cinnamon, provokes Urine, and is of a heating, drying, and gently astringent Nature. Hence he asserts, that it is proper for Malagmas, and Medicines intended to render the Sight clear. When mixed with Honey, and used by way of Ointment, it removes Freckles. It also provokes the Menses; and, when drank in a proper Vehicle, proves beneficial against the Wounds made by Vipers. It is also good against all internal Inflammations and Disorders of the Kidneys. It is useful by way of Insession, or Fumigation, for dilating the Pudenda of Women. And double the Quantity of it, mixed with other Medicines, supplies the Place of Cinnamon when it cannot be had, since it produces the very same Effects. In a Word, it is highly useful for a great many Purposes. *Galen* affirms, that Cinnamon consists of very fine Parts, but that it is only hot in the third Degree; that Cassia is in some measure drying, and hot in the third Degree; that it consists of very fine Parts, is highly acrid to the Taste, and somewhat astringent. In consequence of these Qualities, he says, it incides and digests the recrementitious Juices of the Body, and corroborates the several Parts. *Strabo*, *Theophrastus*, *Dioscorides*, *Galen*, and *Pliny*, inform us, that Cinnamon is produc'd not only in *Arabia*, but also in the *East Indies*; for, since this latter Country is equally hot with *Arabia* and *Ethiopia*, it produces the same Aromatics, such as Cinnamon, Cassia, and others. From what has been said 'tis obvious, that the Antients were not well acquainted with the History of Cinnamon. Nor is this to be wondered at, since, according to *Pliny*, the Merchants who imported it into *Europe*, had a Voyage so long and hazardous, that they scarce return'd sooner than five Years, and many of them died during the Voyage, so that this Branch of Trade was principally carried on by Women. Hence it happen'd, that fabulous Accounts were not only raised, but also, because corrupted Commodities of different Appearances were imported, they gave the different Names of Cassia and Cinnamon to one and the same Substance. Some, because we can learn nothing certain from the Descriptions of the Antients, reckon Cinnamon among the Things that are lost. It is at present agreed on by all who have wrote concerning the Cinnamon-tree, that the Bark of the Branches is better than that of the Trunk. Hence the barbarous Nations made a Distinction between Cinnamum and Cinnamomum; by the former of which they meant the gross, coarse, and less aromatic Bark of the Cinnamon-tree, and by the latter that which is finer, and of a more agreeable Flavour. This Distinction is used by almost all the *Arabian* Interpreters, in explaining the three Words *Selicha*, *Darsini*, and *Karse*. By *Karse* they understand the Cinnamomum, by *Darsini* the Cinnamum, and by *Selicha* the Cassia Lignea. But this Distinction is not agreeable to the Opinion of most Authors, who only think, that these are different Parts of the Bark of the same Tree. But the Accounts of the Canella, the Cinnamum, the Cinnamomum, and the Casia Fistula, are so various, and involv'd in so much Obscurity, that they have a Tendency rather to distract and confound, than to satisfy and enlighten the Mind. For this Reason we shall pass them over without attempting a Reconciliation of them, and only observe, that what is at present in the Shops call'd *Cinnamomum*, *Canella Cinnamum*, or *Cassia Cinnamomea*, *odorata aromatica*, *Cassia Fistula*, is an aromatic Bark, of a reddish Colour, woody, friable, made up into Pipes of different Thickness and Length, of a sweetish, pungent, hot, and somewhat astringent Taste, of a fragrant Smell, appropriated to various Uses both in Cookery and Medicine, and gathered from the *Arbor Cinnamomifera Zeilanica*, which is also call'd *Cassia Cinnamomifera*, *Cassia Cinnamomea*, and *Canella Zeilanica*. The *Arbor Cinnamomifera* is produced in several other Parts of the *East Indies*; but all, with respect to the Worth and Efficacy of the Bark, are far inferior to that produced in *Zeilan*. And because in *Zeilan* there are ten Species of this Tree, omitting all the others, we shall only speak of that from which the best Cinnamon is gathered, which is yearly exported by the *Dutch East Indian* Company, and which by the Natives is call'd *Rasse Coronde*, which Words imply acrid, grateful, and sweet Cinnamon. The Tree bears large oval Leaves, of a thick firm Texture, with three remarkable Ribs running from Stalk to End. The Fruit it bears is small, longish, and round, growing in a short Calyx or Cup. From an Incision made in the Root of this Tree drops a Liquor which smells like Camphire. Besides, Camphire now-and-then ouses from the Bark of this Root in the Form of oleous Drops, which insensibly coagulate into white Grains. Hence we may conclude, that the Cinnamon of the Antients was gathered from the same Species of Tree; for *Pliny*, in the nineteenth Chapter of his twelfth Book, informs us, that, "In the Temple erected in Honour of *Divus Au-*" *gustus*, by his Spouse *Augusta*, he saw the Root of a Cinna-" mon-tree of great Weight, from which some Drops being " yearly discharged, were indurated into Grains;" which, no doubt, resembled Camphire. This Species of Camphire, by the *Indians* call'd *Baros*, is also obtain'd by Distillation from the Bark of the Root, dry'd, bruis'd, and immers'd in Water. It comes off, with a Water, in the Form of an Oil; but, after the Water is become cold, it partly coagulates into white, small, pellucid Crystals, like small Icicles form'd at the Edges of Vessels by a moderate Frost. The Physicians of *Zeilan* use this distil'd camphorated Water with Success, exhibiting a Spoonful of it at proper Intervals, as a Sudorific in continu'd and malignant Fever. They also mix it with common Water, against Defluxions, and an epidemical Disease, by the Natives call'd *Pipa*. Externally it is apply'd with Linen Cloths for discussing œdematous and watery Tumors. This Species of Camphire is by far the best for Medicinal Purposes; and in some Parts it is gathered and kept only for the Use of the Kings, who use it as a Cordial Medicine of singular and uncommon Efficacy. Not only the Camphire call'd *Baros*, but also the Oil of Camphire distil'd from the Roots, when taken internally, is possessed of a cordial and restorative Quality. It in a particular manner corroborates the Stomach, dispels Flatulences, is singularly effectual against arthritic Pains, and is of a diuretic Quality. Ten or twelve Drops of it may be taken for a Dose, dropt on white Sugar, or into some proper Liquor. Externally it is apply'd in all Pains of the Joints, produced by Cold or Obstructions. For these Intentions it is to be sufficiently rub'd into the affected Parts with the warm Hand, by which means the Disorder is gradually and insensibly removed. After the Distillation is over, the reddish Liquor, which remains at the Bottom of the Vessel, when evaporated, yields an Extract, which is recommended in Fluxes. From half a Dram to a whole Dram of the Bark of the Root is also exhibited in Substance, in poisonous and malignant Disorders. The Inhabitants of *Zeilan* make their Fires, and build their Houses, of the Wood of this Tree. Its Leaves, in Distillation, yield an Oil of a bitterish Taste, resembling Oil of Cloves, to which a little of the Oil of Cinnamon has been added, and which is call'd *Oleum Malabathri*. This aromatic Oil is highly celebrated as an instantaneous Remedy against Pains of the Head and Stomach, and various other Disorders. *Grimm*, in his *Thesaurus Medicus Insulæ Ceyloniæ*, informs us, that, when exhibited with some proper Water or Powder, it has miraculously remov'd Pains of the Abdomen arising from Cold; and that it is, besides, an excellent Corrector for the more violent and drastic Purgatives. The Water distil'd from the Leaves is said to possess the same Virtues, when exhibited in a large Dose. The Oil of the Leaves, made by boiling them with common Oil, is, on account of its heating, anodyne, and resolvent Quality, highly recommended for Chirurgical Intentions; in the Composition of Liniments, for Instance,

Cataplaſms, and Clyſters; as alſo in Colics, Gripes, Tympanies, and other windy and watery Tumors. The Leaves themſelves, reduced to Powder, are, in *Zeilan*, alſo preſcribed againſt flatulent Diſorders, which require Medicines of an aromatic and heating Nature. They are alſo mixed with Purgatives, in order to correct their Force, and prevent Gripes. They are likewiſe uſed frequently, and in various Forms, for preparing Baths, Cataplaſms, Ointments, and Clyſters. From the Flowers is obtained, by Diſtillation, a fragrant Water, which, when exhibited by Spoonfuls, at proper Intervals, corroborates the Stomach, immediately alleviates colic Pains ariſing from Cold, improves the Colour of the Face, ſweetens the Breath, and is eſteemed proper for preſerving ſeveral Species of Aliments, and rendering them more grateful and agreeable. A Conſerve is alſo made of the Flowers, which is highly commended againſt Diſeaſes ariſing from a cold Cauſe; and which may be given from one to two Drams. From the Kernels of the ripe Fruit is obtained by Expreſſion, as alſo by Boiling, an Oil, which, in ſome meaſure, reſembles Suet, is made up in Cakes like Soap, and has no Smell, except when warm'd, in which Caſe it ſmells ſomewhat like Cinnamon. This Oil is, by the *Dutch Eaſt Indian* Company, call'd *Cera Cinnamomi*, becauſe the King of *Candia* orders his Candles and Torches to be made of it; and theſe Candles, on account of the Fragrance of their Smell, he reſerves for his own Uſe, and that of the Court. He allows, however, the Inhabitants to expreſs the pinguious fluid Juice from a Fruit not unlike that of the Cinnamon-tree, as the Oil is expreſs'd from Olives, in order to burn in Lamps. Among the *Indians* this *Cera Cinnamomi* is uſed in Medicine, and exhibited internally to thoſe whoſe Limbs are luxated, who have fallen from Precipices, or who have received Contuſions or Blows, that the internal Parts, which are hurt and corrupted, may, by its medicinal and balſamic Virtue, be reſtored, and rendered ſound. This Subſtance is alſo exhibited in Dyſenteries, from one Dram to a Dram and an half. When uſed externally, it renders the Skin far more pure and ſoft, than any Species of Pomatum. It is alſo uſed in Ointments, and Plaiſters of the reſolvent, nervous, cephalic, and carminative Kind. In that Species of Palſy by the *Indians* call'd *Beriberi*, it is exhibited internally, and applied externally, becauſe, by its gently anodyne and narcotic Quality, it reduces the Patients to a calm and eaſy State. When the Fruit, not as yet perfectly ripe, and groſly bruiſed, is diſtil'd with common Water, there is yielded with the Water an Oil exactly like that of Juniper in Taſte, Smell, and Virtues. In the Bottom of the Still there remains a Subſtance, which is pinguious, green, and ſometimes hard, like the Wax.

The Tree, which bears the Cinnamon, has a certain determin'd Number of Years within which it becomes fit to have its Bark taken off; but with this Difference, that ſome are ready two or three Years before others: For ſuch as grow in Valleys, covered with a pure, ſmall, whitiſh Sand, are generally ready for Decortication in five Years; whereas thoſe produced in moiſt and dank Soils are not fit for this Purpoſe ſooner than the ſeventh or eighth Year, Thoſe alſo arrive more ſlowly at Maturity, whoſe Roots are deprived of the Influence of the Sun by the Shades of taller adjacent Trees. Hence it alſo happens, that this Species of Bark is not ſo ſweet, and agreeable to the Taſte, as that produc'd in whitiſh ſandy Soils, expoſed to the Sun; ſince the former is bitteriſh, ſomewhat aſtringent, and taſtes like Camphire; for, by the Influence of the Sun, the Camphire is rendered highly fine and volatile, by which means it enters the Juices of the Tree, and begins, in ſome meaſure, to ferment with them; and, riſing upwards, betwixt the Wood and the tender interior Membrane of the Bark, it is ſo diffuſed among the Branches and Leaves, that the ſmalleſt Remains of the Camphire are not to be obſerved. Beſides, this interior, ſoft, and glutinous Membrane between the Wood and the Bark imbibes the ſweet and grateful Particles of this Juice, leaving thoſe which are more groſs and impure, and which are carry'd upwards, and convey'd into the Leaves, Flowers, or Fruit. But, as Accounts of this kind belong more properly to Natural Hiſtory than Medicine, we ſhall proceed to inform the Reader, that, in the Shops, that Cinnamon is generally accounted beſt, which is lately gathered, of a yelloviſh Red externally, and internally of a ſomewhat darker Colour, which is ſmooth, eaſily broken, of a highly fragrant Scent, and pungent Taſte. That which is ſmall is preferable to the larger Kind; and the long Pipes are eſteemed more valuable than the ſhort. The beſt Kind is by ſome Authors call'd *Cinnamomum acutum*; and, according to the *Pharmacop. Auguſt. in Prolegom.* this Commodity is adulterated with the Bark of the Caper-buſh, or Tamariſk, macerated in Cinnamon-water, and afterwards dry'd. But Falſifications of this kind are very rare, and eaſily detected. It is alſo generally adulterated by an Admixture of Caſſia Lignea, which, for the moſt part, does not amount to a Fourth of the Price paid for Cinnamon. Some alſo adulterate, or rather ſpoil, the Cinnamon, by boiling or diſtilling it previouſly, by which means it is deprived of its beſt and moſt aromatic Qualities; but this Piece of Fraud is eaſily detected by the Smell or Taſte of the Commodity. When, indeed, the Pipes, diveſted of their fragrant Oil by Diſtillation, are laid for ſome time among good Cinnamon, they reaſſume their Virtues, which, at the ſame time, are loſt by the good Cinnamon, in Proportion as they are imparted to that which is bad, according to *Boerhaave* in his *Chym. Vol.* 2. So that the bad cannot be diſtinguiſhed from the good without examining every Pipe. But as this would be an immenſe and endleſs Labour to the Merchant, who buys large Quantities of it, he muſt, as *Pomet* well adviſes, take care, that the Perſon with whom he deals be thoroughly honeſt. *Valentinus*, in his *Pandectæ Medico-legales*, *T.* 1. informs us, that the Powder of Cinnamon is ſometimes adulterated by an Admixture of Bole; and, according to *Meier*, with the Barks of other Trees reduced to Powder. The Druggiſts, in order to keep the Cinnamon good, and preſerve its Virtues entire, cover it over with Pepper; but *Ludovici* has obſerved, that, when preſerved in this manner, it ſometimes quite loſes its natural Taſte. Hence the better Method of preſerving it is, perhaps, that of thoſe, who, according to the Advice of *Cardan*, in his Treatiſe *De Subtilitate*, *Lib.* 13. preſerve it among blanched Almonds. Cinnamon is much uſed for procuring a grateful and agreeable Taſte to various kinds of Aliments, either by ſprinkling its Powder upon them, or bruiſing and boiling it among them. As for its Medicinal Virtues, *Bauhine* expreſly affirms, that whatever Virtues the Antients aſcrib'd to their Cinnamomum and Caſſia, juſtly belong to our Cinnamon, ſince it is of an aromatic, ſtimulating, and corroborating Quality. Hence it is claſſed among the ſtomachic and uterine Medicines, and affords ſingular Relief to Women afflicted with a Loſs of Strength, a lax State of the Fibres, or a Suppreſſion of the Menſes. In a Word, whatever can be ſaid of the Uſe or Abuſe of Aromatics, may be juſtly applied to Cinnamon; for, according to *Boerhaave*, in his *Chym. Vol.* 1. Cinnamon, the moſt excellent of all other Aromatics, is poſſeſſed of the ſame common Virtues with them, tho' in a higher Degree. Its Taſte is exquiſitely grateful, and its Smell ſo highly fragrant, that it diffuſes itſelf not only over all the Iſland of *Zeilan*, but alſo, when the Winds blow from the Land, over a large Tract of the Ocean; ſo that, according to *Jurgen Anderſen*, quoted by *Dexbachius*, the Sailors are ſenſible of the Smell of the Cinnamon at ſix or eight Miles Diſtance from the Shore. But 'tis obſerv'd, that Cinnamon, tho' an excellent Cordial, and highly beneficial in a Palpitation of the Heart, has, by being too frequently uſed, brought on the ſame Diſorder in ſome Patients, in which Caſe Acids are the moſt effectual Means of Relief. Tho' 'tis highly proper in ſome Diſorders incident to pregnant Women, yet, in theſe Caſes, *Ettmuller* juſtly adviſes the cautious Uſe of it, becauſe it powerfully irritates the Matrix to diſcharge the Menſes, and expel the Fœtus. Hence it is of ſo ſingular Service in difficult Labours, and in Caſes where the Secundines and Lochia are to be expel'd, that *Lindanus* affirms, that no Emmenagogues, nor Medicines intended to expel the Fœtus, ought to be exhibited without an Admixture of a proper Quantity of Cinnamon. Phyſicians preſcribe the Uſe of it in various Forms. According to *Degnerus*, in his *Hiſtoria Medica de Dyſenteria*, *Baglivi* ordered it to be chew'd in Subſtance during the whole Day, and the Saliva to be ſwallow'd. In Powder it is exhibited from half a Dram to a whole Dram. *Bauhine* informs us, "That the Powder call'd the *Pulvis Ducis* is uſed by many, "which conſiſts of Cinnamon and Sugar, and is of ſo grateful "a Taſte, that, with an Addition of Wine, it is uſed as a "Sauce in the Entertainments of Grandees, whoſe Luxury is "grown to ſuch an exorbitant Height, that they uſe the moſt "delicious Medicines as common Aliments." Of half an Ounce of the beſt Cinnamon, infuſed in a cloſe-ſtopt Veſſel, with two Pints of boiling Water, is prepared a highly grateful Drink, which recommends itſelf not only on account of its Colour, Smell, and Taſte, but alſo on account of its analeptic, ſtomachic, and moderately aſtringent Quality in Fluxes; as alſo in a Weakneſs of the Heart and Stomach. *Dexbachius* affirms, that he has been told, by Perſons of unexceptionable Veracity, that ſome Perſons, by the conſtant Uſe of this Infuſion of Cinnamon, as their common Drink, have preſerved an excellent State of Health, and protracted Life to a great Age; and that others of weaker Stomachs, by uſing a Mixture of it and Wine at Meals, by that means got rid of their Diſorder. Wine in which Cinnamon has been infuſed, when paſſed thro' a Filtre with Sugar, is what we call the *Vinum Hippocraticum*, *Hippocras*, or the Hippocratic Wine, which derives its ſo highly celebrated Virtues from the Cinnamon. In Decoctions it is generally ordered to be added laſt, that its aromatic and volatile Qualities may be preſerved. If it is boiled for ſome time in any Liquor, it is diveſted of its volatile and aromatic Nature, and remains an aſtringent corroborating Subſtance; but, for this Purpoſe, it muſt be boil'd in an uncover'd Veſſel. *Ludovici*, in *Ephem. Nat. Curioſ. Decad.* 1. *a.* 9. *o.* 35. affirms, that a Decoction of one Ounce of Cinnamon, in two Pints of good Wine, may, in a proper Doſe, be twice a Day ſucceſsfully exhibited in immoderate Diſcharges of the Menſes, even to Women of delicate and choleric Conſtitutions. The

deſired Effect, produced by this Preparation, is, in my Opinion, to be accounted for from the corroborating Quality of the Cinnamon, by which the Tone of the Veſſels being reſtor'd, the Blood was by that means enabled to make its way thro' Paſſages before obſtructed; and thus an equable Circulation being reſtored, the immoderate Diſcharge of the Menſes was removed, as the Blood was derived elſewhere. Dr. *Hales*, in his *Statical Eſſays*, demonſtrates the ſtyptic Quality of the Decoction of Cinnamon, by the following Experiment: He injected a certain Quantity of it warm into the ſlit Inteſtines of a large Dog; upon which he obſerved the Veſſels gradually contracted, and the Liquor received was retain'd for ſome time: Hence he infers, how effectual Cinnamon is, by its great Stypticity, in ſtopping too large Diſcharges into the Cavity of the Guts.

Before we enumerate the officinal Preparations of Cinnamon, we ſhall briefly give its chymical Analyſis from *Boerhaave*, that we may be able to diſcover in what Part of it thoſe efficacious Qualities, by which it diſtinguiſhes itſelf from other Aromatics, are lodged.

"If, ſays this incomparable Author, you cautiouſly, and "according to Art, diſtil a Pound of the beſt Cinnamon with "boiling Water, and take care, that nothing of it be loſt, it "will yield you a milky Liquor of a fine Smell and Taſte, "and at the Bottom of it a ſmall Quantity of a rediſh Oil, "which is exceedingly fragrant, and poſſeſſes, in a very high "Degree, the genuine Virtues of the Cinnamon; as, indeed, "does this milky Liquor. If you, then, remove both theſe, "and boil up the Cinnamon, which remains, with freſh Wa"ter, you will draw off a clear watry Liquor, of an acid "Taſte, and faint Smell; which is ſo far from containing any "Signs of Cinnamon, that it is ſo like many others, that you "will not be able to diſtinguiſh the one from the others. "Then examine the Reſiduum of the Decoction, and you will "find it of a browniſh-red Colour, an acid auſtere Taſte, "without Smell, or any other ſenſible Quality, which gives "the ſmalleſt Indication of Cinnamon. The Body of the "Aromatic, indeed, remaining in the Decoction, one would "be tempted to take for Cinnamon, ſince it reſembles it ſo "exactly in its Figure, and outward Appearance: But, upon "farther Examination, we find, that this outward Reſem"blance is the Whole it retains of that noble Bark, ſince it "has now loſt all its primitive Virtues; and, indeed, there is "very little Difference to be obſerved betwixt this and any "other Bark or Wood, that has been previouſly treated in the "ſame manner.

"The genuine and peculiar Virtue, therefore, of the Cin"namon, is contain'd in the diſtil'd Water and the Oil, which "ſubſides to the Bottom of it. If you let this Water remain "at Reſt for a conſiderable time, in a cloſe Veſſel, it will let "fall an Oil, grow clearer, and become leſs aromatic. In the "Oil, therefore, this uncommon Virtue is principally con"tain'd. But if you ſeparate this Water from the ſubſiding "Oil, whilſt it yet remains richly impregnated with the Cin"namon, and put it into an open Bottle with a ſmall Mouth, "the whole Place will ſmell ſtrong of Cinnamon, and in a "ſhort time the Water will become quite vapid, without any "of the Properties of the Cinnamon; and yet, upon Exami"nation, we ſhall find, that it has loſt no more of its Weight "than would have exhaled from common Water, in an equal "time, in the ſame Veſſel, and in the ſame Place. The un"common Virtue, therefore, of this Water is lodged in a very "ſmall Quantity of it, which muſt, of courſe, be poſſeſs'd of "very ſingular Qualities. Laſtly, if this Oil is expoſed to the "Air in a wide-mouth'd Glaſs Veſſel, a highly fragrant and "grateful Smell of Cinnamon is diffuſed thro' the whole Place; "but the Oil will, in the mean time, loſe its peculiar Virtue; "and, after a ſhort time, there will remain an Oil, almoſt of "the ſame Weight with the former, but perfectly exhauſted "and deprived of its original Qualities." If the pureſt Oil of Cinnamon is diluted in Alcohol of Wine, and if the whole Alcohol is again drawn off by Diſtillation in a gentle Heat, it will, indeed, carry the Spirits along with it; but it leaves, in the Bottom of the Still, an Oil deſtitute of Spirits, and, at the ſame time, of a reſinous Nature: Hence 'tis obvious, that the whole Virtues of the Cinnamon are lodged in the ſmall Quantity of Oil it yields, and that they even reſide in a ſmall Quantity of that Oil. *Helmont* affirms, that, when the Oil is extracted from Cinnamon, it has an aſtringent Taſte, like Oak-bark. *Caſpar Newman*, in his *Prælectiones Chymicæ*, tells us, that Cinnamon conſiſts of oleous, ſaline, reſinous, gummy, and moſtly of earthy Parts: So that in one Pound of Cinnamon are contain'd almoſt three Fourths of an indiſſolvable Earth, two Ounces of a reſinous Subſtance, one Ounce and an half of a gummy Subſtance, and about two Scruples and an half of an eſſential Oil.

This Oil is yielded with the Water in Diſtillation, and ſubſides to the Bottom, in conſequence of its being ſpecifically heavier. It is of a yellowiſh or golden Colour, limpid, of a highly acrid, inflammatory, and corroſive Nature, whether externally applied, or internally exhibited. It ſpeedily cauteriſes any Part, to which it is applied, into a gangrenous Eſchar. When preſerved for ſeveral Years in cloſe ſtopt Phials, a great Part of it is ſaid to be transform'd into a genuine Salt, which is capable of being diſſolved in Water, and which is impregnated with the Virtues peculiar to Cinnamon. And Dr. *Slare*, as we are inform'd in the *Philoſophical Tranſactions abridged*, V. 3. found, that, in twenty Years time, half of a certain Quantity of this Oil was become a Salt. We ſhall ſubjoin what *Ludovici* has obſerved, concerning the Nature of this Salt. He kept ſome of the Oil of Cinnamon for ſeveral Years, pouring a little common Water to it, leſt, in Proceſs of Time, it ſhould become too thick and reſinous. But in the Water he previouſly diſſolved a ſmall Quantity of common Salt. At certain Intervals he renew'd the Oil, and ſometimes made an Addition to the Water, when it was too much exhauſted. After he had neglected this for ſome time, he informs us, that a Salt was ſlowly concreted among the thicker Parts of the Brine, which, in its inferior Part, retain'd a cubical Form; but its ſuperior Part was furniſh'd with ſmall Striæ, like thoſe of Nitre, but diſpoſed in a more irregular manner. This Salt, taken out, and cleanſed with brown Paper and Cotton, under the Teeth, appear'd more compact than common Salt and Nitre, and almoſt reſembled Sal Ammoniac; but its Taſte was found leſs intenſe than that of other Salts of the ſame Kind. When laid upon live Coals, it did not burn or flame like Nitre, but was totally, and without any Noiſe, evaporated into a thick white Smoak, leaving only a black Spot, or the extinguiſh'd Coal, below it. The Smoak, however, did not ſo much reſemble that of Cinnamon alone, as that of Cinnamon and Benjamin. But becauſe this Oil, when negligently kept in the Air, loſes its Spirits, and leaves not a Salt, but a dead Maſs, it ſeems probable to *Boerhaave*, that in this Spirit, in conſequence of its ſulphureous Principle, there is lodged a certain Power of generating a Salt. A Pound of Cinnamon, tho' of the beſt Kind, according to *Sala* and *Hoffman*, ſcarce yields a Dram of Oil; and at moſt a Dram and an half, according to *Bauhine* and *Lemery*. But, in *Holland*, the People who diſtil it, from each Pound, obtain more than an Ounce of the Oil, by the Aſſiſtance of Spirit of Wine, prepared in a particular Manner, which they keep as a Secret, as *Pomet* informs us he was told by a Perſon of Veracity: Hence it is, that the only Oil of this Kind, kept in the Shops of Apothecaries, is made by the *Dutch*, of whom they can buy it at a cheaper Rate than they could prepare it themſelves. The ſame Author tells us, that he was credibly inform'd, that their Oil, commonly intended for Sale, was not genuine; but ſo adulterated with Spirit of Wine, well dephlegmated and tartarized, that not above one half of it is genuine Oil of Cinnamon: But he tells us, that this Piece of Fraud is eaſily detected, by putting the Point of a Knife into it, which, when applied to a lighted Candle, takes Flame immediately; whereas, when the Oil is genuine, it does not flame, but only ſmoke.

This Oil, by reaſon of its acrid cauſtic Nature, is by many highly celebrated as an excellent Medicine, in a deep ſeated Caries of the Bones. In which Caſe, it is either applied with a Tent, or dropt into the Part affected, or laid upon it, with Lint, covering all with a dry Dreſſing of the ſame. *Juncker*, in his *Conſpectus Therapiæ generalis*, uſes the following Words: "Diſtil'd Oil of Cinnamon is juſtly accounted a valuable and "efficacious Medicine for ſtopping the Progreſs of a Mortifica"tion; only 'tis to be lamented, that its exorbitant Price hin"ders Surgeons from ſaving, or at leaſt relieving, by its means, "moſt of the miſerable Patients afflicted in this manner." *Tulpius*, in his *Obſervat. Medic. L.* 1. *C.* 37. informs us, that, in order to ſeparate the carious Parts of Bones, he never ſaw nor read of any Medicine more effectual than Oil of Cinnamon, mix'd with Oil of Sublimate. As for the genuine medicinal Virtues of this Oil, when exhibited internally, *Boerhaave* informs us, that nothing in the *Materia Medica* is comparable to it, with reſpect to its reſtorative Quality, in Caſes where Strength is impair'd, in Women during Geſtation, hard Labours, or after Delivery, when, at the ſame time, there is no Inflammation, no Rupture, or Gaping of the Veſſels; and that, if there is any Relief to be expected in Diſorders of the Uterus, ariſing from a cold and mucous Phlegm, it is to be obtain'd by this Oil, properly uſed: Hence 'tis obvious, that, in Caſes where 'tis not proper to increaſe the Heat of the Body, or the Motion of the Fluids, when the Heat and Motion are already too intenſe, we muſt abſtain from the Uſe of this Oil. On the contrary, when that Species of Coldneſs is to be corrected, which ariſes from a flaccid State of the Veſſels, or from a languid, mucous, or aqueous Condition of the Humours, it proves an excellent ſtimulating, corroborating, reſolvent, and heating Medicine, provided the Veſſels are entire. Hence 'tis obvious, that it may properly be added to Purgatives, not only with an Intention to render them more palatable, but alſo to prevent Flatulences and Gripes. Thus 'tis alſo added to Liniments, Ointments, and Balſams, not only for the ſake of its fragrant Smell, but alſo on account of its reſolvent, diſcutient,

and heating Qualities. Six Drops of it may be given in Substance, either in a poach'd Egg, ſweet Wine, or Broth prepared with Fleſh; but, moſt properly, dropt upon Sugar.

There are various Preparations of Cinnamon kept in the Shops, and directed in the ſeveral Diſpenſatories, to which every one may have recourſe, either when his Inclination leads him, or Neceſſity compels him. Such as the *Aqua Cinnamomi ſimplex*, call'd alſo the *Aqua Cinnamomi ſine vino*; and, in the *London Diſpenſatory*, the *Aqua Cinnamomi tenuis*. See AQUA. The *Aqua Cinnamomi cum vino*, in the *Pharmacop. Argentoratenſis*. The *Aqua Cinnamomi Spirituoſa*, in the *Diſp. Brandenburgicum*. The *Aqua Cinnamomi Spirituoſa*, in the *Pharmac. Pariſienſis*. The *Aqua Cinnamomi fortis*, in the *London Diſpenſatory*, which, in that of *Edinburgh*, is call'd the *Aqua Cinnamomi cum vino*. See AQUA. The *Aqua Cinnamomi*, in the *Pharmacopœia Bruxellenſis*. The *Aqua Cinnamomi hordeata*, in the *Pharmacop. Pariſienſis*, which, in the *Pharmac. Amſtelodamenſis*, is only call'd *Aqua Cinnamomi*. The *Aqua Cinnamomi buglóſſata*, in the *Pharmacop. Argentorat.* The *Aqua Cinnamomi borraginata*, which, in the *Pharmacop. Auguſt.* is call'd the *Aqua Cinnamomi Cordialis*. The *Aqua Cinnamomi cum aquis Cordialibus*, in the *Diſpenſ. Hafnienſe*. The *Aqua Cinnamomi Cardiaca*, in the *Pharmacop. Batæana*. The *Aqua Cinnamomi Cydoniata*, in the *Pharmacop. Argentoratenſis*. The *Aqua Cinnamomi contra Epilepſiam*, in the *Diſpenſat. Norimbergenſe*. The *Aqua Cinnamomi contra Peſtem*, in the *Diſpenſat. Brandenburgenſe*. The *Elæoſaccharum Cinnamomi Compoſitum*, call'd alſo *Aurum Horizontale*, *Panacea Kornmanni*, and which, in the *Pharmac. Pariſienſis*, is ſtyl'd *Pulvis Dreſdenſis ſive auratus Germanorum*. The *Pulvis aureus Cellenſis*, in the *Diſpenſat. Ratiſbonenſe*. The *Balſamum Cinnamomi*. The *Eſſentia*, or the *Tinctura Cinnamomi*. The *Tinctura Cinnamomi Blancardi*. The *Elixir Cinnamomi*, in the *Diſpenſat. Norimbergenſe*. The *Syrupus de Cinnamomo*. The Species *Diacinnamomi*, or the *Diacinnamomum Meſuæ*. The *Electuarium de Cinnamomo Meſuæ*, in the *Antidotarium Bononienſe*, which is alſo call'd the *Confectio Cinnamomi Meſuæ*. The *Confectio de Cinnamomo Regia*, in the *Diſpenſat. Norimbergenſe*. The *Diacinnamomum Regium*, in the *Diſpenſat. Ratiſbonenſe*. The *Confectio Cinnamomi ſicca*. The *Cinnamomum Coctum*, in *Zwelfer Pharmac. Reg.* The *Cinnamomum Laxativum Mynſicht*. The *Magiſterium Cinnamomi*, in *Schroed. Pharmac.* The *Sal Cinnamomi fixus*, in the *Diſpenſat. Brandenburgenſe*, and that of *Schroder*. And the *Sal Volatile Oleoſum Cinnamomi*, in the *Diſpenſat. Brandenburgenſe*.

Another Sort of *Cinnamon* is call'd,

CASSIA LIGNEA, Offic. Hern. 35. *Caſſia Lignea Officinarum*, Park. Theat. 1580. *Caſſia vulgaris Calibacha dicta*, Piſ. Mant. A. 165. *Caſſia Malabarica*, Herm. Cat. Hort. Lugd. Bat. 130. Comm. Flor. Mal. 73. *Cinamomum ſive Canella Malavarica, & Javanenſis*, C. B. Pin. 409. THE CINNAMON-TREE OF MALABAR, Raii Hiſt. 2. 1560. *Canella Malavarica & Javenſis*, Jonſ. Dendr. 164. *Arbor Canellifera Malabarica, cortice ignobiliore, cujus folium Malabathrum Officinarum*, Breyn. Prod. 2. 18. *Cinamomum Malabaricum, Canella Malabarica*, Mont. Exot. 8. *Carva*, Hort. Mab. 1. 107. Tab. 59. THE CASSIA LIGNEA-TREE.

This is the Bark of a Cinnamon-bearing Tree produced in *Malabar*, *Sumatra*, *Java*, and the *Philippine Iſlands*. It is a Tree of the ſame Kind with that found in *Ceylon*; only its Bark is thicker, of a more woody Texture, and of a redder Colour. Whatever is ſaid concerning that of *Ceylon*, may alſo be affirm'd of this, only in a lower Degree. The Bark of the *Caſſia Lignea* is brought into *Europe* in ſmall Pipes, like the *Ceylonian* Cinnamon; but is of a darker and more ruſty Colour, of a more hard and compact Texture, of a more languid Smell, of a ſweetiſh mucilaginous and leſs hot Taſte. It is alſo in ſmaller Pipes. Becauſe this Species of Cinnamon is much cheaper than that of *Ceylon*, this latter is frequently adulterated with it. And the Caſſia Lignea itſelf, according to the *Pharmac. Auguſt. in Prolegom.* is adulterated with the Barks of the Caper-buſh and Tamariſks, macerated in the Water of *Ceylonian* Cinnamon, and afterwards dried. That is reckon'd beſt, which is ſmall, of a purpliſh Colour, eaſily broken, fragrant, acrid, of a ſweetiſh and ſomewhat mucilaginous Taſte. Becauſe it abounds with a volatile oleous Salt, theath'd up in a large Quantity of a mucilaginous Subſtance, it therefore operates leſs powerfully on the human Body, and is proper in Caſes where the Intention is moderately to heat, open, reſolve, and ſtrengthen. It alſo obtunds the Acrimony of the Humours, by the mild and balſamic Mucilage it contains. Some recommend an Infuſion of it in Diſorders of the Throat; and 'tis generally ſaid to be highly beneficial in Diſeaſes of the Uterus. Its Virtues are the ſame with thoſe of the *Ceylonian* Cinnamon, only it is ſomewhat weaker, and leſs aromatic. It is an Ingredient in the *Theriaca*, and ſome other Preparations, which come under the Denomination of Antidotes. By Phyſicians it is rarely preſcrib'd for other Purpoſes. From the Caſſia Lignea, previouſly digeſted for a conſiderable time, is obtain'd, by Diſtillation, an Oil like that yielded by the *Ceyloniàn* Cinnamon, but leſs valuable. *Mynſicht*, of the diſtil'd Oil of the Caſſia Lignea, prepares an Elæoſaccharum, which he adds to the Rob of Quinces, boil'd, in a gentle Heat, to the Thickneſs of Honey, and reduced to the Conſiſtence of an ordinary Syrup, by an Addition of the Tincture of the Caſſia Lignea. This Medicine he highly recommends as a Cordial, eſpecially to old Men, and ſuch as are of a cold Conſtitution.

Another Sort of Cinnamon is the

CASSIA LIGNEA COMMUNIS, *Pharmacopoiis*. *Caſſia Lignea fuſca aromatica*, C. B. Pin. 409. *Caſſia Lignea fuſca aromatici & glutinoſi ſaporis*, J. B. 1. 451. *Caſſia, Canella*, Chab. 33. *Arbor canellifera Indica, cortice acerrimo, viſcido ſeu mucilaginoſo, qui Caſſia Lignea Officinarum*, Breyn. Prod. 2. 17. THE COMMON CASSIA LIGNEA.

It is a Bark, thicker than Cinnamon; but of a fainter Smell and Taſte, of a redder Colour, harder Subſtance, and deprived of its outer Rind or Pellicle. It is brought from the *Eaſt Indies*, and common enough in the Shops.

The *Cinnamomum craſſiore Cortice* is the MALABATHRUM, which ſee.

Cinnamomum Album is the CANELLA ALBA, which ſee.

Cinnamomum Magellanicum is the CORTEX WINTERANUS, which ſee.

Cinnamomum Spurium is, according to *Rieger*, the *Cortex Caryophyllatus*.

CINNIOGLOTTUS, CINNATUS. Terms coin'd by *Paracelſus*, *Chirurg. Lib.* 5. *Cap.* 7. by which he would expreſs the total Deſtruction and Corruption of mineral Bodies.

CINNUS. The ſame as CYCEON, which ſee.

CINZILLA. A Name, in *Paracelſus*, for that Diſtemper which is by others call'd ZONA, which ſee.

CION, κίων, is defin'd, by *Aretæus*, a ſolid Body hanging from the Palate or Roof of the Mouth, between the Tonſils. It is alſo call'd, as he ſays, *Gargareon*; for *Staphyle* is the Name of a Diſeaſe. It is of a nervous Subſtance, but moiſt, becauſe placed in a moiſt Situation. *Aret. de Cauſ. & Sign. acut. Morb. Lib.* 1. *Cap.* 8. Κίων is alſo a Diſeaſe, when the Part before deſcrib'd ſwells to an extraordinary Size, and hangs down in an oblong Figure, repreſenting a Pillar, which is the Signification of κίων, in *Latin*, *Columna* or *Columella*. See UVULA. From ſome Reſemblance to this Diſorder, *Hippocrates*, *Lib.* περὶ γυναικ. φύσ. and *Lib.* 2. περὶ γυναικείων, gives the Name κίων to a carunculous Excreſcence in the *Pudendum Muliebre*.

CIONIA, ἰόνια, (or, as *Hermolaus Barbarus* reads it, κιόνια) in *Dioſcorides*, are the middle Parts of the Whelks and Purple-fiſh, near the Centre of the Striæ; which, being calcin'd, have a more cauſtic Quality than the other Parts, becauſe of its preſſory Nature. The Fleſh of Whelks and Purple-fiſh is grateful to the Palate, and friendly to the Stomach, but of a binding Quality. *Dioſcorides*, *Lib.* 2. *C.* 6. See BUCCINUM.

CIONIS, κιονὶς. The ſame as CION, which ſee.

CIPOREMA. A Species of Garlick growing in *Braſil*, without Leaves. *Raii Index*.

CIRCÆA, κιρκαία, from *Circe*, a famous Inchantreſs, who is ſuppoſed to have made great Uſe of this Herb in her Faſcinations.

Circæa, which ſome call Dircæa, has Leaves like Garden Nightſhade, and abounds with Shoots. The Flowers are ſmall, black, and numerous; and the Seed like Millet, ſometimes incloſed in a Sort of ſmall corniculated Capſules. The Roots are three or four Spans in Length, white, ſweet-ſcented, and of a heating Quality. It grows moſtly on rocky Grounds, and open Places expoſed to the Sun and Wind.

The Root, to the Quantity of four Ounces *, bruiſed, and macerated a Day and Night in three Pints of ſweet Wine, [οἴνῳ γλευκίνῳ] and drank for three Days together, purges the Womb. The Seed, taken in ſorbile Liquors, generates Plenty of Milk. *Dioſcorides*, *Lib.* 3. *Cap.* 134.

This *Circæa* is not the ſame as that Plant which now goes by that Name, according to *Parkinſon*.

CIRCÆA, of the Moderns, *Inchanters Nightſhade*.

The Characters are;

The Root is fibrous, creeping, perennial; the Leaves alternate, entire, like thoſe of the common Nightſhade; the Cup of the Flower bifoliated, caducous, and growing in the Margin of the Ovary; the Flower dipetalous, caducous, furniſh'd with two Stamina, and diſpoſed in Spikes. The Extremity of the Pedicle paſſes into an Ovary of a round Figure, inclining to an Oval, furniſhed on its upper Part with a Placenta, and a long Tube, and paſſing into a Pyriform, or Pear-ſhaped, lappaceous, bicapſular, dry Fruit, containing two oblong Sides.

Boerhaave mentions two Species of this Plant.

* For μναῖ I read, with *Cornarius*, ὀυγγίαι, which agrees with *Pliny's Quadrans Radicis*; beſides, four Pounds of the Root could hardly be macerated in three Pints of Wine.

1. Circæa; Lutetiana. *Lob. Ic.* 266. INCHANTERS NIGHTSHADE. *Ocymaſtrum verrucarium*, J. B. 2. 977.

2. Circæa; minima. Col. 2. 79. 80. THE SMALLEST INCHANTERS NIGHTSHADE. *Boerhaave's Index alter Plantarum, Vol.* 1.

Gerrard ſays, the firſt Species has the Virtues of *Garden Nightſhade*.

CIRCIUS. The ſame as ARGESTES, which ſee.

CIRCOS, κίρκος, and, by a Metatheſis or Tranſpoſition of Letters, κρίκος, ſignifies a Ring, a kind of Button, a Loop, and other Things of that Nature. *Rhodius, de Acia*, ſhews, from *Hippocrates's Mochlicus*, and his Book *de Fracturis*, that κρίκοι are Rings made of *Egyptian* Leather, which were ſow'd on to ſome Part of the Apparatus neceſſary for the Diſtention of a luxated Leg.

CIRCUITUS. See PERIODUS.

CIRCULATIO, in Chymiſtry, is explain'd under the Articles CIRCULATORIUM, and CIRCULATUM, which ſee.

CIRCULATIO, in Anatomy, is the Circulation of any Fluid of the Body thro' the Veſſels deſtin'd for its Conveyance. Thus there is a Circulation of the Chyle, for an Account of which ſee CHYLUS. A Circulation of the Blood, ſee SANGUIS. A Circulation of the Lymph, ſee LYMPHA. And a Circulation of the Spirits, ſee SPIRITUS. But Circulation is properly applied only to the Blood, becauſe that moves circularly, or returns to the Heart again, the Origin of its Motion; which the others do not.

CIRCULATOR. A ſtrolling Quack, or Mountebank. See AGYRTA.

CIRCULATORIUM, in *Latin*, correſponds to what in *Engliſh* we call a *Circulatory Glaſs*, which, among Chymiſts, ſignifies a particular Species of Glaſs Veſſel, in which the contain'd Liquor, when put over the Fire, performs certain Gyrations, and circulates by aſcending and deſcending in ſuch a manner, that the more volatile Part of the Liquor, raiſed by the Fire, not finding a Paſſage, may always fall back again. A *Pelican* conſtitutes ſuch a Veſſel, or a Glaſs whoſe Belly is of an oval Figure, for which Reaſon it is call'd *Ovum Philoſophicum*, or the Philoſophers Egg. But in the room of theſe may be ſubſtituted Phials, with long Necks, hermetically ſeal'd; or a Cucurbit, with a blind Alembic placed upon it; or a Cucurbit, or Glaſs Bottle, with a ſufficiently long Neck, is ſo diſpoſed, that, having firſt put in the Materials, another leſſer Phial, whoſe Neck may enter it, is placed upon it. Then the Joinings are to be carefully luted, after the Veſſels and Materials are become ſufficiently warm, for carrying on the Proceſs; for then the Air, being heated, and expanding itſelf, goes out of the Veſſels; the Joinings of which being afterwards luted, the Fire may ſafely be raiſed, and continued at Pleaſure. But, in this Proceſs, it generally happens, that the Liquor, falling cold upon the warm Bottom of the Veſſel, cracks it; for which Reaſon, we muſt proceed cautiouſly in raiſing the Fire. By this we underſtand, that the chymical Operation, commonly call'd *Circulation*, is no more than a certain Species of Digeſtion; and that to circulate a Liquor, is to place it in Circulation or Digeſtion, that its more volatile Parts may be continually raiſed, and fall back; and thus paſſing, as it were, in a Circle, may become finer, and more attenuated; for, according to *Sennertus*, Circulation is only uſed for thoſe Liquors which are already depurated, and freed from their Fæces, or, at leaſt, whoſe higheſt Degree of Subtilization is required. Thus Spirit of Wine, already rectified, is, by Circulation, ſaid to be transform'd into what we call the Quinteſſence. According to *Barnerus*, Circulation is principally inſtituted for two Reaſons. The firſt is, That the Spirits and Liquors to be join'd, being thus mutually driven backwards and forwards, may be the more effectually united. The ſecond is, That any Subſtance to be diſengaged from its Eſſence, or the Liquor in which it is contain'd, may be the ſooner and more effectually ſeparated from it. Since, then, Circulation is no more than a Species of Digeſtion, 'tis obvious, that, according to the Sentiments of M. *Hoffman*, the Subjects of this Operation may be either Liquids alone, or Solids mix'd with Liquids, either for the Purpoſes of Clarification, Depuration, Exaltation, or Maturation; and ſometimes to obtain the Volatilization of fix'd Subſtances, or the Fixation of ſuch as are volatile; but the Veſſels muſt be very cloſely join'd, or hermetically ſeal'd, and a proper Space of Time allow'd for the ſeveral different Intentions of the Operator. That this Proceſs may be ſupplied by repeated Diſtillations, is obvious, from the Article COHOBATIO. Hence the Reaſon is plain, why, in the Language of *Paracelſus*, to be ſubjected to Circulation, and to be diſtil'd into a Spirit, import one and the ſame thing.

CIRCULATUM.

According to *Boerhaave*, the *Circulatum* of *Paracelſus* was a Liquor, by infinite Labour, and a tedious Circulation, prepared from Sea-ſalt, in which bountiful Nature has lodged the higheſt Degree of Perfection. This romantic Chymiſt, by indefatigable Induſtry, from this Salt obtain'd a perpetual Oil, which he call'd *Circulatum Minus*, or *Circulatus Sal minor*. *Kunrath* (*mum Salium*, *Oleum Salis*, *Liquor Salis*, and *Aqua Salis*. In this Proceſs he uſed Spirit of Wine, but of what Kind is not at preſent known. He had alſo a *Circulatum Majus*, to which he likewiſe gave the Names of *Materia Mercurii Salis*, and *Ignis Vivens*, which was much more powerful and efficacious than the *Circulatum Minus*, and obtain'd with far greater Difficulty. From theſe two, intimately united, *Paracelſus* affirms, that he prepared the highly celebrated Solvent, in which Gold was ſo effectually transform'd, as to remain no longer Gold. *Barchuſen*, in his *Pyroſophia*, gives us a diſtinct, tho' tedious, Preparation of both theſe *Circulatums*, extracted from the Writings of *Paracelſus* himſelf. The *Circulatum Minus* is prepared of Sea-ſalt, Water, the Juice of the Radiſh-root, and Alcohol of Wine. The *Circulatum Majus* was prepared of corroſive ſublimate Mercury, and Sea-ſalt. Some affirm, that the *Circulatum Majus* of *Paracelſus* was no more than rectified Spirit of Wine; and that his *Circulatum Minus* was only Spirit of Vinegar. Others, as we find in the *Collectanea Chym. Leydenſ.* will have the *Spiritus Nitri dulcis* to be the *Circulatum Majus* of *Paracelſus*. We there alſo find *Maets* giving the following Directions for preparing the *Circulatum Minus* of *Paracelſus*.

> Take any Quantity of the pureſt Flowers of Sal Ammoniac, twice ſublimed from the common Salt. Upon theſe pour ſuch a Quantity of the Alcohol of Wine, as ſhall riſe three Inches above them. Let them ſtand in a moderately warm digeſtive Heat for three Days and Nights ſucceſſively, or longer; for by this means the Spirit of Wine will intimately unite itſelf with the volatile Sal Ammoniac, and we ſhall obtain a Menſtruum far more efficacious than the *Alcohol* of Wine. And when Spirit of Wine fails in extracting the Tinctures, for Inſtance, from the *Crocus Solis*, from the Glaſs of Antimony, and from other mineral Subſtances, this Menſtruum will ſupply the Defect.

In *Blancard's Lexicon Renovatum*, the *Circulatum Minus* is ſaid to be no more than Spirit of Wine. In a Word, ſome entertain one Opinion, and others another, concerning theſe whimſical and myſterious Preparations, with reſpect to which all are equally in the Dark. See ALCHAHEST.

CIRCULUS, κύκλος, κύκλον, a Circle, beſides its known Signification, is applied to Parts of the Body. Thus, in *Hippocrates*, *Lib.* 2. *de Morb.* κύκλοι τῶ προσώπω are the Balls of the Cheeks; and κύκλα τῶν ὀφθαλμῶν are the Orbs of the Eyes, or Cavities which ſurround the Eyes, *Lib.* 7. *Epid.* And, in the ſame Book, we read ἦσαν ἐρυθροὶ τὰ κυκλώδια, "the Urine "round about its Margin was red, or was ſurrounded with a "red Circle." *Galen* alſo, *de Uſu Partium*, demonſtrates ſeven Circles in the Eye. *Circulus* is alſo a Name which the Chymiſts give to a round Iron Inſtrument for cutting off a Neck of Glaſs, which is thus perform'd: They heat the Circulus red-hot, and apply it to the Glaſs, preſſing it thereon till the Glaſs be thoroughly heated, when, by a few Drops of cold Water, or a cold Blaſt thereon, it flies aſunder. It is alſo call'd *Abbreviatorium*. *Circus quadruplex*, the fourfold Circle, is a kind of Bandage, call'd alſo *Plinthius Laqueus*. *Gal. de Faſciis.* The Circulus is alſo reckon'd among chirurgical Inſtruments, Figures of which, adapted to the Uterus, are repreſented in *Scultetus's Armamentarium Chirurgicum*, *Tab.* 22. *Fig.* 6, 7, and *Tab.* 43. *Fig.* 5.

CIRCUMCALUALIS, CIRCUMOSSALIS, are Epithets in *Aetius*, *Tetr.* 2. *Serm.* 3. *Cap.* 1. of the outermoſt Coat of the Eye, call'd alſo *Tunica Adnata*, and *Conjunctiva*. See OCULUS.

CIRCUMCISIO, περιτομὴ, περιαίρεσις.

Albucaſis has deſcribed ſeveral Ways of Circumciſion, but what he moſt recommends is the following: The upper Skin of the Penis, that is, the Præputium, is taken and ſtretch'd out, and held in that Poſture, by a Ligature made in two Places. This done, the Operator, with a Pair of Sciſſars, immediately cuts off the Prepuce, making a Section between the two Ligatures. The ſame might be perform'd by a very ſharp Razor. *Paulus*, *Lib.* 6. *Cap.* 57. directs Circumciſion as neceſſary, when the Prepuce is affected with a Gangrene, and become black; in which Caſe it muſt be cut off with an orbicular Section, and the Blood ſtopp'd with red-hot falcated Irons. If the Glans alſo be turn'd black, it muſt be ſerved in the ſame manner, and a ſmall leaden Pipe introduced into the urinary Paſſage. I myſelf, in order to ſave the Patient's Life, when the Penis was cancerated, and corrupted below the Glans, have cut off the Part with a very ſharp Razor, and, ſtopping the Blood with red-hot Irons, have ſubdued the Corruption, and cured the Man. *Fabricius ab Aquapendente, de Oper. Chirurg.*

Circumciſion ſeems to be a very convenient Operation in warm Countries, for the ſake of Cleanlineſs. For the Glandulæ Odoriferæ, lying under the Prepuce, diſcharge their Contents, which, lying under the Prepuce, corrupt, and become acrimonious, corroding the Glans, and inflaming both that and

the Prepuce; and this, even in our cold Countries, where the Humours have not ſo great a Tendency to Putrefaction as in warmer Climates. This Caſe is often miſtaken for a *Clap*.

CIRCUMFORANEUS. The ſame as AGYRTA, which ſee.

CIRCUMLITIO, περίχεσις, περιχετὸν, or more properly περιχεισὸν. In *Marcellus Empiricus*, *Medicamentum Perichriſtarion* imports, in general, any kind of Medicine apply'd to an affected Part, by way of Unction, or as a Litus; but, in a ſtrict Senſe, is appropriated to ophthalmic Medicines, with which the Eyelids are anointed. Theſe latter Remedies, as *Scribonius Largus* ſays, N°. 29. are named περιχεισὰ (*Perichriſta*); and *Dioſcorides*, *Lib.* 1. *Cap.* 130. calls them ὀφθαλμικὰ περιχείσεις.

CIRCUMOSSALIS. See CIRCUMCALUALIS. The *Circumoſſalis Membrana* is the ſame as the *Perioſteum*.

CIRCUMSTANTIA, τὸ περιεστατικὸν, in medicinal Matters, comprehends whatever is not eſſentially connected with the principal Indicant. Of this Kind, in what are commonly call'd *Res Naturales*, are the Condition of the Patient, and the Part affected, the Strength, Age, Sex, Cuſtom, and Way of Life; in *Præternaturalibus*, or the Preternaturals, are the Times of Diſeaſes, the Paroxyſms, Number, and Symptoms; and, in the Non-naturals, the Air and Soil. Theſe are the Things which regulate the Conduct of the Phyſician, and indicate how he ought to act. *Caſtellus*.

CIRLUS. A ſmall Bird. The ſame as LUTEA, which ſee.

CIRRHOS, κιρρὸς, is a ſort of Colour, particularly belonging to Wine, and importing the ſame as *Fulvus*, a pale Yellow, or fallow Colour, like that of a Lion. It is call'd alſo *Gilvus*, that is, the Colour of half-burnt Brick. It is a Colour between a White and a Yellow. *Dioſcorides*, *Lib.* 5. *Cap.* 8. makes this Colour in Wine a Medium between White and Black; but, then, he takes κιρρὸς in a large Acceptation. *Caſtellus*.

CIRRI. See what they are under the Article BOTANY. *Cirri* are alſo the ſame as CERÆA, which ſee. And, in *Pliny*, they ſignify the Claws of the Polypus-fiſh.

CIRSIUM.

The Characters are;

The Leaves are cover'd with ſhort ſoft Prickles.

Boerhaave mentions nine Species of this Plant.

1. Cirſium; maximum, radice Aſphodeli. *C. B. P.* 377. THE GREATEST ASPHODEL-ROOTED GENTLE THISTLE.

2. Cirſium; Pannonicum; primum; pratenſe. *Cluſ. H.* 148.

3. Cirſium; latiſſimum. *C. B. P.* 377.

4. Cirſium; majus; ſingulari capitulo magno, vel incanum variè diſſectum. *C. B. P.* 377.

5. Cirſium; ſingulari capitulo ſquamato; vel incanum alterum. *C. B. P.* 377.

6. Cirſium; ſingularibus capitulis parvis. *C. B. P.* 277.

7. Cirſium; acanthoides; montanum; flore flaveſcente. *T.* 448.

8. Cirſium; latifolium; flore flaveſcente in Capitulo foliоſo.

9. Cirſium; maculis argenteis notatum. *T.* 448. THE WHITE SPOTTED GENTLE THISTLE.

Boerhaave's Index alter Plantarum, *Vol.* 1.

The fourth and fifth Sort grow wild in *England*.

Gerrard ſays, that no medicinal Virtues are attributed to any Species of the *Cirſium*.

The Cirſium of *Dioſcorides* is thus diſtinguiſh'd.

CIRSIUM, Offic. *Cirſium foliis non hirſutis, floribus compactis*, C. B. 377. Raii Hiſt. 1. 306. Hiſt. Oxon. 3. 149. Tourn. Inſt. 447. *Cirſium foliis non hirſutis*, Ger. Emac. 1182. *Cirſium montanum capitulis compactis*, Park. 962. *Cirſium Monſpelianum, folio longo glabro Matthioli*, Chab. 346. *Carduus cirſium Monſpeliacum, folio longo glabro Matthioli*, J. B. 3. 44. *Cardui-cirſium foliis non hirſutis floribus compactis*, Pluk. Almag. 83. MELANCHOLY THISTLE.

It grows in ſeveral Places near *Monipellier*; and flowers in *June*. *Dale*.

The Root eaſes the Pains of Varices, (κιρσῶν) if bound to the Part affected, as *Andreas* writes. *Dioſcorides*, *Lib.* 4. *Cap.* 119.

The *Carduus Vinearum repens*; *folio ſonchi*, is call'd *Cirſium, arvenſe, ſonchi folio, radice repente, flore purpuraſcente*.

CIRSOCELE, from κιρσὸς, a Varix or Dilatation of a Vein, and κήλη, a Tumor.

Sometimes the Spermatic Veins, adjacent to and lying above the Teſticles, as alſo thoſe in the Proceſſes of the Peritoneum, in the lower Part of the Scrotum, and ſometimes above the Scrotum in the Groin, are ſo ſurpriſingly ſwell'd, that they reſemble a Species of Varix, the Inteſtine of ſome Bird, a Straw, and ſometimes a Quill; except that they are ſometimes, here-and-there, diverſified with pretty large and unequal Knots, and the Teſticles hang lower than in their natural State. This Species of Diſorder is, by Phyſicians, call'd *Ramix Varicoſus*, *Variocele*, and *Cirſocele*; tho', perhaps, it might be more properly call'd a varicoſe State of the Spermatic Veſſels. Sometimes alſo the Veins of the Scrotum ſwell like *Varices*, as *Celſus* long ago obſerved; but, according to *Fabricius ab Aquapendente*, the Dilatation of theſe Veins is more properly accounted a Varix of the Scrotum than a Hernia, though theſe different Diſorders are often unjuſtly taken for one and the ſame.

The principal Cauſe, both of the one and the other, ſeems to be either a Redundance, or a preternatural Inſpiſſation and Viſcidity of the Blood, which, whilſt it remains in theſe Veins, may diſtend them too much, and excite the moſt troubleſome Symptoms. Sometimes this Diſorder may be produced by an external Violence, which, by contuſing or weakening theſe Veins, muſt of courſe obſtruct and hinder the Circulation of the Blood thro' them. Sometimes alſo young Men, eſpecially thoſe who abound with ſeminal Matter, or are of a ſalacious Turn, are ſubject to this Diſorder, moſt generally within the Scrotum, as I have frequently obſerved; for the Spermatic Veins of ſuch Perſons, in conſequence of the Redundance of Blood, and the impetuous Motion, with which it is carried to the Teſticles, are ſometimes diſtended to a ſurpriſing Bulk. But it rarely happens, that a Cirſocele, or any very troubleſome Symptoms, ariſe from this Cauſe. Nor is every Dilatation of the Veins to be accounted a Cirſocele, as Quacks and Mountebanks often pretend it is; for, unleſs the Diſtention of theſe Veins is accompanied with troubleſome Symptoms, or conſiderable Pains, there ſcarce appears any Reaſon, why, from a ſlight Diſtention, they ſhould be accounted morbid, or employ a Phyſician, much leſs a Surgeon. It will not, however, be improper to give them the Advice afterwards laid down.

When theſe Veins are become ſo preternaturally large and turgid, as to excite intenſe and racking Pains, 'tis then neceſſary to look out for proper Means of Relief. But the Cure may be attempted in different manners; for when, in ſound and vigorous Men, the Diſorder ariſes from a Redundance of Blood, eſpecially in the Spermatic Veins, Matrimony is the moſt ſpeedy and efficacious Remedy, and therefore ought to be warmly recommended to them. But in Caſes where this Method does not prove effectual, for I have ſeen ſome in a married State afflicted with this Diſorder, as alſo in Caſes where the *Cirſocele* is brought on by any external Violence or Contuſion, Medicines are generally of no great Uſe; ſince by their means the preternaturally diſtended, debilitated, and lacerated Veins are, for the moſt part, ſlowly, and with great Difficulty, reſtored to their former Strength and Vigour. But, ſince this Diſorder ſeems principally to ariſe from an inſpiſſated Blood, we are, for this Reaſon, carefully to have recourſe both to ſuch Medicines as dilute the viſcid Blood, and corroborate the weaken'd Veins. 'Tis alſo highly expedient the Patient ſhould conſult ſome ſkilful Phyſician, with reſpect to proper internal Medicines. And externally, beſides Veneſection, aſtringent and corroborating Fomentations are uſed with great Succeſs.

But if, after a fruitleſs and unſucceſsful Uſe of the moſt proper Medicines, the Knots and Pains of the diſtended Veſſels, in the Coats of the Scrotum, are increaſed, the Antients recommended the Application either of the actual Cautery, or of a proper Ligature to theſe Veins. But as theſe Methods of Cure, to me, ſeem harſh and cruel, if theſe Varices are lodged in the Coats of the Scrotum, I think it will not, in this Caſe, be improper to make an Inciſion, with the Knife, in the diſtended Vein, as far as the Tumor reaches, taking from the Wound ſome Ounces of Blood. When this Step is judiciouſly made, the Wound is to be fill'd with Lint, and cover'd with a vulnerary Plaiſter, which muſt be ſecured with a proper Compreſs and Bandage. In the ſubſequent Dreſſings, the Conglutination of the Wound is to be promoted, by the Application of Balſams and Plaiſters of a vulnerary Nature. For by this Method the Body is not only freed from the inſpiſſated Blood, and the Pains produced by it; but alſo the lax and flaccid Part of the Vein is, by the Induction of a ſtrong Cicatrix, ſo corroborated and fortified, that it is not for the future ſo ſubject to be diſtended by the Blood. If the Diſorder has its Seat within the Scrotum, after making an Inciſion in this, and the Proceſs of the Peritoneum, ſome proceed in the manner now directed. In both theſe Species, however, of the Diſorder, the Patient is to be adviſed to drink a ſufficient Quantity of ſome thin Liquor, to uſe frequent Exerciſe, and take ſuch Medicines as attenuate the Blood, not omitting Veneſection twice or thrice a Year. On the contrary, he is carefully to abſtain from ſuch Aliments as are viſcid, and of difficult Digeſtion; as alſo from too ſedentary a Life, ſince by theſe means the Maſs of Blood is remarkably inſpiſſated. This Advice ought alſo to be follow'd by thoſe who perceive this Diſorder beginning in themſelves, either with a View to prevent its Increaſe, or remove it entirely. Some Surgeons, when this Diſorder proves intolerably painful, apply a Ligature to the Spermatic Veſſels in the Groin, and the Proceſs of the Peritoneum, and extirpate the Teſticle, together with the varicoſe Veſſels. But if the Veſſels

are already indurated as far as the Rings of the abdominal Muſcles, 'tis adviſeable to abſtain from this Operation, ſince, in that Caſe, it is generally ſucceeded by the Death of the Patient. *Heiſt. Chirur.*

CIRSOIDES, κιρσοειδὴς, from κιρσὸς, and εἶδος, Reſemblance, varicous, is an Epithet in *Ruffus Epheſius* for the upper Part of the Brain, the lower Part being call'd βάσις, *(Baſis)* the Baſe; it is applied alſo by him to two of the four ſeminal Veſſels, in his way of numbering them, the other two being διστροειδὴ. glandulous.

CIRSOS, κιρσὸς. See VARIX.

CISSAMPELOS, κισσάμπελος, an Epithet in *Galen* and *Ægineta* for a Species of CONVOLVULUS call'd *Helxine.*

CISSAMPELO *ramoſo di Candia Pon. Bald. Ital.* is the Convolvulus; ramoſus; incanus, Foliis Piloſellæ, *C. B. P. Boerhaave's Index alter, Vol.* 1.

CISSANTHEMOS. A Name in *Dioſcorides* for one of his two Species of *Cyclamen.*

CISSINUM, κισσινον. The Name of a Plaiſter in *Ægineta, Lib.* 7. *Cap.* 17. for Wounds of the Nerves, and Stabs or Punctures, tho' never ſo inveterate.

CISSYBIUM, κισσύβιον. A Cup made of the Wood of Ivy, in Uſe among the *Greeks*, which *Langius, Lib.* 1. *Ep.* 19. recommends on two Accounts; firſt, becauſe the Ivy, by its Coldneſs, reſiſted Drunkenneſs; and, ſecondly, becauſe it diſcovered if any Water were fraudulently mix'd with the Wine; for, as *Cato, de R. R. Cap.* 110. aſſerts, if Wine mixed with Water be pour'd into an Ivy Veſſel, the Wine will all paſs thro' the Pores of the Wood, and leave the Water behind.

CIST, or KIST. A Veſſel of Wine containing two Meaſures, or a Meaſure and half, according to the Difference of Places, being about four Pints. *Rulandus. Johnſon.*

CISTA, κιστὴ, κίστις, according to *Pollux*, is a Cupboard to hold Meat, a Trunk for Clothes, or a Box for Medicines. The Word κίστιδα occurs in the ſpurious Additions to *Lib.* 1. γυναικείων, where a Collyrium for the Eyes is directed to be repoſited ἐς χαλκῆν κίστιδα, "in a Copper Box." *Foëſius.*

CISTERNA, a Ciſtern, is a Term uſed by ſome Anatomiſts to ſignify particular Parts of the Body; as, for Inſtance, the fourth Ventricle of the *Cerebrum*, or rather of the *Cerebellum*, and the Concourſe of the Lacteal Veſſels in the Breaſts of Women who give Suck. *Caſtellus.*

CISTUS, κίστος.

The Ciſtus, which ſome call *Ciſtborus*, or *Ciſſarus*, is a Shrub which grows in ſtony Places, is full of Branches and Leaves, but not tall. The Leaves are round, black, and hairy. The Leaves of the Male Ciſtus reſemble thoſe of the Pomegranate-tree, but thoſe of the Female Ciſtus are white.

The Plant is of an aſtringent Quality, for which Reaſon the Flowers, bruiſed, and drank twice a Day in auſtere Wine, cure the Dyſentery; made into a Cataplaſm by themſelves, they reſtrain Nomæ or ſpreading Ulcers; and, in a Cerate, they heal Ambuſtions and old Ulcers (*Galen* ſays, of the Mouth). *Dioſcorides, Lib.* 1. *Cap.* 126.

The Characters of the Ciſtus are,

The Root is perennial, the Habit like a Tree. The Leaves are conjugated; the Calyx conſiſts of three or five Leaves; the Flower is roſaceous, pentapetalous, expanded, and furniſhed with numerous Stamina. The Ovary riſes from the Centre of the Calyx, with a rough, hemiſpherical, incumbent Apex; and becomes a roundiſh or acuminated, quinquecapſular, or multicapſular gaping Fruit, containing very numerous ſmall Seeds. *Boerhaave, Index alter, Vol.* 1.

Boerhaave mentions ſeventeen Species of this Plant.

1. Ciſtus; Ladaniſera; Hiſpanica; ſalicis folio; flore albo, macula punicante inſignito. *T.* 260. SPANISH GUM-BEARING CISTUS, OR ROCK-ROSE, WITH WILLOW-LEAVES, AND WHITE FLOWERS SPOTTED WITH PURPLE.

2. Ciſtus; Ladaniſera; Hiſpanica; ſalicis folio; flore candido. *T.* 260. SPANISH GUM-BEARING CISTUS, OR ROCK-ROSE, WITH WILLOW-LEAVES, AND WHITE FLOWERS.

3. Ciſtus; Ledon; foliis laurinis. *C. B. P.* 476. See LADANUM.

4. Ciſtus; Ledon; foliis populi nigræ; major. *C. B. P.* 467. LARGE SWEET CISTUS, OR ROCK-ROSE WITH POPLAR-LEAVES.

5. Ciſtus; mas; folio oblongo; incano. *C. B. Pin.* 464. *Jonſ. D. Tourn. Inſt.* 459. *Elem. Bot.* 227. *Boerh. Ind. A.* 275. *Ciſtus Hypociſtidem ferens*, Offic. *Ciſtus mas vulgaris*, Park. Theat. 658. *Ciſtus mas cum Hypociſtide*, Ger. 1093. Emac. 1275. *Ciſtus mas* IV. *Monſpelienſis folio oblongo, albido*, J. B. 2. 3. Chab. 95. CISTUS, WITH THE HIPPOCISTUS. *Dale.*

It grows on rocky Hills, and in Woods, and flowers in Summer. The Hypociſtis, which adheres to the Tops of the Clods about the Root, is uſed in Medicine. See HYPOCISTIS.

6. Ciſtus; mas; major; folio rotundiori. *T. Tourn. Inſt.* 259. *Elem. Bot.* 227. *Boerh. Ind. A.* 275. *Ciſtus mas*, Offic. Park. Parad. 421. Ger. 1093. Emac. 1275. *Ciſtus*, Chab. 95. *Ciſtus mas folio rotundo, birſutiſſimo*, C. B. Pin. 464. Raii Hiſt. 2. 1007. *Ciſtus mas folio ſubrotundo*, Park. Theat. 658. *Ciſtus rotundifolius flore roſeo*, Rupp. Flor. Jen. 101. MALE HOLLY-ROSE, OR CISTUS. *Dale.*

It grows in *Italy* and *Spain* ſpontaneouſly, but with us it is cultivated in Gardens, and flowers in Summer. The Leaves and Flowers are uſed in Medicine, and their Virtues are already ſpecify'd from *Dioſcorides*, in the Beginning of this Article.

7. Ciſtus; mas; foliis undulatis, & criſpis. *T.* 259. MALE CISTUS, OR ROCK-ROSE, WITH WAV'D AND CURL'D LEAVES.

8. Ciſtus; mas; folio breviore. *C. B. P.* 464. SHORT-LEAV'D MALE CISTUS, OR ROCK-ROSE.

9. Ciſtus; Luſitanicus; folio ampliſſimo, incano. *T.* 259. H.

10. Ciſtus; mas; II. folio longiori. J. B. 2. 2.

11. Ciſtus; fœmina; folio Salviæ, *C. B. Pin.* 464. *Raii Hiſt.* 2. 1008. *Tourn. Inſt.* 259. *Elem. Bot.* 227. *Boerh. Ind. A.* 275. *Ciſtus fœmina*, Offic. Ger. 1094. Emac. 1276. *Ciſtus*, Park. Parad. 422. *Ciſtus fœmina vulgaris*, Theat. 660. *Ciſtus folio Salviæ*, Rupp. Flor. Jen. 101. *Ciſtus fœmina Monſpeliana, flore albo*, J. B. 2. 4. Buxb. 96. FEMALE HOLLY-ROSE.

The Leaves and Flowers are in Uſe, which agree in Virtues with thoſe of the *Ciſtus Mas.*

12. Ciſtus; Ladaniſera; Monſpelienſium. *C. B. P.* 467. THE GUM-BEARING CISTUS, OR ROCK-ROSE OF MONTPELIER.

13. Ciſtus; Ledon; foliis anguſtis. *C. B. P.* 467. H.

14. Ciſtus; folio Halimi; I. *J. Cluſ. H.* 71. *Ciſtus, fœmina, portulacæ marinæ folio latiore, obtuſo.* C. B. P. 465.

15. Ciſtus; folio Halimi; II. *J. Cluſ. H.* 71. *Ciſtus, folio Halimi longiori incano.* J. B. 2. 5.

16. Ciſtus; fœmina; folio Salviæ; flore Ochræ colore. *C. B. P.* 465.

17. Ciſtus; foliis roriſmarini, ſed non incanis. *C. B. P.* 467. *Boerhaave's Index alter, Vol.* 1.

Beſides the foregoing Species of the CISTUS, *Dale* gives us the following.

LEDUM ROSMARINI FOLIO. Buxb. 182. Rupp. Flor. Jen. 101. *Ciſtus, Ledon foliis Roſmarini ferrugineis*, C. B. Pin. 467. Raii Hiſt. 2. 1006. *Ciſtus, Ledum Sileſiacum*, Ger. 1106. Emac. 1288. *Roſmarinus ſylveſtris quorundam*, J. B. 2. 23. Chab. 103. *Roſmarinum ſylveſtre Bohemicum Matthioli, ſive Ledum Sileſiacum Cluſii*, Park. Theat. 75. BOHEMIAN ROSEMARY.

It grows in Woods, and flowers in *July.* The Herb is in Uſe, which is of an inebriating Quality; for which Reaſon, in many Places of *Saxony*, they boil it in their Beer, to make the Peaſants drunk the ſooner; whoſe Heads, when they have drank freely of this good Liquor, are affected with it for ſome Days afterwards: They lay it alſo among Clothes to expel Moths. *Dale.*

CITHARUS, κίθαρος, according to *Heſychius*, ſignifies the Breaſt, the Side, and a Species of Fiſh. In the firſt Senſe it often occurs in *Hippocrates*, as *Galen*, in his *Exegeſis*, expounds the Word, which, as we are inform'd by *Erotian*, was a Term in Uſe among the *Dorians.*

CITRA *Indis Lignum*, J. B.

A Sort of reddiſh, ſweet-ſcented Wood, of an aromatic Taſte, growing in the *Eaſt Indies.* It is a Queſtion whether this Wood be of the *Citrus Arbor* of the Antients, of which they made very coſtly Tables. *Raii Hiſt. Plant.*

CITRAGO. A Name for the MOLDAVICA; *Betonicæ Flore albo*; which ſee. *Boerhaave, Index alter, Vol.* 1.

CITREUM. The Citron-tree.

The Characters are,

It hath broad ſtiff Leaves, like thoſe of the Laurel, but without any Appendix (as hath the Orange): The Flowers conſiſt of many Leaves, which expand in form of a Roſe: The Cup of the Flower is ſlender and fleſhy, and is divided into five Segments at the Top: The Piſtil of the Flower becomes an oblong, thick, fleſhy Fruit, which is divided into many Cells, is very full of Juice, and contains ſeveral hard Seeds.

Of this there are two Species.

1. Citreum; vulgare. *Tourn. Inſt.* 620. *Elem. Bot.* 493. *Boerh. Ind. A.* 2. 240. *Malus Citria*, Offic. *Citrum, Malus Citria*, Commel. Plant. Uſual. 87. *Malum Citrum*, Aldr. Dendr. 525. *Citreum, Malus Citria, Malus Medica*, Mont. Ind. 40. *Citreum Malum*, Ind. Med. 37. *Malum Citreum vulgare*, Ferr. Hiſp. 61. *Malus Citria vulgaris*, Jonſ. Dendr. 10. *Malus Citria ſive Medica*, Raii Hiſt. 2. 1654. *Malus, Medica ſive Citria*, Park. Theat. 1506. *Malus Citria*, J. B. 1. 94. *Malus Medica*, Ger. 1278. Emac. 1462. C. B. Pin. 435. Chab. 4. THE CITRON-TREE.

2. *Citreum; Medulla dulci.*

The firſt of theſe is principally uſed in Medicine. It does not grow to be a Tree of any great Bigneſs, being frequently planted

planted for Fences and Hedges in the *Weſt Indies*, the Branches having a great many ſharp Thorns growing on them: The Leaves are oval, ſharp-pointed, larger than either Orange or Lemon leaves: The Flowers are white, like Orange-flowers, which are ſucceeded by very large oval Fruit, of a pale-yellow or lemon Colour; on the Outſide ſomewhat rugged, and full of Protuberances; the Inſide is white, fleſhy, and thick, containing but a ſmall Quantity of Pulp in proportion to the Bigneſs of the Fruit, with ſeveral Seeds like thoſe of Lemons.

Some are of Opinion, that the Citreum is that celebrated Tree, whoſe beautiful and alluring Fruit was forbidden to our firſt Parents in Paradiſe; for which Reaſon the Citron is alſo call'd *Pomum Adami*. In the Days of *Pliny* the Fruit was not eaten; and, according to *Salmaſius*, *Plutarch* informs us, that they only began to be eaten a little before his Time; but, on account of their grateful and fragrant Smell, they were laid among Clothes, and were eſteemed effectual for preſerving them againſt Moths. According to *Athenæus*, the Citron was laid in Cheſts among Clothes, as a thing of uncommon Value and Excellence. It was alſo eſteemed beneficial in Caſes where mortal Poiſons had been drank, and in order to ſweeten the Breath; for if any one ſqueezes the Juice of the Citron-peel into his Mouth, and ſwallows it, after being boil'd in Broth, or any other Liquor, it procures a ſweet Breath. The dry'd and freſh Citron, uſed before Meals, is ſaid to reſiſt all Poiſons, according to the Experience of *Athenæus*, who alſo informs us, "That the whole Citron, together with its Seed, boil'd in the "beſt Honey, till it is entirely colliquated, proves an effectual "Antidote againſt all Poiſons, if a ſmall Quantity of the Li- "quor is uſed every Morning." Beſides, *Dioſcorides* informs us, that the Seeds of the Citron, drank in Wine, reſiſt Poiſon, render the Body ſoluble, procure a ſweet Breath, and that they are principally uſed by Women againſt that Species of Diſorder call'd *Malacia*. *Pliny* alſo informs us, that the Seeds, when exhibited in Vinegar, are good againſt a Weakneſs of the Stomach. According to *Matthiolus ad Dioſcor.* *Galen*, when ſpeaking of the Medicinal Virtues of the Citron, uſes the following Words: "The Seeds are poſſeſſed of a highly acid and "dry Quality, ſo that they are dry and cold in the third De- "gree." But *Matthiolus* obſerves, that theſe Words are not to be underſtood of the genuine Seed, but concerning the acid Juice of the Citron, by which the Seed is every-where inclos'd, as is obvious from the following Words. "Its Peel is alſo dry- "ing, but highly acrimonious; but, though it is drying in the "ſecond Degree, it is not cold, but temperate, or nearly ſo. "Beſides, its Pulp alſo contains a thick Juice, which is of a "cold and pituitous Quality; for this is alſo eaten as well as the "Peel. The Seed is unfit for being eaten, as alſo the Kernel "contained in it, which is the genuine Seed. It is bitter, and "poſſeſſed of a digeſtive and drying Faculty, receding from "temperate in the ſecond Degree." The Leaves are alſo of a drying and digeſting Nature. *Paulus Ægineta* alſo makes mention of a purgative Medicine call'd *Diacitrium*, which is compoſed of the Peel and Pulp of the Citron, with Water, boiled to a third Part, to which Honey is afterwards added, and Scammony and long Pepper ſprinkled upon them. From what has been ſaid 'tis obvious, that the Citrons were eaten in the Days of *Galen*. From *Apicius* alſo, *Lib.* 4. *Cap.* 3. we learn, that they were uſed as Food; but, for this Purpoſe, they were choſen with a ſweet Pulp, which, according to *Palladius*, the Antients had a Method of procuring by macerating the Seeds for three Days in Hydromel, or in Sheep's Milk, which is ſtill preferable. Others, according to the ſame Author, had a different Method of obtaining this End. Theſe are almoſt all the Virtues which, in the Works of the antient *Greeks* and *Romans*, we find aſcribed to the Citron; but as the Tree, which bears this Fruit, is much cultivated in *Italy*, *Portugal*, *Spain*, and the South of *France*, the Writings of the Moderns abound with Obſervations on the Virtues of this Tree, and its ſeveral Parts. Thus the Leaves are ſaid to be poſſeſſed of an aromatic Quality, for which Reaſon they are thought to be of a diſcutient drying Nature, and are therefore preſcribed for the Cure of Wounds. The Juice is alſo expreſs'd from the tender Leaves, and young Buds; then it is mix'd with *Venice* Turpentine in a glazed earthen Veſſel, which is to be well covered. When this Mixture is ſubjected to the Fire, it is to be ſuffer'd to boil till the Citron-juice is thought to be conſumed; and when the Subſtance is become tepid, it is ſtrained, and the Part affected anointed with it, as Neceſſity requires. When the ſuperfluous ſmall Branches are taken off, and cut into large Portions, an Oil is extracted from them by Diſtillation with Water, which is of a whitiſh-green Colour, a grateful Smell, and highly beneficial in the Cure of ſeveral Diſeaſes. Thus, according to *Ferrarius*, thirty or forty Pounds of the Leaves, and tender Branches, yield an Ounce of Oil. The Flowers, by their grateful Smell, and fragrant Scent, ſufficiently diſcover their aromatic, analeptic, and heating Quality. According to *Ferrarius*, in Places where theſe Trees are produc'd in great abundance, ſuch as *Regio*, and other Parts of *Sicily*, an Oil is obtained from the Flowers, by Diſtillation with Water, which is of a yellowiſh Amber-colour, a faint Smell, but, at the ſame time, of ſingular Uſe in Medicine; but he tells us, that ſcarce an Ounce of this Oil is to be obtained from fifty or ſixty Pounds of theſe Flowers. They are alſo, like other Flowers, preſerved with Sugar, and uſed as a Sweetmeat. They are of a cordial Nature, and generally preſcribed in Electuaries. The Virtues and various Uſes of Citrons have gradually, and at different times, been diſcover'd by the Experiments of different Perſons. We have already ſeen, that the Antients put them among Clothes, not only for the Fragrance of their Smell, but alſo to preſerve them from Moths; that they look'd upon them to be Antidotes againſt Poiſon, and that they uſed them as Food. According to *Ferrarius*, *Bedreddin*, an *Arabian* Author, tells us the following Story concerning the Virtues of the Citron: It is reported, ſays he, that, among the *Perſians*, a Man celebrated for Wiſdom, and dear to King *Choſroas*, was at laſt deprived of the Favour and Countenance of his Prince. Upon this, being clapt in Priſon, he, by the King's Orders, had his Choice of only one Species of Aliment for his Subſiſtence, and to all the others he preferred Citrons. When he was aſked the Reaſon of this Choice, he anſwered, "The grateful Smell of the Citron "chears my Spirits; its Skin and Seed are cordial, and revive "my Heart; its internal Peel ſupplies the Room of Food, "and its Pulp that of Drink." *Dominicus Pancirolus*, in his *Iatrologiſmoi*, or *Obſervationes Medicinales*, *Pentec.* 2. *Obſ.* 36. gives us an Account of a Patient labouring under an Atrophy, who, being juſt at the Point of Death, longed for Citrons, and upon eating a large one, which weigh'd four Pounds, he began immediately to grow better, and at laſt recovered entirely. In *Braſil* a Piece of Citron is uſed, by way of Suppoſitory, for curing a particular Species of Ulcers in the *Inteſtinum Rectum*, which are frequent in that Country. An entire Citron, ſtuck full of Cloves, is by ſome ordered to be carried in the Pocket, and frequently applied to the Noſe, as a Preſervative againſt contagious Diſeaſes. *Guido Patin*, a celebrated Phyſician, highly extols this Fruit, and gives it the Preference to ſome of the Shop-cordials, which have rather the Name than the real Virtues of a Cordial; and he affirms, that in all malignant Diſorders, putrid and peſtilential Fevers, more infallible Relief is to be expected from a few Citrons, than from all the various Preparations of Oriental Bezoar. *Diemerbroeck*, in his Treatiſe *de Peſte*, *L.* 3. *C.* 2. affirms, that all the Parts of the Citron are poſſeſs'd of an alexipharmic Quality; for which Reaſon, in a Plague, he orders the whole Citron to be cut into Slices, and boil'd among the Patient's Victuals, or mix'd with his common Drink. He alſo prepared a grateful Drink from Citrons, in the following manner:

Take three Citrons, full of Juice; cut them, together with the Peel, into ſmall Slices; then, putting them in a Glaſs Veſſel, add of Spring or Carduus-water, and of Roſe-water, each half a Pint; of ſmall White-wine, one Pint; as much white Sugar, or Syrup of Lemons, as is ſufficient to render it moderately ſweet. Mix all together for Drink. This Preparation is what is commonly call'd *Lemonade*, and is highly extol'd for extinguiſhing Thirſt, and a refreſhing Quality.

There are various other Liquors prepared from the Citron, which are better calculated for the Purpoſes of Luxury than thoſe of Medicine. The *Citronelle* of the *French*, for Inſtance, or what we call *Barbadoes* Water, is prepared in the following manner:

Take of the yellow Citron-rind, dried in the Sun, three Pounds; of *French* Brandy, ſix Pints: Let them ſtand in Infuſion, in a cold Place, for a Month, in a Glaſs Cucurbit, with an Alembic and Receiver adapted to it; then diſtil *in Balneo Mariæ*. When the ſtrongeſt of the Spirit is drawn off, add to the Remainder the Pulps of Citrons; and five or ſix Days after diſtil a Liquor, which ſerves to render the former Spirit weaker. Add to the Mixture a ſufficient Quantity of Sugar; or, in order to give it a more grateful Taſte, a proper Quantity of the Water of Orange-flowers.

The *Ratafia Citri*, ſo much eſteem'd by Perſons of a delicate Turn, is to be found in *Lemery's Pharmacope Univerſelle*. We ſhall here briefly conſider the ſeveral Parts of the Citron.

Firſt, then, as to its yellow Rind; it is of a fragrant Smell, recruits the Spirits, and has an acrid Taſte. In conſequence of the fragrant and highly penetrating Oil, with which it abounds, it is a highly grateful Aromatic, of a corroborating, ſtimulating, heating, inciding, and diſcutient Quality; and may be properly preſcrib'd in Caſes where a Languor is produced by a Defect of the Oſcillatory Motion of the Muſcles, ſince, in ſuch a Caſe, a proper Stimulus is required: Hence it is a beneficial

Medicine

Medicine in Weakneſſes of the Stomach, Flatulences, and Cachexies. Hence the Reaſon is obvious, why 'tis claſs'd among the carminative, antihypochondriac, antiſcorbutic, ſtomachic, and antiſebrile Medicines. It is added to ſeveral Diſhes and Liquors, either entire or raſp'd down, not only with a View to give them a grateful Flavour, but alſo as an Aromatic, in order to correct their cold and flatulent Qualities. By the Confectioners this Rind is uſed in various Preparations. When cut into Slices, and incruſtated with Sugar, 'tis what we call *candied Citron-peel*; which is not only grateful to the Taſte, but corroborates the Stomach, in Caſes where its Weakneſs ariſes from a Laxity of the Fibres. The *Italians* prepare their *Orſchato* of the yellow Rind of the Citron, beat with Melon-ſeeds in Water, which is a Drink of a grateful Taſte, and of an analeptic and refrigerating Quality.

Secondly, the white Skin, lying immediately under the yellow Rind, and which, when eaten, is of difficult Digeſtion, is ſaid to be poſſeſs'd of lithontriptic Qualities; and, according to *Ettmuller*, when diſtil'd with the Fruit of the Alkekengi, it yields an elegant nephritic Water. In the Shops it is ſcarcely uſed, except for the *Electuarium de Citro*, and ſtomachic Lozenges; but, by Confectioners, it is uſed for various Purpoſes.

Thirdly, the acid Subſtance, or Pulp, lying under this Skin, is eaten crude, either with or without Sugar, in Caſes where the Heat of the Body is to be leſſen'd, or the Orgaſm of the Blood check'd: Hence, in all hot Diſorders, it is accounted an excellent Medicine for quenching Thirſt. It not only refrigerates and cools the Body, by leſſening the too violent Motion of the Humours, but alſo reſiſts Putrefaction. For this Reaſon the Pulp is either boil'd among Aliments, or its Juice is expreſs'd crude upon Fleſhes, Fiſh, and in various Broths, not only for the ſake of its grateful Acidity, but alſo with a View to correct their urinous Smell, their Rancidity, or their Tendency to Putrefaction. It is of ſingular Uſe for theſe Purpoſes, eſpecially in the Summer-time, as it procures an Appetite, and promotes Digeſtion: Hence it is accounted an excellent Medicine in Fevers, and againſt the Scurvy, for correcting the muriatic and alcaleſcent Acrimony of the Juices. *Ettmuller* informs us, "That, both in preventing and curing burning malignant Fevers, no Medicines ought to be exhibited without "an Admixture of Citron-juice, whether mix'd with the Patient's Drink, or expreſs'd upon his Aliments; for when "the Spirits are exhauſted by profuſe Sweats, and the Patient "is ſeiz'd with an uncommon Weakneſs, upon exhibiting "Citron-juice, and other Preparations of it, as alſo Decoctions of the Citron, in Imitation of *Mynſicht*, their Acidity "gently coagulates the too fluxile Blood, procures it a due "Conſiſtence, prevents its Diviſion into too minute Particles, "reſiſts Malignity, and proves highly cordial. Beſides, the "Citron-juice is of a diuretic Quality; for which Reaſon 'tis "generally recommended againſt nephritic Diſorders. It is "ſaid to be a preſent Remedy in the Scurvy, and Diſorders "produced by a contaminated State of the Atmoſphere. The "*Dutch*, when they undertake a Voyage to the *Eaſt Indies*, "or any other far diſtant Country, where they generally contract the Scurvy, take along with them Citrons, and "Caſks full of their Juice, as a Cure for the Scurvy, as the "volatile Acid of the Citron corrects the rancid Acid of the "Scurvy." *Ferrarius* informs us, that there was a *German* Phyſician, who, upon the Approach of the Paroxyſms in intermittent Fevers, uſed to exhibit two Spoonfuls of the Citron-juice, mix'd with one Spoonful of *French* Brandy; and that, by means of every ſuch Doſe, the Fever became proportionably milder, and was, in a few Days, totally removed; beſides, the intenſe Thirſt, and feveriſh Heat, were mitigated by this Medicine. He alſo affirms, that the ſalutary Effects of this Medicine were ſufficiently experienced, in the Cure of a tertian Fever, which raged at *Rome* in the Summer-time. But becauſe, in a Plague, the moſt formidable of all the hot Diſorders, the Humours of the human Body have a ſtrong Tendency to Putrefaction, 'tis eaſy to perceive, that the Citron-juice is juſtly claſs'd among the antipeſtilential Medicines. Beſides, its Virtues are highly celebrated in Diſorders ariſing from the Exhibition of acrid and corroſive Subſtances, the noxious Qualities of which are obſerved to be reſiſted by Acids. Thus, in *Baptiſt du Hamel's Hiſtoria Reg. Scient. Acad.* we are inform'd, that thoſe who were at the very Point of Death, in conſequence of having taken Euphorbium, were effectually cured by an Exhibition of Citron-juice: Hence 'tis obvious, for what Reaſon, and againſt what kinds of Poiſons, the Citron-juice may be recommended as an Antidote; and that *Stennelius*, in his *Toxicologia*, is in the right, when he ſays, "There "is no doubt to be made, but the acid Juice of the Citron "reſiſts the alcaline Poiſons of Animals; but I much doubt, "whether the Citron is an univerſal Antidote for all Poiſons, "as *Athenæus* maintains." It is ſaid to prove effectual againſt that Species of Poiſon call'd *Aqueta*, which is a Liquor prepared from Arſenic. *Hoffman*, in his *Clavis Schrod.* affirms, that the Citron-juice cured a Man bit by a Viper; but *Charas*, in whoſe Houſe the Accident happen'd, charges his Story with Falſhood. And *Redi*, in his *Opuſcula*, T. 2. does not heſitate to deny the alexipharmic Virtues of the Citron againſt the Bites of Vipers; and pronounces the Story of *Athenæus*, concerning the Virtues of the Citron againſt the Bites of Aſps, to be entirely fabulous: Hence we underſtand, why the Citron-juice contributes to the Cure of a *Malacia*, or a depraved Appetite, wherein ſome Women, eſpecially when pregnant, long for uncommon and unuſual Aliments; becauſe, for Inſtance, it ſubdues and corrects the predominant alcaline and rancid Acrimony, which is the Cauſe of the Diſorder. It may be claſs'd among the diuretic and ſudorific Medicines, becauſe, by its acid Quality, it ſtimulates the Solids, whilſt, at the ſame time, it dilutes and attenuates the Humours. But whether its reſolvent Virtue, as *Quercetan* would have it, is ſufficient to diſſolve ſtony Concretions form'd within the Viſcera, is what we will not take upon us to determine, ſince we have no Experience with reſpect to this Particular. But the Reaſon that Author aſſigns, which is, that, without the Body, it is capable of diſſolving ſtony Concretions, Pearls and Corals, does by no means appear ſatisfactory, ſince Vinegar does the ſame; which, however, is not celebrated as a Lithontriptic, or Menſtruum for Stones of the human Body. But ſince it is poſſeſs'd of a Quality, by means of which it checks the exorbitant Motions of the Humours, and prevents inflammatory Infarctions or Obſtructions, it is not to be denied a certain Efficacy againſt nephritic Pains, which almoſt always follow inflammatory Stagnations; or, when they laſt for any conſiderable time, bring on ſuch Stagnations. But the Citron-juice is, in a more particular manner, beneficial in alleviating nephritic Pains, when it is exhibited with Oil of ſweet Almonds. But they who recommend an Ounce or two of it, drank in White-wine, for expelling the Stone, muſt be certain, that the Stone is ſo ſituated, that it may be convey'd either from the Ureters to the Bladder, or from the Bladder without the Body; and that the Patient is capable of ſupporting the Stimulus; otherwiſe lubricating and relaxing Medicines alone are more properly to be uſed. This Juice is ſaid to be a Remedy againſt Worms of the Inteſtines, for no other Reaſon, but becauſe Acids prove fatal to them. Since we have ſeen, that, in Caſes where the Citron-juice produces any happy Effects in the human Body, it acts as an Acid, it is obvious, that, by an unſeaſonable or immoderate Uſe of it, the ſame Effects may be produced as by other Acids of the ſimple Kind, which generate thoſe Diſeaſes ariſing from a predominant Acid. But when the Citrons are unripe, and abound with an acid, crude, and harſh Juice, like thoſe generally ſold in the Northern Countries, the too liberal Uſe of them produces an acid Acrimony, which, by its aſtringent Quality, generates various Diſeaſes and Obſtructions. The fatal Effects produced by eating Citrons too plentifully, we learn from the Caſe of a Woman, related in the *German Ephemerides*, who, after eating ſix or ſeven of them a Day for a Year, died of a ſcirrhous Tumor of the Pylorus and Duodenum, ſo that there ſcarcely remain'd room ſufficient to introduce a Quill. The Citron-juice ſeems, in my Opinion, ſays *Rieger*, to contribute to the Protraction of Life, for no other Reaſon, than that it corrects the alcaleſcent State of the Fluids, and conſequently belongs to that Species of Aliment which reſiſts Putrefaction: But the frequent and daily Uſe of it ſeems far ſafer, when it is mix'd with other Liquors, than when it is exhibited alone. Thus, for Inſtance, when reduced to a Syrup with Sugar, it is mix'd with Ptiſans, which may be drank at Pleaſure, to alleviate the Heat and quench the Thirſt; or *Lemonade* may be prepared of it, in which Liquor the Juices of ninety Citrons were conſumed, in the Space of twenty-four Hours, to the Recovery of the Patient from a continued Fever, as we learn from a Caſe in *Blegny's Zodiacus Medico-gallicus*. *Ferrarius* is of Opinion, that the frequent Uſe of the Pulp, made up with Sugar, and boil'd, contributes much to the Preſervation of Health, and the Protraction of Life; and, becauſe theſe are Matters of the laſt Importance, we ſhall here tranſlate the whole Paſſage from that Author. "The Caſe, ſays "he, of *Joannes Baptiſta Martini* convinces me of the ſalutary Qualities of Citron-juice. This Man, for forty Years, "from the Beginning of *March* to the End of *October*, every "Morning almoſt, three Hours before Breakfaſt, took half a "Spoonful of the above-mention'd Compoſition; but in the "Evening, before he went to ſleep, he took the third Part of "a Spoonful of the ſame Liquor. This Evening Doſe he did "not ſwallow all at once, but ſuffer'd it to melt away gradually, that it might wipe away, and render fit for Expectoration, the Phlegm, which, in the Night-time, adheres to the "Fauces and Thorax; as alſo, that it might extinguiſh the "Thirſt generally produced by the firſt Concoction. But in "the Morning he ſwallow'd this Medicine at once, for diſpelling, expectorating, or evacuating by Stool, the Phlegm of "the Stomach, for rendering his Body ſoluble, for provoking "Urine, preventing Putrefaction, and quenching Thirſt. When, in the Winter Seaſon, inclement ſouthery Winds "blow'd, he uſed ſucceſsfully this Medicine. By means of "this

" this delicious and eaſily prepared Remedy, without the " Aſſiſtance of any other, he preſerved his Life, and enjoy'd " good Health for ſo many Years; and, when he was almoſt " eighty Years old, Age was not to him a Diſeaſe, according " to the Proverb, but a healthy vigorous State of Life, em- " ploy'd in the Diſcharge of civil and domeſtic Offices, and " bleſs'd with the grateful Reflections of a well-ſpent Life. In " this Compoſition he was particularly careful, that the Acri- " mony of the Juice ſhould be predominant, leſt too great " Sweetneſs ſhould excite a Nauſea. For this Reaſon he made " up eight Ounces of Citron-juice, with twelve Ounces of " Sugar; then boil'd them to a due Conſiſtence, agitating " them with a wooden Spatula, leſt the Sugar ſhould be burnt, " and become red. To this Compoſition, before it was cold, " he added an Ounce of the fineſt Sugar, coarſely pounded, " that the Compoſition, when concreted, might be more grate- " ful to the Taſte. I myſelf taſted this Mixture, and muſt " own, that the due Mixture of the Acid and the Sweet " was highly grateful to the Palate." The Pulp of the Citron is uſed externally for cooling Epithems, whilſt, for Inſtance, in Fevers, in order to allay the Heat, Slices of it are applied to the Wriſts of the Hands, and the Soles of the Feet. But I very much doubt, whether the Pores can be thus contracted, and Tranſpiration ſtopt, by cold Applications, without Fear of ſome Danger ariſing from a Retropulſion of the perſpirable Matter to the internal Parts. After impure Coition the Citron-juice, mix'd with Water, is ſaid to be of great Uſe for waſhing the Penis. It is alſo poſſeſs'd of a coſmetic Quality, and removes Spots, Freckles, Ring-worms, and Puſtules of the Face, eſpecially when it is mix'd with Camphire and White-wine. *Nibelius* informs us, that, according to *Jonſton*, a Citron, cut thro' the Middle, ſprinkled with Flower of Sulphur, and warm'd in hot Aſhes, contributes to the Cure of the Itch, if the Parts affected are anointed with it. This Effect it produces by its Juice; for which Reaſon, Lemon-juice may alſo be added to the Powders, of which the Ointments againſt the Itch are compoſed. But general Evacuations ought firſt to be premiſed, leſt, even in this Caſe, the Health of the Patient ſhould be endanger'd by a Retropulſion of the perſpirable Matter. But, ſince the Skin is render'd ſomewhat rough by the Uſe of acrid abſtergent Medicines, it may be again ſmooth'd by Milk, or Emulſions of mild farinaceous Subſtances, as the cold Seeds, and ſweet Almonds. The Citron-juice is alſo uſed, inſtead of Vinegar, for coagulating Milk, and ſeparating the Whey. That the Citron-juice may be readily had, when Citrons themſelves cannot be found, the *Italians* ſell the expreſs'd Juice, impregnated with Sugar: This they call *Aigre di Cedre*. In *Egypt* the expreſs'd Juice of the Citrons, after having ſtood ſome time, till it becomes clear, is put up in Caſks, and kept for Sale. The Inhabitants of *Ceylan* boil it in earthen Veſſels, till it becomes black, like Pitch; after which they keep it for Uſe. From the Sediment or Fæces of the Juice, when kept in Jars for Depuration, according to *Pomet*, is prepared, by Diſtillation, the *Oleum Citri vulgare*, which is greeniſh, fragrant, and tranſparent, and of which, for the moſt part, about three Pints are obtain'd from fifty Pounds of the Fæces. According to *Nebelius*, an eſſential Salt may alſo be obtain'd from the acid Citron-juice, by boiling it, when expreſs'd and ſtrain'd, to a Conſumption of the Humidity; and afterwards putting it by in a cool Place, that the Cryſtals may adhere to the Sides or Bottom of the Veſſel. Theſe Cryſtals partake of the ſame Nature with the Juice, and are of a refrigerating Nature, and reſiſt Putrefaction. They alſo ſerve to prepare the *Syrupus Citri Siccus*.

Fourthly, the Citron-ſeeds are poſſeſs'd of an aromatic Quality, and are uſed principally in Emulſions againſt Fevers, and other malignant Diſorders; as alſo againſt the Meaſles, Small-pox, and Worms of the Inteſtines. From their aromatic Quality we muſt account for their Efficacy, commonly aſcrib'd to them, againſt Poiſons; ſince, by increaſing the Motion of the Humours, it promotes a free Perſpiration, and, like other Aromatics of a diaphoretic Nature, affords a proper Opportunity of diſpelling and eliminating the peccant Matter thro' the cutaneous Pores. According to *Ferrarius*, *Piſonelus* affirms, that, when drank in Wine, it is effectual againſt the Hæmorrhoids, and Poiſons of all Kinds, but more eſpecially that of Scorpions. The Oil, expreſs'd with hot Inſtruments from theſe Seeds, after they are unhuſk'd and bruis'd, is, by *Porta*, in his *Magia Natural.* ſaid to be effectual againſt Poiſons. He alſo affirms, that it is the moſt proper Menſtruum for extracting the Odours from Muſk, Amber, and Civet, and for preparing Ointments, becauſe it is long before it becomes rancid. *Ferrarius*, from *Badreddinus*, informs us, that the *Perſians* uſe it in their Lamps. In the *Pharmacopœia Auguſtana*, it is call'd *Oleum è granis Citri*, and is recommended in arthritid Pains, and the Swellings which ſucceed them. It is alſo ſaid to expel the Stone from the Kidneys and Bladder. In a Plague it is recommended as a powerful Alexiteriſt; and ſome pretend, that it kills Worms, either when exhibited internally, or when the Belly is anointed with it.

Beſides the more important and uncommon Preparations of the Citron, already ſpecified, there are ſeveral others directed in the Diſpenſatories, and kept in the Shops; ſuch as the *Conditum totius Citri*, in the *Inſtitutiones Medicæ* of *Sennertus*; the *Syrupus de toto Citro eſſentificatus*, in the *Diſpenſat. Brandenburg.* the *Eſſentia Corticum Citri*, in the ſame Diſpenſatory; the *Aqua Citri compoſita ex Succis*, ibid. the *Aqua Citri cum ſpiritu vini*, ibid. the *Aqua Corticum Citri*, in the *Pharmacop. Pariſ.* the *Decoctum Citratum*, in the *Diſpenſat. Brandenburg.* the *Electuarium de Citro Meſuæ*, in the *Antidotarium Bononienſe*, which, in *Lemery's Pharmacop.* is call'd *Electuarium ex Citro Stomachicum Meſuæ*; the *Electuarium de Citro*, in the *Pharmacop. Pariſ.* the *Electuarium de Citro Tabulatum*, in the *Pharmacop. Bruxellenſis*, which, in the *Pharmacop. Argentorat.* and that of *Lemery*, is call'd the *Electuarium de Citro ſolutivum*; the *Elixir Citri*, in the *Diſpenſat. Brandenburg.* the *Elixir Citri purgans*, in the *Pharmacop. Argentorat.* the *Eſſentia Citri*, in the *Pharmacop. Auguſt.* the *Extractum Diacitri*, *D. D. Hieronymi Reuſneri*, in the *Phar. Auguſt.* and *Argentorat. Morſuli Citri ex ſucco*, in the *Pharmacop. Argentorat.* the *Syrupus de Corticibus Citri*, in the *Diſpenſat. Brandenburg.* the *Syrupus Acetoſitatis Citri*; the *Syrupus e Citro tota*, in the *Diſpenſat. Brandenburg.* the *Syrupus de toto Citro Eſſentificatus*, ibid. and the *Unguentum de Citriis*, in the *Diſpenſat. Brandenburg.* There are ſo many other Preparations of the Citron, in the practical Authors, and Writers of Diſpenſatories, that a bare Catalogue of them would tire the Reader's Patience, without informing his Judgment.

The *Syrupus e Succo Citriorum*, or Syrup of the Juice of Citrons, is thus prepar'd:

Take one Pint of the clear Juice of Citrons; of fine Sugar, two Pounds; and boil into a Syrup, with a gentle Fire.

The *Syrupus Corticum Citriorum*; or Syrup of Citron-peels.

Take five Ounces of the outer yellow Citron-peel, full ripe, and freſh; of Kermes-berries, or, in their ſtead, of the imported Juice, two Drams; of Spring-water, three Pints: Steep them together, for one Night, in a Bath-heat; and, to the ſtrain'd Liquor, put two Pounds and a half of fine Sugar; and, with a moderate Heat, boil up into the Conſiſtence of a Syrup. *London Diſpenſatory.*

The ſame Virtues are attributed to the *Citrium Medulla dulci*, ſweet Citron, as to the ſweet Orange.

CITRINATIO. Complete Digeſtion. *Theatrum Chymicum, Vol.* 2. Or, according to *Rulandus* and *Johnſon*, Reſuſcitation, or Reſurrection.

CITRINELLA, *Geſn.* from its yellow or lemon Colour, is a ſmall Bird, about the Bigneſs of a Lark. It ſings agreeably, and lives upon Seeds. It contains much volatile Salt and Oil, and is judg'd very proper to be eaten for the Epilepſy. *Lemery des Drogues.*

CITRINULA is the Flammula or Spearwort, an Herb much uſed by *Paracelſus*, as appears in his Writings. *Johnſon.*

CITRINULUS. A Stone between a Cryſtal and a Beryl, called, by *Paracelſus*, *Saxifragus*. *Citrinulus*, in *Rulandus*, is a pale Cryſtal. They make of it a Liquor, in manner of an Alcali, againſt the Stone. *Caſtellus.*

CITRONES. A Term which occurs in *Paracelſus*, *Philoſ. Athenienſ.* where he ſays, that, among other Bodies to be found in the Sea, there are *Corallia*, *Trina*, and *Citrones*; but he no-where explains what he means by it. *Caſtellus.*

CITRULLUS, Offic. *Citrullus Officinarum*, Ger. 767. Emac. 913. *Citrullus folio Colocynthidis ſecto, ſemine nigro; quibuſdam Anguria*, J. B. 2. 235. *Citrullus, Anguria, Tetranguria*, Chab. 133. *Anguria*; *Citrullus dicta*, C. B. Pin. 312. Raii Hiſt. 1. 643. Tourn. Inſt. 106. Elem. Bot. 89. Hiſt. Oxon. 2. 228. Boerh. Ind. A. 2. 79. Rupp. Flor. Jen. 43. *Anguria ſive Citrullus vulgatior*, Park. Theat. 771. *Citrullus jacea Braſilienſibus*, Mareg. 29. *Citrullus jacea ſive Anguria*, Piſ. 262. CITRUL, or WATER-MELON.

Among the later *Greeks* it is called ἀγγούριον, from ἄγγος, which ſignifies any Veſſel or Receptacle. This Name was probably beſtow'd upon it, becauſe the Shell of the Fruit, when the Pulp is taken out, may ſerve as a Veſſel for holding any Liquor. It ſpreads along the Earth ſmall rough Twigs, with large Leaves, cut in deep Jags, rough and uneven. From the Sinuſes of theſe Leaves ſpring ſmall Tendrils, as alſo Foot-ſtalks ſuſtaining yelloviſh Flowers, which are ſucceeded by large round Fruit, capable of filling both one's Hands. The Rind is ſomewhat hard, but ſmooth, and without any Tubercles, of a darkiſh-green Colour, and variegated with Specks of a faint-green. Its Pulp is like that of the common Cucumber, white, firm, and of a grateful Taſte. The Seed is placed in a fungous Subſtance, which is lodged in the Meditullium. It is oblong, broad, flat, black, rough, and furniſhed with a pretty hard Huſk, under which there is a white Pulp, which, like that of

the Gourd-ſeed, is grateful to the Palate. The Rind of the Citrul is not always of the ſame Colour; for in ſome it is green, whereas in others it is variegated with whitiſh Spots; in ſome the Pulp is red and ſweet, and in others white, and not ſo grateful to the Palate; the Seeds in ſome are black, and in others of a rediſh-brown. It grows ſpontaneouſly in hot Climates, ſuch as *Apulia*, *Calabria*, *Sicily*, and other Countries which lie towards the South. In the more northerly Regions it is ſown, and bears, but never arrives at perfect Maturity. It flowers in *Auguſt*, and its Seeds are ripe in the Autumn, in *Italy*, *Spain*, and other hot Climates. In the *Indies* it thrives no-where better than in *Braſil*, where its Pulp is ſweet and ſucculent, like thoſe imported yearly into *Muſcovy* and *Peterſburg* from *Aſtracan* and *Caſan*, under the Name of *Arbus*, which is, perhaps, borrowed from the *Turks*, who call the Water-melon *Carpus*. They are capable of being preſerved for a conſiderable time without Corruption; but for this End they muſt be pulled before they are entirely ripe. Their fungous Pulp or Marrow is a grateful Aliment, not very nouriſhing, aqueous, but juſtly celebrated for its moiſtening, laxative, diuretic, and refrigerating Qualities. In theſe reſpects they agree with the Cucumber; but in this they ſurpaſs it, that, being free from its viſcid Quality, they are ſooner digeſted, and do not prove offenſive to the Stomach, though eaten in large Quantities. They are eaten raw, but Luxury, the fruitful Parent of Cookery, has laid a Foundation for their being prepared in a thouſand other Forms. The Seeds are, by Phyſicians, claſſed among the Four greater cold Seeds. They provoke Urine, but leſs powerfully than the Seeds of the Pompion. They are principally uſed in cooling Emulſions. Not only the Species of Citrul, of which we now ſpeak, is poſſeſſed of theſe Qualities, but alſo various other Species growing out of *Europe*, which are grateful to the Palate and Stomach, in proportion to the Heat of the reſpective Climates, in which they are produced.

The Seed is the only Part uſed here, being one of the great cold Seeds, and is of the Nature of Melon and Cucumber-ſeed, agreeing with them in their cooling diuretic Faculties.

Boerhaave calls this Plant *Anguria*.

CITTA, κίττα. A Diſeaſe incident to Women. See PICA.

CITTITES. The ſame as AETITES, which ſee. *Rieger*.

CIVETTA. See ZIBETHUM.

CLADOS, κλάδος, in *Hippocrates περὶ φύσ. παιδίν*, is a Slip taken from a Tree to ſet in the Ground.

CLÆR, A Chymical Term of Art, ſignifying Bone-flour, which is prepared of the Bones of the fore Part of the Cranium of a Calf, depurated from Fat by Boiling, afterwards calcined to a Whiteneſs, and very finely levigated on a Porphyry-ſtone, then moiſtened with freſh Water, and calcin'd again in an Earthen Pot cloſed, and, after Refrigeration, reduced again to a very ſubtile Powder, which is ſprinkled through a Sieve upon Earthen Veſſels, to prevent their contracting any Chinks. *Caſtellus*.

CLAKIS. A Name, in *Rieger*, for BARNACLES, which ſee.

CLAMOR, βοή. An Intenſeneſs of the Voice, a loud Outcry, a Clamour. This is ſometimes the Cauſe of a Rupture of the Veſſels, and ſometimes of a Diſorder like an Inflammation about the Membranes of the Fauces and Muſcles, which may be compared to that ulcerous and inflammatory Laſſitude, which affects the Hands, Legs, and Loins, after exceſſive hard Labour, the ſpirituous and humid Particles being exhauſted, and the Fibres and Membranes dry'd and contracted. Theſe are *Galen's* Obſervations. Sometimes a *Clamor*, as *Paracelſus* ſays, is a Symptom of a tartareous Diſeaſe, and proves the Preſence of a Tartarus, becauſe it burns and cuts like a Knife, *Paracel. de Tartar. Lib. 2. in Notis.* A *Clamor* is ſometimes alſo a ſort of Remedy, and preſcribed as ſuch in order to rouſe Perſons out of a Lipothymy, or Syncope. *Caſtellus*.

CLANDESTINA. A kind of Plant, with a monopetalous, perſonated Flower, tubulated in its lower Part, and its upper divided into two Lips, the upper of which is fornicated, and the lower divided into three Parts. From the Flower-cup, which is tubulated and crenated, riſes the Pointal, which perforates the Bottom of the Flower, and becomes an oblong unicapſular Fruit, which, dividing into two Parts, diſcharges, with a Spring, or elaſtic Force, its Seeds, which are of a roundiſh Figure.

I know but one Species of *Clandeſtina*, whoſe Varieties are the Clandeſtina with the bluiſh, and that with the white Flower. *Tournefort. Inſtit.*

CLANGE, κλαγγὴ, is properly the Cry of Cranes and Geeſe, a ſhrill Noiſe; hence κλαγγώδης φωνὴ, "a ſhrill Voice," an Expreſſion uſed by *Hippocrates*, particularly in *Prorrhet.* where *Galen*, in his *Comment.* obſerves, that κλαγγώδης φωνὴ is occaſioned by a Dryneſs of the vocal Organs, as βραγχώδης, "a hoarſe" (Voice) is of their immoderate Humidity.

CLARETA. The White of an Egg. *Rulandus*.

CLARETUM.

Claretum and *Clareta* ſignify what in *Engliſh* we call Claret. By this Name, in Medicine, is generally imply'd an Infuſion of aromatic Powders in Wine, which is afterwards edulcorated with Sugar or Honey. This Species of Liquor is alſo called *Vinum Hippocraticum*, and, by the *Germans*, *Hippocras*, becauſe, when the Infuſion is finiſhed, it is ſtrained thro' *Hippocrates's Sleeve*, as 'tis commonly call'd. It is prepared of various Aromatics, and other Ingredients, according to the different Intentions to be anſwered. Thus, for Inſtance, there is a laxative Claret in *Schroder's Pharmacopœia*; and another, bearing the ſame Title, in *Zwelfer's Pharmacopœia Regia*. *Schroder*, in the above-mention'd Work, has alſo a purgative Claret, which he calls *Vinum Hippocraticum Antimoniale*. *Barchuſen*, in his *Synopſis Pharmaciæ*, gives us Directions for preparing a purgative Claret; and *Zwelfer*, in his *Pharmacop. Regia*, gives us a Recipe for a hydragogue Claret. Other Formulas of preparing Claret, ſuited to different Intentions, occur in different Authors, to which every one may have Acceſs. Some, for making the Infuſion, uſe Spirit of Wine, both ſimple, and impregnated with Aromatics; others mix diſtil'd Waters with the Wine, or the Spirit of Wine. *Foreſtus*, in *Obſ. Med. Lib. 3. Obſ. 11.* alſo gives the Name of *Claret* to an Infuſion prepared of one Pint of Spring-water, half an Ounce of the beſt Cinnamon, and three Ounces of the whiteſt Sugar. In tertian Fevers he ordered this Infuſion to be drank inſtead of Wine: And *Geiger*, in his *Kelegraphia*, gives us the following Recipe for quenching Thirſt:

> Take of pure Spring-water, two Pints; of Sugar-candy, one Ounce; of the Powder of red Sanders, three Drams; of Cinnamon, two Drams; and of the Flowers of red Roſes, one Dram: Infuſe in a cloſe-ſtopt Glaſs, ſituated in a warm Place, for ſix Hours; then ſtrain off the Liquor, and add one Scruple of the Spirit of Vitriol; of Lemon-juice, and of the Julape of Violets and Roſes, each one Ounce. Mix up into a Claret.

Some will have Claret to be different from the *Vinum Hippocraticum*, becauſe the former is edulcorated with Honey, and the latter with Sugar; and becauſe the Claret is generally rendered yellow by means of Saffron, whereas the *Vinum Hippocraticum* is red, ſince the Powders are infuſed in a Wine which is naturally red, and not made ſo by Art. Whoever intend to make extemporaneous Claret, uſe Spirit of Wine, impregnated with aromatic Powders, or a certain aromatic Eſſence, called the *Tinctura pro Clareto*, of which they pour a few Drops into a Glaſs of Wine. Without giving the particular Recipes, which, in the ſeveral Diſpenſatories, come under the Title of *Vinum Hippocraticum*, we ſhall only here take a View of thoſe which come under the Denomination of Claret. In *Bauderon's Pharmacopœia* the *Clareta Simplex* is prepared in the following Manner:

> Take of the beſt Aqua Vitæ, ſix Ounces; of Roſe-water, four Ounces; of white Sugar, three Ounces; and of the beſt Cinnamon, one Ounce: Infuſe all together for twenty-four Hours, in a narrow-mouth'd and cloſe-ſtopt Glaſs Veſſel; then ſtrain the Liquor twice or thrice thro' *Hippocrates's Sleeve*. An Ounce of this may be exhibited in the Morning before Breakfaſt, in order to corroborate the Stomach, and diſpel Flatulences.

The *Clareta Compoſita*, in the ſame *Pharmacopœia*, is prepared of aromatic and aſtringent Ingredients, which, when macerated in White-wine, are diſtil'd, with an Addition of Baum, white Sugar, and Cinnamon.

There is alſo another Species of Claret, which, in the *Pharmacopœia Pariſienſis*, is call'd the *Claretum è ſex Seminibus Carminativis*, and which is prepared in the following Manner:

> Take of the Seeds of Aniſe, Fennel, Dill, Coriander, Caraway, and Carrots, each one Ounce: Bruiſe and macerate them in a cloſe-ſtopt Glaſs Veſſel, with a ſufficient Quantity of Aqua Vitæ, which muſt riſe four Fingers Breadth above them, expoſing the Whole to the Heat of the Sun for three Weeks. Then ſtrain the Liquor thro' brown Paper, and add to it a Syrup prepared of one Pound of white Sugar, and a ſufficient Quantity of Chamomile, or Graſs-water. Mix all together. A Spoonful or two of this may be exhibited for a Doſe, and it is eſteem'd an excellent Medicine in Flatulences proceeding from a cold Cauſe.

CLARIFICATIO. Clarification.

The Apothecaries are ſaid to clarify any thick and turbid Liquors, the expreſſed Juice of Vegetables, for Inſtance, Decoctions, or Syrups, when they render them more tranſparent, pure, and free from Faeces. This they do, either by placing the Liquor in a cool Place, allowing it Time to ſettle, that its

more

more earthy and feculent Parts may gradually and ſpontaneouſly ſubſide to the Bottom. This, in the Language of the Chymiſts, is call'd *Clarificatio per Subſidentiam*, or *Clarificatio per Reſidentiam*. Liquors are alſo clarify'd by *Filtration*, or *Colation*, by which Method the groſſer Parts remain in the Filtre, whilſt thoſe which are finer, and more ſubtile, paſs thro' it. Fermentation is another Method of clarifying Liquors, becauſe, by the fermentative Motion, their groſſer Parts are carry'd to the Bottom. Liquors are alſo ſometimes clarify'd by being boil'd a little with Whites of Eggs reduced to a Froth; for this Subſtance, in conſequence of its glutinous Nature, adheres to the groſſer Parts of the Fluid, which are afterwards to be ſeparated by Filtration. Another Method of clarifying Liquors is by an Affuſion of other Liquors, according to the Nature of the Liquor to be clarify'd; by which means it being render'd turbid, and a Precipitation produc'd, may become more clear and pure.

CLARUM. Any thing made of Cryſtal. *Rulandus.*

CLASIS, CLASMA, κλάσις, κλάσμα, from κλάω, to break, a Fracture. See FRACTURA.

The Verb κλᾶδς is often uſed by *Galen*, *Lib.* 2. *de Mot.* to expreſs ſuch a Diſtortion or Reflexion of the Muſcles as almoſt deprives them of Action; and ſo in *Hippocrates*, *Lib. de Fract.* it is ſpoken of the Reflexion or Recurvation of a Member.

CLAVATA. The Name of a Suture. See SUTURA.

CLAVATIO. The ſame as GOMPHOSIS. See ARTICULATIO.

CLAUDIACON, κλαυδιακόν. The Name of a Collyrium, in *Ægineta*, *Lib.* 7. *Cap.* 16.

CLAUDICATIO. Lameneſs.

CLAVELLATI CINERES. Pot-aſh. See the Article ALCALI.

CLAVICULÆ, in Anatomy, the Clavicles.

The two Clavicles are ſituated tranſverſly, and a little obliquely, oppoſite to each other, at the ſuperior and anterior Part of the Thorax, between the Scapula and Sternum.

Each Clavicle reſembles an *Italic S*, being a long Bone, irregularly cylindrical, bent forwards near the Sternum, and backwards near the Scapula, as if it were made up of two Arches join'd endwiſe in oppoſite Directions, that which lies on the fore Part of the Breaſt being the largeſt. The Clavicles are more ſtrait in Women than in Men.

The Clavicle is divided into a Body, or middle Part, and two Extremities, one anterior, inferior, and internal, which I term the Pectoral or Sternal Extremity; the other poſterior, ſuperior, and external, which I name the Humeral or Scapular Extremity.

The pectoral Extremity is the thickeſt, and of a triangular Figure, eſpecially near the End, where it is a little enlarged, and ſhews a cartilaginous Surface with three Angles, of which the loweſt is the moſt prominent, and turned a little toward the Cavity of the Thorax. Near theſe Angles there are ſeveral muſcular and ligamentary Impreſſions, one of which, near the inferior Angle, is ſometimes raiſed like a Tubercle.

The humeral Extremity is flat and broad, and two Sides may be conſidered in it, one ſuperior, the other inferior; likewiſe two Edges, one anterior, the other poſterior; and a ſmall articular Surface.

The upper Side has ſeveral Inequalities, and in the lower there is a kind of oblong, rough, oblique Tuberoſity. The poſterior Edge is convex, thick, and uneven, being that of the ſmall Arch of the Clavicle. The anterior Edge is concave, narrow, and ſmooth every-where, except near the great Arch, where it has a rough Impreſſion. The articular Surface terminates this Extremity, being cartilaginous, turned obliquely forward, and of an oval Figure, like that of the Acromium, with which it is articulated.

The Body, or middle Portion, which, together with the pectoral Extremity, forms the great Curvature of the Clavicle, is not ſo thick as the Extremities. It is a little flatted both on the upper and lower Sides, and therefore two Edges may likewiſe be diſtinguiſhed in it. The upper Side is pretty even, the lower ſomething rougher, and a little depreſſed by a ſuperficial Chanel. The Edges are rounded, the anterior being convex, the poſterior concave.

The inner Subſtance of the Extremities is cellulous: The reſt is more ſolid, conſiſting of very thick Sides, with a narrow Cavity, more or leſs fill'd with reticular bony Filaments.

The particular Situation of this Bone is eaſily underſtood from what has been ſaid. The moſt uneven Side of the Body, and rough Side of the humeral Extremity, are always to be turned downward.

The Clavicle is articulated with the Acromium and Sternum by Arthrodia. The Articulation with the Scapula, by means of the Acromium, is as real and diſtinct as the Articulation with the Sternum, which laſt appears ſomething extraordinary in the Skeleton, where the ſmall Notch in the Sternum is noways proportion'd to the broad Extremity of the Clavicle.

The Clavicles ſerve for Butteresſes to the Scapulæ, and bound their Motions forward and upward; by their ligamentary Connections they likewiſe hinder the Scapulæ from running too far back, which might happen in thoſe who drag Burdens behind them. They alſo give Inſertion to many Muſcles.

The ſternal Extremity of the Clavicle is cruſted over with a Cartilage, which is a little convex, and covers its whole triangular Surface; beſides which it has another moveable Cartilage, common to this and the Sternum. See STERNUM.

The ſmall cartilaginous Surface of the humeral Extremity of the Clavicle, anſwering to that of the Acromium, is much thicker in freſh than in dry Bones, and appears, like that of the Acromium, to be a little convex.

Between theſe two Cartilages of the Clavicle and Acromium there is, in ſome Subjects, a thin interarticular Cartilage, very ſmooth on both Sides.

The Articulation of the Acromium, with the Extremity of the Clavicle, is ſtrengthened quite round by ſeveral ſmall ſtrong Ligaments, which go from one Bone to the other. Theſe Ligaments lie very near each other, and are withal ſo tightly braced over the Joint, as to hide it altogether; and they appear more like a cartilaginous Covering than a ligamentary Texture. The internal Surface of theſe Ligaments is lined with the Capſula of the Joint.

When the ſmall interarticular Cartilage is found, its whole Circumference is connected to theſe Ligaments.

The Articulation of the Clavicle with the Sternum is ſuſtain'd by ſeveral Ligaments, fixed by one End, round the pectoral Extremity of the Clavicle, near the Edge of the triangular Surface, and from thence paſſing over the interarticular Cartilage, are inſerted by the other End in the Sternum.

There is a long, narrow, ſtrong Ligament, which goes from one Clavicle to the other, behind the Furca of the Sternum, being fixed to the internal Angle of the contiguous Extremities of the Bones. It may be called the interclavicular Ligament. *Winſlow's Anatomy.*

FRACTURES *of the* CLAVICLES.

The Clavicle*, on account of its tranſverſe Poſition, but principally from its remarkable Tenderneſs, is very often broken, ſometimes in the Middle, ſometimes near the Humerus, or the Sternum; but where-ever it happens, the Part next the Humerus, from the Weight of the Arm ſuſtained by the Clavicle, deſcends below that next the Sternum. And therefore, tho' that Part of it next the Breaſt remains immoveable, yet, from the Tendency of the other downwards, they will of Neceſſity run one over the other.

It is not difficult to know when this Part is fractured; for, firſt, the Patient cannot lift his Arm; ſecondly, the Arm hangs inclin'd towards the Breaſt, whereas before it was extended upwards or backwards; and, thirdly, the Bones of the Clavicles having ſcarce any Muſcles to cover them, a Fracture of thoſe Parts muſt undoubtedly be evident to the Touch, Sight, and Hearing, eſpecially upon the leaſt Motion of the Humerus or Arm on the ſame Side.

The Reduction of the Bones of the broken Clavicle is not hard to effect, eſpecially in a tranſverſe Fracture; for the Humerus, with the connected Fragment of the Clavicle, is uſually reduced with little Trouble, and replaced in its Seat by Help of the Fingers only. But it is far more difficult to keep the reduc'd Bones in their Place, eſpecially in an oblique Fracture; for which there are two Reaſons: Firſt, the circular Bandage, with which the long Bones of the Arms, and other Extremities, are held very firm, are quite improper here on account of the Diſpoſition of the Place or Part affected; and, next, the Weight of the depending Arm very eaſily pulls aſunder what has been replac'd; ſo that it is no Wonder, if the Bones of the Clavicles are very often found either uneven, or elſe very infirm, after Agglutination, tho' we do not want Examples where theſe ſorts of Fractures have been very firmly and happily reſtored, eſpecially when the Patients take due care to keep themſelves at Reſt.

A Fracture of the Clavicle is reduced after the following Manner: The Patient is placed on a low Seat; and an Aſſiſtant, thruſting his Knee againſt the Patient's Back, between the Shoulders or Scapulæ, lays hold with his Hands on the Shoulders, and gently pulls them backwards, by which means the Clavicles are duly extended. While this is doing, the Surgeon, who ſtands before, endeavours with his Hands to reduce the Bones into their proper Place; which done, he orders an Aſſiſtant to hold them firmly in that Poſition. He then applies, firſt, above and below the Clavicles, a narrow, but thick Bolſter, (*Tab.* 30. *Fig.* 13.) folded on one Side, in order to fill up the Cavities. Upon this, ſecondly, he lays two narrower Bolſters, in the Form of the Letter X (*Tab.* 29. *Fig.* 11.),

* A Fracture of the Clavicle is by *Celſus*, *Lib.* 8. *Cap.* 8. called *Jugulum Fractum*; but all our modern Anatomiſts and Surgeons call this Bone the *Clavicle*, and underſtand the Word *Jugulum* in a different Senſe.

Over

Over all theſe, thirdly, he applies a Piece of thick Paper, (*Tab.* 29. *Fig.* 12.) accommodated to the Neck and Shoulders, and firſt dipt in Spirit of Wine or Oxycrate. Then, in the fourth Place, he is to put under the Shoulder a thick Fillet, rolled up, or a Ball, leſt the Arm ſhould again ſlip from its Poſition. And, in the fifth and laſt Place, he is carefully to apply a Bandage to the affected Part, and ſuſpend the Arm in a Sling fixed about the Neck. Plaiſters, whatever ſome may pretend, are, in this Caſe, generally found ſuperfluous and uſeleſs.

But becauſe the Arm is ſometimes with great Difficulty kept back, and with ſtill greater Difficulty conglutinated, unleſs retained in that Situation, Surgeons have, for the Retention of the Humerus, invented an Inſtrument, reſembling the Letter T. This Inſtrument may be made either of Wood or Iron, and is repreſented by *Fig.* 13. in *Tab.* 29. Its Sides are almoſt three Inches broad, and covered either with Leather or Cloth. The Method of applying it is this: Its tranſverſe Parts, A. A. are applied to both Shoulders or Scapulæ, whilſt its longer Part, B. reaches along the Back. In the Hole, C. are fixed two ſtrong Cords, by means of which, after paſſing the Arms thro' the Rings, A. A. this crucial Inſtrument is ſecurely fixed to the Body. The more cloſely or looſely the longer Part, B. is ty'd about the Body, the more or leſs the *Humeri* are drawn backwards. But, in Caſes where a very tight Tying of this Inſtrument does not anſwer the Intention, a longitudinal Bolſter is to be applied to the Back, under the Part B. before the Cords are ty'd; for, by this means, the Clavicle is ſomewhat more powerfully raiſed, and kept back. The Rings, A. A. may be made either of Iron or Leather, and in ſuch a manner, that they may be either leſſen'd or enlarged at Pleaſure.

When Splinters of the Bone are quite diſengaged from the reſt, and not only prick the adjacent Fleſh, but alſo hinder the Reduction of the Clavicles, it ſeems neceſſary, in this Caſe, to make an Inciſion in the Skin, and extract them cautiouſly, before we proceed to the Reduction, and due Treatment, of the other Parts of the Bone. But if Splinters, ſtill adhering to the Bones, ſhould either prick the adjacent Muſcles, or prevent the Reduction, they are either to be cut off with the Sciſſars repreſented by *Fig.* 1. in *Tab.* 29. or, when they are found ſufficiently blunt, they are to be forced into their original Seat, by which means they are often conglutinated with the reſt of the Bone: But, in making this Inciſion, great Care and Caution are neceſſary, leſt the large Subclavian Veins and Arteries ſhould happen to be wounded, and fatal Hæmorrhages by that means brought on.

Luxations *of the* Clavicle.

Tho' the Clavicles, on account of their ſtrong Ligaments, are rarely luxated, yet they are ſometimes forced from the Sternum or Acromium, with which they cohere, by external Violence, ſuch as Falls, for Inſtance, Blows, or the lifting of too heavy Burdens. As to the Cure of this Diſorder, the ſooner the Reduction is attempted, the more eaſily the Bones reſume their natural Situation. On the contrary, the longer the Reduction is delay'd, the Cure is proportionably the more difficult; for old Luxations of the Clavicles are almoſt always found incurable.

The Clavicles may be ſeparated from the Sternum in two Manners, and ſlip either to the internal Part towards the Aſpera Arteria, or to the external Part. In the former of theſe Caſes a certain Sinus is generally obſerved about the Part affected; and the Aſpera Arteria, the adjacent Carotids, the contiguous Nerve, and the Oeſophagus itſelf, are ſtrongly ſqueezed and compreſſed; whereas, when the Clavicle is ſeparated and diſjoined externally from the Sternum, a preternatural Tumor is obſerved about the Joining of theſe Bones.

As for reducing luxated Clavicles, and retaining them in their natural Situation, the ſame Rules are to be obſerved as in reducing Fractures of the Clavicles; only the Surgeon muſt carefully obſerve to apply a proper Bandage, as ſoon as the Bones are reduced; for, if an accurate Application of Bandages is neceſſary in any Caſe, it is particularly ſo when the Clavicle is diſlocated, eſpecially when the Relief of the Patient has been delay'd for a conſiderable time; for, as the Clavicles are ſupported by ſcarce any Muſcles, ſo alſo, in Caſes of this Nature, their Ligaments are generally ſo hurt and weaken'd, that they are inſufficient for ſupporting the Arm; for which Reaſon the Application of a proper Bandage is in this Caſe abſolutely neceſſary.

Luxations of the Clavicles, happening at that Extremity towards the Acromium, are generally diſcovered with ſo much Difficulty, that, according to *Hippocrates*, in his Book *De Articulis*, and the ſkilful *Paré*, many of the moſt knowing Phyſicians and Surgeons have miſtaken them for Diſlocations of the Humerus, and accordingly ſubjected the Patients to unneceſſary Pain to no manner of Purpoſe; for when a Caſe of this Nature happens, as *Paré* obſerves, the ſuperior Part of the Clavicle protuberates upwards, and a Hollow or Cavity is obſerved in the Part where the Clavicle is ſeparated from the Acromium. The Patient is alſo afflicted with violent Pains, and the Arms are abſolutely incapable of moving or raiſing themſelves up. Unleſs, therefore, the Clavicles are ſpeedily reduced, it is not to be wonder'd at, if the Arms of Patients, to whom this Misfortune has happen'd, ſhould become ſo weak and paralytic, that they are not afterwards able to lift them to their Mouth or Head. *Galen*, in his Commentaries on the firſt Book of *Hippocrates de Articulis*, informs us, "That in Wreſtling he had his Clavicle "ſo far ſeparated from the Acromium, that there was a Sinus, "almoſt three Inches broad, between the two Bones;" but, by a tight Bandage, worn for forty Days, they were again united.

From what has been ſaid it naturally follows, that the principal and moſt diſtinguiſhing Characteriſtics of a luxated Clavicle are, firſt, a Hollow or Cavity between the Clavicle and Acromium, which, as it is wanting in ſound Perſons, denotes a Separation of theſe Bones, which, in their natural State, adhere to each other. Secondly, the Patient cannot lift his Arm to his Head. In treating Diſorders of this kind the Surgeon is to be particularly careful to extend and reduce the luxated Parts to their natural Situation, with as much Expedition and Dexterity as he poſſibly can; and, ſince the principal Means of Cure are placed in Bandages, theſe are to be apply'd with the greateſt Care; for Patients, to whom the Bandages have, in this Caſe, been unſkilfully or negligently applied, are ſeldom ſo perfectly cured, but a Stifneſs or Weakneſs of the Arm remains. *Heiſter. Chirurg.*

Bandages *for the* Clavicle.

I. There are two Kinds of Bandage for a fractured Clavicle, with reſpect to the Diſtance of the Fracture from the Sternum, or the Os Humeri. In the former Caſe the moſt convenient Bandage is the *Capitalis Reflexa*, or Capeline, conſiſting of a Roller, ſix Ells long, and three or four Fingers wide, which is rolled up with two Heads. The Fracture then being duly reduced, the Cavities above and below the Clavicle are fill'd up with narrow Bolſters, upon which are laid thick Splints of Paſteboard, about an Inch in Breadth, along the Clavicle; and upon theſe again, at the Place of the Fracture, a third Splint, which is very ſmall, and well covered, and ſecured with a ſquare Bolſter, and a Splint of very thick Paſteboard, (*Tab.* 29. *Fig.* 12.) to prevent the Clavicle from ſlipping out on either Side. This rightly done, the Surgeon orders an Aſſiſtant to hold his Hand upon the Dreſſings, while he applies the Middle of the Roller to the Top of the diſeaſed Shoulder (*Tab.* 58. *Fig.* 23. *a.*); whence he brings down the anterior Head of the Roller obliquely over the Breaſt, *b.* carrying the poſterior Head obliquely over the Back between the Scapulæ to the Axilla, *c.* of the ſound Side, under which he paſſes it; and, bringing it up acroſs the Breaſt to *d.* paſſes it over the anterior Roller; and, drawing it under the Axilla, *e.* of the diſeaſed Side, brings it out towards the Back. Then the anterior Head of the Roller, which was taken in by the circular Motion of the other Head, is reflected over the diſeaſed Shoulder, *f.* and taken in by the other Head of the Roller, on the Back, in its circular Progreſs towards the Breaſt; and, being reflected, is carry'd back over the Shoulder, to croſs the other again upon the Breaſt. Thus is the Roller ſpent in carrying one of its Heads round the Body, while the other Head is taken in by it, and reflected from the Breaſt to the Back, and from thence back again, at every mutual Concurrence of the Heads; by which means the Splints, with the ſubjacent Bolſters, are firmly covered, and ſecured upon the fractured Bone. In the laſt Place, the Ends of the Roller are to be well faſten'd with Pins, and the Arm to be ſuſpended in a Sling, as in *Tab.* 59. *Fig.* 17. C. C. But, ſince it is very difficult to retain the Parts of the broken Clavicle, after they are reduced, in their proper Situation, by this Bandage alone, becauſe they are very ſubject to be drawn out of their Place by the Weight of the Arm, the Surgeon would do well to aſſiſt it with another Bandage, termed, from its Figure, the *Stellate*, which draws back, and in a manner ſuſpends, the Shoulders. The Application of it is as follows:

II. Take a ſingle-headed Roller, four or five Ells long, and three Fingers broad, and apply the End of it upon a Bolſter under the Axilla of the ſound Side (*Tab.* 58. *Fig.* 24. *a.*); whence carry it obliquely up the Back, between the Scapulæ, to the Top of the Shoulder next the Fracture, *b.* from whence deſcending before, let it paſs under the diſeaſed Axilla, *c.* and from thence return obliquely up the Back, and over the Shoulder, to the ſound Axilla, where it began; ſo that the Courſes, by their Interſections, *e.* form the Figure of an X in the Middle of the Back. Theſe Circumvolutions are to be continued till the Roller is ſpent, when the Bandage fixed on the Shoulders will repreſent the Figure (∞), that is, of two Rings cohering by vertical Angles, or oppoſite and continued Vertices; and the Shoulder next the Fracture will be firmly retained in a backward Poſture, by which a Diſlocation of the reduced Fragments will be prevented. If this Bandage, after ſome time, becomes ſlacker, as it uſually happens, it may be neceſſary, after every two or three Days, to renew the ſame, the Arm being held back by an able Aſſiſtant, while it is off; and, at other times,

the Patient muſt conſtantly keep his Arm in a Sling. See *Tab.* 59. *Fig.* 17. And this is the Bandage call'd *Stellate*, from ſome ſort of Reſemblance it ſhews on the Back to a Star. It may alſo begin by applying the End of the Roller upon the Shoulder, *d.* and thence carrying it by *e.* and *c.* to *b.* and from thence by *e.* and *a.* to *d.* again, and ſo on till it is ſpent. Obſerve, laſtly, that, inſtead of this Bandage, the Machine recommended above, and repreſented *Tab.* 29. *Fig.* 13. may commodiouſly be uſed.

III. When the Clavicle is fractured near the Humerus, the moſt proper and commodious Species of Bandage is that call'd the Spica Simplex, ſo denominated from its ſuppoſed Reſemblance to an Ear of Grain. It has alſo gone under the Name of Geranium, among Phyſicians, ever ſince the Days of *Hippocrates*. It conſiſts of a common or ſimple Roller, about five Ells long, and three Fingers Breadth, rolled up into one Head. The Fragments being rightly reduced, and ſecured as before directed, the End of the Roller is apply'd under the ſound Axilla upon a Bolſter, and an Aſſiſtant ordered to hold it on the Place. See *Tab.* 58. *Fig.* 25. *a.* From hence the Roller is carry'd obliquely over the Breaſt, *b.* and the broken Clavicle, *c.* and thence deſcends behind over the Top of the Scapula; and, paſſing under the diſeaſed Axilla, is reflected from its interior Part, *d.* to its poſterior Part, in ſuch a manner as to paſs over the former Courſe, *c.* making with it the Figure X over the Axilla; whence it deſcends obliquely over the Back to the oppoſite Axilla, *a.* where it began. When the Roller is thrice paſſed about the Patient in this manner, the remaining Part of it may be diſpoſed of either in the ſame Courſe, or in a circular Direction about the Humerus, adjacent to the affected Clavicle; and the End of it is to be ſecured either by a Pin, or by Suture. The Patient's Arm is alſo to be ſuſpended in a Sling, leſt by its Weight the reduced Bone ſhould be removed from its Situation. The Surgeon, in the mean time, is to be particularly careful, that the Bandage be exactly applied to the fractured Part, and retain it in its due Poſition. The Patient muſt alſo keep his Arm as eaſy as poſſible; for which Purpoſe ſome faſten it to the Breaſt by a circular or ſpiral Bandage.

Others apply the Bandage for this Purpoſe, by beginning under the Axilla of the ſound Side, as in *Fig.* 25. from whence they proceed obliquely acroſs the Back, and over the Shoulder adjacent to the fractured Clavicle, *c.* which is alſo to be comprehended by the Bandage: And, having paſſed the Roller under the Axilla, *d.* it is carry'd over the Shoulder; and, interſecting the former on the Fracture, *c.* it goes obliquely acroſs the Breaſt, *b.* to the oppoſite Axilla, *a.* where it began; and thus they continue till the Roller is ſpent, faſtening its End about the Shoulder, or where-ever it terminates. The Uſefulneſs of theſe Bandages, in a Fracture or Luxation of the Clavicle, is ſelf-evident. It may be alſo apply'd with Advantage in a Luxation of the Humerus, and even in a Fracture of its Neck.

IV. The ſimple Spica with two Heads is a Bandage made with the ſame or a ſomewhat longer Roller, rolled up into two Heads in manner following: The Middle of the Roller is fix'd under the ſound Axilla, (*Fig.* 25. *a.*) whence its anterior Head paſſes over the Præcordia, *b.* and its poſterior over the Back obliquely to the affected Shoulder, *c.* where the Heads changing, deſcend one behind, the other before, to the Axilla, *d.* under which they again change, and are carry'd up to the Top of the Shoulder, *e.* where they croſs again, and deſcend obliquely, one over the Breaſt, the other over the Back, to the Right or ſound Axilla, *a.* under which again croſſing, they continue the ſame Courſe as before, till the Roller is run out, and the Clavicle well cover'd and ſecur'd. After this the Arm is to be ſuſpended in a Sling, and the ſame Cautions are to be obſerv'd as before.

Another Method of applying the double-head *Spica* is as follows: The Middle of the Roller is fixed under the Axilla of the Side affected, *Fig.* 25. *d.* whence both Heads are carry'd up to the Top of the Shoulder, *e.* where croſſing, they muſt be drawn tight, and carry'd obliquely over the Breaſt, *b.* and the Back to the Right Axilla, *a.* where again croſſing and changing, they return by the ſame Way to the Top of the Shoulder, *e. e.* and there croſſing, and being duly ſtrain'd, they are carried down under the Left Axilla, *d.* where the Bandage firſt began. And thus the ſame Courſe is to be repeated, till the Roller is run out, and the affected Part well cover'd and ſecur'd. Some modern Surgeons, following *Galen* and the Antients, apply a Part of this Bandage, in manner of a Sling or Bridle, about the lower Arm, in order to ſuſtain it; but as, by that means, the fractured Clavicle will be drawn downwards by its ſuſtaining the Weight of the Arm, I ſhould rather approve of a particular Sling, ſuch as is repreſented *Fig.* 17. *Tab.* 59. to be faſten'd about the Neck and the ſound Shoulder.

Monſ. *Gouey*, a *French* Surgeon, in his *Chirurgie veritable*, has directed a Bandage different from the preceding, but equally neat and commodious, and perhaps preferable, as being applicable to all kinds of Fractures of the Clavicle. In this Method, which is a particular Application of the *Capitalis reflexa*, or *Capeline*, he uſes a Roller, ſix Ells long, and two Fingers broad, which is alſo rolled up with two Heads, in the following Manner: The Middle of the Roller is fixed under the Axilla neareſt to the affected Clavicle, (ſee again *Fig.* 25. *Let.* d.) and the two Heads of the Roller carry'd up to the Top of the Shoulder; where they croſs in the Figure of an X, and are thence brought down, one over the Breaſt, *b.* the other over the Back, to the oppoſite Axilla, *a.* under which they croſs; and thence being carry'd in a Circle round the Body, meet again under the Axilla next to the Fracture; and there croſſing, are again carry'd up to the Top of the Shoulder, and their Courſe continued as before, till they return to where they began; the poſterior Head is then brought forward over the Shoulder down to the Breaſt, and is there taken in by the anterior Head, (ſee *Fig.* 23. *a. b.*) which is carry'd circularly round the Body; and having thus paſſed under it, is reflected back in the Direction *f.* and again taken in by the circular Turn on the Back; whence it is again reflected, and taken in by the Circle at the Breaſt; and thus the Heads continue their Courſe, till the Roller is ſpent. That we may know the Reaſon, which moved the Author of this Bandage to prefer it before all others, it will be proper to ſhew its Uſefulneſs, according to the Deſcription of the Inventor. While, then, the Beginning of this Bandage ſtreightly compreſſes the Axilla next the diſeaſed Part, the broken Clavicle, which was drawn downwards from its Situation by the Weight of the Arm, is reduced or forced into its Place. And again, as ſoon as the Roller, after croſſing upon the Shoulder, is carry'd obliquely over the Breaſt, and the diſeaſed Place, to the oppoſite Axilla, the Fragment of the Clavicle near the Sternum, which is always raiſed upwards by the Fracture, is moſt commodiouſly depreſſed into its proper Situation, ſo that, after two Circles only of the Roller, the broken Parts of the Clavicle will be reduced to their natural Poſition. M. *Gouey* alſo judges this Bandage better than the common Sort for a Fracture of the Scapula.

The Bandage for a Luxation of the Clavicle is almoſt the ſame as for a Fracture of it, the Injury in theſe Caſes being much of the ſame Nature. As ſoon, therefore, as the Luxation is reduced, a Bolſter, dipt in Spirit of Wine, is to be apply'd to the Part; and, if the Diſlocation be of that End next the Sternum, the *Capeline* Bandage, before deſcribed, is to be uſed; but if the Clavicle be depreſſed inwards, it will be alſo neceſſary to apply the Stellate Bandage, deſcribed above, in order to keep the Shoulders extended backwards, that the Clavicle may be thrown outwards; but, when this Bone is diſlocated outwards, this Bandage muſt be omitted; and we muſt endeavour to depreſs it by Application of thick Bolſters. If the Head of the Clavicle, next the Scapula, be diſlocated, your Bandage muſt be the ſimple *Spica* with two Heads, or that of M. *Gouey*, before deſcribed. Laſtly, when both the Clavicles are violently diſplaced, the double *Spica* is to be applied in the Manner directed for Luxations of the HUMERUS and SCAPULÆ, which ſee. In all Fractures and Luxations of this kind, the Patient is to carry his Arm in a Sling, faſtened at his Neck, till the Parts are ſufficiently confirmed, to prevent a new Diſlocation. *Heiſter*, *Chirurg.*

CLAVICULÆ, in Botany, is the ſame as *Capreoli*. See CAPREOLUS.

CLAVIS *Siliginis*. *Lonicerus* calls by this Name the Grains of Rye, which are ſpoiled in the Growth, and look black. I think the Country People call it *Smutted Rye*. It is eſteemed an excellent Remedy againſt an immoderate Flux of the *Lochia*.

CLAVIS, in Anatomy, is the ſame as CLAVICULA.

CLAVIS, in Chymiſtry, is any Menſtruum, particularly of Minerals, which unlocks them, as it were, and penetrates to their inner Subſtance: Or it imports Directions for performing any ſecret Proceſs.

CLAUSTRUM *Gutturis*, κλεῖθρον, κλεῖθρον. The Paſſage to the Throat, which lies immediately under the Root of the Tongue and Tonſils. *Clauſtrum Virginitatis* is the *Hymen*.

CLAUSURA. An Imperforation of any Canal or Cavity in the Body. Thus *Clauſura Uteri* is a preternatural Imperforation of the Uterus. And *Clauſura Tubarum Fallopianarum* is a morbid Imperforation of the Fallopian Tubes, mention'd by *Ruyſch* as one Cauſe of Infecundity.

CLAVUS is a Chirurgical Inſtrument of Gold, with a large Head, mentioned by *Amatus Luſitanus*, which was deſigned to be introduced into an exulcerated Palate, for the better Articulation of the Voice. *Foreſtus* takes notice of one made of Silver.

CLAVUS *Hyſtericus* is an hyſterical Symptom, which *Sydenham* thus deſcribes:

Hyſterics ſometimes attack the external Part of the Head, between the Pericranium and the Cranium, and occaſion violent Pain, which continues fix'd in one Place, not exceeding the Breadth of the Thumb; and it is likewiſe accompany'd with enormous Vomitings. I call this Species the *Clavus hyſtericus*, which principally affects ſuch as have the Green Sickneſs. *Sydenham.* See HYSTERICA.

Such a Pain in the Head alſo ſometimes ariſes from a Venereal Caries or Exoſtoſis of ſome Bone of the Cranium. *Aſtruc.*

CLAVUS *Oculorum*, according to *Celſus*, *Lib.* 7. *Cap.* 7. is a callous Tubercle on the White of the Eye, taking its Denomination from its Figure. This, he ſays, it is proper to perforate with a Needle to the Bottom of its Root, to cut it out, and then to dreſs it with lenient Medicines.

CLAVUS alſo ſometimes imports indurated Tubercles of the Uterus.

CLAVUS is alſo a Corn on the Foot. Very frequently hard and preternatural Tubercles, not unlike ſmooth Warts, are form'd on the Extremities of the Feet, and more eſpecially between the Toes. Theſe Tubercles, whatever their Form and Shape may be, are called by the common Name of *Clavi*. The principal and moſt general Cauſe of this Misfortune is by Phyſicians juſtly aſcribed to narrow Shoes; for Perſons who, from a Principle of Vanity, or ſome other miſtaken Notion, wear Shoes of this kind, are not only more ſubject to this Diſorder, but alſo more tormented by it, than others, eſpecially when the Weather is exceſſively hot, or when they are reduced to a Neceſſity of ſtanding long, or walking far. Tho' various Medicines, both of the emollient and corroſive Kind, are by different Phyſicians preſcribed for the Extirpation of Corns, yet the moſt natural and effectual Way of going to work is, firſt, to ſoften them, when they are preternaturally hard. This Intention is moſt effectually anſwered by frequently waſhing the Feet, after which the upper and harder Part of the Corns are to be carefully and cautiouſly pared off with a Knife; for, by this means the Pain, with which this Diſorder is accompany'd, is often removed: But if it ſhould not yield to theſe Meaſures, a Plaiſter of green Wax, or of Gum-ammoniac, or the Mucilage-plaiſter, or one prepared of ſliced Soap, or a Leaf of the *Sedum Majus*, or greater Houſleek, is to be apply'd to the Corn, after paring it, and to be renew'd daily. After theſe Meaſures have been diligently perſiſted in for ſome time, the Corn may, without much Trouble, be either ſcratched off with the Nail of the Finger, cut out with a Knife, or, which is ſtill more proper, cautiouſly abraded. But the Knife is in this Caſe cautiouſly to be uſed, leſt, by an unſkilful Application of it to the Toes, the Tendon of the Extenſor Muſcle ſhould be wounded; by which means the Patient is often ſubjected to violent Pains, Inflammations, Gangrenes, Convulſions, and ſometimes to an immediate Danger of loſing his Life; Inſtances of which are related by *Hildanus*, and other practical Authors.

Tho', for the moſt part, Corns are not entirely extirpated by Paring, but generally appear afreſh after ſome time, yet they are ſometimes removed by this Method, or, at leaſt, the Pain and Trouble accompanying them are alleviated, eſpecially if, at the ſame time, ſufficiently large Shoes are wore; if the Method already directed is uſed every Month, or repeated as often as the Pain and other Symptoms require; and if ſome of the before-mention'd Remedies, after abrading the external Parts of the Corn, are apply'd freſh every twenty-four Hours. By this Method the Corns are either gradually entirely mortify'd, or, at leaſt, grow more ſlowly, and become tolerable. *Heiſter's Surgery.*

After Corns are cut away, *Harris* ſays the Diachylon ſimplex will prevent them from growing again; as will alſo the *Galbanum Coctum Mynſichti*; and alſo, that ſoft Wax which is uſed by the Lawyers. But, above all, a clean Linen Rag bound about the Toe, after the Callus is cut away. This was much recommended by King *Charles* the Second. *Harris's Diſſert.*

The Pulp of Lemon laid to a Corn, and bound on all Night, ſoftens it by the Morning, ſo that it may eaſily be taken off.

CLEIDION, κλειδίον. An Epithet of a Paſtil deſcrib'd by *Galen*, in his Treatiſe *de Compoſitione Medicam. S. L.* 9. *C.* 5. and by *Paulus Ægineta*, *L.* 7. *C.* 12. It is alſo the Name of an Epithem, deſcrib'd by *Aetius*. They are all of the reſtringent Kind, and take their Names from κλείω, to ſhut. It ſometimes imports the ſame as *Clavicula*.

CLEIS, κλείς. The ſame as CLAVIS.

CLEISAGRA, from κλεὶς, the Clavicle, and ἄγρα, a Prey. The Gout in the Articulation of the Clavicles to the Sternum. *Paré.*

CLEITHRON, κλεῖθρον. The ſame as CLAUSTRUM, which ſee.

CLEMA, κλῆμα. A Twig or Tendril of a Plant. The ſame as *Sarmentum*. Hence,

CLEMATIS. A Name for the *Vinca Pervinca*. See PERVINCA. Hence, alſo,

CLEMATITIS. A ſort of Plant ſo call'd, becauſe it climbs up Trees with Claſpers or Tendrils, like thoſe of Vines.

The Characters are,

The Root is fibrous and perennial; the Leaves conjugated; the Flower is naked, tetrapetalous, ſeldom pentapetalous, diſpoſed ſomewhat in the Form of a Croſs; the Stamina are many in Number, villous, ſet thick together, and ariſing from the loweſt Part of the Margin of the Baſe of the Ovary; the Apex of the Peduncle becomes a Placenta, round which grow many Ova, furniſh'd with a long plumous Tube.

Boerhaave mentions twelve Species of this Plant.

1. Clematitis; ſive Flammula ſurrecta; alba. *J. B.* 2. 127. *Raii Hiſt.* 1. 621. *Tourn. Inſt.* 294. *Elem. Bot.* 244. *Boerh. Ind. A.* 46. *Hiſt. Oxon.* 3. 316. *Chab.* 117. *Flammula Jovis*, Offic. *Flammula Jovis ſurrecta*, Ger. 741. Emac. 888. Park. Theat. 382. Parad. 393. *Flammula recta*, C. B. Pin. 300. *Flammula ſurrecta*, Rupp. Flor. Jen. 54. Buxb. 114. UPRIGHT LADIES BOWER.

This flowers in Summer. The Herb, with the Flower, is uſed, and are of a cauſtic burning Quality. *Dale.*

The Flowers, Seed, Bark, and Root, have a cauſtic Virtue. This Species, rub'd with the Fingers, and then held to the Noſtrils, ſtrikes them, like Lightning, in an Inſtant with a moſt ſtrong and vehement Smell. It yields a Water as hot as Spirit of Wine; and is found to be very effectual, as *Matthiolus* tells us, in the coldeſt Diſeaſes; but, doubtleſs, it cannot be taken inwardly with Safety, unleſs it be well mix'd and temper'd with other Waters, to prevent its injuring the Viſcera.

Some commend the Oil for the Pain of the Sciatica, Joints, and Ilia, for Difficulty of Urine, and the Stone in the Kidneys, to be rub'd on the Parts hot, or infuſed in Clyſters. This Oil is thus prepared:

> They take the Leaves of the Flammula, cut very ſmall, and put them into a Glaſs Veſſel in Oil of Roſes; then expoſe the Veſſel, well ſtopt, to the Sun during the Summer. It is taken alſo in Food, for theſe Diſtempers, to the Weight of three Drams. *Raii Hiſt. Plant.*

2. Clematitis; ſylveſtris; latifolia. *C. B. P.* 300. See ATRAGENE.

3. Clematitis; peregrina; foliis pyri inciſis. *C. B. P.* 300. SPANISH CLIMBER, OR TRAVELLERS JOY, WITH CUT LEAVES.

4. Clematitis; Canadenſis; trifolia; dentata; flore albo. *H. R. Par.* 1. *H. ſubm.* THREE-LEAVED CANADA CLIMBER, WITH A WHITE FLOWER.

5. Clematitis; cœrulea; erecta. *C. B. P.* 300. *M. H.* 3. 616. UPRIGHT BLUE CLIMBER.

6. Clematitis; cœrulea; vel purpurea; repens. *C. B. Pin.* 300. *Tourn. Inſt.* 294. *Elem. Bot.* 244. *Boerh. Ind. A.* 46. *Clematis altera*, Offic. *Clematis peregrina cœrulea ſive rubra*, Ger. 740. Emac. 887. Raii Hiſt. 1. 622. *Clematis peregrina flore rubro vel purpureo ſimplex*, Park. Theat. 381. Parad. 392. *Clematis ſive Flammula flore purpureo & cœruleo ſcandens.* J. B. 2. 128. Chab. 117. *Clematis flore ſimplici*, Rupp. Flor. Jen. 54. VIRGINS BOWER. *Dale.*

This is thought to be the *Clematitis* of *Dioſcorides*, who informs us, that the Seeds, taken in Water or Hydromel, purge Phlegm and Bile; and that the Leaves, applied to the Part affected, cure a Leproſy. The Moderns have added nothing to theſe Virtues.

7. Clematitis; repens; rubra. RED CREEPING CLIMBER.

8. Clematitis; Orientalis; folio Apii; flore ex viridi flaveſcente, poſterius reflexo. *T. Cor.* 20. *t. ſubm.* EASTERN CLIMBER, WITH A SMALLAGE-LEAF, AND A REFLEX'D FLOWER OF A GREENISH YELLOW.

9. Clematitis; cœrulea; flore pleno. *C. B. P.* 301. BLUE CLIMBER, WITH A DOUBLE FLOWER, OR DOUBLE VIRGINS BOWER, *vulgò.*

10. Clematitis; Alpina; geranifolia. *C. B. P.* 300. *Prodr.* 135. *M. H.* 3. 616.

11. Clematitis; Hiſpanica; ſurrecta; altera; & humilior; flore albicante. *H. R. Par. H. ſubm.* LOW SPANISH CLIMBER, WITH A WHITISH FLOWER.

12. Clematitis; erecta; folio fraxini.

The ſecond Sort is found wild in moſt Parts of *England*, and grows upon the Sides of Banks, under Hedges, and extends its trailing Branches over the Trees and Shrubs, which are near it. *Miller's Dictionary.*

CLEONIS *Collyrium*. The Name of a Collyrium, deſcrib'd by *Celſus*, *Lib.* 6. *C.* 6. The *Cleonis Glutin*, mention'd by *Oribaſius*, *L.* 4. and recommended for reſtraining Fluxions, conſiſts of Terra Samia, Myrrh, and Grains of Frankincenſe, each equal Parts, mix'd with the White of an Egg: It is to be ſpread on Linen Cloth, and applied to the Temples and Forehead.

CLEOPHANTUS. An antient Phyſician quoted by *Celſus*, who, according to this Author, *L.* 3. *C.* 14. cured Tertians by pouring a great Quantity of Water on the Patient's Head, before the Acceſſion of the Paroxyſm, and then exhibiting Wine. This Method *Celſus* diſapproves.

CLEPSYDRA, κλεψύδρα, from κλέπτω, to conceal, and ὕδωρ, Water. Properly an Inſtrument to meaſure Time, by the Dropping of Water from one Veſſel, perforated with a ſmall Hole,

Hole, into another Veſſel. But it is uſed to expreſs a chymical Veſſel perforated in the ſame manner. *Clepſydra* is alſo an Inſtrument mention'd by *Paracelſus*, contrived to convey Suffumigations to the Uterus.

CLIBANUS, κλίβανος. A little portable Oven, made either of Earth, Iron, Copper, or any other convenient Materials. See ARTOS.

CLIDION. The ſame as CLEIDION, which ſee.

CLIMA, κλίμα. A Climate. It is very neceſſary for a Phyſician to be well acquainted with the Differences of Climates, not only becauſe they produce Variety of Diſtempers, but alſo becauſe they require the Methods of Cure, and Regimen, to be varied. *Paracelſus.*

CLIMACION, κλιμάκιον, or κλιμάκιον. The Round of a Ladder. It is mention'd in the Treatiſe of *Hippocrates de Arte*, when ſpeaking of reducing a luxated Shoulder.

CLIMACTER, κλιμακτήρ. It imports the ſame as *Climacion*, that is, the Scale or Round of a Ladder. Hence,

CLIMACTERICUS *Annus*. A climacteric Year. According to ſome, every ſeventh Year is a Climacteric; but others only allow thoſe Years produced by multiplying ſeven by the odd Numbers 3. 5. 7. and 9. to be climacterical. Theſe Years, they ſay, bring with them ſome remarkable Change, with reſpect to Health, Life, or Fortune. The grand Climacteric is the ſixty-third Year; ſome, making two, add to this the Eighty-firſt. The other remarkable Climacterics are the Seventh, Twenty-firſt, Forty-ninth, and Fifty-ſixth. I believe the Credit of climacteric Years can only be ſupported by the Doctrine of Numbers introduced by *Pythagoras*; tho' many great Men, both among the Antients and Moderns, appear to have had great Faith in it.

CLIMIA. A Name for the *Cadmia Fornacum*. *Climia Ereps Rulandus* explains by *Cadmia Auripigmenti*.

CLINERES, κλινῆρες. The ſame as CLINOPETES, which ſee.

CLINICUS, κλινικὸς, from κλίνη, a Bed. Clinical. A Clinical Phyſician is one who viſits Patients confin'd to their Beds. Hence Clinical Medicine, of which *Hippocrates* is ſaid to have been the Author. *Clinicus* is alſo applied to a Patient who keeps his Bed.

CLINOIDES. The four ſmall Proceſſes of the Os Sphenoides, which form the *Sella Turcica*. *Caſtellus.*

CLINOPETES, κλινοπετὴς. A Perſon who, on account of great Weakneſs, or any Diſtemper, is obliged to lie in Bed, or on the Bed.

CLINOPODIUM. A Plant thus call'd.

The Characters are,

The Calyx is long, tubulous, quinquefid, rough, and cloſely compacted; the Galea is roundiſh, erect, bifid, and furniſh'd with a tripartite Beard; the Flowers grow in thick Whorls, cloſely ſet round the Stalk.

Boerhaave takes notice of nine Species of this Plant.

1. Clinopodium; Origano ſimile; elatius; majore folio. *C. B. Pin.* 224. *Cat. Monſp.* 71. *Hiſt. Oxon.* 3. 374. *Tourn. Inſt.* 195. *Elem. Bot.* 163. *Boerh. Ind. A.* 158. *Rupp. Flor. Jen.* 188. *Buxb.* 75. *Clinopodium*, Offic. Dill. Cat. Giſſ. 132. Rivin. Irr. Mon. *Clinopodium majus*, Raii Hiſt. 1. 558. Phyt. Brit. 28. *Clinopodium vulgare*, Merc. Bot. 1. 29. *Cinopodium quorundam Origani facie*, J. B. 3. 250. *Clinopodium, Acinos*, Ger. 548. Emac. 675. Mer. Pin. *Acinos ſive Clinopodium majus*, Park. Theat. 22. GREAT WILD BASIL. *Dale.*

It grows frequently in Hedges. The Herb, and the Decoction thereof, is taken as an Antidote againſt the Bites of venomous Animals, and as a Remedy for Spaſms, Contuſions, and Stranguries. It facilitates Delivery, provokes the Menſes, and cures penſile Warts, call'd *Acrochordones*, if taken for ſome Days. It ſtops a Diarrhœa, boil'd to the Conſumption of one Third, and then drank. It muſt be boil'd in Wine, in caſe of a Fever; but Water, if there is no Fever. *Dioſcorides.*

2. Clinopodium; Alpinum; roſeum; ſaturejæ foliis. *Bocc. Muſ. p.* 119. *a.* ALPINE FIELD BASIL, WITH LEAVES LIKE SAVORY.

3. Clinopodium; anguſtifolium; minus; Pulegii odore; Romanum. *Bocc. Muſ. p. T.* 45. *a.*

4. Clinopodium; Orientale; hirſutum; foliis inferioribus Ocymum, ſuperioribus Hyſſopum, referentibus. *T. Cor.* 12. *a.*

5. Clinopodium; Canadenſe; fiſtuloſum; foliis dilutè virentibus & hirſutis. *Flor.* 2. 69. *Origanum, fiſtuloſum, Canadenſe.* Cornut. 14. *Leonurus, Canadenſis, Origani folio.* T. 187.

6. Clinopodium; Canadenſe; fiſtuloſum; foliis ſaturatius virentibus & hirſutis. *Flor.* 2. 69.

7. Clinopodium; Orientale; humile; verticillis florum ſingularibus & craſſioribus. *T. Cor.* 12. *a.*

8. Clinopodium fiſtuloſum; pumilum; Indiæ Occidentalis; ſummo caule floridum. *Pluk.* *a.*

9. Clinopodium; ſpicatum; & verticillatum; Luſitanicum. *T.* 195. *Bigula, odorata, Luſitanica.* Corn. 46. *a.*

Boerhaave's Index alter Plantarum, Vol. 1.

CLISSUS, in *Paracelſus*, is a certain Virtue, or occult Viciſſitude of Things, which goes and returns to the Place from whence it departed. Thus the Flowers of all Vegetables grow flaccid in the Evening, but revive, and are expanded, in the Morning, by virtue of this *Cliſſus.*

It imports alſo the ſame as CLYSSUS, which ſee.

CLISTUS. The ſame as CLYSSUS, which ſee.

CLITORIS, or as it is call'd *Oeſtrum Veneris*, is a Part of the external Pudenda, ſituated at the Angle which the Nymphæ form with each other. See the Explication of the Letters *a. b b. c c. d.* and *e.* in *Tab.* 16. *Fig.* 7. and 9. in *Fig.* 3. of *Tab.* 17. and the Figures.

The Clitoris appears, at firſt Sight, like a ſmall imperforated Glans. Its upper and lateral Sides are cover'd by a kind of Prepuce, form'd by a particular Fold of a Portion of the inner Side of the Nymphæ, which appears to be glandular, and to diſcharge a certain Moiſture, and its Inſide is granulated.

By Diſſection, we diſcover in the Clitoris a Trunk, and two Branches, as in the Penis, made up of a ſpongy Subſtance, and of very elaſtic Coats, but without any Urethra. This Subſtance may be inflated either by Air, or by anatomical Injections into the Artery. The Trunk is divided into two lateral Parts by a middle Septum, from the Bifurcation to the Glans, where it is inſenſibly loſt.

The Bifurcation of the Trunk is on the Edge of the cartilaginous Arch of the Oſſa Pubis; and the Branches, which reſemble the Roots of the Corpora Cavernoſa, are inſerted in the inferior Branches of theſe Bones, and in thoſe of the Oſſa Iſchium, where they terminate by degrees; but there is ſometimes a membranous Tube on each Side, which reaches to the Tuberoſity of the Iſchium.

The Trunk of the Clitoris is ſuſtain'd by a ſuſpenſary Ligament, fix'd in the Symphyſis of the Oſſa Pubis, and containing this Trunk in its Duplicature, nearly as in the other Sex.

Four Muſcles, or Faſciculi of fleſhy Fibres, are inſerted in the Trunk of the Clitoris, two on each Side. One of them runs down on the fore Side of the neighbouring Corpus Cavernoſum, and is inſerted by a tendinous or aponeurotic Portion, partly in the Extremity of the Corpus Cavernoſum, and partly in the Tuberoſity of the Iſchium. Theſe two Muſcles are call'd *Erectores*; but the Name of *Iſchio-cavernoſi* would be more proper.

The other Muſcle on each Side lies under the former, and runs down on the Side of the Urethra, and great Orifice of the Uterus, all the Way to the Anus; increaſing gradually in Breadth in its Paſſage, and terminating partly like that which is call'd *Accelerator* in Males.

Theſe two Muſcles ſurround, very cloſely, the lateral Parts of the Urethra, and of the great Orifice. They expand very much as they deſcend, and are ſpread in the lower and lateral Parts of the great Orifice; for which Reaſon ſeveral Anatomiſts have look'd upon them as muſcular Sphincters. All theſe four Muſcles, and eſpecially the two latter, are oftentimes almoſt cover'd with Fat.

The Blood-veſſels of the Clitoris come principally from the Hypogaſtricæ, and the Nerves from the ſecond and third Pairs of the Nervi Sacri, by means of which they communicate with the inferior Meſenteric Plexus, and with the great Sympathetics. *Winſlow's Anatomy.*

The Clitoris has, like the Penis, an Erection; and is eſteem'd to be the principal Seat of Venereal Pleaſure.

Extirpation of Part of the CLITORIS, *when too large.*

The Clitoris is in ſome ſo ſhamefully large as to protuberate without the Lips of the Pudenda; in which Caſe it is by the Attrition of the Clothes erected, and powerfully ſtimulated to Venery: For this Reaſon the *Egyptians* judged it expedient to amputate a ſufficient Part of it, before it aſſumed ſuch an enormous Size, at that time eſpecially when Virgins were to enter into a married State. Their Method of performing this Operation is as follows: The Virgin, who was to have her *Clitoris* curtail'd, is placed in a proper Seat, with a robuſt Fellow behind her, who, with his Arms, is to ſecure her Legs, and the Whole of her Body, in a Poſture proper for the Operation. Then the Surgeon, ſtanding before the Patient, is, with a pretty large Forceps in his Left Hand, to lay hold of the Clitoris, and extend it in a due Degree: After this he is, with his Right Hand, to cut it off near the Teeth of the Forceps. But, as in the Exſection of the Columella, he is to take particular Care not to extirpate it totally, but only to cut off its ſuperfluous Parts; for, in conſequence of its being furniſh'd with ſeveral Pellicles, it is capable of being much extended; by which means the Surgeon is in Danger of performing the Amputation beyond the proper Part, and this Error is follow'd by an involuntary Diſcharge

charge of the Urine. When the Operation is thus perform'd, the Wound is to be cleanſed with a Sponge, ſqueez'd out of aſtringent Wine, or cold Water. Then the Part affected is to be ſprinkled with Powder of Frankincenſe. After this a Linen Cloth, dipt in Oxycrate, is to be applied to it; and a Sponge, ſqueez'd out of the ſame Liquor, ſecured over all. But, after the ſeventh Day, the Parts are to be ſprinkled with Cadmia, finely triturated, either by itſelf, or with Roſe-leaves, or with a dry Preparation of the *Phrygian* Stone, recommended for Fiſſures of the Pudenda, or with the Aſhes of Date-ſtone. *Aetii Tetrabib.* 4. *Serm.* 4. *C.* 103.

An Operation, ſomewhat analogous to this, is perform'd for that Species of Diſorder by the *Greeks* call'd κλειτωσις, by the *Latins Cauda*, and which, by *Aetius*, in the above cited Part, is deſcrib'd in the following manner: In ſome Women, ſays he, a certain fleſhy Subſtance ariſes from the Mouth of the Uterus, and fills the Vagina. Sometimes it alſo protuberates without the Lips of the Pudenda, like the Tail of ſome Animal, from which Circumſtance it has received the Denomination of *Cauda*. The Patient is, in this Caſe, to be ſituated in the manner directed for the Amputation of the Clitoris; and the protuberating Caruncle is to be extended with a Forceps, and totally extirpated. After the Operation is perform'd, the Dreſſings, and other Meaſures of Cure, are the ſame as in the Amputation of the *Clitoris*. *Ib.* 104.

In ſome Women the *Clitoris* is ſo preternaturally large, as to prove a monſtrous Deformity. In this Caſe, the Patients are to be laid in a ſupine Poſture, and the ſuperfluous Parts of the *Clitoris*, being laid hold of with a proper Forceps, are to be extirpated with the Knife; but, in performing this Operation, the Surgeon muſt take particular Care not to make the Inciſion too deep, leſt an involuntary Diſcharge of Urine ſhould be brought on. The Cauda (κλειτωσις) alſo, which is a fleſhy Body ariſing from the Mouth of the Uterus, and filling the Vagina, ſometimes protuberates without the Lips of the Pudenda; in which Caſe its ſuperfluous Parts are, as well as the *Clitoris*, to be extirpated with the Knife. *Paulus Ægineta de Re Medica*, *Lib.* 6.

The Clitoris, in ſome Women, is of ſo extraordinary a Size, as to reſemble a Penis, and procure its Subjects the Name of Hermaphrodites *, though it be deſtitute of any Perforation or Duct for the Emiſſion of Semen or Urine. As the enormous Bigneſs of this Part is a great Incumbrance to the conjugal Office, the Aſſiſtance of the Surgeon is ſometimes deſired to remedy the Nuiſance. Among the *Arabians* and *Egyptians*, this Diſorder is ſaid to have been very frequent; ſo that it was a common Practice with them to cut off from the new-born Girls whatever was indecently prominent in that Part. Such an Operation indeed is rarely performed among *Europeans*, becauſe the Subjects of this Diſorder are ſtudious to conceal it, either through Modeſty, or Dread of the Knife. But, that the Surgeon may not be at a Loſs how to proceed, if ſuch a Caſe ſhould happen, we ſhall direct him to two Methods of Cure: The firſt is to make a Ligature upon the Part, and ſo take off all Superfluities or Excreſcences, in the ſame manner as is done in Tubercles, or removing a mortified Part of the Penis. The ſecond Method is to cut off the indecent Part with an Inciſion-knife, and, after it has bled ſufficiently, to ſtop the Hæmorrhage with Styptics and a Bandage, performing the Cure as in other Wounds. *Bellonius* relates, that the *Indians* reduce the exceſſive Length of this Part in their Women, by applying an actual Cautery. *Heiſter. Chirurg. p.* 1025.

CLITORIDIS *Flos Ternatenſibus*. Breynei. A beautiful Flower, which grows in the Iſland *Ternate*, which the Inhabitants boil and eat. But I do not find any particular Virtues aſcribed to it.

CLOACA ſignifies ſtrictly a Jakes, a Word which relates to Phyſic, only as it is a neceſſary Appendage to moſt medicinal Springs, which are, in any Degree, reſorted to; for this Reaſon, I preſume, Dr. *Short*, in his Account of *Harrigate* Spaw, has been particularly careful to ſpecify at what Point of the Compaſs the Neceſſary-houſe at that Place lies from the Spring. A neceſſary Inſtruction for Strangers, who are ſtudious of Cleanlineſs!

But CLOACA, in comparative Anatomy, imports the Canal in Birds, through which the Egg deſcends from the Ovary in its Exit. In this it is remarkable, that the Part, which is next the Ovary, is jagged, like the *Morſus Diaboli*, and fluctuates in the Abdomen, without any Attachment to the Ovary; hence Anatomiſts have been ſomewhat puzzled to comprehend, by what Means the Egg falls into the Ovary.

CLONODES, κλωνώδες. An Epithet for a ſort of Pulſe, which is vehement, large, and at the ſame time unequal in one and the ſame Stroke. *Caſtellus*.

CLONOS, κλόνος. Any tumultuary and inordinate Motion. It is applied to any epileptic, convulſive Motions.

CLUNES. The Buttocks. They conſiſt of the Skin, Fat, and Muſcles, principally thoſe called *Glutæi*.

CLUPEA. A Fiſh called the Shad. See ALOSA.

CLUTIA.

The Characters are,

It hath a roſe-ſhaped Flower, conſiſting of five Leaves. In the Centre ariſes the Pointal, ſurrounded by five Stamina. This Pointal afterwards becomes the Fruit, which is divided into three Parts, and hath three Cells, in which are contained Seeds. *Miller's Dictionary*, *Vol.* 2.

Boerhaave mentions but one Species of this Plant, which is,

Clutia. *Frutex Æthiopicus, Portulacæ folio, flore ex albido vireſcente*, H. A. 1. 177. SHRUBBY ETHIOPIAN CLUTIA, WITH A PURSLANE-LEAF, AND A GREENISH-WHITE FLOWER. *Boerhaave's Index alter Plantarum*, *Vol.* 2. *p.* 260.

CLYDON, κλύδων. It imports a Fluctuation and Flatulency in the Stomach and Inteſtines.

CLYMA. The Fæces of Silver and Gold. *Caſtellus*.

CLYMENOS DIOSCORIDIS is the *Scorpioides folio Bupleuri*. Boerhaave's Ind. alt. Vol. 2. p. 52.

CLYMENUM, Chickling-vetch.

The Characters are,

The Stalks, Flowers, and Fruit, of this Plant are like thoſe of Lathyrus; but the Leaves conſiſt of many Conjugations placed on a Mid-rib, which ends in a Tendril. *Miller's Dictionary*, *Vol.* 1.

Boerhaave mentions four Species of this Plant, which are,

1. Clymenum; Hiſpanicum; flore vario; ſiliquâ planâ. *T.* 396. *Lathyrus, vicioides, vexillo rubro, petalis roſtrum ambientibus cæruleis.* M. H. 2. 50. *Lathyrus, viſcoſi nomine miſſus.* Ind. 159. a. SPANISH CHICKLING-VETCH, WITH A VARIABLE FLOWER, AND A PLAIN POD.

2. Clymenum; Hiſpanicum; flore vario; ſiliquâ articulatâ. *T.* 396. *Lathyrus vicioides, floris vexillo phœniceo, foliis labialibus, ſubalbeſcentibus; ſiliquis Ochri.* M. H. 2. 55. a. SPANISH CHICKLING-VETCH, WITH A VARIABLE FLOWER, AND A JOINTED POD.

3. Clymenum; Bithynicum; ſiliquâ ſingulari; flore minore. *Juſſieu. a.* BITHYNIAN CHICKLING-VETCH, WITH A SINGLE POD, AND SMALLER FLOWER.

4. Clymenum; vexillo obſoletè cæruleo, petalis pallidis. *An Clymenum, Pariſienſe, flore cæruleo?* T. 396. a. COMMON CHICKLING-VETCH, WITH A BLUE FLOWER. *Boerhaave's Index alter Plantarum.*

To theſe *Miller* adds a fifth, which is the

Clymenum; Græcum, flore maximo ſingulari. *T. Cor.* GREEK CHICKLING-VETCH, WITH A LARGE SINGLE FLOWER.

CLYPEALIS CARTILAGO. The Thyroide Cartilage.

CLYPEUS. This ſeems to have been a ſort of Regiſter belonging to the Baths of the Antients, ſo called from its Form. The Uſe of it was, to increaſe or diminiſh the Heat, by excluding or letting in the Air.

CLYSMA, κλύσμα. A Clyſter. See ENEMA.

CLYSSIFORMIS *Deſtillatio*. A Deſtillation of ſuch Subſtances as are ſubject to take Fire, and fulminate, by a tubulated Retort. *Caſtellus* from *Wedelius*.

CLYSSUS.

Among the antient Chymiſts, the Word *Clyſſus* imported an Extract prepared of various Subſtances mixed together; and, among the Moderns, it alſo ſignifies a Mixture, containing the various Products of one Subſtance united with each other; when, for Inſtance, the diſtilled Water, the Spirit, the Oil, the Salt, and the Tincture, of Wormwood, are ſo blended, that the Mixture is poſſeſſed of all the united Virtues of the Simple, from which theſe various Preparations are obtained. According to this latter Senſe of the Word, *Rulandus*, in his Lexicon, informs us, that "a Clyſſus may contain "the whole Eſſence of any Subſtance, when, by a Separation "of its impure and feculent Parts, its eſſential and conſtituent "Principles are reduced to one Compound; or, a *Clyſſus* is "an Extract of all the ſubtle Parts of any Plant combined and "united in one common Subſtance." According to *Poterius*, a *Clyſſus* is a certain Union of all thoſe Virtues of any Plant, which exiſt in the three conſtituent Principles of Bodies, Sulphur, Salt, and Mercury, extracted from the ſeveral Parts of the Plant; when, for Inſtance, theſe three Principles are extracted from the Roots treated apart, and then from the Leaves, the Fruit, and the Seeds, and afterwards mixed, and ſufficiently united and incorporated, with each other. The Oil is firſt to be mixed with the Salt over a moderate Fire, agitating them gently together. The diſtil'd Water, which is that ſpirituous Liquor reſembling Aqua Vitæ, is to be added laſt of all, and is properly the Mercury, the Elixir, and the Quinteſſence of the Plant. If there is a conſiderable Quantity of Liquor, theſe Subſtances are moſt eaſily incorporated with each other by repeated Cohobations, with the Mouths of the Veſſels cloſe-ſtopt for this Purpoſe. They may alſo be converted into a Powder, or into any other Form, at Pleaſure; but they are moſt commo-

* Inſtances of this kind are frequent enough in *Tulpius, De Graaf, Platerus, Rhodius, Plazzonus, Panarolus, Paullinus*, and others.

diouſly kept under the Form of an Extract. They are very commodious for Uſe, and may be exhibited either diſſolved in ſome proper Liquor, or in the Form of a Bolus, or that of Pills. The Doſe is only to be known and aſcertained by Experience. In exhibiting Medicines of this Nature, the Phyſician muſt chuſe a proper Time, and carefully advert to the Nature of the Diſeaſe, the Condition of the Patient, and the State of the Weather. *Borrichius*, in his Treatiſe *De Uſu Plantarum indigenarum in Medicina*, ſpeaks in the following Manner, with reſpect to the Uſe and Method of preparing a Clyſſus of this Kind:

> Take, ſays he, any recent Plant, or Flower, or Seed, or Root, or all thoſe together; bruiſe them in a Mortar of Stone, or Iron. Immediately after, without waiting for a Fermentation, from a low, but pretty large, Glaſs Cucurbit, extract, and keep for Uſe all the Liquor, which can be obtained in this Manner, in Balneo Mariæ; whilſt at the ſame time the Veſſel is deep-lodged among wet Sand.

We muſt obſerve, that, from moſt Plants thus treated, a far more efficacious Water is obtained, than the common diſtil'd Waters; and this Water is alſo accompanied with an Oil. After this, take out the remaining Parts of the Plant, which are now perfectly dry, and conſequently Proof againſt Putrefaction, and preſerve them in a wooden Veſſel for future Uſe; and, when Neceſſity requires, add to this dry Magma a Quantity of any proper Water, ſufficient to riſe an Inch or two above it, and leave the Whole upon warm Aſhes for a Quarter of an Hour. Then expreſs the Liquor ſtrongly, and, if it is neceſſary, ſtrain it, that it may, at laſt, become clear by ſubſiding. What is thus clarified, is to be exhibited with a little Sugar, if the Patient nauſeates it without, or with thrice the Quantity of Broth. The feculent Parts, ſtill remaining in the Veſſel, are to be put into an earthen Veſſel, cloſe ſtopped, and calcined to black Aſhes; and, making a Lixivium of it, add the yellowiſh Salt, collected from that Lixivium, to the Liquor formerly expreſſed, or, if you pleaſe, keep it by itſelf. By this Method, none of the Virtues of the Plant are loſt, and no uſeleſs or corrupted Parts of it are kept in the Shops. Nor is an empyreumatic Taſte to be dreaded, if the Sand, in which the Cucurbit is placed, be continually moiſtened with Water. By this means, the Farrago of Syrups, and the numerous Veſſels filled with the inſignificant Waters of the Shops, may be juſtly laid aſide, and thoſe far more ſalutary Waters kept in fewer and ſmaller Glaſſes. If to this Mixture or Clyſſus, when become pure, we add good Vinegar, there will be produced inſtantaneouſly the Vinegar of Scordium, of Roſes, of Clove-julyflowers, of Raſpberries, or of Sage, according to the Diverſity of the Clyſſus. If compound Mixtures are deſired, they may be tranſformed into Clyſſuſes with as much Eaſe as ſimple Plants, by extracting, by Diſtillation, the Principles from ſeveral Subſtances at one and the ſame time, and afterwards adding them, at Pleaſure, to their inſpiſſated Juices, and clarifying them. It will amount almoſt to the ſame thing, whether this dry Magma, remaining in the Cucurbit after Diſtillation, be kept for Uſe in wooden Boxes, or whether, by boiling in Fountain-water, and afterwards by a gentle Evaporation, it be reduced to what we call a Rob, and kept in Phials for extemporaneous Purpoſes. Nor is it of any Importance to object, that, in this Caſe, the Spirits of the Plants, which are the moſt efficacious Means of Health, are excluded; for the more pure theſe Spirits are, the more ſeverely they ſometimes ſhock the Patient, and injure the natural Spirits of the Body; whereas this Mixture, when prudently exhibited, acts moderately, and produces no preternatural Heat in the Body. The drier Plants and Seeds, upon Diſtillation, yield ſo ſmall a Quantity of Liquor, that it is ſcarce ſufficient to moiſten the Magma; for which Reaſon the Magma, remaining in the Cucurbit after Diſtillation, is to be boiled in Spring-water, and inſpiſſated to a Rob. After this, it is cuſtomary to add its native Liquor to it, that it may, by that means, be reduced to a proper Conſiſtence. But the Reaſon, why, for this Purpoſe, we rather chuſe yellowiſh Salts, than ſuch as are white, is, becauſe the white Salts, being long expoſed to the Violence of the Fire, have, by that means, loſt almoſt all the eſſential Virtues of the Plants; whereas the yellowiſh Salts, in conſequence of their being gently expoſed to the Fire in a cloſe Veſſel, retain more native Oil and Sulphur. 'Tis certain, that only a ſmall Quantity of Salt can be obtain'd in this manner; but what is obtain'd, is found to partake the more of the Virtue of the Plant. If we afterwards have a mind to ſubject this black inſpiſſated Subſtance to an open Fire, more Salt will indeed be obtained, but leſs of the native Virtues of the Plant. From what has been ſaid, 'tis obvious, that, by this Method, we may obtain all the united active Virtues of one or more Plants, which may be expected in the Salt, and the eſſential Oil, whilſt, at the ſame time, the elemental Water ſerves for a Vehicle accommodated to medicinal Uſes. *Boerhaave*, in the thirty-ninth Proceſs of the ſecond Volume of his Chymiſtry, proceeds in a Manner ſomewhat different from this:

> "Take, ſays he, a Dram of any Elæoſaccharum, and two "Drams of the medicated Salt of *Tacherius*; grind them "together ſtrongly, and for a conſiderable Time, in a "Glaſs Mortar, till they become thoroughly mixed; then "add ſix Ounces of the cohobated diſtil'd Water of the "ſame Plants, of which the Elæoſaccharum was made; "and, if a Syrup of the ſame Plants be kept in the Shops, "a little of it may alſo be added: And thus, in a ſmall "Compaſs, the Virtue of a Plant may be collected for "medicinal Uſes, and act according to its own Nature in "the Body. The Salt of *Tachenius* will not here communicate any Virtue foreign to the Deſign, tho' prepared "from a different Plant; for the particular Virtue of "Plants does not reſide in the Salts, but in their eſſential "Oil. If a Perſon therefore, for making this medicated "Liquor from Cinnamon, ſhould add the Salt obtained "from burnt Cinnamon, he would loſe more of that Aromatic, or more Labour, than the Virtue of the Liquor "would compenſate."

By this means, the proper Virtues of every Plant are obtained concentrated, becauſe the elementary Water is the ſame in all Plants, and therefore does not alter their Effects. The Salt alſo loſes its own Nature in the Burning, ſcarce retaining more than the common one, and therefore proves of the ſame Virtues, whatever the Plants be that afforded it; ſo that all the peculiar Virtue of a Plant remains in its preſiding Spirit, which is here ſeparated, and lodged in the Oil: Whence this Preparation is extremely commodious, efficacious, and uſeful, if the medicinal Virtue of the Plant be previouſly well known; for thus we obtain a certain, tho' a leſs perfect Kind, of ſaponaceous, oily, eſſential Salt of the Plant, than that in which the learned *Helmont* places almoſt all the Efficacy of Medicines. The Doſe of theſe medicated Liquors is principally determined from the Power of the Oil employed in them. The moſt proper Time for exhibiting them is, when the Stomach is empty; but, when they are uſed, a due Regard ought to be had to the Nature of the Diſeaſe: For Inſtance, a ſimple Tertian Fever, very cold in the Beginning, is to be cured after this manner: Two Hours before the Fit is expected, let the Patient uſe a warm Bath to his Legs and Feet, till he grows moderately hot; and afterwards take, every Quarter of an Hour, half an Ounce of the medicated Liquor, prepared from the Water, Oil, and Salt, of Wormwood; then let his Feet and Legs be well rub'd, and the whole Regimen be continued till two Hours after the Fit was expected. And by this means all theſe Caſes are generally cured with Eaſe and Safety, even in old Age, except there be any Scirrhoſity or Suppuration attending them. So again, in the Caſe of Worms, a like Preparation from Tanſey, being given for ſome time upon an empty Stomach, proves excellent; but here, inſtead of the Salt of Tanſey, which is ſcarce, the Salt of Wormwood may be uſed. *Rieger. Boerhaave.*

CLYSSUS ANTIMONII.

This Liquor is alſo called *Aqua Stimmi Sulphurea*, *Clyſſus Mineralis*, and, in the *Diſpenſatorium Brandenburgenſe*, *Spiritus Antimonii*. It is a Liquor obtained from a Mixture of Antimony, Nitre, and Sulphur, thrown by Spoonfuls into a Retort, whoſe Bottom is red-hot, ariſing from their Detonation, and collected in Vapours, applying at the ſame time to the Retort a large Receiver, with ſome Water in it. The Proportion of the Ingredients is varied, according to the Humours or Intentions of different Operators. It is a ſomewhat acid Spirit, partaking much of the Nature of Spirit of Vitriol, which proceeds from the kindling of the Sulphur, both of the common Sort which was added, and alſo what was contained in the Antimony, and united with the inflammable Portion of the Nitre in the Detonation.

It ſerves for various Purpoſes; for it is preſcribed to feveriſh Patients, in order to procure a grateful Acidity to their Potions. It is alſo exhibited to ſuch as labour under a Loſs of Appetite. *Schulzius*, in his *Prælectiones*, informs us, that, by the Uſe of it continued for ſome time, he has known the Worms of Children expel'd, and obſtinate Epilepſies cur'd; and perhaps the Perſon who firſt added Spirit of Vitriol to the compound Water of Swallows, obſerved Inſtances of the like Nature. It may be exhibited from three to fifteen or twenty Drops, according as it contains a ſmaller or larger Quantity of Phlegm, provided it be diluted in a large Quantity of ſome aqueous Vehicle. According to *Ettmuller*, in *Tom.* 2. it is obſervable, that, in making this Clyſſus, during the Detonation, there are raiſed at the ſame time, in the Neck of the Retort, reddiſh Flowers of Antimony, of a ſomewhat acid Taſte, and which, when edulcorated with common warm Water, may be kept as a Succedaneum to the Flowers of Antimony. Some prepare the Clyſſus of Antimony with Tartar, inſtead of Sulphur; but, in this Caſe, a more ungrateful Liquor is yielded, or an urinous, volatile, diaphoretic, diuretic, carminative, and antiacid Spirit, which is called *Aqua Tartarea*.

CLYSTER, or CLYSTERIUM; κλυσὴρ, or κλυσήριον, from κλύζω, to waſh. A Clyſter. See ENEMA.

CNA-

CNACOS, CNECOS, κνακὸς, κνηκός. A ſort of Colour between White and a yelloviſh or fallow Colour. *Caſtellus.*

CNAPHOS, κνάφος, is the *Carduus Fullonum*, Teaſel; and in *Hippocrates*, *Lib.* 2. περὶ γυναικείων, ſignifies a Fuller's Shop.

CNEMATA, κνήματα, in *Galen's Exegeſis*, are expounded by ξύσματα, Parings, Scrapings, Shavings. Some Copies read κνήσματα, and ſo it is written *Lib.* περὶ φύσ. παιδίου.

CNEMIU, κνημίου, is expounded by *Galen*, τοῦ τῆς κνήμης, "of ſomething pertaining to the Tibia." Perhaps it ſhould be κνημαίου, as the beſt Copies have it. *Foeſius.*

CNEMODACTYLÆUS, κνημοδακτυλαῖος. The Name for the *Muſculus Extenſor digitorum Pedis communis. Caſtellus.*

CNEORON, κνέωρον. The *Cneoron* is the ſame as the *Gneſtron*, or *Thymelæa*, as appears from *Dioſcorides*, *Lib.* 4. *Cap.* 173. and *Pliny*, *Lib.* 13. *Cap.* 21. who ſay, "That "ſome call this Shrub *Thymelæa*, others *Chamelæa*, others "*Pyros Achne*, others *Cneſtron*, others *Cneoron.*" A Decoction of the *Cneſtron* is directed by *Hippocrates*, *Lib.* 1. περὶ γυναικ. as a Purge for Phlegm and Bile; and *Lib.* 2. of the ſame Treatiſe he orders a Decoction of two Potions (δύο πόσιας) of *Cneſtrum* to be boiled in a Cotyle of Water, and mix'd with Oleum Narciſſinum, or Anthinum, to be injected into the Uterus, under an Inflammation of that Part.

CNEORON *Album* is the Convolvulus; major; rectus; Creticus; *argenteus.* See CONVOLVULUS.

The CNEORON *nigrum* is the Thymelæa; Alpina; linifolia; humilior; flore purpureo; odoratiſſima. See THYMELÆA.

The laſt is ſuppoſed to be the *Cneoron* or *Cneſtron* of *Hippocrates* and *Galen.*

CNESERA, κνησέρα. A Sieve or Searſe.

CNESIS, κνῆσις. The ſame as κνῆσμός, *Cneſmos*, (from κνάω, to ſcratch) which, as *Galen* ſays, *Com. in Aph.* 4. *Sect.* 5. *Lib.* 6. ſignifies that eager Hurry and Motion with which Animals employ their Nails in ſcratching any Part about them which itches; and this is no more than what is natural to them all, as he obſerves. But it is more generally meant of the Itching itſelf, in which Senſe one has defin'd it a dolorific Pleaſure excited in the Skin, by a thin, ſalt, acrimonious Ichor, without an Exulceration.

CNESMA, κνῆσμα. See CNEMATA.

CNESMOS. See CNESIS.

CNESTRON, κνῆστρον. The ſame as the CNEORUM. It alſo imports a Raſp; which is likewiſe call'd *Cneſter.* And, particularly, it ſignifies a Raſp for ſcraping Cheeſe.

CNICELÆON, κνικέλαιον, from κνίκος, Cnicus, and ἔλαιον, Oil, is Oil made of the Seeds of Cnicus, the Manner of which is directed by *Dioſcorides*, *Lib.* 1. *Cap.* 44. The Virtues of it, as the ſame Author tells us, are the ſame with thoſe of the Oil of the *Grana Cnidia*, being cathartic, only weaker.

CNICION, κνίκιον. A Name in *Dioſcorides*, *Lib.* 3. *Cap.* 123. for the *Trifolium.*

CNICUS. A Name for the CARTHAMUS, which ſee. But the more modern Botaniſts have excluded the *Carthamus* from the Species of *Cnicus.* According to theſe, the Characters of the *Cnicus* are,

The Heads are ſurrounded with a Crown, formed of a Complication of Multitudes of Leaves.

Boerhaave mentions nine Species of this Plant, which are,

1. Cnicus; perennis; cœruleus; Tingitanus. *H. L. Carduus cœruleus, erectus, Tingitanus, Cnici facie, foliis magis integris*, M. H. 3. 159. TANGIER PERENNIAL BLUE DISTAFF-THISTLE.

2. Cnicus; Atractylis lutea dictus. See ATRACTYLIS.

3. Cnicus; Atractylis purpurea dictus.

4. Cnicus; exiguus; capite cancellato; ſemine tomentoſo. *T.* 451. Carduus parvus. *J. B.* 3. 93. Carduus, minimus. *Alpini Exot.* 254. *a.*

Proſper Alpinus ſays it is of no Uſe in Medicine.

5. Cnicus; ſylveſtris; hirſutior; five Carduus Benedictus, *C. B. P.* 378. *Tourn. Inſt.* 450. *Boerh. Ind. A.* 140. *Carduus Benedictus*, Offic. J. B. 3. 77. Chab. 351. Ger. 1008. Emac. 1171. Park. Parad. 530. Raii Hiſt. 1. 303. *Carduus luteus; procumbens ſudorificus & amarus*, Hiſt. Oxon. 3. 160. *Cardduo-cnicus ſylveſtris hirſutior*, Pluk. Almag. 82. HOLY-THISTLE.

From a ſmall woody Root, which periſhes after giving ripe Seed, there ariſe ſeveral rediſh hairy Stalks, two Foot high or more, on which grow long hairy green Leaves, cut in, or torn, on both Sides, into ſeveral Laciniæ or Jags, each terminating in a ſmall harmleſs Spinula. On the Top of the Stalks grow the Flowers, in round Heads, encompaſſed with ſeveral Leaves ſmaller and ſhorter than thoſe below, leſs jagged, and ſomewhat more prickly: They are yellow and fiſtular, ſtanding in ſcaly Calyces, each Scale of which ends in a long ſlender Spine, denticulated on both Sides like the Saw of a Saw-fiſh. The Seed is longiſh, round, and ſtriated, of a brown Colour, encompaſs'd at the Top with a Crown of ſtiff *Setæ* or Briſtles, ſtanding out like the Feathers of a Shuttle-cock. The whole Plant is very bitter. It is ſown every Year in Gardens, flowering in *June.*

Paulli, after *Cæſalpinus*, obſerves, that the Head of this Herb is of a fragrant Smell, reſembling that of the Muſcadel-pear; but *Cæſalpinus* compar'd it to that of Muſk itſelf. This Fragrance, however, does not diffuſe itſelf to a great Diſtance, nor impregnate the Air at all times; but is principally perceiv'd, when, during a ſerene and dry State of the Atmoſphere, it is formed into a perfect Flower, which, after ſome time, loſes its grateful Scent. Becauſe the Fragrance of this Flower is only to be perceived at a ſmall Diſtance, being in a manner overbalanced by the fetid Smell of the Herb itſelf, and becauſe it is ſurrounded with a large Number of offenſive Prickles, he thinks, that none, before the Days of *Cæſalpinus*, had Courage enough to inveſtigate and diſcover it. The whole Plant is remarkably bitter, except the Root, which has ſcarce the ſlighteſt Degree of Bitterneſs. Some have obſerv'd, that when the Buds of the Carduus are cut, before they are blown into full-form'd Flowers, they yield a ſmall Quantity of a bloody Juice; but *Matthiolus* denies the Truth of this Aſſertion. This Thiſtle is dignify'd with the pompous Epithets of *bleſſed* and *holy*, in conſequence of its ſingular Virtues againſt various Diſeaſes. *Pontedera* is of Opinion, that this Plant was either unknown to the Antients, or at leaſt neglected by them; for he thinks, if they had known its ſingular Efficacy in the Cure of ſeveral Diſeaſes, they would not have conceal'd their Sentiments with reſpect to this Matter, ſince they have often beſtowed over-done Encomiums upon Plants whoſe Virtues exiſted rather in the Imaginations of the Whimſical, than in the Plants themſelves. This Cnicus is ſaid to have been firſt imported from the *Indies* by way of Preſent to the Emperor *Frederic* the Third; at which Juncture it was highly celebrated, either uſed in Aliments, or Drink, as an excellent Preſervative againſt that Species of Head-ach, which the *Greeks* call *Hemicrania.* The Phyſicians of this Emperor, in order to ingratiate themſelves with their Maſter, began to uſe it in various Caſes; and, when the Succeſs in Practice anſwered the Encomiums beſtowed upon it, the Plant acquired an uncommon Fame and Reputation. Upon this it was cultivated by ſuch a Number of Hands, that it was in a ſhort time the Produce of various Provinces. It was, however, afterwards diſcover'd, that this Cnicus grew ſpontaneouſly in *Europe*; for, according to *Bellonius*, in his *Obſervations des pluſieurs Singularités*, *Lib.* 1. *Cap.* 25. it is to be frequently met with in the Fields of *Lemnos*, an Iſland in the *Mediterranean* Sea. It is alſo produced in *France*, on thoſe towering Parts of the *Alps* called *Marignols*, near *Monſterias* in *Provence.* According to *Ray*, the Species produc'd on the Summits of theſe Hills is firmer, and ſomewhat leſs, than that cultivated in the Gardens. It is at preſent reckoned among the leſs valuable Plants, tho' it ſtill retains its former Worth in the Eyes of Phyſicians, for whoſe Uſe it is ſtill cultivated in many Gardens. It flowers in the Summer, and in the Autumn its Seeds become ripe. *Hoffman*, in his Treatiſe *De Medicamentis Officin. Lib.* 2. *Cap.* 50. gives us an Account of the Medicinal Virtues of this Plant, in the following Words: "Its Virtues are nearly "the ſame with thoſe of Wormwood. Decoctions of it, eſpe-"cially in Wine, are of ſingular Efficacy when the Patient is "not feveriſh. It is leſs efficacious when exhibited in Powder, "and the diſtil'd Water is much leſs ſo. It is highly extol'd in all "pituitous Diſorders of the Head, Hemicranias, Deafneſs, "Vertigos, Epilepſies, Defluxions on the Breaſt, Dropſies, "Quartan Fevers, and thoſe of long Standing, as theſe Diſor-"ders draw their fatal Origin from Obſtructions. It is alſo "celebrated as an excellent Medicine in Colics, nephritic and "ſciatic Pains, as it partly diſcuſſes the peccant Matter, and "partly derives it to the urinary Paſſages. But its Efficacy is "principally celebrated in that formidable Diſtemper the "Plague, againſt which it is uſed both internally and externally. "Internally it is exhibited both with a preſervative and cura-"tive Intention, ſince it powerfully excites a Diaphoreſis. Ex-"ternally it is apply'd for breaking and opening peſtilential "Buboes, with which Intention it is alſo apply'd to other Im-"poſtumations. In the Opinion of the common People, a "Wine, prepared of it in the Autumn, is poſſeſſed of ſo "powerful Qualities, that it is little leſs than a *Panacea*, or "univerſal Remedy. It is preferable to the Wine of Worm-"wood, becauſe, in conſequence of its analeptic Quality, it "does not prove offenſive to the Head, whilſt, at the ſame "time, it is equally, if not more, beneficial to the Stomach; "for, if I am not much miſtaken, it is proper both for bilious "and pituitous Patients, as it is a powerful Abſtergent: It is "alſo ſo effectual an Aſtringent, that it is uſed in ſtopping "Hæmorrhages." According to *Pontedera*, it abounds with volatile Salts; for which Reaſon he concludes, that it is highly ſalutary in Caſes where Coagulations or Inſpiſſations of the Juices happen. A Decoction of it, therefore, in Water, may be properly exhibited to Patients labouring under a Hemicrania, "a Vertigo, an Epilepſy, or a Dulneſs of Hearing. By the

Uſe

Uſe of this Decoction colic Pains, ariſing from preternatural Diſtentions of the Colon by Flatulences, are often happily removed, as alſo nephritic Pains, and moſt Indiſpoſitions to which the urinary Veſſels are ſubject. It is alſo an excellent Medicine for ſuch as labour under Fevers, either of the totally intermittent Kind, or of that Species which never ſo intermit, that the Patient is quite free from them. By an Exhibition of this Medicine in the Paroxyſm, as ſoon as the Patient's Extremities are become cold, I have known many, ſays *Pontedera*, ſpeedily cured; which I can alſo affirm of other Medicines, by my own Preſcription exhibited in Agues at that particular Time. *Rulandus*, according to *Ettmuller*, after having previouſly exhibited a Preparation of Aſarabacca, or Antimony, by way of Vomit, orders a Decoction of this Plant, and Leaves of the leſſer Centaury, to be uſed for ſome Days, in order to promote a Diaphoreſis; and he affirms, that by this Method he cured many Patients labouring under Quartan Fevers; for which Purpoſe he either uſed this Plant alone, or in Conjunction with Aſarabacca-root. The Powder of the tender Leaves in the Middle of the *Carduus Benedictus*, dried, and exhibited three Nights ſucceſſively in warm Wine, was, according to *Bauhine*, the celebrated Arcanum of a certain great Phyſician in *Germany* againſt Fevers. According to *Ettmuller*, "A Dram of the "Powder, exhibited with an Intention to promote a Diapho- "reſis, is, among the common People, a celebrated Remedy "for Tertian Fevers; but thoſe of the Quartan Kind do not ſo "eaſily yield to it." The *Carduus Benedictus* is of a highly penetrating bitter Taſte, which, however, does not remain long in the Mouth. It contains little Oil, which is in a ſmall Quantity diffuſed through the Plant, and rendered almoſt of a ſpirituous Quality; for which Reaſon *Ludovici*, in his *Pharmacopœia*, affirms, that it is ſcarcely to be obtained. Hence this Plant is poſſeſſed of a reſolvent and highly ſudorific Quality, eſpecially when prepared recent by way of Infuſion, ſince its bitter Principle is of a highly ſubtile Nature, and renders its Infuſion preferable to that of the *Lapis Porcinus*, or Stone found in the Gall-bladder of the Porcupine. For this Reaſon, infuſed in Water, and drank like Tea, it is an excellent ſudorific Medicine againſt Fevers, in Patients of languid, cold, pituitous, and lencophlegmatic Habits. And if this Herb is infus'd either in Wine alone, or Wine mixed with Water, to be drank warm, it, by promoting a powerful Diaphoreſis, carries off all intermittent Fevers of a mild Kind, and purifies the Maſs of Blood tainted with any Admixtures of adventitious Salts; for which Reaſon it is no deſpicable Remedy in ſcorbutic Caſes. According to *Ray*, our Countrymen boil it in Poſſet-drink, which they exhibit in a ſmall Doſe, when the Intention is only to promote a Diaphoreſis; but increaſe the Quantity, when a Vomit is to be excited, or the ſordid Contents of the Stomach to be evacuated. According to *Bauhine*, *Geſner*, in order to kill Worms of the Inteſtines, prepared a Powder of the dried Leaves of the *Carduus Benedictus*, a little Cinnamon, Fennel, and Sugar, which he exhibited either in the Morning, or after Supper, with a little toaſted Bread ſoaked in Wine. Theſe Effects aſcribed to the *Carduus Benedictus* are to be accounted for from the Bitterneſs, and the penetrating and reſolvent Quality, of the Plant. Hence we underſtand, for what Reaſon it is claſſed among the ſudorific, alexipharmic, emmenagogue, antiſebrile, and antiſcorbutic Medicines. *Hoffman*, in his *Clavis Pharmaceutica Schrœderiana*, recommends the following Infuſion as a Preſervative againſt all Diſeaſes:

Take of the Herb Carduus Benedictus, of the Tops of Wormwood, and the leſſer Centaury, each one Ounce: Infuſe in two Pints of *Rheniſh* Wine, mixed with two Drams of the Spirit of Vitriol. Let them ſtand in a warm Place for three Days.

The Doſe of this Liquor, when ſtrain'd, is a Spoonful or two, to be taken at Bed-time. This Preparation is by ſome accounted a Specific againſt the Pleuriſy; but, for my own Share, I cannot conceive, how this Medicine can prove effectual againſt that Diſorder by any other Means than by exciting a Diaphoreſis, where that is indicated by the State of the Patient. According to *Ettmuller*, it is an excellent Remedy againſt the Pleuriſy, in whatever Manner it is exhibited, but more eſpecially in the Form of a Decoction. Hence it is an Ingredient in the antipleuritic Spirit of *Michaelis*, which is prepared by pouring Spirit of Wine upon antipleuritic Plants, and ſubjecting them to a ſlow Diſtillation by the Alembic; then it is mixed with Spirit of Nitre, digeſted, and again ſubjected to Diſtillation by the Alembic. Thus the Spiritus Nitri Dulcis is obtain'd, which, by itſelf, is alſo of an antipleuritic Nature. One or two Drams of this, exhibited in a Water diſtil'd from the *Carduus Benedictus*, or in any other proper Water, prove an excellent Remedy in Pleuriſies accompany'd with a Difficulty of Breathing. This Medicine alſo excites a Diaphoreſis, removes Inflammations, promotes Expectoration, and puts a ſeaſonable Stop to Fevers. According to the ſame Author, the *Carduus Benedictus* contributes to the Reſolution of grumous Blood, eſpecially when produc'd by Falls from an Eminence, by exciting a Diaphoreſis. It alſo expels the grumous Blood, when attenuated, by the urinary Paſſages. Thus we are ſatisfy'd with reſpect to the ſeveral Methods in which this Plant operates, which are either by opening Obſtructions, and eliminating the peccant Matter from the Body; or by promoting a Diaphoreſis, or a Diſcharge of the Urine, according to the particular Regimen uſed for different Intentions. In hot Diſeaſes, the Uſe of it ſeems not ſo much to be dreaded, as that of moſt other Medicines of a reſolvent and ſudorific Nature; for, in conſequence of its reſolving the thick Juices by the Fineneſs and Subtilty of its Parts, it does not lodge long in the Body, whilſt, at the ſame time, it puts the Humours into a Commotion. For this Reaſon, to uſe the Words of *Paulli*, "I think 'tis now known "to every body, that malignant Diſorders of every kind can- "not be more ſucceſsfully and effectually removed, than by "means of a proper Uſe of the Carduus Benedictus." Unſpeakable Advantages, therefore, ariſe from the due Uſe of this Plant, when Plagues, petechical Fevers, Meaſles, and the Small-pox, rage. I am alſo of Opinion, that this Plant acts by its reſolvent and penetrating Quality, when uſed in external Applications. Hence the Steam, ariſing from a Decoction of it, admitted into the Ears, is ſaid to be an excellent Remedy for Dulneſs of Hearing, becauſe it opens the Obſtructions, and reſolves the indurated Sordes of the Ear. *Paulli* affirms, that he had ſcarce found any Herb comparable to it in conſolidating putrid obſtinate Ulcers, and even Cancers; and informs us, from *Bauhine*, that *Arnoldus de Villa Nova* affirms, that he had ſeen a Man recovered, who by putrid and hollow Ulcers had the Fleſh of his Legs conſumed to the very Bones, and who had in vain ſpent all he had on the Cure. This Patient took the recent Leaves of the Carduus Benedictus; and, after bruiſing them, boil'd them in generous Wine, to which adding melted Hogs-lard, he boiled them together; then putting in ſome Wheaten-meal, he, without Interruption, agitated the whole Maſs with a Spatula, till it aſſum'd the Conſiſtence of a Plaiſter, by applying which, twice a Day, warm to his Ulcers, they were cured. *Paulli* alſo, from *Bauhine*, informs us, that a certain Woman, whoſe Breaſts were by a Cancer conſumed to the very Ribs, was, by means of the diſtil'd Water of this Plant, and the Powder of its Leaves ſprinkled on the Parts affected, perfectly freed from her Diſorder. But *Garidel*, in his *Hiſtoire des Plantes qui naiſſent aux environ d' Aix*, ſuſpects, that this Paſſage is hyperbolical, and that by this means, perhaps, a malignant or cancerous Ulcer was cured, but not a genuine and legitimate Cancer, againſt which no Simple in the Fields, no Plant in the Gardens, no Preparation in the Shops, has hitherto been found effectual. The Seeds of this Plant are poſſeſſed of the ſame Medicinal Virtues with the Plant itſelf. In Caſes where the Hypochondria are indiſpoſed by Flatulences, or Obſtructions of the Liver, theſe Seeds are generally exhibited in hot Wine: Half an Ounce of them may be given for a Doſe. They are principally and moſt frequently uſed in Emulſions againſt the Pleuriſy, prepared with Water of wild Poppies; in which Caſe the Patient muſt be kept warm, in order to promote a Diaphoreſis. An Emulſion of the Seeds of the Carduus Benedictus is alſo commonly prepared, with ſome proper Liquor, for expelling, by a Diaphoreſis, the malignant Matter in the Small-pox, Meaſles, and other malignant Diſorders. The Root of this Plant, ſo far as we know, is uſed in no Preparation, except that of the *Spaniſh* Balſam, directed in *Lemery*'s *Pharm. Univerſ.* There are various Shop-preparations of this Plant, ſuch as the *Succus inſpiſſatus*, which is no more than the Juice expreſs'd from the green Herb, and boil'd over a gentle Fire to the Conſiſtence of a Syrup. A Spoonful of this Juice is an effectual Vomit; but, when exhibited in a ſmaller Quantity, half a Dram, for Inſtance, it is recommended for provoking the Menſes. In Conjunction with a warm Vehicle, and a proper Regimen, it excites a Diaphoreſis. This Effect is alſo produced by the *Extractum Cardui Benedicti*, (Extract of Carduus Benedictus) which is prepared by evaporating the Decoction of the Herb, and is preſcrib'd in Pills. A few Grains of it are, by ſome, alſo added to purgative Medicines, in order to prevent Flatulences, and Gripes of the Inteſtines.

If, according to *Schroder*, it is prepared with diſtil'd Vinegar, it is an excellent Remedy againſt putrefactive Diſorders, ſuch as the Plague; and, according to the Obſervation of *Ettmuller*, when exhibited from half a Scruple to a whole one, in Conjunction with a little Laudanum Opiatum, it excites ſo powerful a Diaphoreſis, that the Patient ſeems ready, as it were, to be diſſolved in Sweat. The Syrup, prepared from the recent expreſs'd Juice of the Leaves, and made up with Sugar, is, by Nurſes and the common People, highly extol'd in Diſorders of the Stomach, Crudities, and Loſs of Appetite. They alſo uſe this Syrup after Sallies of Paſſion, and in the Colic. They likewiſe recommend it for killing Worms, and removing Putrefaction; on which account they order it in Pleuriſies, in malignant and peſtilential Fevers. The Doſe is from one to two or three Spoonfuls. The ſimple diſtil'd Water, obtain'd from the *Carduus Benedictus*, is one of the Four antipleuritic Waters.

ters. By the good Women it is exhibited in all thoſe Diſeaſes in which the Herb is recommended, eſpecially with a View to increaſe Tranſpiration, and promote the Eruption of the Small-pox and Meaſles; but as this Water is ſomewhat weak, and ſlow in its Operation, the Water diſtil'd from the fermented Plant, in the manner deſcrib'd under the Article AQUA, is preferable, where a Diaphoreſis is intended: This is much commended by *Ludovici*. The Eſſence, prepared from this Herb with Spirit of Wine, is bitter, in Virtues agrees with the Eſſence of Wormwood, and is, in a peculiar manner, appropriated to Diſorders of the Stomach. Twenty, thirty, or more Drops of it may be exhibited for a Doſe. The *Oleum diſtillatum Eſſentiale* of the *Carduus Benedictus*, in Virtues, agrees with the Oil of Wormwood. Theſe are the moſt common Preparations from this Plant.

6. Cnicus; five Carduus Benedictus; ex Chio. *Volk. a.*

7. Cnicus; Hiſpanicus; arboreſcens; fœtidiſſimus. *T.* 451. *H.* STINKING SPANISH TREE DISTAFF THISTLE.

8. Cnicus; cœruleus; humilis; & mitior. *T.* 451. *Eryngium, minimum, mitius, capitulo magno.* H. R. Par. H.

9. Cnicus; cœruleus; aſperior. *C. B. P.* 378. *T.* 456. *Carthamus, ſive Cnicus, flore cœruleo.* J. B. 3. 80. *Carduus erectus, cœruleus, Cnici facie, foliis diſſectioribus.* M. H. 3. 159. *Boerhaave's Index alter Plantarum, Vol.* 1.

Dale mentions another Species of the *Cnicus*, which is,

CARDUUS PINEA, Offic. *Carduus pinea Theophraſti*, Alp. Exot. 126. Raii Hiſt. 1. 301. *Carduus Creticus humillimus integris & anguſtis foliis*, Hiſt. Oxon. 3. 159. *Carduus humilis gummifer, magno flore ſimplici cœruleo*, Ejuſd. 158. *Carduus pinea ſeu Ixine Theophraſti*, Park. 970. *Carlina acaulos gummifera*, C. B. 380. *Cinara acaulis gummifera*, Raii Hiſt. 1. 301. *Cnicus Carlinæ folio, acaulos, gummifer, aculeatus, flore purpureo & flore albo*, Tourn. Coroll. 33. *Chamæleo albus Apulus purpureo flore gummifer*, Raii Hiſt. 1. 301. *Chamæleo albus verus acaulis.* THE TRUE CHAMÆLEON, OR CHANGEABLE THISTLE, WITHOUT A STALK, Park. 967. THE PINE-THISTLE, *Dale.*

The Country-people of *Apulia*, who attend the Flocks, gather the Gum produced in the Head, and between the Leaves of the Cup. This Gum they call *Cera di Cardo*, becauſe, when it is concreted, it becomes hard like Wax. They uſe it as a drawing Topic. Whilſt it is recent, its Parts cohere, like thoſe of Bird-lime, and it may be drawn out into a Thread of a whitiſh Colour; for it originally conſiſts of a milky Juice, which, when collected, becomes thick like Wax, and, when handled, aſſumes a blackiſh Colour. Theſe Accounts are given by *Colonna*. *Raii Hiſt. Plant.*

CNIDE, κνίδη, is a Name in *Dioſcorides*, *Lib.* 4. *Cap.* 94. for the Urtica, or Nettle.

CNIDELÆON, κνιδέλαιον, from κνίδεος, *Cnidian*, and ἔλαιον, Oil, is Oil made of the *Grana Cnidia*. The Manner of Preparation is ſhewn in *Dioſcorides*, *Lib.* 1. *Cap.* 43.

CNIDIA GRANA, *Cnidian* Berries. Theſe are directed, by *Hippocrates*, as a Purge. Modern Botaniſts do not agree of what Plant this is the Fruit; but moſt take it to be that of the *Thymelæa, foliis Lini*, C. B. P. Others, however, believe the *Grana Cnidia* to be the Fruit of the *Mezereon*, as *Cordus*, and *Scroder*. *Schulzius* is of Opinion, that they are the Berries of the *Cneoron*, or *Cneſtron*. *Ray* ſays, the Berries of the *Thymelæa* are not the *Grana Cnidia*, but the Seeds contain'd in the Berry. See THYMELÆA.

CNIDOSIS, κνίδωσις. An itching and ſtimulating Senſation, ſuch as is excited by the *Cnide*, or Nettle. The Word occurs ſeveral times in *Hippocrates*, *Prorrhet.* 2. *Celſus*, *Lib.* 2. *Cap.* 8. renders κνιδώσεις, in *Hippocrates*, *Pruriginem.*

CNIPES. A kind of ſmall Worms, which infeſt Vines. See AMPELITES TERRA.

CNIPOTES, κνιπότης, is expounded, in *Galen's Exegeſis*, by κνησμὸς, "an Itching;" but ſome, as he obſerves, take it for a dry Ophthalmy, which is *Erotian*'s Expoſition of the Word.

CNISMOS, κνισμὸς, is the ſame as CNESMOS, which ſee.

CNISSOREGMIA, κνισορεγμία, (from ὄσφρα, a nidorous Smell, and ἐρεύγω, an Eructation) a nidorous Eructation, as ὀξυρεγμία is an acid Eructation. Thus *Caſtellus*; but he does not ſeem very happy in compounding of Words, for κνισερεύγμὸς and ὀξερεύγμὸς are Terms of a better Stamp, and more expreſſive of his Meaning.

CNYMA, κνῦμα, from κνύω, the ſame as ξύω, to ſcrape or grate, in *Hippocrates*, is a Raſure, Punction, or Vellication; and alſo the ſame as *Cneſmos*. Κνῦμα, in *Galen's Exegeſis*, is ſaid to be a Term made by an Onomatopœia to expreſs a gentle or ſoft Sound; and κνῦμα μολύβδινον, *Lib.* 2. περὶ γυναικ. is a leaden Peſſary.

CO, COS, COOS, κῶ, κῶς, κῶος. An Iſland in the *Archipelago*, now call'd *Lango*, the Birth-place of *Hippocrates*, who, from hence, is uſually call'd *Cous*.

COA. A Plant, ſo named by Father *Plumier*, in Honour of *Hippocrates*. It is a ſcandent Plant, growing to the Height of five or ſix Feet, and is an Ever-green, bearing a globular Bell-ſhaped Flower, conſiſting of one Leaf, from whoſe Cup ariſes a multifid Pointal, fix'd like a Nail in the hinder Part of the Flower, which afterwards becomes a Fruit, compoſed of three membranaceous Seed-veſſels, which are compreſs'd, bivalve, and divided into two Cells, in which are contain'd oblong wing'd Seed. It grows plentifully in *America*, particularly about *Campeachy*, whence the Seeds have been brought to *England*, and Plants raiſed from them.

We have but one Species of this Plant, which is,

Coa ſcandens, fructu trigemino ſubrotundo. Plum. CLIMBING COA, WITH A ROUNDISH FRUIT, WHICH OPENS INTO THREE PARTS. *Miller's Dictionary, Vol.* 2.

COACTIO. See ANANCE.

It is alſo the Name of a Diſeaſe in Horſes, cauſed by hard Labour, bad Food, or want of Care. It may be call'd a *Surfeit*. *Veg. L.* 1. *C.* 37.

COACUS. An Epithet of a Treatiſe of *Hippocrates*, call'd *Coacæ Prænotiones*, from *Coos*, the Birth-place of their Author.

COAGULANTIA. In general, Subſtances, which, when mix'd with Fluids, coagulate them. But it is uſually expreſſive of Remedies, or Poiſons, which coagulate the Blood and Juices.

COAGULATIO.

The *Coagulatio* of the *Latins*, the πῆξις of the *Greeks*, and the *Coagulation* of the *Engliſh*, import a certain Change in the State of any Liquor, by means of which, inſtead of retaining its Fluidity, it becomes more or leſs conſiſtent and ſolid, according to the Degree of the Coagulation. Changes and Tranſmutations of this Kind happen almoſt everywhere in Nature, ſince ſolid Bodies ſeem to be little elſe than concreted Liquors. The hardeſt Woods ariſe from a Concretion and Coagulation of the nutritious Juices. The moſt ſolid Parts of animal Bodies, the Bones, for Inſtance, are gradually and inſenſibly form'd of an inſpiſſated Fluid. Beſides, there are many ſatisfactory Arguments, proving, that foſſile Subſtances are originally fluid. Some Fluids, by means of Cold, aſſume a very conſiderable Degree of Conſiſtence, and are converted into what we call Ice. Coagulations of a morbid and preternatural Kind alſo happen in the human Body; whence ariſe Obſtructions of thoſe Veſſels and Cavities, which ought to remain pervious and open. Heat and Cold are the two principal Inſtruments commonly uſed by Nature, for producing Coagulations. Sometimes alſo Fluids are coagulated by an Admixture of ſome foreign and adventitious Subſtance, which produces a firmer Coheſion of their Parts. Apothecaries condenſe and coagulate Fluids in various Manners, by Evaporation, for Inſtance, or Diſtillation, when they prepare the inſpiſſated Juices of Vegetables, Extracts, and Jellies; for, by this means, the moſt fluid and diluted Parts being carried off, the others, which have a natural Tendency to Coalition, conſtitute a coagulated Body. This Species of Coagulation is, by Chymiſts, call'd *Coagulatio per Segregationem*, or *per Separationem*. Its Oppoſite is what they commonly call *Coagulatio per Comprehenſionem*; which is, when the Whole of the Fluid, without the Loſs of any of its Parts, is ſo treated as to be coagulated into an uniform Subſtance. Whoever intends to produce Coagulations of the former Kind, ought to advert to the following Advice of *Hoffman*. "If, ſays he, in order to pro-"duce the Conſiſtence of an inſpiſſated Extract, any Fluid is "to be drawn off, this is to be done *in Balneo Mariæ*, that "an Empyreuma, and the Aduſtion of the Particles of the "Extract, may be prevented; which is to be obſerved in pre-"paring the Extracts of Aloes, Opium, and other Vegetables: "Or, 'tis ſtill more adviſeable to carry off the greater Part of "the Liquor, over a bare Fire, or by means of a Sand-heat. "Then the Inſpiſſation is to be perfected by the Aſſiſtance of a "more mild and gentle Heat. We muſt alſo obſerve, that "ſome Extracts, as alſo Robs, and ſome other Subſtances of "a like Nature, cannot, by a bare Fire, or a ſtrong Degree "of Heat, be reduced to a due State of Conſiſtence, but al-"ways remain fluid; whereas they become inſpiſſated, and "aſſume a due Conſiſtence, if, after having been previouſly "and ſufficiently boil'd, they are, during a proper time, treated "with the mild and gentle Heat of a Stove, or proper Fur-"nace."

What thoſe Subſtances are, by the Addition or Interpoſition of which Fluids aſſume a Conſiſtence, we are taught, by Chymiſtry; an Art, which, when genuine, imitates unerring Nature in her Operations: For chymical Coagulations are produced,

1. By Water, either in the way of Congelation, Cryſtallization, or Precipitation. Congelation is produced by the Aſſiſtance of Cold, and is explain'd under its proper Article. Salts, diſſolved in Water, are reduced to Cryſtals after an Evaporation of the Water, by boiling. Thus, if you intend to

transform a very fine Powder into a Salt, 'tis abſolutely neceſſary you call in Water to your Aſſiſtance; for, when Salts are diveſted of Water, they aſſume the State and Condition of a Powder, and do not retain the Form of coherent ſmall Maſſes. This holds true with reſpect to all the Species of Vitriol, and metalline Salts in general. Water is alſo united with common Sulphur, and is the Cauſe of its Coagulation; for Spirit of Sulphur, obtain'd by the Bell, contains about three fourth Parts of Water, which adhere to the acid Principle reſiding in it. Water is thus lodged not only in animal and vegetable Subſtances, but alſo in Metals themſelves; for, in the Earth, almoſt every thing owes its reſpective State and Condition to Water. 'Tis by means of this Fluid that Earths cohere; for all Earthen and Clay Veſſels are, by means of Water, model'd into their particular Shapes and Forms: Thus Bricks, by an Addition of Water to the Earth, and a proper Application of Fire, are converted into hard ſtony Subſtances; which, when reduced to a Powder, and ſubjected to Diſtillation, yield a certain Quantity of Water. Thus alſo Stones are form'd of the Water dropping from the Roofs of certain Caverns, when coagulated and inſpiſſated. That Coagulations are produced by Precipitation, we learn from the Preparation of the *Mercurius Vitæ*; whilſt, for Inſtance, the Oil of Antimony, which, in a liquid Form, keeps the Regulus of Antimony diſſolved in the Acid of the Sea-ſalt, precipitates a Powder, when dropt into pure Water. Camphire, diſſolved in oleous and acid Menſtruums, is coagulated by an Affuſion of Water.

2. Coagulations are alſo produced by Oil, with the Application of a due Degree of Fire, which unites the Parts of Sulphur, Salts, and Metals: Thus Oil coagulates an alcaline Salt into a Soap: Sulphurs are, by means of Oil, transform'd into Balſams of a very thick Conſiſtence. Sugar of Lead and Litharge, when boil'd for a conſiderable time in Oil, are reduced into one ſolid Maſs.

3. Alcohol of Wine coagulates alcaline volatile Spirits, the Whites of Eggs, the Serum of the Blood, the Oil of Vitriol, and the Spirit of Nitre.

4. An alcaline and an acid Salt are united together in a ſolid Coagulum, as is obvious from the Preparation of vitriolated Tartar, from a Combination of the Oil of Tartar *per Deliquium*, and the Oil of Vitriol: Thus rectified Butter of Antimony is form'd into a Coagulum with Oil of Tartar; Spirit of Urine is coagulated with a ſtrong Solution of Vitriol. Spirit of Nitre coagulates with any fix'd Salt, as we learn from the Preparation of the *Nitrum Regeneratum*.

5. Coagulations are produced by alcaline fix'd Salts, as in Milk, for Inſtance. Thoſe are, therefore, in an Error who lay it down as an Axiom, that alcaline Salts diſſolve, and acid Salts coagulate; for an Experiment, made by the celebrated Mr. *Matte*, Royal Profeſſor of Chymiſtry at *Montpelier*, demonſtrates, that what has been coagulated by an alcaline is ſometimes diſſolved by an acid Salt. He reduced, for Inſtance, to a Powder, that Subſtance which remains in the Retort after the Diſtillation of the Spirit of volatile Sal Ammoniac with Lime. This Subſtance he boil'd in pure Water for two Hours. He afterwards filtrated this Water, and permitted ſome Part of it to evaporate, ſtirring it now-and-then with a wooden Spatula, till a Pellicule was form'd on its Surface. Then he mix'd two Drams of it with two Drams of the Oil of Tartar, *per Deliquium*, in a Glaſs Veſſel, agitating them with a Stick, in order to unite them the more effectually. In a ſhort time the Mixture was reduced to ſuch a Conſiſtence, that ſmall Balls might be made of it, which might be roll'd up and down the Table without loſing their Form. By an Affuſion of the Spirit of Nitre the Liquor recover'd its former Fluidity, which was again removed by an Affuſion of the Oil of Tartar.

6. Coagulations are produced by an acrid Salt, as in Milk, for Inſtance, Whey, the Whites of Eggs, Bile, the expreſs'd Oils of Olives, and ſweet Almonds; as alſo in ſome foſſile and other Subſtances: Thus the Oil of Vitriol, with the Fæces of the Regulus of Antimony, diſſolved in a ſubterraneous Cellar, is form'd into a Coagulum. The ſame Oil runs into a Coagulum with Sea-ſalt, as alſo with Filings of Steel. When dropt into Oil of Aniſe, it produces a perfectly reſinous Coagulum. It alſo produces a Coagulum with a Decoction of Quick-lime and Arſenic. The Tincture of Lead-ore, prepared with the *Acetum Radicatum*, when mix'd with Butter of Antimony, in Proceſs of Time forms a Coagulum; as does alſo the Spirit of Vinegar, when mix'd with the Calx of Lead, with Coral, or with Pearls. Rectified Spirit of Nitre coagulates Oil of Olives, if digeſted with it for ſome Days. From what has been ſaid 'tis obvious, that Acids, mix'd with Alcalis, produce Coagulations.

7. By the Steam or Fume of melted Lead, Mercury is coagulated.

8. By Aſtringents or Styptics the Whites of Eggs, Milk, and Bile, are coagulated.

9. That by Motion alſo alone, without the Addition of any ſenſible Subſtance, Fluids are transform'd into coagulated or conſiſtent Bodies, we learn from the Churning of Butter, from the frequently repeated Diſtillation of the Oil of Turpentine, and Spirit of Wine; as alſo from the Preparation of the *Mercurius præcipitatus ruber per ſe*. We now conclude, with Mr. *Boyle*, that many, tho' not all, Coagulations are produced by Salts, as ſome have erroneouſly aſſerted: But, as to the indurating Quality of Salts, it does not, in this Author's Opinion, ariſe from any peculiar and inexplicable Property, by which they coagulate and brace up Bodies, "but rather from the "Figure and Motion of the ſaline Corpuſcles, which ſeem "naturally more diſpoſed, than other concreted Subſtances, to "inſinuate themſelves into the Pores of other Bodies, and to "join their Parts not only to themſelves, but alſo to each "other; and that, either by joining theſe Corpuſcles, as it "were, with Wedges, or by penetrating a large Number of "them by their rigid ſlender Parts, or by their ſharp Corners "and Edges, juſt as Pieces of Paper are kept from being ſcat-"ter'd by having a File paſs'd thro' them, or as a Knife, "thruſt into ſeveral Pieces of Bread, or Victuals, lifts them "all at one and the ſame time." But in whatever manner any Coagulation is produced, whether by Nature or Art, we may probably conclude, with this Author, that, in order to its Production, the conſtituent Parts of the Fluid muſt either be render'd thicker, and leſs diſpoſed to fluctuate, and roll over each other; or that its component Parts remain in a State of Reſt among themſelves, with their Surfaces touching each other almoſt in every Point, juſt as two poliſh'd Plates of Marble cohere with each other; or that they be kept in mutual Coheſion, juſt as two Bodies are fix'd together by a Nail or Cement. Thus a Change of the Texture or Diſpoſition of the component Parts of the Body muſt be allow'd to be moſt commonly the Cauſe of the Coagulation, in whatever manner it is produced. To theſe various Species of Coagulation we muſt add what *Beecher* has ſaid, concerning the *Coagulatio Continui*, the *Coagulatio Partis*, and the *Coagulatio Totius*. The *Coagulatio Continui* is produced in two Manners, either by Impaſtation or Condenſation: By Impaſtation, when Powders are mix'd with Water or Slime; whence, by an Evaporation of the Humidity, the Mixture is coagulated, but again reſolved, upon an Addition of it. Coagulation by Condenſation is, when the Subſtance of Water by its Coldneſs congeals; in which Caſe it is again diſſolved by Heat, as in Ice, for Inſtance. In theſe two Species of the *Coagulatio Continui*, the following Axiom is to be obſerved: *Whatever is coagulated by Fire, is reſolved by Water*; *and*, vice verſa, *whatever is coagulated by Water is reſolved by Fire*. The *Coagulatio Partis* is when an oleous adheres to a ſaline Principle, Sulphur to Salt, Oil to Water, Male to Female, dry to moiſt, and what is volatile to what is fix'd. This Species of Coagulation is reſolved either in the way of Sympathy, or in the way of Antipathy; in the way of Sympathy, by a Subſtance like itſelf; in the way of Antipathy, by a Subſtance oppoſite to itſelf. With reſpect to this Coagulation, the following Axioms are to be laid down: *What is weak yields to what is ſtronger. Things of ſimilar Natures agree with each other. Nature intends the moſt perfect Productions. The Life of one Subſtance is the Deſtruction of another. Let every Separation be made with Modeſty and Caution.* The *Coagulatio Totius* is alſo of two Kinds, preternatural and natural. The preternatural is when heterogeneous Subſtances are coagulated; whereas the natural is, when homogeneous Fluids are coagulated by way of Generation. *Rieger.*

COAGULUM.

The Coagulum of the *Latins*, the πυτία and the τδμιτος of the *Greeks*, are the ſame with what in *Engliſh* we call *Rennet*. This is the concreted Milk found in the Stomach of ſucking Quadrupeds, which have as yet received no other Nouriſhment than their Mothers Milk. It is found not only in the Stomachs of cloven-footed, ruminating Animals, but alſo in thoſe of cloſe-hooved Quadrupeds, ſuch as Horſes and Aſſes, and in the Stomachs of thoſe Animals, whoſe Feet are furniſhed with Claws, ſuch as theſe of the Hare-kind. In ruminating Animals, which have a conſiderable Number of Stomachs, it is generally found in the laſt, which is called *Abomaſus*, tho' it is ſometimes to be met with in ſome of the other Stomachs, eſpecially in the third, which is called *Omaſus*, included in the numerous Folds of its Membranes, which occur there. But the Reaſon why it is generally found in the laſt Stomach of Calves, when killed, is, becauſe theſe Animals are rarely killed immediately after Suction; ſo that, in Proceſs of Time, the coagulated Milk may have paſſed from the other Stomachs to the laſt. The Antients affirmed, that all Rennet in general was of the ſame acrid Nature; that it was beneficial in ſtopping Fluxes, checking the exorbitant Diſcharge of the Menſes, preventing the fatal Effects of Poiſons, reſolving coagulated Milk in the Stomach, and diluting concreted Blood. *Ariſtotle* maintained, that Rennet was poſſeſſed of a highly hot and fiery Quality; that the older it was, the more valuable and efficacious it became; that it was an excellent Cure for Fluxes; and that the Rennet of a Calf of a Red Deer was preferable to that of other Animals. But, according to *Galen*, that of the Hare is the moſt valuable. *Dioſcorides* informs us, that the Rennet of every Animal, in which

it

it is to be found, coagulates fluid Subſtances, and reſolves ſuch as are coagulated. *Hippocrates*, in the ſecond Book of his Treatiſe *De Morbis Mulierum*, for Fluxes, and all Diſorders of the Uterus, preſcribes a Potion prepared of Wine, the Rennet of an Aſs, the Root of the ſweet Pomgranate, and Galls. According to *Galen*, ſome of the Antients, in their Writings, alſo affirmed, that the Rennet of the Hare, drank with Vinegar, proved a Cure for epileptic Patients. *Cœlius Aurelianus*, however, in the fourth Chapter of the firſt Book of his Treatiſe *De Tardis Paſſionibus*, rejects the Uſe of *Rennet* in the Cure of Epilepſies. *Averroes*, according to *Hieronymus Mercurialis in Morb. Mul. L. 3. C. 5.* advanced in his Works, that every Species of Rennet was poſſeſſed of an aſtringent Quality, as was obvious from Fluxes being ſtopped by the Exhibition of Rennet. *Mercurialis* affirms, that this Opinion of *Averroes* is true, and confirmed by Experience; but that, notwithſtanding this, Rennets are of a highly reſolvent and attenuating Nature; and he thinks, that the aſtringent Virtue of Rennets depends on ſome occult Property; whereas their attenuating and reſolvent Virtues depend upon their manifeſt and ſenſible Qualities. *Riverius* informs us, that, againſt an immoderate Flux of the Menſes, the Women in *France* uſe half a Scruple of the Rennet of a Kid or Hare; which not only ſtops the Diſcharge of the Blood, but diſſolves and attenuates it, when concreted in the Uterus. *Rondeletius*, in his Treatiſe *De Ponderibus*, determines the Doſe of Rennets in internal Medicines to be from one to twelve Grains; and, in external Applications, he allows the Quantity to be from a Scruple to a Dram. In the *Antidotarium Florentinum*, the Rennet of the Hare is ſaid to be, of all others, the beſt for medicinal Purpoſes; that of the Kid is ſaid to come next to it; and that of the Calf of the Red Deer next to that of the Kid. It is to be taken from theſe Animals before they have taſted any thing, except their Mothers Milk. The Rennet of the Sea-Calf is alſo highly commended, if taken from the Animal before it can ſwim about with its Mother in Queſt of Prey. Theſe Rennets, if dried in the Smoke, or in the Sun, and kept in a dry Place, preſerve their Virtues for a Year or two. So far as we know, Rennets are, at preſent, neither kept in the Shops, nor preſcrib'd by the Phyſician. Beſides the medicinal Uſes of Rennets, the Antients applied them for coagulating Milk, in order to make Cheeſe; for which Purpoſe they generally choſe that of a Lamb or Kid, according to *Columella*, *L. 7. Cap. 8.* and *Pallad. L. 6. Tit. 9. Varro*, *L. 2. Cap. 4.* affirms, that the Rennets of the Hare and Kid were more eſteemed than that of the Lamb. *Pliny*, in the forty-firſt Chapter of his eleventh Book, informs us, that the Rennets of the Calf of the Red Deer, the Hare, and the Kid, were highly eſteemed. The Virtues of the Rennet in coagulating Milk, and ſeparating its ſerous Part for the Formation of Cheeſe, are ſufficiently known to the moſt ignorant of the Country People. According to *Johannes Jacobus Scheuchzerus*, in his *Itinera Alpina*, the Inhabitants of *Switzerland* take two Calves Stomachs, and an Handful of common Salt; then pouring upon theſe common Water, till they are covered, they ſuffer them to macerate for about two Weeks. Of the Liquor, thus prepared, a Spoonful is uſed for coagulating thirty or forty Pints of warm Milk, ſtirring all about, in order to mix them the more effectually. If too large a Quantity of this Liquor is mixed with the Milk, the Cheeſe made of it has too ſalt a Taſte; a Circumſtance which proves, that ſome Particles of that Salt coaleſce with the coagulated Parts of the Milk. For this Reaſon, ſome rather chuſe Rennet prepared of the Stomachs of Calves, or Lambs, dried, bruiſed in a Mortar, and macerated in Vinegar. Others prepare Rennet in a different manner, eſpecially that of the Calf, for coagulating Milk, in order to make Cheeſe. Some alſo keep their Art of preparing the Rennet a Secret, eſpecially in *Holland*, where, by their Method of preparing it, they render the Whey highly grateful to the Taſte. Here, in *England*, ſome take the interior Membrane of a Calf's Stomach, well waſhed from its Sordes. This, after ſalting it, they hang up in brown Paper. When they intend to uſe it, they waſh off the Salt, and macerate a ſmall Portion of it during a Night, in a few Spoonfuls of Water, which they afterwards pour into Milk, with an Intention to coagulate it. We muſt here obſerve, that not only the *Rennet* of the Calf, which is moſt generally uſed, but alſo the Stomach, in which it is contained, coagulates warm Milk, without any previous Preparation. It alſo tinges the Juice of the Turnſole of a rediſh Colour, and proves a briſk Purge. Hence we may juſtly infer the acid Nature of Rennets. Whoever reflects, that Milk, kept for ſome time in a warm Place, recedes from its mild Nature, and becomes more and more aceſcent, and that, in a particular Manner, its pinguious Parts, called the Cream, become rancid, will eaſily and readily conceive, firſt, that Rennets are principally of an acid Nature, on account of the large Number of Parts contained in the Milk, from whence Rennet derives its Origin, which incline to an Acid, and are intermixed with others, which have a Tendency to become rancid. Secondly, that the acid Acrimony muſt be more or leſs prevalent than the rancid Acrimony, according to the Nature of the Animal, of whoſe Milk, impregnated with a greater or ſmaller Number of pinguious Parts, the Coagulum is produced. Thus Rennets are poſſeſſed of an Acrimony, which partakes both of an acid and of a rancid Nature; and there will be ſome Difference between the Rennets of different Animals, according as they are poſſeſſed of greater or ſmaller Degrees of Rancidity. But in this they all agree, that they belong to the Claſs of acrid and reſolvent Medicines. As for the aſtringent Virtue of Rennets, this ſeems only to be aſcribed to them, becauſe they are found beneficial in the Cure of Fluxes. I am inclined to think, that where-ever Rennets have really been obſerved by Phyſicians to ſuppreſs any Fluxes, their Efficacy, in this reſpect, may be derived from their reſolvent Quality; inaſmuch as they expelled the peccant and irritating Matter, which was the Cauſe of the Flux, or reſolved the concreted Matter, which formed the Obſtructions; and conſequently removed the Spaſms ariſing from them, which frequently prove the Cauſes of an Hæmorrhage. *Galen* therefore, in his Treatiſe *De Medic. Facult. L. 10. Cap. 2.* condemns the Advice of ſome, who, in their Writings, have aſſerted, that the Rennet of the Hare drank contributes to the Suppreſſion of bloody Vomitings, becauſe it is an acrid Remedy; whereas the Diſorder indicates the Uſe of Aſtringents. According to *Martin Shockius*, in his Treatiſe *De Averſatione Caſei*, the ſame *Galen* obſerved, that the Acrimony of the Rennet is conveyed from it to the Cheeſe, during its Preparation. But nobody, who eats acrid Cheeſe, is ſenſible of any aſtringent Quality; which, in like manner, is not proved by aſſerting, that Rennets coagulate Milk; for, beſides Acids and Aſtringents, this Effect may be alſo produced by other acrid Subſtances, and even by Alcalis, as is obvious in the Article COAGULATIO.

From what has been ſaid above with reſpect to the reſolving Virtue of Rennet, the Reaſon is obvious, why Rennet is found an effectual Medicine in Caſes where the Stomach has been overcharged by a Debauch, or, as it is uſually expreſſed, *ſurfeited*, when exhibited in the Manner directed under the Article ALCALI.

Hence alſo a Reaſon may be deduced, why Cheeſe, when ſtrong of the Rennet, and old, may be poſſeſſed of a reſolvent Virtue, and aſſiſt the Stomach in attenuating the Aliment, when it overloads this Organ, in conſequence of its being ſuperior to the Powers of Digeſtion.

COALESCENTIA. Coaleſcence. The Union or growing together of two Bodies, before ſeparate. It is principally applied to ſome Bones in the Body, which are ſeparate during Infancy, but afterwards grow together; or to ſome morbid Union of Parts, which ſhould naturally be diſtinct from each other. Thus, there is a Coaleſcence of the Sides of the Vulva, Anus, and Nares, of the Eyelids, Fingers, Toes, and many other Parts.

COALTERNÆ *Febres*. Fevers mentioned by *Bellini*, which, in all Probability, are utterly imaginary. They are deſcribed to be two Fevers affecting a Patient at one and the ſame time, the Paroxyſm of one commencing ſoon after that of the other ends. This ſecond Paroxyſm is more likely to belong to the ſame Fever, which produced the firſt.

COAPOIBA. See CAOPOIBA.

COARCTATIO. Coarctation. A rendering the Canals more narrow; or Contraction of the Diameters of the Veſſels.

A Coarctation of the Pulſe is its Diminution.

COARTICULATIO. The ſame as ABARTICULATIO, which ſee.

COAXOCHITL. The *American* Name for the *Tagetes*; *Indicus*; *minimus*; *flore ſericea hirſutie obſito*. Boerh. Ind. alt. See TAGETES.

COBALTUM. Cobalt. See ARSENICUM and CADMIA.

COBASTOLI. Aſhes. *Rulandus*.

COBBAN. A ſmall Tree like the Peach-tree, which grows in *Sumatra*, called *Perſicæ affinis in Taprobana*. C. B. *Arbor Gehuph, ſive Cobban*. J. B.

It bears a ſmall Leaf, like that of the Tree which produces the *Siliqua Cathartica*, with ſhort Branches, and a yellowiſh or ſaffron-colour'd Bark. The Fruit is pretty thick, and round, like a Tennis-ball, incloſing a Nut as big as a Filberd, which contains a very bitter Kernel, taſting like the Root of Angelica.

The Fruit is very proper to quench Thirſt; but the Kernel, however bitter, is far ſuperior in Virtue. The Inhabitants of *Sumatra*, where the Tree grows, extract an Oil out of the Kernel, which is very efficacious in Pains of the Liver and Spleen, taken inwardly, or uſed outwardly by way of Unction; and is alſo a ſovereign Remedy in the Pain of the Gout, to which the Inhabitants of this Iſland are very ſubject.

From the ſame Tree diſtils a Gum, which is very ſerviceable in the fore-mentioned Diſorders, if it be diſſolved with a moderate Quantity of Oil, and applied to the affected Parts by way of Cataplaſm. *Ray Hiſt. Plant. p. 1518.*

COBITES. A Species of freſh Water-fiſh of the Gudgeon-kind, mentioned by *Aldrovandus*.

COBRA DE CAPELLO. The Name of a very venomous Serpent, called alſo *Serpens Indicus*, Offic. *Serpens Indicus Coronatus*,

renatus, Diademate ſeu Conſpicillo inſignitus, Raii Synop. A. 330. *Cobras de Capello Luſitanis dictus*. Garc. ab Hort. *Vipera Indica vittata geſticularia*. Cat. Muſ. Ind. *Vipera pileata quibuſdam*. INDIAN SERPENT.

The Part of this Serpent in Uſe, is the Stone, or rather Bone, of the Head, called *Pedro del Cobra*. This Stone of the Serpent, called in *Ind. Med.* 65. by Miſtake, *Piedra di Cobra*, is of an oval Figure, plain on one Side, and gibbous on the other, of a brown Colour, ſhining, with Pores interſperſed.

It expels all Sorts of Poiſons, either taken inwardly, or outwardly applied. It reſiſts Putrefaction, promotes inſenſible Perſpiration, raiſes the vital Spirits, comforts the Heart, communicates a new Fermentation to the Blood, and relieves Nature under all malignant Diſtempers. *Marl. Ob.*

Though this Stone be deſcribed by *Garcias*, *Redi*, and others, yet the Learned among the Moderns differ about it principally in two reſpects, as, 1. Whether it be a Thing natural or factitious. *Kircher*, in his *China Illuſtrata*, and *Thevenot*, in his Relation of Voyages and Travels, affirm theſe Stones to be found in the Head of a great *Chineſe* Serpent; Mr. *Boyle*, in the Head of an *African* Serpent. Others, on the contrary, as Father *Boccone*, in *Muſeo di Fiſica*, ſuppoſe them to be artificial Subſtances, as calcined Bones, and other teſtaceous Fragments; and *Thevenot* the younger will have them to conſiſt of a Mixture of the Aſhes of ſome burnt Roots, and a ſort of Earth found near *Diu* in the *Eaſt Indies*.

Another thing in which they differ, is about their Virtues. Father *Kircher* relates ſeveral Experiments of their Virtue in extracting the Poiſon infuſed by the Bite of a Viper, or another Serpent. Mr. *Boyle*, in his Treatiſe of ſpecific Medicines, affirms the ſame from an Experiment made on a young Cat. And *Clayton*, in his Account of *Virginia*, *Act. Philoſoph.* No. 210. writes, that he was preſent when the ſaid Honourable Gentleman tried the Experiment on ſome Chickens, which all recovered. Dr. *Havers* was an Eye-witneſs, as he tells us, of the ſalutary Effects of this Stone upon a Dog; and Dr. *Tyſon*, in his *Anatomy of the Rattle-ſnake*, relates an Obſervation, which he received from a celebrated Phyſician of *London*, who, by means hereof, cured a Man, who was bitten by Vipers. *Baglivi* alſo performed the ſame thing for one, who was ſtung by a Scorpion. But, tho' theſe Experiments ſucceeded well with all the Perſons before-mentioned, yet others, as *Redi* and *Charas*, made the ſame Trials with a different Succeſs.

Having given this brief Account of the Opinions of the Learned on both Sides, my beſt Way, I think, is to endeavour to reconcile them. For this End, I ſhall only obſerve, that I have ſeen two Sorts of this kind of Stone; one of which was like a Bone, porous, and had viſible Marks of the File; the other was of a more compact Subſtance, and poliſhed. This I ſuppoſe to be the factitious Stone, and a Counterfeit of the former; and therefore conjecture, that the unſucceſsful Experiments were made with thoſe artificial Stones, and not with the true.

The *Lapis Colubrinus*, which formerly went at a high Price, is now ſold very cheap at *Manile*; but what is thus ſold, is not taken from the *Coluber* (Snake), but is made of Hartſhorn luted up in an earthen Pot, where it is burnt to a Blackneſs, and afterwards poliſhed. The *Moors* call this adulterated; but ſay, it is made of a ſtrange Kind of Clay, like Terra Sigillata. The true *Lapis Colubrinus* cures the Bites of Serpents by Application. In a Fever attended with purple Spots, ſeveral of theſe Stones applied relieve the Patient. In the Year 1681 I ſaved from preſent Death a Boy of three Years old at *Brana*, who had ſwallowed Arſenic diſſolved in Milk, by the repeated Application of this Stone. It is a Queſtion, whether the Virtue of this Stone is to be aſcribed to the Salt in the Hartſhorn not being thoroughly burnt, or to its Pores, by which it attracts like a Cupping-glaſs. *Ex MSS. Camell. Dale.* See BOICININGA.

COCAZOCHITL. The *Mexican* Name for the *Tagetes*; *Indicus*; *medius*; *flore ſimplici, luteo-pallido*. Boerh. I. alt. See TAGETES.

COCCA *Gnidia*, or *Cnidia*. See CNIDIA.

COCCALOS, κόκκαλος. Some call the *Grana Cnidia* by this Name; but the moſt general Signification of the Word is, the *Nux Pinea*, or Pine Nut; or rather, in *Hippocrates*, the Kernels. See PINUS.

COCCARIUM. A very ſmall Pill, about the Size of a Cicer. *Oribaſii Synopſ. L.* 3.

COCCINELLA. See COCHINILLA.

COCCION, κόκκιον. A Weight in *Myrepſus*; the ſame as SILIQUA, which ſee.

COCCOBALSAMON, κοκκοβάλσαμον, in *Myrepſus*, is the Fruit of the true Balſam-tree.

COCCONES, κόκκωνες. The Grains or *Acini* of the Pomegranate.

COCCONILEA. A Name for the COCCYGRIA.

COCCOTHRAUSTES, from κόκκος, a Grain, and θραύω, to break. A Bird, which is found in the Woods of *Italy* and *Germany*, called alſo *Fringilla Roſtrata*. It receives its Name from its Manner of Living; for it feeds on the Kernels of Cherry-ſtones, and other Fruit of the like Kind.

This Bird is recommended as a Remedy for the Epilepſy, and as a Diuretic, if either eaten, or taken by way of Decoction. *Lemery des Drogues.*

COCCULUS INDUS, Offic. Park. Theat. 1582. *Cocculus Officinarum*, Jonſ. Dend. 156. *Cocculus*, Ind. Med. 38. *Cocculæ Officinarum*, C. B. Pin. 511. Mont. Exot. 11. Pluk. Mant. 52. Phytog. 345. *Cocci Orientales*, Ger. 1365. Emac. 1548. J. B. 348. Raii Hiſt. 2. 1812. Chab. 26. *Natſiatam*, Hort. Mal. 7. 1. Tab. 1. *Arbor Indica Cocculos Officinarum ferens*, Breyn. Prod. 2. 19. Commel. Flor. Mal. 24. *Solanum racemoſum Indicum arboreſcens, Cocculos Indos ferens*, Raii Dendr. 115. INDIAN BERRY.

This is a little Berry, about as big as a Bay-berry, but more of a Kidney-ſhape, having a wrinkled Outſide, with a Seam running lengthways from the Back to the Navel. It is of a bitteriſh Taſte, being the Fruit of a Tree deſcribed in the ſeventh Volume of the *Hortus Malabaricus*, under the Name of *Natſiatam*, bearing Leaves in Shape of a Heart, and Bunches of five-leav'd white Flowers, which are ſucceeded by theſe Berries. They grow in *Malabar* in the *Eaſt Indies*.

They are rarely uſed in Phyſic, being accounted to be of a hurtful and pernicious Nature. *Miller's Bot. Off.*

Condronchius, who has wrote a Treatiſe concerning theſe Berries, informs us, that he had often found from Experience, that a ſmall Quantity of the Powder of theſe Berries, mix'd with Hogs-lard, a boil'd Apple, or ſome Subſtance of a like Nature, if apply'd to the Heads of Children, kill Lice more effectually than Staveſacre, and with leſs Danger than Quickſilver.

But theſe Berries are principally uſed for catching Fiſhes. *Cardan*'s celebrated Receipt for this Purpoſe runs thus:

> Tak of the Berries of the oriental Coccus, a Quarter of an Ounce; of Cumin, and boiling Water, each two Ounces; of Cheeſe, one Ounce; and of Meal, three Ounces: After bruiſing theſe together, form them into ſmall Balls.

Others mix the Berries with old Cheeſe, Honey, and Wheaten-meal, of which they form ſmall Balls to be thrown to Fiſhes. Others, for this Purpoſe, mix a Variety of other Subſtances with theſe Berries; but there is no Neceſſity for ſo troubleſome an Apparatus, ſince I know from Experience, ſays *Ray*, that a ſimple Ball of the Powder of theſe Berries, made up with Wheaten-meal and Water, is equally efficacious for ſtupifying, and at laſt killing Fiſh: For that Fiſhes, as ſome aſſert, are, by eating Balls of this kind, only rendered vertiginous and ſtupid for a while, but ſoon return to their natural State, is not confirm'd by Experience; for my own Experience quadrates with the Opinion of thoſe Fiſhers ſpoke of by *Condronchius*, and who affirm, that Fiſhes are ſoon kill'd by Balls of this kind. But I don't know whether, as they aſſert, they ſoon become putrid, and fall into Pieces, unleſs they are ſpeedily taken out of the Water. If, ſays *Condronchius*, any ſhould object, that, upon taking theſe Balls, the Fiſhes ſwim up and down with uncommon Haſte and Precipitation, by which means their Intoxication or Vertigo is produced, I anſwer, that they do not thus ramble in conſequence of their Vertigo, but in conſequence of the intolerable Pain they feel from that unfriendly Subſtance, juſt as other Animals, eſpecially Men, do, when they are racked with any intenſe Pain. I readily grant, that, by theſe Balls, Fiſhes are at firſt rendered vertiginous, and, as it were, intoxicated; but, at the ſame time, I affirm, that they are ſoon after kill'd; for I am not ſo much of Opinion, that they are render'd vertiginous, and kill'd by the bitter and acrid, as by ſome other hitherto unknown Quality of theſe Berries. I will not, however, take upon me to determine, whether Fiſhes, kill'd in this manner, may be ſafely eaten; but, with *Condronchius*, I am of Opinion, that no Danger attends the Uſe of them as an Aliment, if they are gutted and boiled as ſoon as they are taken.

That theſe Berries are hot, and by no means cold, as *Matthiolus* maintains, notwithſtanding their narcotic Quality, is ſufficiently obvious from their acrid and bitter Taſte, as alſo the other Effects produced by them, as *Condronchius* has evidently demonſtrated.

This ſame Author is of Opinion, that theſe Berries are by no means poſſeſſed of a poiſonous and deleterious Quality; and that it is not by this, but by their Bitterneſs, and primary Qualities, that Fiſhes are kill'd; but the contrary to me ſeems plain from a Story related by *Amatus*. A certain Schoolmaſter, aſking for Cubebs from an ignorant Apothecary, received theſe Berries in their ſtead. When the Schoolmaſter had greedily devour'd three or four of them, he was ſeiz'd with a Nauſea, Hiccough, and Anxiety, which Symptoms, together with the Danger they threatened, were immediately remov'd by the Exhibition of a Vomit. *Raii Hiſt. Plant.*

COCCOS, or COCCUM; κόκκος, in *Hippocrates*, when without any Addition, imports the *Cnidia Grana*. But Coccus implies any Berry or Grain.

COCCOS. The Coco-nut. See PALMA; COCCIGERA; ANGULOSA.

COCCUS *Americanus* is the Cochineal. See COCHINILLA.

The COCCUM *baphicum*, *infectorium*, *tinctorium*, *Chermesinum*, or *Scarlatinum*, is the CHERMES, which see.

The COCCUS *Polonicus*, which *Breynius* calls *Coccus Radicum Tinctorius*, becauſe it is principally found adhering to the Roots of the *Polygonum Cocciferum*, *Koſmaczeb Polonis*, C. B. which he takes to be the *Polygonum Germanicum*, *incanum*, *flore majore perenni*, Raii, is another ſort of Grain us'd in Dying.

This, ſays *Breynius*, is found ſometimes ſingle, ſometimes more, even forty adhering to one Plant, of different Sizes, from a Poppy-ſeed to that of a white Pepper-corn. It is roundiſh, ſmooth, and of a purple-violet Colour, and, in a thin Cuticle, incloſes a blood-red Juice: One Half, or more of it, is cover'd with a rough dark-brown Cruſt, by which it adheres to the Roots.

The Countrymen gather it about Midſummer, and dry it with a ſlow Fire in Earthen Platters.

Several of theſe Cocci he expoſed to the Sun in open Glaſſes, and found, that by the 24th of *July* every one, according to its Size, had excluded a ſmall Worm with ſix Feet. That Part, which ſeem'd to be the Head, had two ſhort carnoſe Antennæ; for he could not perceive, with Glaſſes, any thing like either Mouth or Eyes. On the Back, lengthwiſe, were two Sulci, which were more or leſs viſible according to the different Motions of the Animalcule. Its Feet ſeem'd arm'd with Claws, and the firſt Pair ſtronger and darker than the reſt. The whole Worm was of an obſolete Purple-colour, and had ſeveral Briſtles of a brown-grey.

Theſe, after ten or fourteen Days, lay in a State of Reſt, and ſoon became covered with an exceeding white, fine, lanuginoſe Subſtance; in which Condition they continued five or eight Days longer, and then laid their Eggs; fifty, one hundred, or more, apiece; which, to the naked Eye, appeared but like ſo many red oblongiſh Points, but, with Glaſſes, looked like Ants Eggs, almoſt tranſparent, with a diluted blood-red Content.

Theſe Eggs, being again expoſed in the Sun about *Bartholomew-tide*, were hatched a Month after, when ſome Vermiculi were excluded, which, in the Microſcope, appear'd to be Hexapods of a purpliſh Hue, with two Antennæ at their Head, and two greyiſh Briſtles at their Tails, ſcarce viſible, except upon black Paper.

He ſuppoſes theſe laſt-excluded Vermiculi, after ſome Wanderings, at laſt fix themſelves to the Roots, and ſome of the loweſt contiguous Branches, of the Polygonum, where, being deprived of local Motion and Senſe, by ſome way or other, they imbibe that Juice from the Plant, and at laſt become the *Cocci*, ſo call'd, or Veſicles full of that blood-red Juice, ſo uſeful in Dying.

This Inſect, under what Shape ſoever it appears, either of a Giarn, a Male Worm, a Nymph, a Fly, a Female Worm, or a Worm coming out of an Egg, always, when preſſed and cruſhed, affords a Matter of a Purple-colour, which, however, is obſerved to run moſt copious in the Cocci and the Worms, eſpecially the Female ones. *Phil. Tranſ. abr. Vol.* 8.

As for the Medicinal Uſes of this Species of Coccus, the learned *Paulli* informs us, that the common People in *Sileſia* ſwallow every Year three Grains of it, in order to prevent the Attack of Fevers; but he juſtly cenſures this as a ſuperſtitious Practice, as it is not attended with the propoſed Succeſs. The ſame Author alſo brands, with the odious Name of Superſtition, the Practice of the credulous and giddy Multitude, who, about the Middle of the Day, on St. *John*'s Eve, dig up theſe Grains, in order to imprint on their Shirts and Breaſts certain Characters, with the bloody Juice they yield upon being bruis'd, thinking, by this means, to eſcape Falls, Contuſions, Wounds, the Bites of mad Dogs, and a large Train of other Diſeaſes. But tho' this learned Author affirms, that he has juſt Cauſe to deteſt and condemn the internal Uſe of this Species of Coccus, yet I ſee no Reaſon why they ſhould be rejected for Medicinal Purpoſes, ſince the whimſical Uſes, to which ſuperſtitious Fools apply any Medicine, can never rob it of its real and inherent Virtues. This I am the rather inclin'd to think, becauſe the Coccus Polonicus is found, from Experience, to have the ſame Efficacy in Medicines as the Kermes, and may be ſafely uſed as a Succedaneum to them. They are not, however, as yet receiv'd into the Shops. If, in Caſes of this Nature, Conjectures are pardonable, I am inclined to think, that the Cocca Polonica, if ſubjected to the ſame Chymical Analyſes as the Kermes, would yield the ſame Principles, and diſcover themſelves to be of a ſimilar Nature. *Rieger.*

COCCUS DE MALDIVA, Offic. Park. Theat. 1598. *Coccos de Maldiva, ſive Nux Indica ad venena celebrata*, Chab. 28. Raii Hiſt. 2. 1359. *Palma coccifera figura ovali*, C. B. Pin. 509. *Nux Indica ad Venena celebris, ſive Coccus de Maldiva*, J. B. 1. 384. *Tavaccare, ſive Nux Medica Maldivenſium*, Piſ. Mant. 203. *Palma Naldivenſis, aliis Maldivenſis*, Jonſ. Dendr. 147. THE MALDIVA NUT.

This Nut has a black Rind, which is more ſhining than that of the common Coco, or *Indian* Nut, and its Shape is more upon the Oval, and not ſo round as that of the other; the Medulla, or interior Pulp, when dry'd, is extremely hard, and of a white Colour, ſomewhat inclining to Paleneſs, very porous, and full of Clefts in the Superficies, and of no excellent Savour.

The Nuts, which *John Bauhine* ſaw, were a Foot in Length, and in Compaſs as much as he could graſp with both Hands; the Part compreſs'd was ſix Inches broad, in which appear'd a large Perforation, from another Fruit which was ſeparated, ſo that the Fruit was really double, and, in that State, was much larger than a Man's Head; the Shell was hard and thick, like that of other Nuts, mark'd with long oblique Striæ on the Outſide, and, when ſtruck, ſounding like a Pot.

Garcias ſays there is a vulgar Tradition, that the *Maldives* were once a Continent, but, by an Inundation of the Sea, were reduced into a Multitude of Iſlands; on which Occaſion the Palm-trees, which bore theſe Cocos, were bury'd in the Earth, where their Fruit were hardened in the manner they now find it. But, whether they are of the ſame Species with other Cocos, is not eaſy to determine, becauſe none ever ſaw a Leaf, or a Bough, of the Tree to which they belong, but only the bare Nuts, which are caſt upon the Shore, ſome ſingle, ſome double; but no one dares gather them up on Peril of his Life, becauſe whatever the Sea throws upon the Shore, belongs to the Sovereign. The Pulp, or medullary Subſtance, is taken out of the Shell, and then dry'd and harden'd to a Condition fit for Sale.

It is of ſo high a Value among the Natives and People of *Malabar*, that, as *Acoſta* aſſures us, not only the common Sort, but even their Princes, have recourſe to it as to a ſovereign Remedy under almoſt all kinds of Diſeaſes; and it is accounted, in particular, an excellent Alexipharmic. Under this Perſuaſion they make Drinking-cups of it, and let a Piece of the Pulp hang by a Chain in the Water which they drink, being confident, that no Poiſon can hurt thoſe who drink out of theſe Cups, which will, beſides, preſerve them againſt many Diſeaſes. But, ſince theſe Virtues are not confirmed by ſufficient Experiments, and ſome Phyſicians affirm, that they have made uſe of this Nut for the Purpoſes aforeſaid, but with no Effect; and others ſay, that they have found by Experience, that this Medicine was more injurious than beneficial; we ſhall ſay no more on this Head.

As to its ſpecific Quality, ſays *Piſo*, of promoting and facilitating Delivery in a difficult Labour, and of reſiſting the Fits of the Epilepſy, we have it confirm'd by more than one Experiment, and thoſe made by ſome of our moſt eminent Phyſicians, who have made uſe of it with all the deſired Succeſs. *Ray, Hiſt. Plant.*

COCCYGRIA. See COTINUS CORIARIA.

COCCYMELEA. Another Name for the *Cotinus Coriaria.*

COCCYX, or *Os Coccygis*, κόκκυξ. This Bone is ſituated at the Extremity of the Os Sacrum, and is, in ſome meaſure, an Appendix thereof. The Figure of it is ſomething like that of an inverted Pyramid, a little bent forward toward the Pelvis. The anterior Side is flat, the poſterior a little convex. It is made up of four or five Pieces, like falſe Vertebræ, joined together by Cartilages, more or leſs pliable. Sometimes all the Pieces are entirely cemented together.

The firſt Piece is the largeſt, and, on each Side of its Baſis, there are ſometimes ſmall Apophyſes or Cornua, joined cloſely to the Extremity of the Os Sacrum. It has alſo ſometimes a kind of tranſverſe Apophyſes, with ſmall Notches on their upper Part, which, joining with thoſe in the laſt Piece of the Os Sacrum, form a Pair of Holes, ſituated in the ſame Row with the other large ones. The other Pieces of the Os Coccygis are irregular Squares, diminiſhing in Size as they deſcend, ſo that the loweſt is like a Seſamoide Bone.

The Cartilages, which join the different Portions of the Os Coccygis, are preſerv'd in ſome Subjects to a very great Age; in others they ſoon become entirely bony. *Winſlow's Anat.*

COCHIA. A Name for certain officinal Pills. The Etymology of this Word is very obſcure. *Caſtellus* derives it from κόκκος, a Berry, on account of the Form of Pills; or from κόχος, a redundant Flux of Humours, alluding to their Effects. But, as the Preſcription is originally *Arabic*, 'tis probable the Name is ſo likewiſe.

Pilulæ Cochiæ Majores.

The greater PILL COCHIÆ.

Take of Hiera Picra, ten Drams; of the Troches of Alhandal, three Drams and a half; of Diagrydium, two Drams and a half; of the moſt reſinous Turpeth, five Drams, and make them into a Conſiſtence fit for Pills with a ſufficient Quantity of Syrup of Buckthorn. S. A.

This is taken from the *Rhaſes*, *Cap.* 1. *ad Almanſorem*, and was received at firſt by the *College* and *Auguſtan Diſpenſatories*; but the former Emendation of the College changed the Pulp of Colocynth, which was in the original Preſcription, for the Trochiſci Alhandal: But this hath further mended it, by rejecting the Stœchas, and making it into a due Conſiſtence with Syrup of Buckthorn inſtead of Syrup of Stœchas, which is more ſuitable to the Deſign of the Medicine; but it is hardly ever uſed in the preſent Practice.

Pilulæ Cochiæ Minores.

The leſſer PILL COCHIÆ.

Take of bright Aloes, the pureſt Scammony, and the Pulp of Colocynth, of each one Ounce. When they are powdered, make them into a Maſs, with a ſufficient Quantity of Syrup of Buckthorn, S. A. adding thereunto two Drams of the diſtil'd Oil of Cloves.

This is a modern Compoſition, and the moſt in Uſe of any under this Claſs: It was not in the firſt *Diſpenſatories* of the College; and, in the laſt but one, there were but two Scruples of the Oil of Cloves to the ſame Proportion of Ingredients; ſo that this is much warmer, which greatly adds to its Efficacy in many Intentions, eſpecially in colic Pains, and to diſcuſs Viſcidities, watery Humours, and Flatulences, for which Purpoſes it is often preſcribed: But then a Grain or two of Opium is generally mixed with it, to make its Operation milder, and prevent the Membranes from being too much irritated therewith. Its Doſe is from fifteen Grains to two Scruples to grown Perſons.

Pilulæ Cochiæ cum Helleboro.

PILL COCHIÆ *with* HELLEBORE.

Take the Species of the leſſer Pill Cochia, and Powder of black Hellebore, of each one Ounce: Make them into a Maſs with Syrup of Stœchas.

This has been in ſome former Editions of the *College Diſpenſatory*, but is rejected in the laſt, where many a great deal worſe are retained; for, if this be well underſtood, it is an admirable Cathartic in maniacal, hypochondriacal, and almoſt all nervous Caſes; and nothing likewiſe more effectually opens the menſtrual Diſcharges, when they are wanted, than this Medicine. It may be given from fifteen Grains to half a Dram. At firſt Uſe it will ſometimes vomit, but, after a few Repetitions, it takes more downwards. *Quincy's Diſpenſatory.*

COCHINILLA & COCCINILLA, Offic. *Cochenille*, Duret. 66. *Cochinilla*, Laet. Ind. Occ. 229. *Cochinille, ſive Fici Indici grana*, Park. Theat. 1498. *Ficus Indicæ Grana*, C. B. Pin. 458. *Coccinella*, Offic. *Coccus Indicus tinctorius*, Geoff. Tract. 370. *Nepalnocheztli, ſeu Coccus Indicus in Tunis quibuſdam naſcens*, Nieremb. 312. Hern. 79. *Cochenilla Hiſpanis*, Breyn. Hiſt. Cocc. 6. *Scarabeolus hemiſphæricus Cochineelifer*, Gaz. Pet. T. 1. Fig. 5. Sloan. Hiſt. Jam. 2. 208. *Scarabæus nigricans alarum alias rubicundus limbis*, Mer-Surin. 2. *Cochineal*, Act. Philoſoph. Lond. No. 176. 193. COCHINEAL.

This Drug comes from the *Weſt Indies*, but Authors are not agreed as to its Nature, ſome taking for a kind of Worm, others ſuppoſing it to be purely the Grain of a Tree.

Father *Plumier*, a *Minim*, and a famous Botaniſt, who dy'd in 1704. was of the firſt Opinion; but *Pomet*, who dy'd about the ſame time, in his general Hiſtory of Drugs, ſtrenuouſly contends for the latter.

It might, perhaps, be prov'd, that they are equally miſtaken in their Deſcriptions of Cochineal, whether it be a Worm, or a Grain; and yet, to reconcile them in ſome meaſure, it may be ſuppoſed, that there is one Sort of Cochineal which is a Worm, and another which is only a Grain.

This is the Opinion of *Dampier*, an *Engliſh* Traveller, who, in his Relation, intituled, *A new Voyage round the World*, where he profeſſes to affirm nothing but what he had ſeen, or knew the Original of, ſpeaks of both theſe Sorts of Cochineal.

His Deſcription of them is ſo exact and circumſtantial, that, if it be not true, it is at leaſt more probable than all that has hitherto been ſaid on the Subject. He deſcribes the Worm-cochineal in the following Manner:

Cochineal is an Inſect generated in a kind of Fruit very much reſembling the Prickly-pear. The Shrub, which bears that Fruit, ſeldom grows above five or ſix Feet high, and is very thorny. On the Top of the Fruit grows a red Flower, which, when ripe, turns in upon the Fruit. When this Flower, being dry'd by the Heat of the Sun, falls off, the Fruit opens to the Breadth of two or three Inches, and appears quite full of ſmall Inſects, which have Wings of a ſurpriſing Minuteneſs, and would there die and putrify, if they were not removed. As ſoon, then, as the Fruit is ſufficiently open, the *Indians* ſpread a large Sheet, and beat down the Inſects with Poles.

The Tree which produces theſe Inſects is thus diſtinguiſh'd: COCHINILLIFERA, Offic. *Ficus Indica major, lævis, ſive non ſpinoſa, Vermiculos, quos Cochinilla vocant, proferens*, Pluk. Phytog. Tab. 231. Almag. 145. *Opuntia maxima, folio oblongo, rotundo, majore, ſpinulis obtuſis, mollibus, & innocentibus, obſito flore ſtriis rubris variegato*, Cat. Jam. 194. Hiſt. 2. 152. Raii Dendr. 19. *Tuna mitior flore ſanguineo, Cochenillifera*, Dillen. Hort. Eltham. 399. Tab. 297. Fig. 383. *Arbor Cochenille*, Duret. 66. *Nocheznopatli, ſeu Nopalnocheztli, in quo Coccus Indicus naſcitur*, Hern. 78. *Nepalnocheteli ſeu Nochetzli Nopalli*, Jonſ. Dendr. 56. THE COCHINEAL TREE. *Dale.*

There are large Plantations of theſe Trees at *Guatimala*, *Chepe*, and *Guexaca*, in *Mexico*, as alſo in the Province of *Tlaſcala*.

According to *Dampier*, the vegetable Cochineal is produc'd by a Tree not unlike that, from which the animal Species is procur'd. The Fruit of this, when ripe, opens, and diſcloſes a great Number of ſmall Grains, which the *Indians* gather. This, according to the above-quoted Author, affords near as beautiful a Colour as the other Cochineal.

But, I think, it is now univerſally allow'd, that the Cochineal uſed in Medicine is an Inſect. *Melchior de la Runſcher* took the Pains to procure from *Antiquera* in *New Spain*, the Place where there is the greateſt Traffick for Cochineal, Atteſtations upon Oath of eight Perſons, who have been immediately employed in propagating and managing it for many Years; from whence the whole Natural Hiſtory of this Drug is collected. Theſe ſhew, firſt, in regard to Cochineal itſelf,

That they are ſmall living Animals, with a Beak, Eyes, Feet, and Claws; that they creep, climb, ſeek their Food, and bring forth Young, not changing their Species, as Silkworms, but producing their like; which are not larger than Knits, or ſmall Mites, or the Point of a Needle; but, when come to Maturity, reſemble, in Size and Figure, a Dog's Ticke. Thus far is certain; but their Manner of generating is doubtful, tho' it is commonly believed by thoſe who cultivate them, that they are impregnated by a ſmall Butterfly, which is bred upon the Nopal, (the Plant they live upon) which paſſes and repaſſes over them.

Secondly, As to the Manner of raiſing, nouriſhing, and managing them, it appears, that at the proper Time, that is, after Winter, (when theſe little Animals can bear the open Air) when the Cochineals, which they have kept in their Houſes, are grown ſo large and big as to produce young ones, they put twelve or fourteen together into a Paſtle or little Neſt, made of fine ſoft Hay, or Straw, or Moſs of Trees, or the Down, which immediately invelopes the Cocoa Nut. Theſe Paſtles are then placed upon the Plants of the Nopal, or prickly *Indian* Fig (which they take care to cultivate well for this Purpoſe); and in two, three, or four Days, theſe Animals bring forth a great Number of young ones; ſoon after which the Mothers die. In the mean while the young ones, coming out of the Neſts, climb up the Nopal, fix themſelves to it, and ſuck its Juice, which is their only Nouriſhment; but do not eat the Plant; and for this Reaſon they always ſeek thoſe Parts of it, which are greeniſh, and fulleſt of Juice, taking care at the ſame time to place themſelves on the Parts moſt ſheltered from the Wind and Weather. During this Time, whilſt they are growing up, and become pregnant, great Care is taken, that no Vermin incommode or kill them, as alſo to keep them clean, and diſengage them from certain Threads, like Cobwebs, which grow upon the Nopal; as likewiſe to defend them from too much Heat or Cold, from the Rain and Winds, becauſe the fine Cochineals are very tender. Nevertheleſs the wild Cochineals ſtand all theſe Inconveniencies; but then they are ſo gritty, of ſo ill a Smell, and of ſuch little Value, that they ought not to be mixed with the fine.

Thirdly, In regard to the gathering of the Cochineal: The firſt is of the Mothers, which, having brought forth their young, have died in their Neſts. Three or four Months after this, as the Seaſon permits, when the firſt young ones are become ſufficiently large and big, and are in a State to bring forth Young in their Turn, and alſo have produced ſome few, the *Indians* carefully gather them off the Nopals with a little Stick, to which they fix a little Hair, in the Nature of a Pencil. Theſe Animals being collected in this Manner, and afterwards killed by hot Water or Fire, this is called the ſecond Gathering, or rather the firſt of the young ones that have been nouriſhed and raiſed in the open Air. Three or four Months after this, they gather the ſecond Brood of thoſe, which have been born upon the Nopal, which, being become big, have brought forth already ſome young ones. This they do much in the ſame manner as before; only now they take off the Plant a great many young ones with their Mothers; which makes this Sort of Cochineal be called *Granilla*, from the Number of ſmall ones found in it. In the mean time they keep a Number of theſe young ones alive upon the Nopals, which they pluck up, or cut, and lock up in their Houſes, to nouriſh theſe Animalcules during the rainy Seaſon. Laſtly, theſe being grown large, they put them into the Paſtles, and proceed in the Manner above expreſſed;

preſſed; ſo that, for the moſt part, they make three Gatherings in a Year.

Fourthly, as to the Manner of killing the Cochineal: This is commonly done two Ways, either in hot Water, or in Tamaſcales, which are little Ovens made for that Purpoſe; tho' there are ſome People who kill them by roaſting them upon Comales, which are flat Stoves with Fire under them, made uſe of by the *Indian* Women to bake their Maiz-bread. Theſe three different Methods give the Cochineal three different Colours. The firſt renders them of a brown Red, the hot Water making them loſe the white Colour, with which they are cover'd when alive. The ſecond makes them of an Aſh-colour, and marbled, or jaſper'd; both upon account of the natural White with which they are cover'd, and the red and tranſparent Colour of the Cochineal. The third Sort becomes black, as if it had been burnt. Of the old ones, which died after dropping their Young, four Pounds produce but one, when dried; or rather, one Pound is reduced to four Ounces: But three Pounds only of the Living, which have been taken off the Nopals, being kill'd and dried, produce as much.

Theſe Inſects are accounted a powerful ſudorific, alexipharmic, and antifebrile Medicine, capable of curing all Fevers, however malignant; for which Reaſon they are frequently exhibited in the Plague, and in petechical Fevers. *Dale.*

Geoffroy ſays, that the Cochineal is uſed in all the ſame Intentions, with Chermes; and, beſides the common Scarlet, is the Baſis of that beautiful Colour call'd *Carmine*, which is uſed by Painters.

Lemery informs us, it is good for the Stone, for the Gravel, for a Diarrhœa, and to prevent a Miſcarriage, being taken in Powder from twelve Grains to half a Dram.

We are inform'd, in the *Philoſophical Tranſactions*, that there grows a Berry (by Report) both in *Bermudas* and *New-England*, call'd the *Summer-Iſland Reed-weed*; which Berry is as red as the Prickly-pear, giving much the like Tincture; out of which Berry come out firſt Worms, which afterwards turn into Flies, ſomewhat bigger than the Cochineal-fly, feeding on the ſame Berry; in which, we read, there hath been found a Colour, not inferior to that of the Cochineal-fly, and, as to medicinal Virtue, much exceeding it.

COCHLAX, κόχλαξ. A Flint.

COCHLEA.

The *Cochlea* of the *Latins*, and the κόχλος or κοχλίας of the *Greeks*, import what, in *Engliſh*, we call a *Shell-ſnail*. Among the *Greeks* it received this Name from the Word κόχλω, to wind or wreath; becauſe this Animal is wreath'd or wrapt up in a Shell of a ſpiral Form. Without enumerating all the Peculiarities relating to the Natural Hiſtory of this Animal, we ſhall only obſerve, that Shell-ſnails are divided into thoſe of the Land, and thoſe of the Water Kind. Thoſe of the former Claſs are again ſubdivided into Garden and Vineyard Snails; whereas thoſe of the latter Claſs are diſtinguiſh'd into Sea and River Snails. Theſe Animals vary conſiderably with reſpect to Bulk, Figure, and Colour. *Swammerdam*, in his *Biblia Naturæ*, informs us, that he had found from Experience, that a Shell-ſnail was not conſumed, as is commonly believed, but only kill'd, by ſprinkling Salt upon it; ſince by that means, in conſequence of the ſtrong Contraction of the Muſcles, all the Viſcera are ſo powerfully corrugated, that nothing of a diſtinct Form is to be obſerved; for all the Mucus is at that time ſqueez'd out of their Bodies, as he ſays he himſelf obſerved. The ſpermatic Veſſels of this Species of Snail were alſo render'd a Third leſs by the Salt: Hence Salt, to him, appears a truly purgative Medicine to the Snail, by which all the Humours of its Body are evacuated. He alſo thinks it would be expedient to anoint this Animal with various Kinds of purgative Medicines, in order to obſerve the Effects produced by this means. This Attempt, he is of Opinion, would be of no inconſiderable Service to Medicine. But, waving Topics of this Nature, we ſhall briefly inquire into the various Uſes, to which theſe Animals have been apply'd, both by the Antients and the Moderns. That Shell-ſnails, therefore, were by the *Greeks* uſed as an Aliment, we may learn from *Athenæus*, in *Lib.* 2. *Cap.* 23. and, that the *Romans* apply'd them to the ſame Purpoſe, is obvious from thoſe ſubterraneous Cavities call'd *Cochlearia*, deſtin'd for keeping theſe Animals; of which, according to *Apicius Cœlius*, *de Opſoniis & Condimentis*, *L.* 7. *C.* 16. various Diſhes were prepared among the *Romans*, after they had been fed or fatten'd in a particular manner. *Pliny*, in the fifty-ſixth Chapter of his ninth Book, informs us, that theſe Animals were fed to ſuch a Bulk by proper Subſtances, that their Shells were capable of containing *Octo Quadrantes*, as *Salmaſius*, in his *Exercitationes Plinianæ*, will have the Paſſage read, and not *Octoginta Quadrantes*, according to the common Reading. Now a Quadrans is the fourth Part of a Sextarius, and contains five Ounces, Wine-meaſure; ſo that eighty *Quadrantes* amount to twenty Sextarii, which are equivalent to our twenty Pints, according to the Calculation of *Geſner*. According to *Dioſcorides*, in *L.* 2. *C.* 9. "Land Snails, call'd "*Operculares*, are beneficial to the Stomach, and not ſoon "corrupted. The Sea Shell-ſnail is alſo beneficial to the Sto"mach, and eaſily diſcharged by Stool. The River Snail "ſmells rank. But that Species which adheres to Briers and "Buſhes, and which is by ſome call'd *Seſilon*, produces Diſor"ders in the Belly and Stomach, and excites Vomitings. "When apply'd raw, with their Integuments, they diſcuſs "anaſarcous Swellings; but they ought not to be removed till "all the Humour is evacuated, or drawn out. They afford "Eaſe in arthritic Inflammations. When Splinters are lodg'd "in any Part of the Body, they are drawn out by anointing "it with Snails. When triturated, and applied by way of "Peſſary, they provoke the Menſes. Their Fleſh, made up "into an Ointment, with Frankincenſe and Myrrh, conglu"tinates Wounds, eſpecially thoſe of the Nerves. When tri"turated in Vinegar, they ſtop Hæmorrhages of the Noſe. "The Body of a live Shell-ſnail, eſpecially one of the *African* "Kind, if eaten with Vinegar, mitigates Pains of the Sto"mach. If it is triturated, with its Shell, in Wine and "Myrrh, a little of this Wine, drank, removes Pains of the "Colon and Bladder. The viſcid Juice of the Land Snail, "applied to the Hair, makes it lie in any Poſition in which it "is placed. The Shells of all the Species of Snails are of a "drying and cauſtic Nature. They alſo remove Leproſies, "Vitiligos, and Foulneſs of the Teeth. Theſe Shells, when "calcined with their Fleſh, and triturated with Honey, make "an Ointment for ſore Eyes, for Foulneſs of the Face, for "Films of the Eyes, and Dulneſs of Sight." *Pliny*, in the fourth Chapter of his thirtieth Book, affirms, "That the "Aſhes of all Shell-ſnails inſpiſſate and heat by their ſapona"ceous Quality; for which Reaſon they are uſed in Cauſtics, "and as an Ointment in the Itch, Leproſy, and Freckles." Pains of the Uvula are alſo mitigated by anointing the Part affected with the Juice of a Snail, let out with the Point of a Needle. A little after, he ſubjoins, that Roughneſs and Defluxions of the Fauces are mitigated by Snails boil'd in Milk, when the Earth is waſh'd from them; after which they are to be bruiſed, and exhibited for Drink, in that Species of Wine which the Antients call'd *Paſſum*. The ſame Author informs us, that Tooth-achs are removed by putting the ſmall Sand, found in the Horns of the Snails, into the Hollows of the Teeth. He alſo affirms, that theſe ſandy Concretions procure an eaſy and unpainful Dentition; and that the Aſhes of the Shells, with Myrrh, are beneficial to the Gums. He aſſerts, that the Fleſh of the Snail is of Service to the Stomach, if, after a gentle Boiling, it is roaſted on the Coals, and exhibited in Wine and Garum; but their rank Smell produces a bad Breath. With *Dioſcorides*, he condemns the River and Wood Snails; but commends thoſe found in the Sea, as an excellent Medicine for Pains of the Stomach, if eat alive with Vinegar. He alſo ſays, that Shell-ſnails, without the Shells, bruiſed in Water, make an excellent Medicine, if drank by ſuch as ſpit Blood. For alleviating a Cough, he recommends Snails bruis'd to be drank in three *Cyathi* of moderately warm Water. By boiling unwaſh'd Snails in Muſt, (*Protropum*) or in Sea-water, he ſays, a Decoction is prepared very proper for Uſe at Meals; and that theſe Animals, with their Shells, triturated in *Muſt*, make an excellent Medicine againſt a Cough. He alſo aſſerts, that Patients afflicted with Deliquiums, Alienations of Mind, and Vertigos, are greatly relieved by drinking Snails, triturated with their Shells, in three Ounces of warm Wine, for nine Days; and that, for this Purpoſe, ſome uſed but one Snail for the firſt Day, two for the ſecond, three for the third, two for the fourth, and one for the fifth; and that by this means Aſthmas, and Impoſtumations of the Lungs, are render'd more tolerable; as alſo, that three Snails, triturated with their Shells, and boil'd in Wine, with fifteen Grains of Pepper, are properly exhibited for a Draught to Patients afflicted with Pains of the Loins. The ſame Author, in *Cap.* 7. informs us, that two Snails, triturated with their Shells, with an Egg, and an Addition of Salt, and two Ounces of Paſſum, or Palm-juice, or three Ounces of Water, boil'd in a new Veſſel, make an excellent Draught for Dyſenteric Patients; for which Purpoſe he alſo recommends their Aſhes to be drank in Wine, with the Addition of a ſmall Quantity of Reſin. In the ſubſequent Chapter he informs us, that three Snails triturated, without their Shells, in an Ounce of Wine, make an excellent Medicine for the Cure of an involuntary Diſcharge of Urine. The Day following two are only to be uſed, and the Day after that one. He alſo recommends the Aſhes of the calcin'd Shells for expelling the Stone; and affirms, that the Juice of Snails, extracted by Puncture, removes a *Procidentia Ani*, if the Part affected is anointed with it; that ſciatic Pains are alleviated by drinking *Aminean* Wine, in which crude Snails and Pepper are triturated; that, if one of the Teſticles hang lower than the other, the Diſorder is removed by anointing it with the Froth of Snails; and that broad ſmall Snails, either triturated in Vinegar, or the Aſhes of theſe Animals, cure running Ulcers of theſe

theſe Parts; that the Aſhes of *African* Snails, calcin'd with their Shells, and drank in ſome proper Liquor, cure an Hydrocele; that the Aſhes of the Shells, mix'd with Wax, contribute to the Diſcuſſion of *(Pani)* glandulous Tumors; and that Tumors of the Groins are cured by anointing them with Snails bruiſed with Honey. In his ninth Chapter he ſays, 'tis commonly reported, that, by drinking broad Snails, Pains of the Feet and Joints are removed; that, for this Purpoſe, two of them muſt be triturated with Wine, and the Snails themſelves apply'd to the Part affected, with the Juice of the *Helxine*; but that, for this Purpoſe, ſome only triturate them in Vinegar. In the thirteenth Chapter of the ſame Book he affirms, that Snails bruiſed, and applied to the Forehead, contribute to ſtop Hæmorrhages from the Noſtrils; that, when bruiſed with their Shells, they are proper for the Cure of ſpreading Ulcers; that, when triturated with Myrrh and Frankincenſe, they cure wounded Nerves; that Land Snails, dried in the Sun, and applied with Vinegar, are beneficial to Wounds; that, when taken out of their Shells, bruiſed, and applied, they conglutinate recent Wounds, and put a Stop to ſpreading Ulcers; that the Species of Shell-ſnails, which, in Cluſters, live upon Leaves, if bruiſed with their Shells, and applied, extract Splinters, Arrows, or any other ſuch Thing, from the Body; and that ſuch as are eaten are to be uſed without the Shells; but that they are moſt efficacious with the Rennet of the Hare. *Pliny*, in the fourteenth Chapter of the ſame Book, affirms, that Snails, uſed by way of Aliment, accelerate the Expulſion of the Fœtus; and that they alſo contribute to Conception, when applied with Saffron. That an Ointment made with Snails, Amylum, and Gum Tragacanth, ſtops Hæmorrhages of the Uterus; that, when uſed in Aliments, they promote a Diſcharge of the Lochia; and, in Conjunction with the Marrow of the Stag, correct the Indiſpoſitions of the Uterus; whoſe Flatulences they alſo diſcuſs, when triturated, without their Shells, with Oil of Roſes; but that, for theſe Purpoſes, the Shell ſnails of *Stampalia* are moſt proper. That two *African* Snails, triturated with as much Fenugreek as can be taken up in three Fingers, with an Addition of four Spoonfuls of Honey, are proper for anointing the Belly; but, for this Purpoſe, they muſt be firſt well anointed with the Juice of Orris. That the long ſmall whitiſh Shell-ſnails, which occur every-where, when dry'd in the Sun, reduced to a Powder, and mix'd with an equal Quantity of Bean-meal, prove an excellent Medicine for rendering the Skin white and ſmooth; and that, by the ſmall broad Shell-ſnails, mix'd with Polenta, a Species of fine Flour, the Deſire of Scratching is removed. In *Lib.* 30. *Cap.* 15. he alſo tells us, that the Froth or Mucus of Snails, apply'd by way of Ointment to the Eyes of Children, corrects the Eyelids, and enlarges them when too little; that the Aſhes of Snails, prepared with Frankincenſe and the Whites of Eggs, apply'd by way of Ointment, for thirty Days, to the Part affected, cures Hernias; that the Aſhes of their Shells, mix'd with Wax, prevent a Procidentia Ani; but that, with theſe Aſhes, there is a Neceſſity of mixing the Sanies of the Viper's Brain, let out by Puncture; that the Deſire of Venery is check'd by the Excrements of Snails, drank with Oil and Wine; but *Petronius* aſſerts, that the Necks of Shell-ſnails prove a powerful Stimulus to Venery. *Pliny* alſo, in the fifth Chapter of his thirty-ſecond Book, affirms, that the Fleſh of River Shell-ſnails, whether raw or boil'd, is good againſt the Stings of Scorpions; that, for this Reaſon, ſome keep them ſalted, and apply them to Wounds of any Kind. And, in the tenth Chapter of the ſame Book, he informs us, that recent River Snails may be uſed, as an Aliment, for the Cure of Quartan Fevers; that, for this Purpoſe, ſome keep them in Salt, and exhibit them triturated in ſome proper Liquor.

Hippocrates, in his Treatiſe *de Fiſtulis*, in a *Procidentia Ani*, orders the prolapſed Part to be anointed with the Mucus of Snails, and fomented with a ſoft Sponge, drench'd in ſome proper Liquor. According to *Matthiolus ad Dioſcoridem*, *Galen*, when treating of the medicinal Uſe and Virtues of Shell-ſnails, ſpeaks in the following manner: If the Whole of the Snails are calcin'd with their Shells, and mix'd with unripe Galls, and white Pepper, they are ſingularly beneficial in Dyſenteries, where the Ulcers are not as yet become putrid. 'Tis proper, that, for this Purpoſe, there ſhould be one Part of Pepper, two of the Galls, and four of the Aſhes of the Snails. When theſe are ſufficiently levigated, the Powder is to be ſprinkled on Aliments, and exhibited to be drank either in Water, White-wine, or tart Wine; but, without the Admixture of the Galls, the Aſhes of the Snails are of a very drying Quality, and ſomewhat hot, in conſequence of the Calcination. Beſides, Shell-ſnails, which have not been calcin'd, if triturated with their Shells, and applied to the Bellies of dropſical Patients, and to arthritic Swellings of the Joints, can hardly be removed again, but dry very conſiderably. They muſt alſo be ſuffer'd to adhere to the Parts, till they fall off ſpontaneouſly. They are to be applied in the ſame manner to Tumors ariſing from Blows, and which are with Difficulty reſolved; as alſo to Tumors of the Ears, ariſing from Contuſion; for they greatly dry all theſe Species of Tumors, tho' a thick and viſcid Humour ſhould be deep-ſeated in them. The Fleſh of Shell-ſnails, firſt bruiſed in a Mortar, and afterwards reduced to an equable Softneſs, powerfully dries Parts abounding with ſuperfluous Humours; for which Reaſon it is a proper Medicine in dropſical Caſes. The Juice of theſe Animals, which, without their Fleſh, is call'd by ſome μύξα κοχλίου, that is, the Mucus of the Snail, when mix'd with Aloes, Frankincenſe, or Myrrh, or with all theſe together, to the Conſiſtence of a Cerate, is a Medicine of a conglutinating Quality; dries up purulent and mucous Diſcharges from the Ears; and, when applied to the Forehead, removes Defluxions of the Eyes. Some alſo uſe the Whole of theſe Snails, levigated with their Shells, for extracting Splinters of Wood lodged in any Part of the Body; and others uſe them, thus prepared, for ſtopping immoderate Diſcharges of the Menſes. I myſelf, ſays *Galen*, in the Country, once apply'd their Fleſh triturated to a Wound, accompanied with Contuſion, and an Injury of the Nerve, and the Wound was by that means elegantly conglutinated; but the Patient was a robuſt and hardy Country Fellow. After they were triturated, I mix'd with them the fine volatile Flour, which adher'd to the Walls of a neighbouring Mill. For this Purpoſe, a little triturated Reſin may be alſo mix'd up with them. When you intend to procure a large Quantity of the Mucus of theſe Snails, their Fleſh is to be pierced with a Probe; but this muſt be done a few Days after they are taken, for, in Proceſs of Time, they become dry. And 'tis obſerved, that recent Snails contain moſt of this viſcid Mucus, which, when pierced, they diſcharge. *Galen* alſo, according to *Konigius*, informs us, that, for Abſceſſes of the Tonſils, Shell-ſnails are an excellent Medicine, if they are diveſted of their Shells, torrefied in a Pot, reduced to a Powder, mix'd up with Honey, and applied, by way of Ointment, to the Part affected: And *Avicenna*, in a Hydrocephalus, recommended Snails to be made into a cephalic Decoction, with *Arabian* Stœchas and Calamint. In the ſame Author we find, that, for this Purpoſe, ſome bruiſe them, and apply them to the Head. According to *Liſter ad Apicium*, *Galen* maintains, that the Fleſh of the Shell-ſnails is of hard and difficult Digeſtion; but that, when concocted by the Stomach, it is of a highly nutritive Quality. In theſe Animals the hard Part, call'd *Spondylus*, is to be ſeparated from that Lobe or Cavity, in which the tender Viſcera are contain'd. *Galen* alſo, in his Commentary on the eighteenth Aphoriſm of the ſecond Section of *Hippocrates*, informs us, that Shell-ſnails nouriſh ſlowly, and by little and little. *Celſus*, in the eighteenth Chapter of his ſecond Book, claſſes Shell-ſnails among the Aliments of a highly tender Subſtance; and, in the twentieth Book of the ſame Chapter, affirms, that they contain a laudable Juice. We muſt alſo obſerve, that *Horace*, in the fourth Satire of his ſecond Book, affirms, that Shell-ſnails procure an Appetite after a Debauch. From what has been ſaid, 'tis obvious, that the Antients uſed Shell-ſnails againſt many Diſorders of the human Body; that they were perſuaded of their conglutinating, drying, refrigerating, and repellent Qualities; and that, for this Reaſon, they judged them proper for correcting Acrimony, and alleviating Pain. They were alſo convinced, that they were poſſeſs'd of a ſtimulating Quality, render'd the Body ſoluble, promoted Conception, and expel'd the Fœtus; but that the medicinal Virtues of theſe Animals differ'd, according to their various Species, the different Methods of preparing them, or the Nature and Qualities of the Ingredients with which they are joined. But they were, in a particular manner, full and explicit upon the abſtergent and drying Qualities of calcined Snails, eſpecially their Shells; and aſſerted, that, in conſequence of theſe Properties, they were effectual in removing Diſorders of the Skin. We muſt alſo obſerve, that, before the Days of *Serenus Samonicus*, who flouriſh'd in the third Century after *Chriſt*, Shell-ſnails were not recommended in phthiſical Caſes.

What are the genuine Virtues of theſe Animals, and for what Reaſons they are beneficial in the above-mention'd Diſorders, we ſhall now endeavour to inveſtigate from what the Moderns have advanced on this Subject. But we muſt previouſly obſerve, that, abſtracting from the Shell, which conſtitutes their particular Genus, theſe Animals do not differ from other Snails without Shells. With reſpect to theſe Animals, *Swammerdam*, in his *Biblia Naturæ*, delivers his Sentiments in the following Words: "Tho', ſays he, the Snail is claſſed among the impure "Animals, the Uſe of which, by way of Food, was prohi- "bited to the *Jews*, (probably on account of their ſtrong "Tendency to an alcaline Putrefaction) many Chriſtian Na- "tions uſe Snails as a Delicacy, tho' every Species of Snails is "not apply'd to this Purpoſe. Tho' in *Holland* there are "various Species of Shell-ſnails, yet I do not know, that any "of them are uſed, except that Species of the Sea Snail called "*Aliekruyk (which is our Periwinkle)*. Nor do we eat theſe "at every Seaſon of the Year, but only between *Eaſter* and "*Whitſuntide*, or a few Days longer, at which time Jars of "them

" them are convey'd into the Towns; and, after boiling them " with Salt and Water, they are ſold out by Meaſure. Sailors, " and ſuch as love to create a Thirſt by ſalt Food, are generally " the Perſons who eat theſe Animals, drawing them from their " Shells with a Needle, or a Pin, and taking a large Draught of " Liquor after them. As for my own Part, I don't much ad- " mire their Taſte, ſince in the Mouth they ſeem to be too ſalt " and rancid. Their Liver is more ſapid, or better taſted, " than any other Part of their Body. Beſides, they are a " heavy tenacious Aliment, uſed rather to create Thirſt, than " preſerve Health. Their Inteſtines are alſo frequently ſo " ſtuffed with Clay or Sand, that they grate upon the Teeth. " Other Nations, ſuch as the *Italians*, the *Germans*, and the " *French*, uſe the Vine-ſhell-ſnails, eſpecially after, by a want of " Food for ſeveral Months, they have purg'd themſelves from " their Sordes; for then, in the Orifice of the Shell, there is " form'd a certain Covering, as it were, of Clay, which pre- " vents the Acceſs of Earth, or any other Sordes; for this " Species of Snail lies above ſeven Months without Motion, " that is, from the Autumn to the Spring, during which time " they abſtain from every kind of Aliment." *Henricus Mun- dius*, in his *Opera Phyſico-medica*, informs us, that among the *Italians*, and other Nations of a delicate Turn with reſpect to Cookery, an Aliment, much eſteem'd by the Luxurious, is prepar'd of Shell-ſnails, dreſſed with Wine, Aromatics, and Oil; but that, for this Purpoſe, the Species call'd *Pomacia* is moſt proper, eſpecially thoſe produc'd in *Liguria*, and ſome other Parts. *Aldrovandus* affirms, that, in his time, Shell-ſnails were eaten at any Seaſon of the Year. He likewiſe informs us, that ſome gather them in the Autumn during rainy Weather, and preſerve them in a proper Vault ſtrew'd with Bran or Sand, that by this means they may be purg'd. Then the Animals, fixing themſelves to the Walls, and other Parts of the Vault, are left in that State during the Winter, and are uſed as Food in the Spring, and during *Lent*. Then he informs us, that, at *Bononia*, they are prepar'd in various Manners, either boil'd with ſome Broth, in Conjunction with Parſley bruis'd, and ſeaſon'd with Aromatics, or only fry'd with Oil. The ſame Author alſo informs us, that the *Swiſs* uſe Shell-ſnails as an Aliment; and that, in *Switzerland*, and other Countries on the ſame Side of the *Alps*, they are gather'd, and imported into *Italy*. *Matthiolus ad Dioſc.* informs us, that in the inland Part of *Italy* Shell-ſnails are very rarely us'd as an Aliment, but that they are frequently eaten by thoſe who live on the Sea- coaſts. *Bruyerinus*, in his Treatiſe *De Re cibaria*, *Lib.* 3. *Cap.* 51. uſes the following Words: " I am inform'd," ſays he, " that ſome of my Countrymen in *Breſcia* preſerve Shell- " ſnails in Ditches, as a Delicacy in the Winter-time; for " theſe Animals, in conſequence of the Mucus and viſcid " Juice they contain, are capable of being preſerved for a " great while. 'Tis alſo reported, that they become more " valuable in proportion as this Juice is exhauſted. In *France* " the ſmall white Shell-ſnails are moſt eſteem'd, which are " found in Vineyards and Nurſeries. They are principally " uſed in the Spring during *Lent*; but when the Vines begin to " ſend forth their Buds, and their Tendrils become turgid, " they are no longer uſed by thoſe of a more faſhionable and " delicate Turn. The Method of preparing them is very " tedious and laborious; for they waſh them three times in cold " Water, that the Mucus, which, according to *Galen*, the " *Greeks* call μύξα, may be thoroughly taken from them. " Then they boil them in Water, which they pour out, and " add freſh Water, boiling them again, in order to ſoften their " Fleſh, which is very hard. Others fry theſe Snails in a Pan, " others bake them in Pyes, which are generally made very " rich. Among Phyſicians 'tis agreed upon, that the Fleſh of " theſe Snails is very heavy, and of difficult Digeſtion. When " it is thoroughly concocted, it is, however, highly nutritive; " but the frequent and liberal Uſe of it generates black Bile." In the *Bibl. Angl. T.* 13. we are inform'd, that in *Sileſia* Shell- ſnails are fed for an Aliment, with the Leaves of Plants. In the *Commercium Literarium* for the Year 1739. we are told, that in ſome Gardens in *Brunſwick* there are peculiar Repoſito- ries, or deep ſquare Caverns, whoſe Sides are cover'd with Wood, and over whoſe Mouths there is a kind of Iron Net, prepared for gathering theſe Snails during the Summer, when they are fed with Lettuce, in order to be taken out for Uſe in the Winter. I think moſt Phyſicians are agreed, that, for Ali- ments, thoſe Snails are moſt proper, which are found in Vine- yards and Nurſeries, adhering to the Hedges, and Tendrils of the Vines. Thoſe of this Species are call'd *Operculares*, or *Pomatiæ*, *Edules*, *Geſneri*, and the κηπαρίαι of *Dioſcorides*, from θῦρα, *operculum*, a Cover or Lid. But *Matthiolus* obſerves, that Shell- ſnails, whether black or white, whether large, ſmall, or of an indifferent Size, are all poſſeſſed of the ſame common Nature and Qualities; and that, if there is any Difference between them, it is the Conſequence of the Soil in which they are produc'd and nouriſh'd; for thoſe which live in open ſunny Places, and feed upon Herbs, are certainly preferable to thoſe found in ſhaded or marſhy Soils; which may be eaſily diſcover'd by the Taſte, ſince theſe latter are either inſipid, or retain the Relish of the Slime; whereas the former are better taſted, and more grateful to the Palate. Thoſe alſo which have fed upon Wormwood yield a grateful Bitter; whereas thoſe fed upon Mother-of-thyme, Peny-royal, Calamint, Origanum, and other fragrant Herbs, are recommended by their grateful Smell. Among theſe we may claſs that Species of Snails, which, being ſomewhat larger than Lupins, are found in the Fields about *Rome*, where large Cluſters of them are in the Autumn obſerv'd to adhere to the Stalks of certain Thiſtles. *Swammerdam*, in his *Biblia Naturæ*, has obſerv'd, that the moſt proper Seaſon for conveying that Species of Shell-ſnails call'd *Operculares* from one Place to an- other is in the Winter, ſince, at that time, they remain ſhut up in their Shells without Motion, and are obſerv'd to have the Mouths of their Shells cloſed up with a kind of Cover. If, on the contrary, they are to be carry'd in the Summer, he ſays 'tis moſt expedient to pack them up with ſome Herbs. If they are intended for preſent Uſe, they are to be put into a Bag, and have cut Straw intermixed with them, ſince, by the Stimulus and Puncture of theſe, they will be hinder'd from coming out of their Shells. I think it may be affirm'd in general, that Snails may be advantageouſly uſed by thoſe for whom a mucilaginous and glutinous Diet is proper, and conſequently by thoſe of a robuſt and hardy Make. But, from this very Cir- cumſtance, it may be juſtly doubted, whether they are proper for phthiſical, conſumptive, and extenuated Patients. *Wel- ſchius*, in his *Curationes propriæ*, obſerves, that they prove pre- judicial in a Phthiſis; and *Lanzonius*, in his *Opera Medico- phyſica*, thinks, that Shell-ſnails are not proper in a Phthiſis, becauſe they are concocted with Difficulty, and do not afford a laudable Juice; and becauſe phthiſical Patients labour under a Fever, and for that Reaſon have a ſmall Degree of natural Strength, incapable of digeſting Aliments of difficult Concoction. *Sebizius* argues pretty much in the ſame Strain, and concludes his Reaſoning with the following Queſtion: " How is it poſſible," ſays he, " that a laudable and ſalutary " Nouriſhment can be convey'd to the human Body by that " which is of a cold and viſcid Nature, which lives under the " Earth, and on its Surface, in dark and marſhy Places, and " which is of itſelf often nouriſhed with noxious Aliments?" The Force of this Reaſoning *Boeclerus* attempts to invalidate in the following Words: " Ducks and Geeſe live in marſhy " Places, and are often nouriſhed upon Subſtances of a hurtful " Nature, in conſequence of which they cannot, according to " this Reaſoning, afford a laudable and ſalutary Nouriſhment. " 'Tis, indeed, certain, that theſe Animals, when ill prepar'd, " or us'd in two large Quantities, may prove prejudicial; but " it does not from this follow, that they are not at all to be " us'd; but it frequently happens, that Phyſicians commend or " condemn to others what they themſelves like or diſlike." *Rolfincius*, in his *Ordo & Methodus Medicinæ*, affirms, " that " a frequent Uſe of the Shell-ſnails, gather'd in Vineyards, " and prepar'd in Fleſh-broths, is beneficial to Patients labour- " ing under Hectic Fevers; and that they afford an Aliment of " eaſy Digeſtion, ſomewhat cold, moiſtening, and ſolid." According to *Sennertus*, hectic and extenuated Patients are not abſolutely to be forbid the Uſe of Shell-ſnails, but only of their Fleſh, becauſe it is of difficult Digeſtion, and conſequently re- quires a ſtrong Stomach; for which Reaſon it is neceſſary it ſhould be long boil'd, and prepar'd with various Sauces; but, in whatever manner it is cook'd, it continues to be of difficult Digeſtion, generates a thick and black Blood, and creates Ob- ſtructions. But what is ſaid to be principally beneficial to hectic Patients is, the Broth of theſe Snails, not of the firſt, but of the ſecond Boiling; becauſe, by long Boiling, a large Quantity of the glutinous and alimentary Subſtance is extracted. There is alſo in the poſterior Part of theſe Snails, which, according to ſome, *Ariſtotle*, in his *Hiſtoria Animal. Lib.* 4. *Cap.* 4. call'd μύξων, a certain glutinous Subſtance, of a ſomewhat hard cheeſe-like Conſiſtence, eaſily diſſolvable, ſoon yield- ing to the Teeth, concocted with Eaſe, and highly nutritive. This Part is, therefore, to be choſen for the Uſe of hectic Pa- tients, or their Broth alone is to be exhibited, becauſe it is friendly to the Stomach, Pains of which it is alſo ſaid to re- move. But no ſmall Care is to be uſed in the Choice of theſe Snails; for they frequently adhere to, and feed upon, loathſome, corrupted, and poiſonous Subſtances, ſuch as Funguſes, Ser- pents, putrid Bodies, and poiſonous Herbs, in conſequence of which it has been obſerv'd, that ſome have died by eating theſe Snails. Hence *Cardan* pronounces the Man a Fool, who raſhly expoſes himſelf to ſo conſiderable a Danger. But, if we are reſolv'd to eat them, he adviſes, that they ſhould be fed for fif- teen Days in a Pot; that they ſhould be often ſhifted from one Place to another; and, above all things, that they ſhould be gather'd in clean Places. Sir *Theodore Mayerne*, in his *Opera Medica*, has the following Particulars relating to the Uſe of theſe Animals. According to *Matthiolus*, Wood-ſnails, well cleanſed from their native Mucus, and boil'd in new Milk, with Colts-foot, are ſucceſsfully uſed as an Aliment by con- ſumptive Patients. The Fleſh of theſe Animals, freed from their

their Shells and Excrements, washed with Water, and wrapt up in several Folds of Linen, are to be bury'd for two Hours in hot Horse-dung; when they are taken thence, they are to be wash'd with some warm Liquor, and boil'd in Broth prepar'd with Pullets. When thus prepar'd, they afford singular Relief to consumptive and extenuated Patients. But they may, with still greater Advantage, be prepar'd in the following Manner:

Take fifty large Shell-snails: After washing them sufficiently, boil them with Water in their Shells, along with Barley stript of its Husks, till the Barley breaks: Then, taking them out of their Shells, boil them a second time, in Capon-broth, till they are sufficiently tender. Strain the Broth thro' a clean Linen Cloth, and every Morning and Evening exhibit six Ounces of it, edulcorated with one Ounce of Sugar, three Hours before Breakfast and Supper.

Another Method of preparing them is this:

Take of Snails, divested of their Shells, two Pounds; of fresh Liquorice-root, one Pound; of Marshmallow-root, four Ounces: After cutting all these small, distil them from a Glass Alembic, plac'd in a Bath Heat. Four Ounces of this Water, edulcorated with one Ounce of Sugar, are every Morning to be exhibited to consumptive Patients.

Johannes Junckerus, in his *Conspectus Therapiæ generalis*, informs us, that, for the Use of consumptive, hectic, and phthisical Patients, those Shell-snails are accounted most proper, which, for some time before, have been fed upon Sugar and Meal; but, because they are with Difficulty concocted, they excite a Loathing in most Persons, and afford no very considerable Relief, he thinks, that their Jellies are preferable to them. But *Ettmuller* affirms, that all Shell-snails afford a Jelly impregnated with a large Quantity of a highly mild volatile Salt, like that contained in refrigerating Plants: He also asserts, that Shell-snails are possessed of a moistening Quality, and are not of very difficult Digestion. Hence he concludes, that they are highly proper in hectic Cases, when prepar'd after the manner of a certain *Italian*, whose only Remedy, in Disorders of this Kind, were Mountain Shell-snails, prepared in the following Manner: For some Days they were fed only with Sugar and Meal: Two or three Days after they were gently boiled with Water and a little Vinegar, and afterwards in rich Broth, prepared with Fowls or Mutton. *Boeclerus* positively affirms, that he himself, when so extenuated, that his Skin adhered in a manner to his Bones, was happily restored by the Broth of Shell-snails, and by Jelly of Oatmeal. See GELATINA. The Method of preparing this Broth he directs in the following Manner:

Take the mucous Part of eight or ten Snails, well boil'd, and two or three River-crabs, with their Heads cut off, and their Intestines taken out. After these are cut and bruised, let them be boil'd in Flesh-broth, till the Broth assumes a reddish Colour. Then strain the Broth, and boil it a second time. Then add, of Scurvy-grass, and Water-cresses, each two or three Pugils; and take the Vessel off the Fire, covering it well up. In the mean time dissolve the Yolk of an Egg in a sufficient Quantity of some other Broth; and, when the former Broth is so cold, that it may be drank, mix both Broths together, adding Salt, Butter, or Mace, at Pleasure. This Liquor is to be drank for some Weeks, on an empty Stomach.

Other Instances of phthisical Patients cur'd, and render'd fat, by the Use of Shell-snails, may be seen in *Eph. Nat. Curios. Decad.* 2. *a. b.* It is not to be doubted, but Shell-snails, when boil'd, afford a Substance capable of nourishing the human Body; but, at the same time, it cannot be deny'd, that their viscid and glutinous Nature renders them somewhat difficult to be digested. I am, however, persuaded, that, when diluted in other Liquors, they are easily digested, and contribute powerfully to obtund and correct the Acrimony of the Humours. Whoever reflects upon this correcting Quality of Snails, join'd to their glutinous Nature, by which they block up the Pores, will be easily able to determine, in what particular Cases and Disorders the Use of them is to be recommended. If by the Use of Shell-snails different Effects from these are produc'd, they are to be accounted for from the particular Constitution of the Patient, which, perhaps, cannot bear glutinous Substances; or from the Things on which the Snails have been previously nourish'd and fed. To these I shall subjoin a Remedy, prepar'd from Shell-snails, against the Stone of the Kidneys and Bladder, and, by the learned *Bruckmannus*, describ'd in the following Words: "Garden Snails, gather'd from their Holes in the "Ground, in the Winter-time, when they sleep securely, "and are defended from the Cold by their white and chalk-like "Shells, are to be strongly calcin'd, for two Hours at least, in "a new Earthen Vessel, cover'd and luted, by means of a "rotatory Fire. When they are cold, they are either to be "triturated in a Mortar, or, by Levigation on a Marble, re-"duc'd to a Powder of a cineritious blackish Colour, which is "to be pass'd thro' a Hair Sieve, in order to alleviate nephritic "Pains, and expel the Stone. During the Paroxysm, half a "Dram of this Powder is to be exhibited every four Hours in "Water, either with or without Sal Prunellæ, till the Pain "ceases; the Patient, in the mean time, drinking a proper "Quantity of the Oil of sweet Almonds after every Dose. "With a preservative Intention the Patient is, about the Full "of the Moon, every Month, to take three Doses of the "Powder at Bed-time, either in simple or distil'd Parsley-water; "and this Method is to be persisted in for a Year. During a "twenty Years Course of Practice, I have, with uncommon "Success, exhibited this Powder to large Numbers of Patients "labouring under nephritic Disorders. This Medicine is of "an earthy and alcaline Nature, as a great many others of the "lithontriptic Kind are." 'Tis observable, that this is one of Mrs. *Stevens's* Ingredients. *Wagnerus*, in *Eph. Nat. Curios. Decad.* 2. *a.* 10. *o.* 110. informs us, that large Snails, well triturated with their Shells, render'd hot in any Vessel over the Fire, spread on a Linen Cloth, and frequently apply'd by way of Cataplasm, are an excellent Remedy in arthritic Pains, arising from a Defluxion of acrid Humours. Some also, according to *Ettmuller*, from Snails, previously well wash'd, distil, in Balneo Mariæ, a Phlegm or Water, calculated not only for diuretic, but also for cosmetic Purposes; such as removing Disorders of the Skin, Hands, and Face: But, in his Opinion, the Liquor obtain'd from these Animals, per Deliquium, is justly preferable to the distil'd Water. *Schroder* is also of Opinion, that the distil'd Water is excel'd either by the Liquor flowing spontaneously from Shell-snails, upon their being prick'd with a Needle, or by that excellent cosmetic Liquor into which they are colliquated, when they are bruis'd, and common Salt, or rather Salt of Tartar, is sprinkled upon them in a cool Place; for both these Liquors are impregnated with a moderately oleous and volatile Salt, in consequence of which they prove excellent anodyne and refrigerating Medicines in preternatural Heats, and Pains arising from an acid or a viscid Cause; but they are, in a particular manner, beneficial in the Gout. *Joannes Heurnius*, in *T.* 1. informs us, that eight Ounces of the distil'd Water may be exhibited in Cases where the Strength is much impair'd and exhausted. And *Forestus*, in his *Observ. Medicinal. Lib.* 16. *Obs.* 58. tells us, that, by a Spoonful of the Water distil'd from young Snails, gather'd in Vineyards before the Rising of the Sun, and now-and-then exhibited with the Yolks of two Eggs, he knew a certain Monk, so extenuated as to be a truly venerable Spectacle of Mortification, render'd fat, and restor'd beyond Expectation, in a few Months. With respect to the external Use of this Water, *Juncker* advises Practitioners to take care, lest the Use of it should prove prejudicial to their Patients by a sudden Repulsation of any recrementitious Matter from the Surface of the Body. But, with respect to the common distil'd Water of Shell-snails, *Hoffman*, in his *Clavis Schroderiana*, justly observes, that these Animals, in Distillation, yield none of their Virtues; whereas, when they are boil'd, they deposit in the Liquor that Mucilage, in which their glutinous and nutritive Virtue is lodged. According to *Hoffman*, *(ad Poterium)* the Shells of the Snails, calcin'd to a very white Calx, are an excellent antinephritic Medicine: And the same Author, in his *Dissertatio de Remediorum Domesticorum Præstantia*, affirms, that, as a Preservative against the Stone, he found no Medicine more effectual than the Powder of Snails, exhibited frequently every Week. The learned *Adolphi* thinks, that between half a Dram and a Dram of the fine Powder of Snail-shells, frequently exhibited in a proper Vehicle, is preferable to most other antinephritic Medicines, because it powerfully dissolves the Gravel, and gritty Matter, of which the Stones are form'd, since, by the Use of it, large Quantities of Sand are evacuated with the Urine. But, in all Probability, this Powder is not possessed of greater Virtues than other Substances of an equally absorbent Nature. The white Opercula or Covers of Land Snails, well wash'd, and reduc'd to a Powder, are, by *Ettmuller*, recommended for carrying off a Dropsy by a plentiful Discharge of Urine, if, every Morning and Evening, the Patient takes as much of the Powder as may be held on the Point of a Knife, in a proper Vehicle. The same Author observes, that others dissolve these Opercula or Covers in Spirit of Salt, coagulate them by drawing off the Menstruum, and, *per Deliquium*, reduce them to a Liquor, which, he says, is a powerful Diuretic in Dropsies; and if, instead of the Spirit of Salt, this Solution is made in sour Wine or Vinegar, he asserts, that the Liquor will be possessed of the same Virtues. These Covers are, of all other Parts of the Snail, most easily obtain'd, because the Snails, spontaneously breaking thro' them every Spring, remove them. They are recommended in Suppressions of Urine; and, when mix'd with a little Nitre, highly extol'd as an Arcanum in the Stone. Some also add Crabs-eyes, the Kernels of Peach-stones, or the Raspings of Boars Teeth. In practical Authors, various Instances occur of Patients who have discharg'd Shell-snails, of different Kinds, both by Vomit and Stool.

There are various Sorts of Shails taken notice of, and deſcrib'd, by Naturaliſts; but we ſhall only briefly mention thoſe to which we find any Medicinal Virtues aſcrib'd, ſuch as the

COCHLEA NUDA. See LIMAX.

COCHLEA OLEARIA. This Animal receives the Epithet *Olearia*, becauſe, according to *Pliny*, in *L.* 32. *Cap.* 11. its Shell, from its commodious Figure, was uſed by way of Oil Crewet; perhaps alſo becauſe it was eſteem'd of ſome Efficacy againſt Poiſons.

COCHLEA TERRESTRIS, LIMAX TERRESTRIS, Offic. *Cochlea teſtacea*, Schrod. 5. 283. *Cochlea cinerea, maxima, edulis, cujus os operculo craſſo, velut Gypſeo; per hyemem clauditur*, Liſt. Hiſt. Animal. Angl. 111. *Cochlea cinereo rufeſcens faſciata, lviter umbellicata*, Ejuſd. Hiſt. Conch. 1. n. 46. *Cochlea Pomatia edulis Geſneri*, Ejuſd. Exer. Anatom. 1. *Pomatia*, Geſn. de Aquat. 255. *Cochlea terreſtris Gypſeo operculo obſerata*, Aldrov. de Exang. 389. THE SNAIL.

Theſe are the Snails commonly uſed in Food and Medicine.

COCHLEA CÆLATA, Aldrov. de Exang. 393. Jonſ. de Exang. Tab. 12. Geſn. de Aquat. 240. Rondel. de Piſc. 2. 98. Charlt. Exer. 62. *Cochlea cælata antonomaſtice dicta*, Bonan. 114. Tab. 11. n. 11, 12, 13. *Cochlea Trochiformis ſtriata, rugoſa, papilloſa, &c.* Lang. Meth. Teſt. 51.

This is a Species of Shell-ſnail found in the *Mediterranean* Sea. Its Operculum or Cover is, according to ſome, the *Umbilicus Marinus* of the Shops. See UMBILICUS MARINUS.

COCHLEA MINOR EX LUTEO ET NIGRO VARIEGATA, Ind. Med. *An Cochlea interdum unicolor, interdum variegata, &c.* Liſt. Hiſt. Conch. 1. n. 54. THE PARIS GARDEN SNAIL.

Theſe are us'd in Collyria. *Dale.*

COCHLEA AQUATICA, Offic. *Cochlea fuſca, faſciis crebris anguſtiſque prædita*, Liſt. Hiſt. Animal. Ang. 162. *Cochlea nigricans, denſe & læviter ſtriata*, Ejuſd. Hiſt. Conch. 4. Sect. 5. n. 43. THE WATER SNAIL, OR PERIWINKLE.

COCHLEA *Purpurifera* is the *Murex*. Purple-fiſh.

COCHLEA *Sarmatica*. A very large Snail found in the *Baltic* Sea, mention'd by *Aldrovandus* and *Johnſon*. *Rieger* ſays, it is as large as a *(Dolium)* Hogſhead, with Horns as big as thoſe of a Stag. I do not find, that it is us'd, either in Phyſic, or as an Aliment.

COCHLEA *Cærulea*. A Sea-ſhell, eſteem'd only for its beautiful Colour.

COCHLEA *Margaritifera*. See CONCHA MARGARITIFERA.

The Shells of all theſe, when calcin'd, become Lime.

COCHLEA *Foſſilis, vel Lapidea*. See COCHLITA.

COCHLEAR, COCHLEARE, COCHLEARIUM, κοχλιάριον. A Spoon, thus call'd, perhaps, from its Reſemblance to a ſort of Shell.

In medicinal Authors, it imports a Meaſure, both for liquid and dry Subſtances. *Rieger* ſays, the *Attic* κοχλιάριον was the fourth Part of the Cyathus, containing four Scruples and two-fifths of a Grain; and that the *Roman* Cochleare was the ſame. According to *Eiſenſchmidius* and *Galen*, it was only one-tenth of a Cyathus. *Monardus* ſhews, that, in *Dioſcorides* and *Pliny*, a Cochleare is not ſo much as a Dram; and that, in *Galen*, mention is made of two Sorts of Cochlearia, the leſſer and the greater. *Sennertus* is of Opinion, that the Cochleare was of four Sorts, the leaſt, the ſmall, the greater, and the greateſt; ſo that the leaſt was half a Dram; the ſmall one a Dram; the greater a Dram and a half, or two Drams; and the greateſt half an Ounce. *Arbuthnot* informs us, that a *Cochleare* was half a Chema, which is the ſixtieth Part of an *Attic* Xeſtes, or *Roman* Sextarius. By this way of calculating, a Cochleare was one-tenth of a Cyathus.

In the *London* and *Edinburgh* Diſpenſatory, a Cochleare is defin'd in Syrups half an Ounce; in diſtil'd Waters three Drams.

COCHLEARIA.

The Characters are,

The Fruit is almoſt globous; the Seeds are round.

Boerhaave mentions ſix Species of this Plant, which are,

1. Cochlearia; folio Cubitali. *Tourn. Inſt.* 215. *Elem. Bot.* 184. *Boerh. Ind. a.* 2. 10. *Dill. Cat. Giſſ.* 66. *Buxb.* 77. *Raphanus ſylveſtris*, Offic. *Raphanus ruſticanus*, Cod. Med. 96. Ger. 187. Emac. 241. Park. Theat. 860. C. B. Pin. 96. Raii Hiſt. 1. 818. Synop. 3. 301. Merc. Bot. 1. 64. Phyt. Brit. 103. Mer. Pin. 102. Hiſt. Oxon. 2. 237. *Raphanus ſylveſtris, ſeu Armoracia multis*, J. B. 2. 851. *Raphanus ſylveſtris Armoracia*, Chab. 474. *Armoracia Rivini*, Rupp. Flor. Jen. 74. HORSE-RADISH. *Dale.*

The Roots of this are a Finger thick, and more long, ſinking deep in the Earth, of a white Colour, and of a hot, biting Taſte, and of a volatile, pungent Smell. It has many long, large, undivided Leaves, indented about the Edges, of a dark-green Colour. The Stalks ariſe not very high, having a few, long, narrow Leaves, and ſlender Spikes of ſmall, white, four-leav'd Flowers, ſucceeded by little, round-pointed Seed-veſſels, which ſeldom bring ripe Seed. It grows wild in ſeveral Places near River-ſides, and is planted in Gardens for the Root's ſake, which is only uſed.

It is heating, drying, and aperitive, frequently us'd in Sauces, to create an Appetite. It is of great Uſe againſt the Scurvy, Dropſy, and Jaundice, and is often put into Diet-drinks for thoſe Purpoſes. *Miller's Bot. Off.*

The only Medicine, deriving its Name from this Plant, is the *Aqua Raphani Compoſita*. See AQUA.

When this Plant is calcin'd, very little or no Salts can be extracted from the Aſhes, theſe being naturally volatile.

The expreſſed Juice, being ſuffered to putrify, affords an alcaline volatile Salt, as does Urine; which is the Reaſon why it is ſo highly beneficial in the acid Scurvy. In the other kind of Scurvy, it is very pernicious; in which Caſe I have known it to procure a Rupture of the Liver. But where there is a Defect of Heat, and a Coldneſs and Viſcidity of the Juices, it is very proper. In a Scurvy attended with a hot Fever, and a Putridneſs, it would deſtroy the Patient. So alſo in a Dropſy, if it proceeds from a cold Cauſe, this Plant is proper to be uſed, otherwiſe not. I have ſeen bloody Stools and Urine procur'd by an unſeaſonable Uſe of it. A Maid in this City (*Leiden*) was afflicted with a hot Scurvy; by taking this Herb, ſhe fell into a continual Bleeding at the Noſe, from which ſhe was afterwards freed by the Uſe of *Acetoſa*. The Root, taken in a large Quantity, excites Vomiting. Bruiſed ſmall, and drank to the Quantity of two Ounces, it is good for thoſe, who are afflicted with a pituitous Stomach; and, if this be attended with Vomiting, it will be proper to drink plentifully of warm Water, after taking the Doſe. The Herb, in Conjunction with Acetoſa, makes an excellent antiſcorbutic Medicine; otherwiſe, where its Acrimony is to be feared, it is to be temper'd with Milk, Whey, or Raiſins. It is uſed for Gargariſms in Putrefactions of the Gums, and yields a noble Spirit and Tincture. *Boerh. Hiſt. Plant. p.* 419.

This Plant is frequently uſed in ſtimulating Cataplaſms, together with Muſtard-ſeed, old Yeaſt, and Vinegar.

2. Cochlearia; hederæ folio. *M. H.* 2. 308. *Hederaceum Thlaſpi.* J. B. 2. 933. Lob. Ic. 615. Obſ. 338. a.

3. Cochlearia; folio ſubrotundo. *C. B. P.* 110. *Tourn. Inſt.* 215. *Elem. Bot.* 184. *Boerh. Ind. a.* 2. 10. *Rupp. Flor. Jen.* 67. *Buxb.* 76. *Cochlearia Batava, rotundifolia, hortenſis*, Offic. *Cochlearia*, J. B. 2. 942. Chab. 297. Raii Hiſt. 1. 822. Synop. 3. 302. Mer. Pin. 27. *Cochlearia rotundifolia*, Ger. 324. Emac. 401. *Cochlearia major rotundifolia, ſive Batavorum*, Park. Theat. 285. *Cochlearia major Batavica ſubrotundo folio*, Hiſt. Oxon. 2. 308. *Cochlearia rotundifolia, ſive Batava*, Merc. Bot. 2. 19. Phyt. Brit. 29. GARDEN SCURVY-GRASS.

The Root of this Scurvy-graſs is ſomewhat long, and full of Fibres, from which ſpring a great Number of flatiſh ſucculent green Leaves, on long Foot-ſtalks, which are round, and appearing ſomewhat hollow, like a Spoon; whence it has its Name *Cochlearia*. The Stalks grow to be eight or nine Inches high, brittle, and cloath'd with the like Leaves, which are more angular and pointed. The Flowers grow in Tufts on the Top of the Stalks, conſiſting of four ſmall white Leaves, which are ſucceeded by little, round, ſwelling Seed-veſſels, parted in the Middle by a thin Film, and containing ſmall round Seeds. Both Leaves and Flowers have a biting, hot Taſte. It grows wild in ſeveral Parts of the North of *England* by the Sea-ſide; but is very much cultivated in Gardens, and flowers in *April*.

Scurvy-graſs abounds with fine volatile Parts; and therefore the Herb infuſed, or the Juice expreſſed, is more prevalent than a Decoction, the volatile Parts flying away in the boiling. This is accounted a ſpecific Remedy againſt the Scurvy, cleanſing and purifying the Juices of the Body from the bad Effects of that Diſtemper, and clearing the Skin from Scabs, Pimples, and foul Eruptions.

Officinal Preparations are the ſimple Water, the Spirit, and a Conſerve. *Miller's Bot. Off.*

It muſt be remembered, that theſe warm alcaleſcent Plants are only proper in an acid Scurvy; but that, in a putrid alcaline Scurvy, they are Poiſons, as is remarked under the firſt Species of Cochlearia.

4. Cochlearia; major; Batavica; erecta; folio oblongo, *H. L.* 165. *a*,

5. Cochlearia; folio ſinuato, *C. B. P.* 110. *Raii Hiſt.* 1. 833. *Synop.* 3. 305. *Tourn. Inſt.* 215. *Elem. Bot.* 184. *Boerh. Ind. a.* 2. 10. *Cochlearia Britannica marina*, Offic. *Cochlearia Britannica*, Ger. 324. Emac. 401. *Cochlearia Britannica folio ſinuato*, Hiſt. Oxon. 2. 308. *Cochlearia vulgaris*, Park. Theat. 285. Mer. Pin. 27. *Cochlearia vulgaris longo & ſinuoſo folio*, Merc. Bot. 1. 29. Phyt. Brit. 29. SEA SCURVY-GRASS.

This Sort of *Scurvy-graſs* grows to be about as high as the Garden Scurvy-graſs; but the Leaves are rather thicker, longer, narrower, and more pointed at the Ends, frequently ſinuated about the Edges, of a duller green Colour than the Garden. The Flowers and Seeds are alike in both. It has a ſalter Taſte,

not

not nigh ſo hot and pungent as that. It grows in ſalt Marſhes, and particularly by the *Thames* Side, all the Way below *Woolwich*, flowering rather later than the Garden-kind.

The *Sea Scurvy-graſs* is frequently uſed in ſcorbutic Remedies along with the Garden ſort; but, wanting its fine volatile Parts, it ſeems not ſo prevalent, but, abounding more in ſaline Particles, it may be uſed, to good Purpoſe, as a Diuretic. *Miller's Bot. Off.*

6. Cochlearia; minima; ex montibus Walliæ, *Sher. a.* THE LEAST SCURVY-GRASS FROM THE WELSH MOUNTAINS.

COCHLEATA. See MEDICA.

COCHLIA, or COCHLIAS. See COCHLEA.

COCHLIAXON, κοχλιάξων. A Name for a Part in a Machine deſcrib'd by *Oribaſius*, in his Book *De Machinamentis*, *C.* 24. which he calls *Gloſſocomum Nymphodori*.

COCHLIDIUM, κοχλίδιον, the ſame with κόχλος. A ſmall Shell-ſnail, whoſe Shell, according to *Breynius*, is of a conical, and regularly ſpiral Form. This Author, in his *Diſſertatio Phyſica de Polythalamiis*, enumerates various Species of the Cochlidium.

COCHLITA. This is alſo call'd Cochlea foſſilis, or lapidea. It is a Stone of the Shape and Figure of a certain Shell-ſnail.

This is ſaid to be poſſeſſed of ſome lithontriptic Virtue.

COCHONE, κοχώνη. *Galen* explains this the Juncture of the Iſchium near the Seat or Breech; whence, ſays he, all the adjacent Parts about the Seat are call'd by the ſame Name. *Hippocrates* repreſents theſe Parts, in his firſt Book *De Morbis Mulierum*, as ſubject to Pains in certain Irregularities of the menſtrual Flux, which he there deſcribes, when they grow inveterate; and, in the ſecond Book, he alſo mentions Pains of theſe Parts in certain uterine Diſorders; and, in the fifth Book of his Epidemics, he relates the Caſe of *Eupolemus*, who was afflicted with Pains in the right Coxendix, the Groin, and the Juncture of the Iſchium, which is at the fore Part of the Iſchium with the Inguen, I ſuppoſe he means the Os Pubis. Theſe Pains, he informs us, terminated in a Suppuration about the Iſchium, Inguen, and *Cochone*, and at laſt prov'd fatal. *Heſychius* ſays, *Cochone* is the Part of the Spine, which is adjacent to the Os Sacrum and Breech; and tells us, that ſome call the Parts on both Sides the Os Sacrum by this Name; and adds, that the Iſchia are thus nam'd.

COCILIO. The Weight of eleven Ounces. *Rulandus.*

COCOLATA. Chocolate.

COCOMICA SIGNA. A Term uſed by *Paracelſus* in his Treatiſe *De Podagricis*, *L.* 2. It is no eaſy matter to diſcover his preciſe Meaning. He ſeems to be ſpeaking of what we uſually call Blaſts, which, he ſays, reſide in half the Middle of the Sky (*Cœli*), and deſcend upon Herbs, Leaves, Trees, and the like: And in the ſame manner, ſays he, either with or without the Dew, many Figures, Forms, and *Cocomic Signs*, are found, which frequently fall upon Men whilſt walking in the Line of their Direction.

COCOS. See PALMA, INDICA, COCCIGERA, ANGULOSA.

COCTIO. The *Coctio* of the *Latins*, and the πέψις of the *Greeks*, imports what, in *Engliſh*, we call *Boiling*, which is heating any Liquor over a Fire to ſuch a Degree, that Bubbles ariſe in it. This Proceſs is a Species of ſtrong and powerful Digeſtion; for which Reaſon *Juncker*, in his *Conſpectus Chymiæ Theoretico-practicæ*, informs us, that, among the antient Chymiſts, the Word *Coctio* was frequently uſed inſtead of *Digeſtio*, and convey'd the ſame Idea. Chymiſts and Apothecaries boil ſeveral Bodies furniſhed by the mineral, the vegetable, and the animal Kingdoms, in different Liquors, with various Views, for preparing Extracts, Eſſences, and what we call medicated Decoctions, that, by this means, the Virtues of theſe Bodies may be transfuſed into the reſpective Liquors in which they are boil'd. *Coction* or *Boiling* is alſo uſed for depurating ſome Subſtances from their Sordes; for inſpiſſating Juices; for qualifying Preſerves for a longer Continuance in the State they are deſir'd; for correcting and mitigating the draſtic Virtues of ſome Subſtances; and for removing the flatulent Qualities of ſome Aliments and Medicines. *Oribaſius*, in his *Medicinal Collections* from *Galen*, gives us the following beautiful Account of Coction or boiling with Water: "Any ſolid Subſtance, ſays he, "when boil'd in Water, depoſits in that Fluid the primary Qua- "lities, of which it was poſſeſſed; by which means it is diveſted "of every Quality, and aſſumes an inſipid Nature; nor does it "retain any thing of a ſaline, bitter, or aſtringent Taſte." If bitter Subſtances are twice or thrice boil'd, they evidently depoſit their Bitterneſs in the Water, and become like thoſe Subſtances, which are ſaid to be deſtitute of Qualities. Acrid Subſtances, in like manner, when boil'd, depoſit their Acrimony in the Water uſed for that Purpoſe. The ſame alſo holds true with reſpect to aſtringent Subſtances.

Various Liquors are uſed, and different Portions of Time allotted, for Coction, according to the different Intentions of Operators, or the particular Natures of the Subſtances to be boil'd; ſo that nothing general can be determin'd with reſpect to this, the Obſervation of which would be of univerſal Uſe to the Operator; but we are to judge of the Manner, in which particular Subſtances are to be boil'd, from a Knowledge of the reſpective Natures of the Bodies to be ſubjected to this Operation. I think, it is ſufficiently obvious, from the penetrating and powerful Action of the Fire, and from the pervading and reſolvent Virtues of the Liquors added, that, if Bodies are of ſuch a Nature as to be penetrable by the Liquor, they are, by Coction, conſiderably chang'd, and, in a particular Manner, diveſted of thoſe Qualities, which depend upon their volatile Parts, which are more or leſs lodg'd in the Menſtruum, in which the Coction or Boiling is perform'd, in proportion as they are reſtrain'd and kept from flying off by the Veſſel's being cloſely covered, or the reverſe. But the longer the Coction of any Liquor is protracted in an open Veſſel, without an Effuſion of freſh Liquor, the more inſpiſſated it muſt be, in conſequence of the Diſſipation of its more fluid and volatile Parts. Hence it is obvious, that, according to *Boerhaave*, in his *Chymiſtry*, *Vol.* 2. the Fermentation of fermentable Juices may be deſtroy'd by Coction or Boiling. With reſpect to that particular Species of Coction called *Aſſatio*, ſee the Article ASSATIO.

Vegetables, by boiling, loſe their native Waters, their volatile eſſential Oil, wherein their diſtinguiſhing Spirit reſides, and a Portion of the Acid they originally contain'd. There remain their Earth, a Portion of fix'd Oil, and the Salts.

The Coction of the Aliments in the Stomach is their Digeſtion, or Reduction to a ſort of Emulſion or Chyle.

By the Coction of the Humours, the Writers of Inſtitutes mean, the Reduction of the Chyle to Blood, which is call'd the ſecond Coction; and alſo the Separation of any Fluid from the Blood, by means of Glands deſtin'd to this Uſe, which is call'd the third Coction.

It is commonly ſaid, that the Faults ariſing from any Defect in the firſt Coction, are not mended in the ſecond, nor thoſe from the ſecond by the third; that is, when the Aliment is not ſufficiently comminuted in the Organs of Digeſtion, the Particles of the Chyle are not ſmall enough to circulate regularly through the minute Veſſels of the Lungs, and be converted into good Blood, it being not poſſible for the Organs of Sanguification to diſſolve farther the Particles they receive from the Stomach. Hence, theſe Particles being too large to circulate thro' the Capillary Arteries, Obſtructions, and all their Conſequences. And the third Coction, that is, in the Glands, is not better adapted to the farther Diſſolution of theſe Particles, than the ſecond.

The Coction of the morbific Matter, or the Matter which forms a Diſeaſe, is its Reduction, either ſpontaneouſly, by the vital Powers, or the Force of Medicines, to a natural and healthy State, ſo that it may be no longer offenſive; or the preparing it for Expulſion out of the Body, by a ſalutary Criſis. See CATHARTICA. And, when this is accompliſhed, the Diſeaſe ceaſes, or, at leaſt, is much diminiſhed, together with all its Symptoms; the Strength and Firmneſs of the vital Powers increaſe; the injured Functions are reſtored to their natural Vigour; and the circulating Humours, Secretions, Excretions, and Excrements, which are alter'd by the Diſeaſe, now put on a natural and healthful Appearance. The ſooner this Coction is brought about, and the more perfectly, the leſs dangerous is the Diſeaſe, and *vice verſa*.

The Remedies proper to promote this Coction, and a ſubſequent Criſis, are ſuch as attenuate the inſpiſſated Juices; obtund and deſtroy Acrimony; open the obſtructed Veſſels; ſtrengthen the lax Fibres; relax thoſe which are too rigid; and moderate the Motion of the Blood: And, on Medicines ſuited to theſe Intentions, the Cure of all Diſtempers, whether acute or chronical, depends.

CODAGA-PALA, H. M. *Arbor Malabarica lacteſcens, Jaſmini flore odoro, ſiliquis oblongis.* D. Syen.

A Tree which grows in *Malabar*. The Bark of the Trunk and Root, powder'd, and drank in ſour Milk, put a Stop to any Flux of the Belly, and to the Hæmorrhoids. The Root powder'd, and boil'd in Water wherein Rice has been waſh'd, makes an excellent Fomentation for the tumefy'd Part in a Quinſey, or for any other Tumors, and for the Gout: It alſo cures the Tooth-ach, if held in the Mouth; and alſo kills Worms. *Raii Hiſt. Plant.*

CODAGEN. See *Hydrocotyle*; *Zeilanica*; *Aſari folio.*

CODDAM-PULLI. See CARCAPULI.

CODDA-PANNA. See *Palma montana, folio plicatili, ſtabelliformi, maximo*; *ſemel tantum frugifera.*

CODESELLA. A Carbuncle. *Foreſtus.*

CODIA, κώδια, κώδεια, or κώδεις, in *Hippocrates*, import a Poppy-head. *Galen. Heſychius.* The Heads of other Plants are alſo call'd by this Name.

CODI-AVANACU, H. M. *An Lathyris fruticeſcens, fructu in foliorum alis echinato?*

This is an Under-ſhrub, which grows in ſandy Soils in the *Eaſt Indies*. The Juice of the whole Plant, taken in Wine, is a good Remedy for Fluxes. This Juice alſo, boil'd with Oil, is exhibited as a Reſtorative in caſe of Weakneſs. The Oil procured

procured from the whole Plant, makes a good Embrocation for the Head, in order to remove a Vertigo.

CODOSCELLÆ. Buboes. *Fallopius.*

CŒLA, κοῖλα. The Cavities or Hollows, as they are call'd, of the Eyes. Theſe are two, one immediately above the ſuperior Eyelid, which is properly call'd κοῖλον· the other immediately under the inferior Eyelid, call'd ὑπόκοιλον. Theſe are ſubject to ſwell, and be fill'd up, in a Cachexia, Oedema, or any bad Habit of Body.

The κοῖλα of the Feet are the hollow Parts at the Bottom of the Foot, adjacent to the Heels.

COELESTINUS *Color*, in *Paracelſus*, is a ſky Colour. He informs us, that a Circle of this Colour, in the Urine of Women, is a Sign of a leprous Putrefaction in the Matrix; and that a Bubble of this Colour, on the Urine, is a Sign of a Leproſy, or ſometimes of an Alopecia.

COELIA, κοιλία, or κοιλίη. This has many different Significations. For, firſt, it imports a Cavity in any Part of the Body, or in any of the Viſcera. Secondly, it implies the ſame as ALVUS (which ſee). The κοιλίη, with the Addition of ἄνω, that is, ἡ ἄνω κοιλίη, is the Stomach, and ſometimes the Thorax; and ἡ κάτω κοιλίη is the lower Belly, or inteſtinal Tube.

As κοιλίη, therefore, ſignifies the entire Alimentary Duct, from the Cardia to the Anus, I ſhall, in this Place, give the Reader the anatomical Deſcription of theſe Parts, conſidering them as one Organ, that they may be the better underſtood.

The Stomach is a great Bag or Reſervoir, ſituated partly in the Left Hypochondrium, and partly in the Epigaſtrium.

The Figure of the Stomach is like that of the Bag-pipe, that is, it is oblong, incurvated, large, and capacious at one End, and ſmall and contracted at the other. We ſee this Figure moſt evidently, when the Stomach is moderately fill'd with Air, or with any other Fluid.

The Curvature of the Stomach gives us Occaſion to diſtinguiſh two Arches in it, one large, which runs along the greateſt Convexity; and one ſmall, directly oppoſite to the former. I name theſe Arches the great and ſmall Curvatures of the Stomach; and by the Sides of the Stomach I underſtand the two lateral Portions, which lie between the two Arches.

The Stomach has two Extremities, one large, and one ſmall, like a crooked Funnel. It has two Openings, call'd the Orifices of the Stomach, one between the great Extremity and the ſmall Curvature; the other at the End of the ſmall or contracted Extremity. The firſt Opening is a Continuation of the Œſophagus; the other joins the inteſtinal Canal, and is call'd by the Name of Pylorus.

The Stomach is not ſituated in the Left Hypochondrium, and Epigaſtric Region, in the manner repreſented in moſt of the Figures. It lies tranſverſely, obliquely, and almoſt laterally, in ſuch a manner, as that the great Extremity, and the Orifice next it, are on the Left Hand; and the ſmall Extremity, with its Orifice, or the Pylorus, on the Right Hand, and lower, and more inclined, than the former. Therefore we ought, with the antient Anatomiſts, to call one of theſe Orifices ſuperior, the other inferior.

The great Extremity of the Stomach is in the Left Hypochondrium, and, for the moſt part, immediately under the Diaphragm; yet the ſuperior Orifice is not in the Left Hypochondrium, but almoſt oppoſite to, and very near the Middle of the Bodies of the loweſt Vertebræ of the Back.

The ſmall Extremity of the Stomach does not reach to the Right Hypochondrium. It bends obliquely backward, toward the upper Orifice; ſo that the Pylorus lies about two Fingers Breadth from the Body of the Vertebræ, immediately under the ſmall Portion of the Liver, and conſequently lower down, and more forward, than the other Orifice by almoſt the ſame Diſtance. This Extremity of the Stomach has ſometimes a particular Dilatation on the Side next the great Curvature.

According to this natural Situation, the Stomach, eſpecially when full, lies ſo, as that the great Curvature is turn'd more forward than downward, and the ſmall Curvature more backward than upward.

One of the lateral convex Sides is turn'd upward, the other downward; and not forward and backward, as they appear in dead Bodies, where the Inteſtines do not ſupport them in their natural Situation.

If we divide the Stomach, along the two Curvatures, into two equal Parts, we ſhall ſee, that the two Orifices do not both adhere to the ſame Half of this Diviſion, as we would be apt to imagine, according to the common Notion; but that the diaphragmatic Orifice is entirely in the upper Half, and the inteſtinal Orifice in the lower Half.

Therefore, the Body of the Stomach is ſo far from lying in the ſame Plane with the Œſophagus, as it is commonly repreſented in Figures, drawn from a Stomach taken out of the Body, and laid upon a Table; that it forms an Angle or Fold, immediately at the Paſſage of the Œſophagus thro' the ſmall Muſcle of the Diaphragm; and it is on account of this Angle, that the ſuperior Orifice is turn'd backward.

The Stomach is compoſed of ſeveral Parts, the chief of which are the different Strata which form its Subſtance, to which Anatomiſts give the Name of Tunicæ or Coats. Theſe Coats are commonly reckon'd to be four in Number, the outer or common, the fleſhy or muſcular, the nervous or aponeurotic, and the villous or inner Coat; and they are afterwards ſubdivided ſeveral Ways.

The firſt or outermoſt Coat is ſimply membranous, being one of the internal Productions of the Peritonæum. This appears evidently at the Connection of the ſuperior Orifice with the Diaphragm, where the external Membrane of the Stomach is really continuous with the Membrane which lines the inferior Surface of the Diaphragm; and it is from this, that it has been named the common Coat.

The ſecond or muſcular Coat is made up of ſeveral Planes of Fibres, which may all be reduced to two, one external, the other internal. The external Coat is longitudinal, tho' in different reſpects, following nearly the Direction of the Curvatures and Convexities of the Stomach; and the internal Plane is tranſverſely circular.

The Fibres of the external Plane run ſlanting in ſeveral Places, and are interſected by ſmall oblique whitiſh Lines, which ſeem to be in ſome meaſure tendinous. This Plane is ſtrengthen'd by a particular Faſciculus, which runs along the ſmall Curvature, its Fibres appearing to be leſs oblique than thoſe of the great Plane.

The Fibres of the inner or circular Plane of this muſcular Coat are ſtronger than thoſe of the outer Plane: They are rather Segments, which unite at different Diſtances, than entire Circles; and they are likewiſe interſected by great Numbers of ſmall white Lines, in ſome meaſure tendinous, and very oblique, which, all together, repreſent a kind of Network, the Areolæ or Meſhes of which are very narrow.

As theſe Circles or Segments advance on the great Extremity of the Stomach, they diminiſh gradually, and form a kind of muſcular Vortex, the Centre of which is in the Middle of that Extremity.

Between the outer and inner Planes, round the ſuperior Orifice, there are two diſtinct Planes, about the Breadth of a Finger, and very oblique, which ſurround this Orifice in oppoſite Directions, and interſect each other where they meet on the two lateral Sides.

Along the Middle of each lateral Side of the ſmall Extremity there runs a tendinous or ligamentary flat Portion, above a Quarter of an Inch in Breadth, which terminates in the Pylorus. Theſe two Portions lie between the common and muſcular Coats, and adhere very ſtrongly to the firſt.

Between the ſame two Coats there is a cellular Subſtance, which adheres very cloſely to the external Coat, and inſinuates itſelf between the fleſhy Fibres of the ſecond, all the Way to the third, as may be perceived by blowing it up. Some make it a diſtinct Coat, and call it Tunica Celluloſa; but it is no more than the cellular Portion of the membranous Coat, like the cellular Portion of the Peritonæum.

The third Coat, call'd commonly Tunica Nervoſa, ſuſtains, on its convex Side, a very large reticular Diſtribution of capillary Veſſels and Nerves. On the concave Side it ſeems to be of a very looſe Texture, and, as it were, ſpungy or filamentary, containing a great Number of ſmall glandular Bodies, eſpecially near the ſmall Curvature, and ſmall Extremity of the Stomach.

This ſpungy Texture reſembles fine Cotton, as may be ſeen by macerating it a little in clear Water, which ſwells it conſiderably in a very ſhort Space of Time. It is ſupported by a kind of Ground-work of very fine ligamentary or aponeurotic Filaments, which interſect each other obliquely, much in the ſame manner as the third Coat of the Inteſtines, of which hereafter; and it adheres to the convex Side of the villous Coat.

The fourth Coat of the Stomach is term'd Villoſa, becauſe, when it ſwims in clear Water, ſome have imagined they ſaw ſomething in it like the Pile of Velvet. The Antients call'd it Tunica Fungoſa, and perhaps this Name agrees beſt with its true Structure. We obſerve in it a great Number of ſmall Holes, anſwering to the ſmall Glands already mention'd.

Theſe two Coats are of a larger Extent than the two former, and they join in forming large Rugæ on the concave Surface of the Stomach; the greateſt Part of which are tranſverſe, tho' irregular and waving. There are likewiſe ſome longitudinal ones, which interſect the others; but at the Pylorus they all become longitudinal, and terminate there.

At the ſuperior Orifice of the Stomach theſe Rugæ are in a manner radiated, and ſeem to be a Continuation of the Plicæ or Folds of the Œſophagus; only they are thicker, and, where theſe Rugæ and Plicæ meet, they form a ſort of Crown, which diſtinguiſhes the ſuperior Orifice of the Stomach from the inferior Extremity of the Œſophagus.

In the Interſtices of theſe Rugæ there is often found a ſort of ſlimy Mucus, with which the whole Cavity of the Stomach ſeems likewiſe to be moiſten'd. This Mucus is much more fluid in living Bodies, and is ſupplied by the Glands of the Stomach. It may be term'd Succus Gaſtricus, or Stomachicus.

On the inner Surface of the ſmall Extremity of the Stomach, at the Place where it ends in the inteſtinal Canal, we obſerve a broad thin circular Border, with a roundiſh Hole in the Middle. This Hole is the inferior Orifice of the Stomach, call'd by the *Greeks* Pylorus, which ſignifies a Porter.

This Border is a Fold or Duplicature of the two inner Coats of the Stomach, the Nervoſa and Villoſa; and it is form'd, in Part, by a Faſciculus, or fleſhy Fibres, fix'd in the Duplicature of the Tunica Nervoſa, and diſtinguiſh'd not only from the other fleſhy Fibres of the Extremity of the Stomach, but alſo from thoſe of the Inteſtines, by a thin whitiſh Circle, which appears even thro' the external or common Coat, round the Union of the Stomach and Inteſtines.

The Figure of the Pylorus is that of a Ring, tranſverſely flatted, the inner Edge of which, or that next the Centre, is turn'd obliquely toward the Inteſtines, like a broad Portion of a Funnel. This inner Edge runs naturally more or leſs into little Plaits or Gathers, like the Mouth of a Purſe almoſt ſhut; all which Particulars are very different from what Figures, and dried Preparations, would make us believe. It is, therefore, a kind of Sphincter, which can contract the inferior Orifice of the Stomach, but ſeems not capable of ſhutting it quite cloſe.

The principal Arteries of the Stomach are the Coronaria Ventriculi, which runs along the ſmall Curvature, and the two Gaſtricæ, that is, the Siniſtra or Major, and Dextra or Minor, both which form one common Artery, which runs along the great Curvature. The Coronaria Ventriculi becomes united in the ſame manner with the Pylorica, and both make one common Veſſel.

Theſe two arterial Arches ſend a great Number of Branches toward each other on both Sides of the Stomach, and theſe Branches are gradually ramified in different Directions, by very frequent Diviſions and Subdiviſions, the greateſt Part of which communicate with thoſe from the other Artery.

From theſe frequent Ramifications and Communications of the arterial Arches of the Stomach, two different reticular Textures ariſe, whereof one, which is the largeſt, lies between the common and muſcular Coats in the cellular Subſtance found there; the other, which is very fine, lies on the Surface of the Tunica Nervoſa. This latter is a Production of the firſt, being form'd by means of a great Number of very ſhort Branches, which go out from the other, and paſs thro' the ſmall Interſtices between the Fibres of muſcular Coats.

By artificial Injections we can ſhew a third extremely fine reticular Texture of capillary Veſſels, which run between the glandular Bodies and Papillæ of the Tunica Villoſa. Theſe do not ſeem, in the natural State, to be purely Blood-veſſels, as Inflammations and Injections may incline us to think.

The Arteries of the Stomach come originally from the Cœliaca, by means of the Hepatica, Splenica, and Coronaria. The Pylorica, and Meſenterica ſuperior, likewiſe contribute to them by Communications, more or leſs immediate. They communicate alſo with the Mammariæ Internæ and Diaphragmaticæ, and, by means of the Epigaſtrica ſiniſtra, with the Meſenterica inferior.

The Veins of the Stomach are Ramifications of the Vena Portæ in general, and in particular of the Meſeraica major, Splenica, and Hæmorrhoidalis interna. They accompany the Arteries more or leſs, and form nearly the ſame kinds of Arches and reticular Textures; with this Difference, that they are proportionably greater, their reticular Areolæ larger, and their external Communications more frequent.

Between the common and muſcular Coats of the Stomach we find a great Number of Nerves, of different Sizes. Many of them accompany each other, in form of a broad flat Faſciculus, along the ſmall Curvature of the Stomach, from the ſuperior to the inferior Orifice. The reſt are ſpread in different Directions, on the Sides, Extremities, and great Curvature, forming, at different Diſtances, a kind of reticular Plexus, from which a great Number of Filaments are detached to the inner Coats.

They ariſe chiefly from the Nervi Sympathetici Medii, or eighth Pair, by means of the Plexus Coronarius Stomachicus form'd round the ſuperior Orifice of the Stomach, by the Expanſion of the Extremities of two large Ropes, which run down upon the Œſophagus, by the Name of Nervi Stomachici. The great ſympathetic Nerve, commonly call'd Intercoſtalis, contributes likewiſe to them, by communicating Filaments, which the Plexus Stomachicus receives from the ſemilunar Ganglions of the Plexus Hepaticus, and particularly from the Plexus Splenicus.

The Stomach receives, in general, whatever the Mouth and Tongue ſend thither, thro' the Canal of the Œſophagus; but its particular Uſe is to receive the Aliments, to contain them for a longer or ſhorter time, in proportion as they are more ſolid and fluid, and to digeſt them; that is, to put them in a Condition to be turn'd into that nutritious Fluid, call'd Chyle.

This Operation, which goes by the general Name of Digeſtion, and by which Chylification begins, is perform'd partly by the Succus Gaſtricus, which flows continually from the Tunica Villoſa, and partly by the continual Contraction and Relaxation of the muſcular Coat. Theſe Motions, in Men, are but very weak, and no ways ſufficient for Digeſtion, without the Aſſiſtance of the alternate Motions of the Diaphragm, and Muſcles of the Abdomen.

The Pylorus, or fleſhy Circle of the inferior Orifice of the Stomach, ſerves to retain the Aliments in it, till they have acquired a ſufficient Degree of Fluidity, to paſs eaſily thro' that Opening. I ſay, eaſily; for, by a particular Irritation of the muſcular Coat of the Stomach, and ſtill more by a violent Contraction of the Diaphragm and Muſcles of the Abdomen, the Contents of the Stomach may be very ſoon forced towards the ſmall Extremity, and puſh'd thro' the Pylorus.

The gentle and alternate Motions of the orbicular Fibres of the muſcular Coat may aſſiſt in ſending thro' the Pylorus, in the natural Way, the Aliment that is ſufficiently digeſted. This was call'd the periſtaltic or vermicular Motion, by thoſe who believed, that it is ſucceſſively reiterated, like that of Earth-worms when they creep.

Trituration might be a proper enough Term for this Operation, provided it be made to ſignify only a gentle Agitation, or Action of the fleſhy Fibres, in a Subſtance continually moiſten'd by the Gaſtric Liquor, and not a violent Grinding of a dry Subſtance.

The Situation of the Stomach, which is nearly tranſverſe, is likewiſe of Uſe in making the Aliment remain long enough in that Cavity, and may ſerve to make the Length of this Stay in ſome meaſure arbitrary, by means of the different Poſtures of the Body; for, when we lie on the Left Side, the Aliment muſt remain longer, than when we lie on the Right Side, *&c.*

The Obliquity of the Stomach may ſerve to clear up a Difficulty, that very much torments thoſe who believe, that both Orifices of the Stomach lie in the ſame Level; which is, how any heavy Subſtance, once got into the Stomach, can ever riſe again to this Level, to paſs into the Inteſtines.

The INTESTINES *in general, and* INTESTINUM DUODENUM *in particular.*

Between the Pylorus and the very loweſt Part of the Abdomen lies a long Canal, bent in a great many different Directions, by numerous Convolutions or Turnings call'd the Inteſtines.

This Canal, thus folded and turn'd, forms a conſiderable Bulk, which fills the greateſt Part of the Cavity of the Abdomen; and it is connected, through its whole Extent, to membranous Productions or Continuations of the Peritonæum, principally to thoſe call'd the Meſentery and Meſocolon.

The Incurvations of the inteſtinal Canal form two Arches, a ſmall one, by which it is connected to the Meſentery and Meſocolon, and a great one on the oppoſite Side, which lies looſe. The whole Canal is generally about ſeven or eight times as long as the Subject.

The inteſtinal Canal is neither of an equal Size nor Thickneſs, through its whole Length; from whence Anatomiſts have taken Occaſion to conſider its different Portions as ſo many particular Inteſtines, and to divide them all into ſmall and great.

And as they ſtill found ſome Differences in each Claſs, taken all together, they divided each into three Portions, which they diſtinguiſh'd by particular Names. In the ſmall Inteſtines the three Portions are named Duodenum, Jejunum, and Ileum; and, in the great Inteſtines, Cæcum, Colon, and Rectum.

The Inteſtines in general are compoſed of ſeveral Coats, much in the ſame manner with the Stomach. The firſt and outermoſt is a Continuation of the Meſentery, or of ſome other Elongation or Duplicature of the Peritonæum.

This is commonly term'd the common Coat, and it has a cellular Subſtance on its inner Surface, like that of the Stomach, which M. *Ruyſch* thought fit to call a diſtinct Coat, by the Name of Tunica Celluloſa.

The ſecond Coat of the Inteſtines is fleſhy or muſcular, and made up of two Planes, one external, the other internal. The external Plane is very thin, and its Fibres longitudinal; the internal Plane is thicker, and its Fibres run tranſverſely round the Circumference of the inteſtinal Cylinder.

I am not of Opinion, that theſe Fibres are ſpiral, nor that they are perfect Circles or Rings; but they ſeem rather to be Segments of Circles, diſpoſed much in the ſame manner as in the

the Stomach, and thus ſurrounding entirely the inteſtinal Canal.

Theſe two Planes adhere cloſely together, and are ſeparated with great Difficulty. They adhere likewiſe to the common Coat, by the Intervention of the cellular Subſtance, which is in greater Quantities on the Side next the Meſentery than on the other.

The third Coat is call'd Nervoſa, and is ſomething like that of the Stomach. It has a particular Plane, which ſerves as a Baſis to ſuſtain it, made up of very fine, ſtrong, oblique Fibres, which ſeem to be of the ligamentary or tendinous Kind.

To ſee this Plane diſtinctly, a Portion of the Inteſtines muſt be inflated, the common Coat removed, and the fleſhy Fibres ſcraped off.

This Coat ſuſtains two reticular Subſtances, which are both vaſcular, one arterial, the other venal, accompanied by a great Number of nervous Filaments. Theſe Veſſels and Nerves are Productions of the Meſenteric Veſſels and Nerves; and, as they ſurround the whole Canal of the Inteſtines, ſome Anatomiſts have form'd them into a diſtinct Coat, by the Name of Tunica Vaſculoſa.

The nervous Coat ſends off, from its inner Surface, a great Number of Portions of Septa, more or leſs circular, which contribute to the Formation of what are call'd Valvulæ Conniventes. It likewiſe ſeems to ſuſtain ſeveral different glandular Bodies, which we diſcover in the Cavity of the Inteſtines.

The fourth or innermoſt Coat is very ſoft, and is named Tunica Villoſa. It has the ſame Extent with the third Coat, which ſupports it, and it lines all the Septa of that third Coat; but it is not uniform thro' the whole Canal.

Intestina Tenuia.

The ſmall Inteſtines form one continued uniform Canal; and tho' three Portions of it have three different Names, yet we have no ſufficient Marks whereby to diſtinguiſh them, to fix the preciſe Extent or Length of each Portion, or to ſettle its juſt Limits.

The firſt and ſmalleſt Portion of the whole Canal is called Duodenum; the ſecond, which is much longer, Jejunum; and the third, which is ſtill longer than the ſecond, Ileum.

The firſt Portion of the ſmall Inteſtines was call'd Duodenum, from the Length aſcribed to it by the Antients, that is, the Breadth of twelve Fingers; and the Moderns need not cavil about this Length, if it is meaſured with the Ends of the Fingers of the Subject.

This Inteſtine, having ariſen from the Pylorus, is immediately bent a little backward, and obliquely downward; then it bends a ſecond time toward the Right Kidney, to which it is a little connected; and from thence paſſes before the renal Artery and Vein, aſcending inſenſibly from Right to Left, till it gets before the Aorta and laſt Vertebræ of the Back. It continues its Courſe obliquely forward, by a gentle Turn, which may be reckon'd a third Incurvation, and alſo the Extremity of the Duodenum.

Through this whole Courſe the Duodenum is firmly bound down by Folds of the Peritonæum, eſpecially by a tranſverſe Duplicature, which gives Origin to the Meſocolon. The two Laminæ of this Duplicature, being at firſt ſeparate, and ſoon after uniting, muſt leave a triangular Space between them, which is lined with a cellular Subſtance.

It is in this Space that the Duodenum adheres, by means of the cellular Subſtance, to the Parts already nam'd; and the Inteſtine is contained therein, as in a Caſe; ſo that, without Diſſection, we can ſee nothing but its two Extremities, and even theſe are hid by the Colon, and by the firſt Convolutions of the Jejunum.

The firſt Coat of the Duodenum is conſequently different from that of the other ſmall Inteſtines, having this peculiar to it, that it does not inveſt the whole Circumference of the Inteſtine, becauſe, thro' the greateſt Part of its Length, it lies in the triangular Space already mention'd; and for the ſame Reaſon there is a greater Quantity of cellular Subſtance belongs to the outer Coat of the Duodenum, than to that of the other Inteſtines.

The muſcular Coat of the Duodenum is thicker than in the Jejunum and Ileum.

The Tunica Nervoſa and Villoſa form conjointly, on the Inſides of this Inteſtine, a great Number of ſmall Duplicatures, which advance into the Cavity more or leſs directly, like Portions of circular Planes, with one Edge fixed to the Inteſtine, and the other looſe. Theſe are what Anatomiſts call Valvulæ Conniventes.

The looſe or floating Edge of theſe Valves is form'd into ſmall Gathers or Waves in the natural State: I ſay deſignedly, in the natural State, to rectify the falſe Ideas which dry Preparations of the Inteſtines are apt to beget. The whole Surface of theſe Duplicatures or Valves is villous, as well as that of the Interſtices between them.

The Villi of this Inteſtine are thicker than in the Stomach; but the Texture of them in Men is not like Hairs, as they are commonly repreſented in Figures; but rather like that of a fungous, granulated Subſtance, compoſed of an infinite Number of very fine Papillæ of different Figures, in which we ſee, thro' a Microſcope, a Multitude of depreſs'd Points or Pores, by which their whole Surface ſeems to be pierc'd.

By the ſame Help we obſerve, on different Places of the inner Surface of this Inteſtine, ſeveral round villous Tubercles, riſing, like ſmall Verrucæ, at different Diſtances from each other.

This Subſtance ſuſtains an infinite Number of capillary Veſſels of different Kinds; for, beſides the Blood-veſſels, we ſometimes obſerve a great Number of white Filaments, which run thro' it, and end at its inner Surface, like ſo many capillary Roots of the Veſſels, call'd Venæ Lacteæ.

The fungous Subſtance, which binds theſe capillary Filaments together, and ſurrounds them, is very tender; and the capillary Extremities of the ſmall Blood-veſſels, diſtributed thro' it, ſeem to be turned toward the Pores of the Papillæ. Through theſe Pores a mucous Fluid, more or leſs tranſparent, is diſcharg'd, which continually moiſtens the Cavity of the Inteſtine.

The internal Surface of the Duodenum is furniſh'd with a great Number of ſmall flat glandular Tubercles, raiſed on the Sides, and depreſſed in the Middle, by a kind of Foſſula; and they are more numerous near the Beginning of this Inteſtine than any-where elſe. About the Pylorus they lie in a manner in Heaps or Cluſters, and from thence the Diſtance between them increaſes gradually all the Way to the other Extremity, where they are ſingle.

Theſe Glands, when examined carefully, appear like little Bladders, with the Orifices turn'd toward the Cavity of the Inteſtine, and the Body fix'd in the ſpungy Subſtance next the nervous Coat. They furniſh a particular Fluid, which is often found to be viſcid.

In the inner Surface of the Duodenum, almoſt at the lower Part of the firſt Incurvation, and on the ſhorteſt Side, there is a longitudinal Eminence, in the Point or Apex of which lies a particular Opening, which is the Orifice of the Ductus Bilarius, within which the Ductus Pancreaticus likewiſe opens.

This Inteſtine is commonly the wideſt, tho' the ſhorteſt, of the ſmall Inteſtines, and is inveſted by more cellular Subſtance, eſpecially while within its triangular Caſe, where it wants the outer Coat, which the others have; and conſequently it is more eaſily dilatable, by the Subſtances which might otherwiſe ſtick within it. See Duodenum.

Intestinum Jejunum.

The Jejunum, ſo call'd becauſe it is oftener found empty than the Ileum, begins at the laſt Incurvation of the Duodenum, and is there connected to the Beginning of the Meſocolon.

From thence it bends downward from Left to Right, and obliquely forward, or from the Vertebræ, and makes ſeveral Convolutions, which lie principally in the upper Part of the umbilical Region. Through all this Courſe it is connected to the Meſentery.

It is a pretty difficult Matter to fix the exact Bounds between this Inteſtine and the Ileum. The external Marks of a redder Colour in the one than in the other, tho' pretty common, are not conſtant; and the internal Marks, fix'd from the Plurality of Valvulæ Conniventes, are indeterminate, and oftentimes appear only from Diſſection.

Theſe two Inteſtines may be better diſtinguiſhed by their different Situations, which are pretty regular; but as even this Mark is not particular enough, the moſt eaſy Way that I have been able to contrive, and which will, in moſt Caſes, be found ſufficiently exact, is to divide both Inteſtines into five Parts, and to allow nearly two Fifths to the Jejunum, and three Fifths and a little more to the Ileum.

The Coats of the Jejunum are nearly of the ſame Structure with thoſe of the Duodenum, but thinner. The common Coat is a Continuation of the Meſentery, and the cellular Subſtance is in leſs Quantity than in the Duodenum, and, indeed, ſeems to be altogether wanting along the great Curvature of the Convolutions, where the longitudinal Fibres of the muſcular Coat adhere very cloſely to the external Membrane.

This muſcular Coat is not ſo ſtrong as that of the Duodenum. The longitudinal Plane of Fibres is very thin, and almoſt imperceptible, except along the great Curvature, oppoſite to the Connection of the Meſentery, where we ſee, thro' the membranous Coat, a kind of whitiſh ligamentary Band, about the third Part of an Inch in Breadth, which is continu'd along the great Curvature of all the Convolutions of this Inteſtine, and of the Ileum.

This ligamentary Band is like thoſe we obſerve on the Sides of the ſmall Extremity of the Stomach. It adheres perfectly to the membranous Coat, and to the longitudinal Fibres of the muſcular Coat, which are here more viſible, and appear to be ſtronger than in any other Place.

The Tunica Nervoſa, which I chooſe rather to call Reticularis, and its proper cellular or lanuginous Subſtance, have nothing

thing peculiar to them more than has been already ſaid about the Inteſtines in general. By blowing artfully into this Subſtance, it may be made to ſwell ſo much, round the whole Cavity of the Inteſtine, as to deſtroy all the Duplicatures or Valvulæ Conniventes.

Theſe Valves in this Inteſtine are very broad, very numerous, and very near each other. On the Side of the great Curvature their Circumference is continuous and uniform, but, next the ſmall Curvature, there are ſeveral Breaks in them, the Extremities of ſome advancing beyond the reſt, and terminating in Points. Some of theſe Valves go quite round, others only ſome Part of the Way, and ſome of them are very ſmall, which go obliquely between two large ones, forming a kind of Communication.

The Papillæ of the Tunica Villoſa are here more raiſed, more looſe, and floating, than in the Duodenum; and each of them ſeems to be divided into ſeveral others, by Inciſures of a very ſingular Kind. In other reſpects they agree pretty much with what has been ſaid in the Deſcription of the Inteſtines in general. The Obſervations and Figures publiſh'd by M. *Helvetius*, in the *Memoires* of the Royal Academy, expreſs theſe Papillæ, and the whole Tunica Reticularis, very juſtly.

The glandular Lacunæ of the Jejunum are of the ſame Structure with the Glandulæ Brunneri or Duodenales; but they are diſpoſed in a different Manner. They are partly ſingle at different Diſtances from each other, and partly in ſeveral Cluſters, like flat oblong Bunches of Grapes, called Plexus Glanduloſi Peyeri. Theſe are in the largeſt Quantity near the great Curvature, and they croſs thro' ſeveral Valvulæ Conniventes at once.

Intestinum Ileum.

The Convolutions of the Inteſtinum Ileum ſurround thoſe of the Jejunum on the two lateral and lower Sides, and it paſſes in a winding Courſe from the Left Side, by the Hypogaſtrium, to the Right Side, where it terminates a little below the Right Kidney, joining the Inteſtina Craſſa. The lateral Convolutions are ſupported by the Oſſa Ileum, ſo called, not from this Inteſtine, but from the Region of the Abdomen term'd Ilea.

The Structure of the Ileum is much the ſame with that of the Jejunum, only the internal Duplicatures or Valvulæ Conniventes decreaſe gradually both in Number and Size. Near the Extremity of the Ileum their Direction is changed, and inſtead of being tranſverſe or circular, they become longitudinal, and terminate in a kind of Pylorus, which advances into the Cavity of the great Inteſtines.

We obſerve likewiſe in this Inteſtine, as in the Jejunum, ſingle or ſolitary Glands or Lacunæ, and alſo reticular Glands, or Glands in Cluſters, the laſt of which, at the Extremity of this Inteſtine, is oftentimes of a great Extent; but the greateſt Part of theſe Glands appear to be flatter here than in the Jejunum. The cellular Subſtance of the external Coat is in leſs Quantities than in the foregoing Inteſtines, and the Ileum appears commonly more pale, or not ſo red as the Jejunum.

For an Account of the Intestinum Cæcum, ſee Cæcum and Appendicula.

Intestinum Colon.

The Colon is the moſt conſiderable of all the Inteſtines. From the Cæcum, of which it is a Continuation, it reaches, in form of an Arch, above the umbilical Region, and to the lower Part of the Left Hypochondrium. Its Continuity is, however, a little interrupted by the Ileum, which advances into the Cavity of the Colon, and, together with a certain Fold of that Inteſtine, forms what is call'd Valvula Coli.

The whole convex Side of the Colon is divided longitudinally into three Parts, by three ligamentary Bands, continu'd from thoſe of the Cæcum, and of the ſame Structure with theſe. Two of theſe Bands run on each Side, along the great Curvature of the Colon, and the third along the ſmall Curvature.

The uppermoſt Band of the two, that belong to the great Curvature, is the broadeſt of the three; that which belongs to the ſmall Curvature, is the narroweſt, and lay hid by the Connection of the Meſocolon, till it was brought to Light by M. *Morgagni*.

Theſe three longitudinal Bands do the Office of longitudinal Fræna, between which this Inteſtine is, thro' its whole Length, alternately depreſſed into tranſverſe Folds, and raiſed into conſiderable Eminences. All the Folds are Duplicatures, which form Portions of Valvulæ Conniventes, in the Cavity of the Inteſtine; and the Eminences form Receptacles, call'd the Cells of the Colon.

All the Coats of the Colon concur equally to the Formation of theſe Duplicatures and Cells, the Depth of which decreaſes gradually toward the Extremity of the Inteſtine; and neither of them go any further than the ligamentary Bands.

Theſe Portions of the Colon, which are immediately cover'd by the ligamentary Bands, are ſmooth, and without Rugæ; and therefore, if theſe Bands alone are cut acroſs, the Inteſtine is not elongated ſufficiently to deſtroy all the Folds and Cells.

The common Coat on one Side is a Continuation of the Meſocolon, and, on the other Side, it contributes, by the ſame Continuation, to form the Omentum. The longitudinal Fibres of the muſcular Coat are very ſlender; and thoſe which anſwer to the annular or circular Fibres of the ſmall Inteſtines, are only Segments ſtretched over the Eminences and Folds. The other Coats are nearly as in the Cæcum; only the glandular Lacunæ, or ſolitary Glands, are broader and more numerous.

The Arch of the Colon begins under the Right Kidney, near the Hanch. It runs up on the fore Side of that Kidney to which it is connected, paſſes under the Veſicula Fellis, which tinges it with a yellow Colour at that Place, and continues its Courſe before the firſt Incurvation of the Duodenum, to which it adheres, and partly hides it. In this Part of its Courſe, therefore, there is a remarkable Connection between the Colon, Duodenum, Right Kidney, and Veſicula Fellis.

From thence the Arch of the Colon runs before the great Convexity of the Stomach, and ſometimes a little lower; then turns backward under the Spleen, in the Left Hypochondrium, runs down on the fore Side of the Left Kidney, to which it is connected; below this Kidney turns toward the Vertebræ, and terminates there by a double Incurvation, or by two oppoſite Convolutions, which repreſent, in ſome meaſure, an inverted *Roman* S.

Theſe laſt Convolutions of the Colon are ſometimes multiplied, and even advance to the Right Side of the Pelvis; and along the great Arch, and the two laſt Incurvations, there are a kind of Fringes call'd Appendices Coli Adipoſæ.

At the Place where the Cæcum joins the Colon, one Portion of the Circumference of both is depreſs'd, and forms a large Fold on the Inſide, which advances into the Cavity of the Inteſtine. It is a little open in the Middle, and its Extremities are very thick, by reaſon of the mutual Duplicature of the Coats of the Cæcum and Colon.

The Extremity of the Ileum is, as it were, grafted in the Opening of this Fold, and ſtrongly united to its Sides by the Adheſion of its tranſverſe Fibres to the tranſverſe Fibres of the Cæcum and Colon.

This Union forms a pretty thick Ring, which likewiſe advances into the common Cavity of the Cæcum and Colon, where it is wrinkled or formed into Gathers, almoſt like the lower Extremity of the Œſophagus, the Pylorus, or Inſide of the Anus. Its Circumference is more or leſs oval; and, by a kind of Continuity with the common Fold of the Cæcum and Colon, it forms two Productions, which M. *Morgagni* calls the Fræna of the Valvula Coli.

The membranous Coat of the Extremity of the Ileum is continu'd on the Cæcum and Colon, without ſinking into any Fold, at the Place where the Ileum enters the Colon. The longitudinal Fibres of the muſcular Coat ſeem here to be confounded with the neareſt circular Fibres of the Cæcum and Colon.

The inner Portion of the muſcular Coat of the Ileum runs in between the circular Fibres of the Ileum and Colon, as into a common Fold of theſe two Inteſtines; from all which a pretty thick ſhort Portion of a fleſhy Tube is formed, which is the circular Riſing already mention'd.

The nervous and villous Coats of the Extremity of the Ileum likewiſe enter the common Cavity of the Cæcum and Colon, and, on the Edge of the circular Riſing, join the like Coats of theſe two Inteſtines; ſo that the circular Riſing, or ſhort muſcular Tube, is covered, both on the outer and inner Sides, by a nervous and villous Coat; that on the Inſide being ſupplied by the Ileum, and the other by the two great Inteſtines.

The Situation of this Extremity of the Ileum is moſt commonly tranſverſe, and is inſerted almoſt in the ſame Direction in the common Cavity of the two Inteſtines; but it is often a little more inclin'd towards the Cæcum than the Colon. And whereas, in all other Places, the Ileum is wide, and eaſily dilatable, it is very narrow at its Inſertion, and its Sides more ſolid and firm.

It is chiefly in this Structure, that the Mechaniſm of the Inſertion of the Ileum in the Cæcum and Colon conſiſts; about which Inſertion or Opening Authors are very much divided, ſome reckoning it a Valve, others only a Sphincter.

It is very evident, from what I have ſaid, that it is a double Machine, contriv'd to hinder the Return of the Excrements into the Ileum, becauſe it can produce this Effect partly as a Valve, and partly as a kind of Sphincter. The dried Preparations of this Part give a very falſe Idea of its Structure and Conformation; and the ſame thing is to be ſaid of the Opening of the Appendicula Vermiformis into the Cæcum.

The capacious Arch of the Colon is connected by both Extremities to the Regio Lumbaris, near the Kidneys, by two particular Ligaments, one on the Right-ſide, the other on the Left, which are only ſmall Duplicatures of the Peritonæum more or leſs tranſverſe.

The remaining Portion, which forms the two Convolutions in form of the *Roman* S, contracts below the Left Kidney, being

being narrower there than lower down. The Coats of this Portion become gradually thicker and ſtronger, and likewiſe the ligamentary Bands, which approach each other by Degrees, and ſeem to increaſe in Breadth.

Intestinum Rectum *and* Anus.

The laſt of all the Inteſtines is nam'd Rectum, or the ſtrait Gut, from its Situation; for, when view'd directly forward, it appears to run down in a ſtrait Courſe from the laſt Vertebra of the Loins, on the fore Side of the Os Sacrum, all the Way to the Os Coccygis, where it ends in what is call'd the Anus.

This Inteſtine, properly ſpeaking, is a true Continuation of the laſt Convolution of the Colon; and it is the Repoſitory, Sink, and common Sewer, of the whole inteſtinal Canal. It has likewiſe a ſpecial Relation to the Bladder, and to the Parts of Generation in both Sexes.

The Rectum, having paſſed below the laſt Vertebra of the Loins, to the Inſide of the Os Sacrum, is bent backward on that concave Side, to which it is connected, and, having reached the Os Coccygis, it runs likewiſe in the Direction of that Bone, and bends a little forward, terminating beyond the Extremity of the Coccyx.

The Figure of this Inteſtine varies according as it is full or empty. When empty, it is irregularly cylindrical, and ſinks in by a kind of tranſverſe Folds; and, in that State, it is about three Fingers-breadth in Diameter, more or leſs: When full, it is wider in proportion to the Quantity of Fæces, Wind, or whatever elſe is contain'd in it; and it may be extended to the Size of a large Bladder, ſo as to repreſent a kind of Stomach.

The membranous Coat often contains a great Quantity of Fat, ſpread between it and the muſcular Coat, and forming, round the Inteſtine, numerous Eminences, in the room of the Appendices Adipoſæ of the Colon.

The muſcular or fleſhy Coat is very thick. The longitudinal Fibres, which, in the other Inteſtines, are very thin, are in this ſtronger than the circular Fibres of the reſt. The ligamentary Bands continue to increaſe in Breadth, and to approach each other, as has been ſaid; and it is to the fleſhy Fibres of theſe Bands that the Thickneſs of the longitudinal Fibres ſeems to be owing.

The nervous, or filamentous and internal Coats are larger here, than in the other Inteſtines; and, when the Rectum is empty, they form a great Number of waving Rugæ in its Cavity, which diſappear, in proportion as that Cavity is fill'd.

The innermoſt Coat is very improperly term'd Villoſa, and ſcarce deſerves the Name of Papillaris, becauſe of the Smalneſs of the little Corpuſcles ſpread on its Surface. It contains a great Number of ſingle or ſolitary Glands; and it is always moiſten'd by a Mucus of different Conſiſtences, diſcharg'd by theſe Glands or Folliculi, and perhaps by the Corpuſcles alſo.

Near the Extremity of this Inteſtine, the Rugæ or Folds become, in a manner, longitudinal; and, at laſt, towards the Circumference of the inner Margin of the Anus, they form little Bags, or ſemilunar Lacunæ, the Openings of which are turn'd upward towards the Cavity of the Inteſtine. Theſe Lacunæ are ſomething like thoſe at the lower Extremity of the Œſophagus, or upper Orifice of the Stomach.

At length the Extremity of the Rectum contracts, and terminates by a narrow Orifice, call'd the Anus, the Sides of which are diſpoſed in cloſe Folds or Gathers. This Extremity of the Inteſtine has ſeveral Muſcles belonging to it, ſome of which ſurround it like Sphincters; the reſt are broad, fleſhy Planes inſerted in it, and which, being likewiſe fix'd to other Parts, ſuſtain it in its natural Situation, and reſtore it to that Situation, when diſturb'd by the Force neceſſary for the Excluſion of the Fæces. Theſe latter Muſcles are term'd Levatores Ani; the firſt go by the general Name of Sphincters.

Theſe Sphincters are three in Number, one inteſtinal or orbicular, and two cutaneous or oval, whereof one is large, ſuperior, and internal, the other ſmall, inferor, and external.

The inteſtinal or orbicular Sphincter of the Anus conſiſts merely in an Augmentation of the inferior Portion of the fleſhy Fibres of the Extremity of the Rectum.

In order to the Deſcription of the Anus, there are two Ligaments, which muſt be deſcrib'd here; the Ligamentum Cutaneum Oſſis Coccygis; and the other, Ligamentum Pubis Interoſſeum.

The cutaneous Ligament goes out anteriorly from the Extremity of the Os Coccygis. It is very ſlender, and divides into two Portions at the Orifice of the Anus, which run into the Membrana Adipoſa, and are inſerted in the Skin on each Side of the Anus by a kind of Expanſion, and, continuing to divaricate, they are loſt on the two Sides of the Perinæum.

The interoſſeous Ligament of the Oſſa Pubis is a very ſtrong triangular Membrane, fix'd, by two of its Edges, in the inferior Branches of thoſe Bones, all the Way up to their common Symphyſis. The third Edge, which is the loweſt, is looſe; and this whole Membrane, the Middle of which is perforated by a particular Hole, is ſtretched very tight between the two Bones, and under their cartilaginous Arch, to which it adheres very cloſely.

At the lower Part of this interoſſeous Ligament, along its whole or looſe Edge, lies a digaſtric Muſcle, fix'd, by its two Extremities, in the Branches of the Oſſa Pubis, its middle Tendon lying on the Middle of the Edge of the Ligament. This Muſcle is to be deſcrib'd under its proper Article, and it is only mention'd here, becauſe of the Relation it bears to the cutaneous Sphincters of the Anus. It is call'd by ſome Muſculus tranſverſalis Urethræ; by others, Muſculus triangularis.

The cutaneous Sphincters have each an anterior and poſterior Inſertion, ending both Ways in a kind of Point, and comprehending the Orifice of the Anus between their middle Portions.

They are diſtinguiſh'd from each other by their Situation, by their Size, and by a kind of white cellular Line. The greateſt of the two appears to be double, and the ſmalleſt lies neareſt the Skin, and adheres moſt cloſely to it.

They are inſerted backward, partly in the Apex of the Os Coccygis, and partly in the contiguous Portion of the cutaneous Ligament of that Bone. Forward their chief Inſertion is in the middle Tendon of the Tranſverſalis Urethræ; and they have likewiſe ſome Connections to other Muſcles of the Urethra.

The Levatores Ani are broad, thin, muſcular Portions, fix'd by one Extremity of their fleſhy Fibres, round the concave Side of the inferior Portion of the Pelvis, from the Symphyſis of the Oſſa Pubis, beyond the Spine of the Iſchium. The other Extremity of theſe Fibres runs down on each Side behind, and under the Curvature of the End of the Rectum, where they meet together, and unite from the Baſis of the Os Coccygis all the Way to the Margin of the Anus.

By their ſuperior Inſertions, theſe Portions are, on each Side of the Pelvis, divided into three Claſſes; an anterior, middle, and poſterior Claſs. The two anterior Claſſes reach from about the Middle of the Symphyſis of the Oſſa Pubis to the upper Border of the Foramina Ovalia of the Pelvis. The middle Claſſes continue the ſame Courſe immediately above the Inſertion of the Obturator internus, on the Oſſa Iſchium, and a little on the Oſſa Ileum. The poſterior Claſſes are ſpread on the inner Sides of the Oſſa Iſchium to the ſpinal Apophyſes of theſe Bones, and even a little beyond theſe, on the Ligamenta Sacro-ſciatica.

The anterior Portions are, in their Paſſage, connected to the proſtate Glands, to the Neck of the Bladder, to the Bulb of the Urethra; and they ſometimes ſend Fibres to the Muſculus tranſverſalis Urethræ.

The Fibres of all theſe Portions, having, by their ſuperior Inſertions, formed this large and ample Circumference, run down obliquely, from before, backward, contracting in Breadth, and approaching each other in the Manner of truncated Radii; and behind, and under the Extremity of the Rectum, they form a digaſtric Muſcle, ſomething like the Mylo-hyoidæus, which terminates the bony Pelvis below, and forms the Bottom of the Cavity of the Abdomen, as the Diaphragm forms the upper Part.

It is here neceſſary to obſerve, that the Muſcles of the Os Coccygis may be looked upon as Aſſiſtants to the Levatores.

We ought likewiſe to remark, that the Margin or Edge of the Anus is form'd by the Union of the Skin and Epidermis with the internal Coat of the Rectum; ſo that the moſt ſuperficial Portion of that Coat ſeems to be a Continuation of the Epidermis.

Mesenterium *and* Mesocolon.

This great Bundle of Inteſtines is not left to move at random in the Cavity of the Abdomen, but artfully bound down by a membranous Web, which prevents the inteſtinal Convolutions from being intangled in each other, and from being twiſted or compreſſed in all their different Ways of Meeting; and yet allows them a gentle, floating, but limited, Motion.

This Web goes ſtill by the antient *Greek* Name of *Meſentery*, as being, in ſome meaſure, in the Middle of the Inteſtines. It is diſtinguiſh'd into two Portions, one of which, being very broad, and very much plaited, connects the ſmall Inteſtines; the other, which is long, and incurvated, does the ſame Office to the great Inteſtines.

Theſe two Portions are, in Reality, only one and the ſame Continuation of the membranous Lamina of the Peritonæum doubled back upon itſelf; and they are diſtinguiſh'd only by their Breadth. Taken both together, they form a kind of ſpiral Roll, more or leſs plaited in its Circumference. The firſt Portion has retain'd the Name of Meſentery, the other is term'd Meſocolon.

The Meſentery begins at the laſt Incurvation of the Duodenum, and runs obliquely, from Left to Right, along the Vertebræ of the Loins. In this Space, the membranous Portion of the Peritonæum is detached on both Hands, produces a Duplicature by two Elongations, or particular Laminæ, applied to each other, and thus forms the Meſentery.

It is narrow at its upper and lower Parts, but chiefly at the upper. The middle Portion is very broad, and the Edge of it,

next the Inteſtines, is every-where very much plaited. Theſe Plaits or Folds are only waving Inflexions, ſuch as may be obſerv'd in the Edge of a Piece of Shamoy, which has been often drawn through the Fingers. They make this Edge of the Meſentery very long, and they run through about one-third of its Breadth.

The two Laminæ are join'd together by a cellular Subſtance, which contains Glands, Veſſels, and Nerves; and, in ſome Subjects, it has a great Quantity of Fat, which keeps the two Laminæ at a good Diſtance from each other.

Along the whole Circumference of the Meſentery, the two Laminæ are naturally ſeparated, and applied to the two Sides of the ſmall Inteſtines, which they inveſt by their Union, or rather reciprocal Continuation, on the great Curvature of that Canal, and carry it as in a Scarf or Sling. This is what forms the external or membranous Coat of the Inteſtines.

The Meſocolon is the Continuation of the Meſentery, which, having reach'd the Extremity of the Ileum, contracts, and changes its Name. At this Place, the particular Lamina, which is turn'd to the Right-ſide, forms a ſmall tranſverſe Fold, call'd *Ligamentum Coli Dextrum.*

Afterwards, the Meſocolon aſcends towards the Right Kidney, where it ſeems to be loſt, by the immediate Adheſion of the Colon to that Kidney, and to the firſt Incurvation of the Duodenum. Then it appears again, and, increaſing in Breadth, it continues its Courſe almoſt tranſverſly under the Liver, Stomach, and Spleen, where it begins to run downward under the Left Hypochondrium towards the Kidney on the ſame Side.

Thro' this whole Courſe, the Meſocolon extends in Breadth, and forms nearly a tranſverſe ſemicircular Plane, very little plaited at its great Circumference. By this Circumference or Edge, it is connected to the Colon, and hides that ligamentary Band of this Inteſtine, which runs along its ſmall Curvature. By its ſhort or ſmall Edge, it forms the triangular Caſe of the Duodenum; and, by its great Edge, the external Coat of the Colon, in the ſame manner as the Meſentery does that of the ſmall Inteſtines. As it paſſes under the large Extremity of the Stomach, it adheres a little to the lower Portion of that Extremity, as the Diaphragm does to the upper.

Having got below the Left Kidney, it contracts, and forms another tranſverſe Fold, call'd *Ligamentum Coli Siniſtrum.* Afterwards it expands again, but not ſo much as in the upper Part, and runs down on the Left Pſoas Muſcle towards the laſt Vertebræ of the Loins. This deſcending Portion is fixed to the Convolutions of the Colon, in the ſame manner as the ſuperior Portion is to the Arch of that Inteſtine.

The Inteſtinum Rectum is likewiſe inveſted by a particular Production of the Peritonæum, call'd commonly by the barbarous Name of Meſo-rectum. This Production is very narrow, and, about the Middle of the Foreſide of the Rectum, it forms a tranſverſe ſemicircular Fold, which appears when the Inteſtine is empty, but is loſt when it is filled.

Glandulæ Meſentericæ, Vaſa Lymphatica & Lactea. See CHYLUS.

The BLOOD-VESSELS *and* NERVES *of the* INTESTINES.

The Duodenum has commonly a particular Artery called Duodenalis or Inteſtinalis, which comes indifferently from the Stomachica Coronaria, Pylorica, Gaſtrica major, or Hepatica. It has likewiſe ſeveral diſtinct Ramifications from theſe Trunks, and from the Meſenterica Superior and Splenica, which Ramifications communicate with each other.

The Arteria Duodenalis, and the other additional ſmall Arteries, form a vaſcular Net-work round the muſcular Coat of the Inteſtine, which ſends out a great Number of Capillaries towards both the outer and inner Sides, that make the whole Inteſtine look of a red Colour.

The Veins of the Duodenum are Branches of the Vena Portæ, and the Diſtribution and Denomination thereof is pretty much the ſame with that of the Arteries; only they communicate more with each other, than the Arteries, and alſo with the great hæmorhoidal Vein.

The venal Ramifications form round the Duodenum a Net-work, like that of Arteries; and the ſame kind of vaſcular Texture is more or leſs to be found on all the other Inteſtines.

The Arteries of the Jejunum come chiefly from the Meſenterica Superior, and ſome from the aſcending Branch of the Meſenterica Inferior. The Veins are, for the moſt part, Branches of the great Meſeraica, and the reſt come from the Splenica and ſmall Meſeraica, or Hæmorrhoidalis Interna.

The principal ſubaltern Trunks of theſe Arteries and Veins accompany each other through the cellular Subſtance between the Laminæ of the Meſentery, are diſtributed by Branches and Ramifications, and form Maſhes, Lozenges, and Arches. The laſt of theſe Arches and Lozenges, or thoſe next to the Inteſtine, produce two ſmall vaſcular Planes, which ſeparate from each other very diſtinctly, and ſurround the inteſtinal Canal in a reticular Manner.

The Blood-veſſels of the Ileum come from the ſame Sources with thoſe of the Jejunum; and it ought to be obſerved concerning both theſe Veſſels, and thoſe of the Jejunum, that, in their whole Courſe through the Meſentery, they give Ramifications to the Glands, Laminæ, and cellular Subſtance of the Meſentery; and alſo, that there is a kind of Communication between ſeveral ſmall meſeraic Veins, and the capillary Branches of the Venæ Lumbares and Spermaticæ.

The Arteries of the Cæcum and Appendicula Vermiformis are Ramifications of the laſt Branch, from the convex Side of the Meſenterica ſuperior; and they have likewiſe ſome ſmall ones from the ſecond and third Branches, when both are found. The Veins of theſe two Parts are Ramifications of the great Meſeraica; and one of theſe Branches is by *Riolan* termed Vena Cæcalis.

The ſtreight Portion of the Arch of the Colon, or that which is an immediate Continuation of the Cæcum, is ſupplied with Arteries by the ſecond Branch, that comes from the concave Side of the Meſenterica ſuperior, and likewiſe a little by the third, when there is a third.

The ſuperior or middle Portion of the Arch of the Colon is furniſhed by the firſt Branch, from the ſame Side of the Meſenterica ſuperior, which, by a Bifurcation, communicates on both Hands with the other Portions of the Arch of the Colon.

The Left Portion of this Arch derives its Arteries partly from the firſt Branch of the ſame Meſenterica, and partly from that of the Meſenterica inferior; which two Branches form the celebrated Communication, or common Arch of the two Meſentericæ.

By means of this Communication or Continuation, in caſe one Artery ſhould be obſtructed or compreſſed, the other would furniſh Blood to all the Branches below the Place of the Obſtruction. The ſecond Branch of the Meſenterica inferior gives likewiſe ſmall Arteries to the Left Extremity of the Colon.

The deſcending Convolutions of the Colon, which repreſent a *Roman* S, are ſupplied by the other Branches of the Meſenterica inferior, the laſt of which forms the Hæmorrhoidalis interna.

The Veins of all theſe Portions of the Colon are Branches and Ramifications of the Vena Portæ Ventralis, and principally of the ſubaltern Trunk, the Meſeraica major, and Meſeraica minor, or Hæmorrhoidalis interna. The Diſtribution of theſe Branches and Ramifications is, in ſome meaſure, the ſame with that of the Arteries.

The Arteries of the Rectum are furniſh'd by the Hæmorrhoidalis interna, the laſt Branch of the Meſenterica inferior, which communicates with the Hypogaſtrics, and particularly with the Hæmorrhoidalis externa, a Production of one of theſe Arteries.

The Veins of the Rectum are Ramifications of the laſt Branches of the Meſeraica minor, or Hæmorrhoidalis interna; and they communicate with the Hæmorrhoidales externæ, which are Branches of one of the Hypogaſtricæ. They communicate likewiſe with the capillary Ramifications of the other hypogaſtric Veins, which go to the internal Parts of Generation of both Sexes.

It is here to be obſerv'd in general, that there is a ſucceſſive Continuation, more or leſs ſimple or multiplied, between all the Arteries of the inteſtinal Canal, and likewiſe between all the Veins; and alſo that the Veins are here thinner, and more capacious, than the Arteries, in a greater Proportion than in the other Parts of the Body.

The Nerves of the Duodenum are the middle Plexus of the ſemilunar Ganglion, and ſome Filaments of the Plexus Stomachicus and Hepaticus.

The Nerves of the Jejunum, Ileum, and meſenteric Glands, are the Plexus meſentericus ſuperior, the poſterior meſenteric Faſciculi, and the Plexus Meſentericus inferior.

The Nerves of the Cæcum are the poſterior meſenteric Faſciculi or Plexus, and the Plexus Meſentericus inferior.

The Nerves of the Arch of the Colon are the ſame Faſciculi, and the two Plexus Meſenterici.

The Nerves of the laſt Convolutions of the Colon are the poſterior meſenteric Faſciculi, and the Plexus Meſentericus inferior, and Submeſentericus.

The Nerves of the Rectum are the Plexus Meſentericus inferior, Plexus Submeſentericus or Hypogaſtricus, and the two Ganglions of that Plexus.

The Nerves of the Anus, and of its Muſcles, are the Ganglions of the Plexus Submeſentericus, the inferior Rope of both Sympathetici maximi, and the common Arch of the Extremities of both Ropes.

The Inteſtines, in general, finiſh what the Stomach had begun. The alimentary Pulp, having been ſufficiently prepared by the Succus Gaſtricus, or Lymph of the Stomach, undergoes a farther Change by the inteſtinal Lymph, Bile, and pancreatic Juice, by which the milky Liquor, call'd Chyle, is produced, and this Liquor render'd fluid enough to enter the lacteal Veſſels through the Tunica Villoſa of the ſmall Inteſtines, while the groſſer Portion of the Aliment continues its Courſe, and, becoming gradually thicker, as it advances towards the great Inteſtine, is there collected by the Name of Fæces.

The

The Dilatation of the Inteſtines is bounded by their common Coat. The undulating, ſucceſſive, and periodical Contraction of the fleſhy Fibres, eſpecially of the orbicular Fibres of the muſcular Coat, expreſſes the inteſtinal Lymph, beats it up into an Emulſion with the alimentary Paſte, ſtrains that Emulſion through the lacteal Veſſels, and propels the Reſiduum.

The nervous Coat ſerves to ſuſtain the Tunica Villoſa, and, by the oblique Diſpoſition of its Fibres, yields to the periodical Motions of the muſcular Coat, without compreſſing the chyliferous Ducts, which paſs through the Maſhes of this Coat in the ſmall Inteſtines.

The Length of the ſmall Inteſtines gives a great Extent to what may be call'd the Strainer of the Chyle, and this Extent is very much inlarged by the numerous Folds termed Valvulæ Conniventes. By means of this large Extent, there is a great Quantity of Chyle ſtrain'd through theſe Inteſtines, and the Valves hinder the alimentary Pulp from paſſing through them too faſt; that is, before all the milky Juice has been expreſſed; and this may be obſerv'd chiefly in the Beginning of the Inteſtines, where theſe Valves are moſt numerous and broadeſt, and the Aliment moſt fluid.

The Cavity of the great Inteſtines ſerves to receive the Fæces of the Aliment, and to contain a conſiderable Quantity thereof for a certain Space of Time, without any Inconveniency, and without being obliged to diſcharge them continually, which would be as great an Inconveniency as any. The Incurvation of the Colon, its Cells, and Contraction of its laſt Convolutions, contribute to this Retention of the Fæces; but the Cæcum ſeems to be the firſt Organ thereof, becauſe the Fæces, being firſt collected there, are obliged afterwards to move in a contrary Direction as they aſcend into the Colon.

The Valve of the Colon, which might more properly be term'd the Sphincter or Pylorus of the Ileum, hinders the Fæces from returning into the ſmall Inteſtines: I ſay, the Fæces or groſs Matter, becauſe it is not certain, that this Valve entirely ſtops that Paſſage, or that it always hinders any fluid Matter, forced downward by the Colon, from entering the Ileum, even in a natural State.

The glandular Lacunæ of the great Inteſtines furniſh continually a kind of Mucilage, which not only defends the internal Coat from the Acrimony of the Fæces, but ſerves alſo to lubricate theſe Fæces, in proportion to their different Degrees of Solidity.

The Appendicula Vermiformis is ſo very ſmall in Adults, that its Uſe cannot be determined with Certainty. Perhaps the mucilaginous Matter in its Cavity, furniſh'd by the numerous glandular Lacunæ of its internal Coat, which can only be evacuated by Plenitude, may, during its Stay there, contract an Acrimony, which may vellicate or ſtimulate the Cæcum, in order to throw its Contents into the Colon.

The Inteſtinum Rectum is the laſt Reſervatory of the Fæces. The great Thickneſs of its muſcular Coat, and the great Number of longitudinal Fibres, by which this Thickneſs is chiefly form'd, enable it to yield to the collected Fæces to ſo great a Degree, as to repreſent a large Bladder or Stomach. The Muſculi Levatores Ani ſerve to ſuſpend the lower Portion of this Inteſtine, eſpecially when full; and it is partly by the Contraction of theſe Muſcles, which overcome the Sphincter of the Anus, that the Fæces are diſcharged out of the Body. Theſe Sphincters form the third Pylorus of the whole alimentary Canal.

The Meſentery and Meſocolon connect the Inteſtines in ſuch a manner, as that they cannot be twiſted or run into Knots, without hindering them from ſliding, and yielding to each other, according to the different Poſtures of the Body, or according as they are more or leſs empty or full.

The Adheſions of the Meſentery form the Convolutions of all the ſmall Inteſtines into a large Bundle, irregularly round, which fills a great Part of the Cavity of the Abdomen, from the Epigaſtrium downward.

The Meſocolon, by its Adheſion to the Colon, forms a kind of Septum Tranſverſum, between the ſmall Inteſtines and the Viſcera contain'd in the Epigaſtrium; and this Septum ſupports the Liver and Stomach, under the Arch of the Diaphragm, juſt as much as it is ſuſtain'd by the Inteſtines. This natural Situation of theſe Viſcera is moſt commonly alter'd in dead Bodies, open'd after the common Method, and without the neceſſary Precautions.

The Breadth of the Meſentery and Meſocolon affords a large Extent to the Ramifications of the Arteries, Veins, and Nerves, diſtributed through them by innumerable Communications and Anaſtomoſes; by means of which any Portion of the Inteſtines may be ſupplied, tho' the principal Branch, which leads to it, ſhould happen to be compreſs'd or obſtructed.

The cellular Subſtance, in the Duplicature of the Meſentery and Meſocolon, ſerves not only for a ſoft Bed to all theſe Ramifications, but alſo to contain thoſe Collections of Fat neceſſary for the Formation of the Bile; and the cellular Subſtance of the Meſentery has likewiſe one Uſe peculiar to it, which is, to inveſt the Lymphatic Glands, and Lacteal Veſſels; and, upon this Account, it is thicker than that of the Meſocolon.

The Lacteal Veſſels being firſt form'd by a copious reticular Texture, round the Circumference of the Inteſtines, reſembling the vaſcular Network of that Canal, and afterwards uniting every-where, thro' the Duplicature of the Meſentery, with the arterial Ramifications, which they likewiſe accompany in many Places; it is eaſy to conceive, that the Pulſation of the Meſenteric Arteries muſt propel the Chyle in the Lacteal Veſſels, from the Inteſtines to the Receptaculum Chyli, that Motion being ſuitable to the Direction of their Valves. *Winſlow's Anatomy.*

CŒLIACA *Arteria*. See ARTERIA.

CŒLIACA PASSIO. The Cœliac Paſſion. This is a Diſtemper not named by *Hippocrates*. *Aretæus* calls thoſe afflicted with this Diſeaſe κοιλιακοὶ, and, *Cœlius Aurelianus*, *Ventriculoſi*. What *Celſus* calls the *Cœliacus Ventriculi Morbus*, is a Diſorder very different from that which the above-mention'd Authors mean, and which the Moderns underſtand by the Cœliac Paſſion: For *Celſus*, *Lib.* 4. *Cap.* 12. deſcribes the Diſeaſe as attended with an Induration and Pain of the Belly, entire Coſtiveneſs, inſomuch that even Wind cannot be diſcharged, Coldneſs of the Extremities, and Difficulty of Breathing. That the Diſtemper meant by *Celſus* is very different from that underſtood by *Aretæus*, and *Cœlius Aurelianus*, will evidently appear, from the Deſcriptions given by the laſt-mention'd Authors, compared with what is quoted from *Celſus*.

The Stomach, which is the Organ of Concoction, is diſturb'd in the Exerciſe of its Function, when the Patient labours under a Diarrhœa, which is a Diſcharge of moiſt and crude Aliment. And if this Diſorder proceeds not from a tranſient Cauſe, but continues for a Day or two, ſo as to render the Body weak for want of Nouriſhment, it becomes a chronic Diſeaſe, and is call'd the *Cœliac Paſſion*. The Cauſe of this Affection is a Debility of the concoctive Heat, and a Refrigeration of the Stomach, when the Heat is ſufficient to diſſolve, but not to concoct the Aliment, and convert it into a Juice proper for the Body, coming ſhort of its End, and performing but half its Work through Imbecillity. The Concoction being thus left unfiniſh'd, the crude Aliment undergoes an Alteration for the worſe, in Colour, Smell, and Conſiſtence, being white, and deſtitute of Bile, of an ill Smell, like Mud, humid, and of no firm Conſiſtence, for want of a due Elaboration, partaking of no more Virtue or Benefit from Concoction, than what was communicated to it in the Beginning.

Hence the Patient is moleſted with Inflations in the Belly, and continual and fetid Eructations, which, if they make their Way downwards, cauſe a Rumbling in the Inteſtines, with a Diſcharge of a rough, humid, argillaceous, and flatulent Matter, ſucceeded by an Efflux of ſomething humid in Appearance. A ſevere Pain, like a pungent Senſation, is felt at the Stomach at Intervals. The Patient, in the mean time, falls into an Atrophy, and becomes lean, pale, weak, and incapable of diſcharging the Duties of his Calling; for, whenever he walks, his Strength fails him, and he is ready to fall down. The Veins of the Temples appear elevated, becauſe of the Hollowneſs of thoſe Parts, thro' Want of Nouriſhment; and the Veins over all the Body are remarkably viſible; for the Aliment is not only unconcocted in any due Meaſure, but, even in its crude and imperfect State, undiſtributed towards the Support of the Body; the Diſeaſe, in my Opinion, conſiſting in a Defect of Diſtribution as well as Concoction.

If the Diſeaſe increaſes, there is a Reflux from all Parts to the Stomach, ſucceeded by a Waſting of the whole Habit, a Dryneſs of the Mouth, and a Defect of Humidity or Sweat over the whole Superficies of the Body. Sometimes the Stomach is afflicted with a burning Heat, as from a fiery Coal; at other times it labours under a refrigerating Senſation, as from a Piece of Ice; ſometimes at the End of the Stools there is an Efflux of yellow, pure, and unmix'd Blood, which ſeems to flow from the open Mouth of ſome Vein; for the Veins are corroded by the Acrimony of the Humour. This Diſorder is of very long Duration, and difficult to be cured; for, tho' it ſhould ſeem to leave the Patient without a manifeſt Cauſe, it returns upon him, whenever the leaſt Error ſhall give Occaſion for a Relapſe, and performs the ſame Circuit over again.

This Diſeaſe is much incident to aged Perſons, and to Women more than Men: As for Children, becauſe of their daily Intemperance in Food, they have a continual Diarrhœa; but this proceeds not from any Diſorder of the Stomach. The Summer is the Seaſon in which this Diſtemper is moſt common; next to that, the Autumn; a very cold Winter alſo, by which the natural Heat is almoſt extinguiſh'd, is productive of the ſame. It proceeds alſo from long Illneſs, from a Dyſentery, and a Lientery; and a greedy Draught of cold Water has been known to occaſion this Diſorder. *Aretæus*, περὶ αἰτ. καὶ σημ. χρον. παθ. *Lib.* 2. *Cap.* 7.

The Diſorder of the Stomach, which the *Greeks* call κοιλιακὸν, (Cœliac) took its Name from that Part of the Body which is affected (from κοιλία). The Cauſe of it is a continual preceding Indigeſtion, a vehement Inflammation, (*Tumor* in the Lan-

Language of the Methodics) or a Dyſentery. The Symptoms attending this Diſorder are, a Variation of the Excrements, both in Quality and Colour; for ſometimes they are of a thin and looſe Conſiſtence, at other times rough, unequal, and denſe; ſometimes they are white, ſometimes like Camels Urine, ſometimes yellow and ſpumous, at other times porraceous, livid, black, purulent, or bloody, extremely fetid, and diſcharged with a Rumbling of the Inteſtines, which they call βορβορυγμὸς, *Borborygmus*. The Stools appear full of Veſicles, or Bubbles, as from an Ebullition, and ſometimes continually fatigue the Patient by Night as well as Day; ſometimes they are diſcharged in great Quantities at Intervals, as once or twice in a Day, or at an Interval of one or two Days, or perhaps more; ſometimes with a Tenſion, Inflation, and Gripings, or with Pain, or the Hiccough, a Compreſſion and Contraction of the Skin which covers the Belly, a Thirſt, great Heat of the Belly, and a ſlight cold Numbneſs in the interior Parts. Theſe Symptoms are ſucceeded by Want of Sleep, Averſion to Food, and ſometimes an extraordinary Appetite, Weakneſs, a whitiſh Paleneſs, and ſometimes a Fever, and afterwards by an extremely fetid Smell of the Body, which is communicated to whatever is touch'd with the Hands, ſo as difficultly to be removed, with an Inflation of the Face and Feet. Sometimes a Dyſentery attends this Diſorder, the Inteſtines being very ſubject to Ulcerations, from the Acrimony of the Humours flowing to them.

This is a Diſeaſe of *Solution*, but ſometimes complicated with a *Stricture*; for, by ſome of its Symptoms, as we may conjecture from what has been ſaid, it ſeems to partake of both. *Cœlius Aurelianus*, *Morb. Chron. L.* 4. *Cap.* 3.

By many of the Moderns the Cœliac Paſſion and Lientery are ſaid to differ only in Degree: But the Difference ſeems to be more than they apprehend; for, in a Lientery, the Aliments are diſcharged crude and undigeſted; an Indication, that the Stomach is, through ſome Defect, unable to diſſolve them: Whereas, in a Cœliac Paſſion, Chyle is diſcharged together with the Excrements; which ſhews, that the Stomach diſſolves the Aliment, but that the Lacteal Veſſels are by ſome means obſtructed, ſo that the Chyle cannot paſs thro' them, or that the Inteſtines are too much relax'd.

Freind diſtinguiſhes betwixt the Cœliac Paſſion, and Chylous Flux: The latter, ſays he, is cauſed by an Obſtruction of the Lacteal Veſſels; the former from Obſtructions of the Inteſtinal Glands, on which account a ſufficient Quantity of Lymph cannot, by theſe, be ſupply'd for diluting the Chyle, and rendering it fit to paſs into the Lacteals; and hence it paſſes off with the Excrements. This, he ſays, is confirm'd by Diſſections of People who have died of theſe Diſtempers.

The Chylous Flux, ſometimes call'd by the Name of *Cœliac Paſſion*, when it proceeds from an Obturation of the Lacteals, is more or leſs dangerous, in proportion as the Obſtructions are obſtinate; upon the Removal of which the Cure depends. If theſe reſide olny at the Orifices of the Lacteals, the Cure is leſs difficult, than when ſituated deep in the Meſentery.

That Species of Cœliac Paſſion, which is cauſed by a Deficience of the diluting Fluid, ſecreted by the Inteſtinal Glands, admits of more ready Cure than the other. But every Species, when it continues long, is attended with a great deal of Danger.

As the Cure of theſe Diſorders, propoſed by the Antients, with Aſtringents, muſt be very wrong, and likely to increaſe the Diſeaſe, I ſhall only ſpecify that of *Aretæus* as an Example.

If the Stomach cannot retain *(a)* the Food, but the Aliment paſſes thro' the Body unconcocted, unchanged *(b)*, and crude, without contributing any thing to the Support of the Body, we call the Patients under this Diſorder *Cœliaci*, as being affected with a Refrigeration of the natural Heat which ſerves for Concoction, and an Imbecillity of the diſtributive Faculty.

In this Diſeaſe the Stomach muſt, firſt of all, be relieved from its Pain by Faſting and Reſt, which will procure a Return of the Strength; and, if the Stomach appears to be oppreſs'd with a Multitude of Humours, the Patient muſt vomit, faſting, with Water or Hydromel. It will be convenient alſo to cover and moiſten the Part with greaſy Wool, as an Aſtringent; or to anoint the ſame with Unguentum Roſaceum, Œnanthinum, or Melinum; or, what is beſt, with Schœnanthinum, together with Hypocyſtis, or Omphacium *(ſee theſe Words in their proper Places)*; and with theſe may be apply'd Cataplaſms, warm to the Touch, and of an aſtringent Virtue. If the Diſorder be attended with a Convulſion or Inflammation of the Liver, or Mouth of the Stomach, it will be proper to uſe Cupping and Scarifying, which have ſometimes been found ſufficient for a Cure; and when the Wounds, thus made, are, by the Application of Cerates, nearly cicatriſed and conſolidated, apply Leeches to the ſame. After theſe may be apply'd Epithems which help Concoction, ſuch as that which is prepared of Seeds, with an Addition of the Root of Chamæleon. Bay-berries are alſo very proper in this Caſe, and alſo the *green* Malagma, and that of our own Invention call'd *Myſterium*, which are of a mollifying and aperitive Quality, excite the natural Heat, and diſcuſs Flatulences in the Viſcera, which are all neceſſary Effects, in order to a due Conſtriction. Muſtard alſo, the Limneſtis, Euphorbium, and other Things of that Kind, prevent Refrigeration, and revive the natural Heat. The following Potions are alſo proper on account of their Aſtringency: Firſt, we ſhall mention the Juice of Plantain, with the aſtringent Water of Myrtle-berries or Quinces. The Kernels or Stones of unripe Grapes, and Wines of the moſt aſtringent Quality, are alſo very proper on this Occaſion. Then let the Patient take ſome Potion, which is of a heating Nature to his Belly, ſuch as is prepared of Ginger, Pepper, and the Seeds of wild Parſley, which grows on the Rocks, all well mix'd together, with Theriaca. If theſe Remedies are of little or no Service, vomit with Horſe-radiſh; and if with theſe you infuſe the Root of white Hellebore, for one Night, you will be provided with an excellent Cathartic, which will cleanſe and evacuate cold Humidities, and revive the natural Heat.

As to Diet, and Way of Living, the Patient muſt be very regular: Let him ſleep in the Night, and ſpend the Day in walking about, in exerciſing his Voice, and being carried thro' Groves of Myrtles and Bay-trees, or over Fields thick-ſet with Thyme; for a free Perſpiration, and Breathing in ſo ſweet an Air, are a great Help to Concoction. Then let him betake himſelf to Gymnaſtics, as Frictions, artificial Motions of the Arms, and throwing of Weights, in order to exerciſe the Breaſt and Stomach. Let him drink well; for Bread will contribute very little towards the Reſtoration of his Strength. *Aretæus*, περὶ διεαπ. χρον. παθ. *Lib.* 2. *Cap.* 7.

Dr. *Freind* ſays, that the moſt rational and ſucceſsful Method of treating the Cœliac Paſſion is to adminiſter ſuch Remedies, as gently ſtimulate the Inteſtinal Tube, and deterge the obſtructed Glands. For this Purpoſe gentle Purges, adminiſter'd in ſmall Quantities, and frequently repeated, are recommended, and gentle Vomits of Ipecacuanha. See LIENTERIA.

CŒLIFOLIUM.

This Subſtance, to which *Paracelſus* gave the Names of *Noſtoch* and *Cerefolium*, and which is by others call'd *Cœli Flos*, *Cœlifolium*, and *Flos Terræ*, appears to be a Species of Jelly, ſometimes clear, ſometimes greeniſh, and agitated with a kind of tremulous Motion ſo long as it is freſh. It is moſt generally found, after Rain, in Meadows, and in dry parch'd and ſandy Soils. It moſt commonly appears between the vernal and autumnal Equinoxes. It muſt be gather'd before the Riſing of the Sun; ſince, by the Heat of its Rays, it is ſo dried and ſhrivel'd up, that nothing of it remains, except ſome Membranes of a browniſh Colour.

Its real Origin is much controverted; ſome imagine, that it falls from the Heavens like Dew, and is the Excrement of ſome Star; whereas others are of Opinion, that it is a Species of Plant, or ſome Production of the Earth.

Mr. *Magnol*, in his *Botanicum Monſpelienſe*, has call'd it *Muſcus fugax Membranaceus Pinguis*; and Mr. *Tournefort*, in his *Traité des Plantes des environs de Paris*, has given it the Name of *Noſtoch Ciniſionum*. I believe they are the only two Botaniſts who have rank'd it among the Number of Plants.

I thought it incumbent upon me to take a View of this Subſtance in its various States, and at its different Ages, in order to convince the World, that it is a Production of the Earth, to which it adheres by one or more ſlender Roots. The Embryo, then, of this Plant, at firſt, appears like a ſmall Tubercle, which is fleſhy, ſoft, and diverſify'd with inconſiderable Inequalities, like theſe obſerved on Strawberries. It is of a greeniſh-brown Colour, but becomes clear, in proportion as its Membrane is inlarged. This Membrane, at laſt, appears entirely unfolded on the Earth, in which it ſometimes leaves the Impreſſion of its Cavities.

When it is arrived at this State, it remains in it ſo long as the Weather is moiſt, and does not fade till the Wind and Sun dry the Earth, and conſequently deprive it of its proper Nouriſhment.

In its natural State I have generally found it folded lengthways; and it appear'd to me, that its two Ends form'd, at their Joining, a Species of membranous Aſſemblage or Bundle.

In the Year 1667. Mr. *Duclos* preſented to the Academy a clear and inſipid Water diſtil'd from the *Cœlifolium*, which gave a whitiſh Colour to the Solution of corroſive Sublimate.

In the Year 1678. Mr. *Bourdelin* ſubjected it to a more accurate Analyſis, extracted from it not only a great deal of Phlegm, but alſo a pretty large Quantity of fetid Oil, and volatile Salt, which was either concreted, or diſſolved in the Liquor.

The Analyſis, to which I myſelf ſubjected it, quadrates pretty exactly with thoſe inſtituted by the above-mention'd Gentlemen. I firſt obtain'd from it a very clear and inſipid Liquor, which render'd the Solution of corroſive Sublimate white, and the Syrup of Violets green.

(a) For ἀκεωτὸς, I read ἀκρατὴς. *(b)* For ἄθρεπτος, I read ἄτρεπτος.

The

The other Liquors I extracted from it, confirm'd what I had before remark'd with reſpect to the firſt.

At laſt, I obtain'd from it a beautiful volatile Salt, concreted, and well cryſtallized on the Sides of the Receiver; as alſo a volatile urinous Spirit, and a fetid Oil. The *Caput Mortuum*, when calcin'd and lixiviated, furniſh'd me with a very ſmall Quantity of fix'd Salt, and was alſo impregnated with Earth. It gave a faint yellow Colour to the Solution of corroſive Sublimate, changed the Syrup of Violets, and render'd it of a greeniſh Colour.

If this Plant is ſuffer'd to ferment by itſelf, in a cloſe-ſtopt Veſſel, it becomes putrid, and is diſſolved into a pretty fetid Liquor, which, at the End of twenty Days, is of a rediſh, and ten Days after of a bluiſh Colour.

I obſerved, that, even after a conſiderable time, one of theſe Liquors was an Acid, and the other an Alcali. The red Liquor had no Effect upon the Solution of corroſive Sublimate, and only produced a faint and almoſt imperceptible Red in the Syrup of Violets: The blue Liquor gave a white Colour to the Solution of corroſive Sublimate, and render'd the Syrup of Violets green.

Uncommon Virtues are, by ſome, aſcrib'd to the *Cæliſolium*. The Country-people in *Germany* uſe it to make their Hair grow. It is alſo accounted excellent in Cancers and Fiſtulas. A *Swiſs* Phyſician reduced it to a Powder, of which he exhibited two or three Grains, in order to leſſen and allay internal Pains. He alſo apply'd it externally for the Cure of Ulcers.

The Cœlifolium is an Ingredient in the *Sperniolum Compoſitum Cnæfelii pro Principe van Eggenberg*, which is deſcrib'd in the *German Ephemerides* for the Year 1676. among the Secrets of *Cnæfelius*.

Some Chymiſts imagine, that the Cœlifolium contains the univerſal Spirit. They alſo extract a mild Spirit from it, to which they aſcribe uncommon Virtues, and which they believe to be the radical Menſtruum, or Solvent of Gold.

The Water is diſtil'd from it either by the Heat of the Sun alone, or by a very ſlow Fire, by the Action of which it is raiſed very faſt. This Water is generally accounted a very mild Diſſolvent. It is by ſome ſaid to be an admirable Remedy for alleviating Pain, and curing Ulcers, however obſtinate and rebellious they may poſſibly be. *Mem. de l' Acad. Roy. des Sciences, Anno* 1708. *by M. Geoffroy the younger.*

This is generally call'd by the Country-people *Star-fall*, and is thought to be what is vomited up by ſome Animals, which live on Frogs or Fiſh, as the Heron, or Bittern.

CŒLOMA, κοίλωμα. See BOTHRION.

CŒLOSTOMIA, κοιλοστομία, from κοῖλος, hollow, and στόμα, the Mouth. A Defect in Speaking, when a Perſon's Speech is obſcur'd, by ſounding as if his Voice proceeded from a Cavern.

CŒLUM. The Air, or Climate.

CŒMENTATIO. CŒMENTUM. See CŒMENTUM.

CŒNA. Supper. Moſt Authors adviſe Suppers to be eaten at a ſufficient Diſtance of Time from going to Bed: They ſhould conſiſt of eaſily digeſtible Aliment, and never exceed in Quantity. Valetudinarians ſhould, in a particular Manner, obſerve theſe Rules, which are alſo of ſome Importance to thoſe who uſe but little Exerciſe.

CŒNOLOGIA. κοινολογία. A Conſultation of Phyſicians.

CŒNOTES, κοινότης, from κοινὸς, common. I know of no *Engliſh* Word which will expreſs the Meaning of this. The Phyſicians of the Methodic Sect aſſerted, that all Diſeaſes aroſe from Relaxation, Stricture, or a Mixture of both. Theſe were call'd κοινότητες, what Diſeaſes have in common.

COFFEE. The Plant which bears Coffee-berries is thus diſtinguiſhed:

COFFEE, Offic. *Coffee Frutex; ex cujus fructu fit potus*, Raii Hiſt. 2. 1691. *Jaſminum Arabicum, Caſtoneæ folio, flore albo odoratiſſimo cujus fructus Coffy in Officinis dicuntur*, Comm. Plant. Uſu. 85. Boerh. Ind. A. 2. 217. *Frutex Coffee*, Act. Reg. Soc. Lond. 208. p. 61. *Arbor Ymenſis fructum Coffé ferens*, Dougl. p. 2. *Euonymo ſimilis Ægyptiaca fructu baccis Lauri ſimili*, C. B. Pin. 428. *Bon arbor cum fructu ſuo Buna*, Park. Theat. 1622. *Bon.* Alp. Ægyp. 63. Veſlinge Obſ. 21. *Bon vel Ban Arbor*, J. B. 1. 422. *Bon vel Ban, ex cujus fructu Ægypti potum Coava conficiunt*, Pluk. Almag. 69. Phytog. 272. THE COFFEE-TREE.

This is a low ſhrubby Tree or Buſh, which grows in *Arabia Felix*. It is a Species of Jaſmine, according to *Commelin*, having very ſweet odoriferous Flowers, like thoſe of Jaſmine. The Leaves are about four Inches long, and two broad in the Middle, decreaſing gradually till they become ſharp at both Ends. The Flowers come forth at the ſetting on of the Leaves, and are ſucceeded by Berries, each of which incloſes two Seeds in an inner thin Skin, being oval and roundiſh on the one Side, and flat on the other, with a Sulcus running thro' it. *Miller's Bot. Off.*

The Coffee-ſhrub is propagated from a Seed which muſt be ſown very recent. Some have affirmed, that the *Arabians*, from a Principle of Envy, will not permit the Seeds to be exported from their own Territories, till they have deſtroy'd their Buds either by Fire or boiling Water, leſt they ſhould ſerve to propagate the Coffee-ſhrub in other Countries; but this is a palpable Miſtake; for the *Dutch* found means to import freſh Coffee-ſeeds from *Arabia Felix* into *Java*, where they produc'd the Coffee-ſhrub in ſuch Perfection, that it bore very good Fruit. When ſome of the *Java* Seeds were imported into *Europe*, firſt the Phyſic-garden at *Amſterdam*, and then that at *Paris*, produc'd the Coffee-ſhrub: And, at preſent, this *Arabian* Seed is ſown and propagated in ſeveral Gardens of *Europe*. But this groundleſs Charge againſt the *Arabians* is juſtly apply'd to the Governors of *Surinam* in *America*, who, by a Statute, have made it Death to export the Coffee-ſeeds from their Territories before their Buds are burn'd; but the *French* fell upon Expedients to fruſtrate their Statute; for, finding means to import theſe Seeds in their natural State into the Iſland *Cayenne*, they there cultivate their belov'd Shrub with great Succeſs.

Theſe Berries, when dry'd in the Sun, are much us'd almoſt in every Part of the habitable World, for preparing, by Infuſion or Boiling, that celebrated Liquor known by the Name of *Coffee*. The firſt among the *Europeans*, who wrote on the Uſe of theſe Berries, were two Phyſicians; *Rauwolffius*, a Native of *Germany*, after he had finiſh'd his Travels thro' the *Eaſt*; and *Proſper Alpinus*, an *Italian*, after he had for ſome time reſided in *Egypt*, which borders upon *Arabia Felix*. Becauſe the Coffee-ſhrubs, cultivated in the cold Gardens of the *Europeans*, do not yield a Quantity of Berries ſufficient to anſwer the Conſumption, we are obliged to have them imported not only from the *Arabians* under the Name of *Levant Coffee*, which is the ſmalleſt of all the other Kinds, but alſo from the *Dutch* in *Java*, under the Name of *Java* or *Eaſt India Coffee*, which is the largeſt, and of a whitiſh livid Colour. Theſe Berries are alſo imported from *America*, under the Name of *Engliſh* or *Surinam Coffee*; and the Berries of this Kind are indifferently large, and of a greeniſh Colour. They are alſo ſometimes imported into *Europe* from a *French* Settlement in *Africa* call'd *Bourbon*, under the Name of *French Coffee*. But thoſe Coffee-berries or Grains are accounted beſt which are ſmall, and of a greeniſh Colour, which are not corrupted by Moiſture or Mouldineſs, which are recent, and affect the olfactory Nerves with a Smell reſembling that of Hay, which have an herbaceous grateful Taſte, which are of a very cloſe Conſiſtence, and ſomewhat tranſparent, ſince 'tis reported, that the Berries of this Kind are capable of being preſerv'd for five or ſix Years. The *Levant Coffee* is generally prefer'd to the other Kinds; but ſome, with good Reaſon, affirm, that the Berries imported into *Europe* from *Surinam* in *America* are the beſt, becauſe they may be had more freſh and recent than thoſe imported from other Parts.

We ſhall now inquire in what Manner the ſeveral Nations, from whom we receive the Coffee-berries, prepare them; what Effects they promiſe themſelves from their Uſe, or on what Accounts they recommend them; and, laſtly, what may reaſonably be aſſerted with reſpect to the Medicinal Virtues and Uſe of Coffee.

The *Arabians* then triturate the Coffee-berries in an open Earthen Veſſel, immediately after they are roaſted; then, pouring boiling Water upon them, they boil them for ſome time, and drink the Liquor forthwith, not waiting till its groſſer Parts ſubſide: But ſome of them, as ſoon as the Veſſel is taken off the Fire, wrap it up in a wet Linen Cloth, in order to produce a Precipitation of the groſs Parts; by which means they drink their Coffee clear and fine. The Men of Note and Diſtinction among the *Arabians* do not uſe the Berries themſelves, but the ſeminal Capſulas, and the Pellicles immediately covering the Berries, which produce a Liquor of a grateful Taſte, and free from Bitterneſs. But, for this Purpoſe, theſe Capſulas and Pellicles muſt be very freſh and recent. This Species of Coffee is, by the *French*, call'd *Café à la Sultane*. When the *Arabians* are aſk'd, what Reaſons induce them to drink Coffee ſo liberally as they do, they generally anſwer, that they are, from Experience, convinc'd of its being poſſeſſed of nutritive Qualities, and ſuch as render them Proof againſt various Diſorders. But they ſeem principally addicted to the Drinking of this Liquor, for no other Reaſon, than that by ſo doing they may paſs the Time agreeably. The Chevalier *D'Arvieux*, in his *Memoires*, informs us, that this Liquor is abſolutely neceſſary for all thoſe, who, like the *Arabians*, are diſtractedly fond of Opiates and Narcotics. The *Egyptians* alſo eſteem the Coffee, prepared from the ſeminal Capſulas and Pellicles, more rich and efficacious than that produc'd by the Berries themſelves. The *Egyptians*, as well as the *Arabians*, uſe warm Coffee very frequently throughout the Day; but, in a particular Manner, they drink large Quantities of it in the Morning for Breakfaſt; for, as *Alpinus* informs us, the *Egyptians* find from Experience, that the Stomach is warm'd and corroborated, and Obſtructions of the Viſcera remov'd, by the Uſe of Coffee. It is a ſpeedy and efficacious Remedy for provoking the Menſes; and, among the

Egyptians, thoſe Women, in whom they flow too ſparingly, drink large Quantities of it pretty warm, ſipping it up by little and little; which is the manner of drinking it among them all. After an univerſal Evacuation of the Body, Coffee, drank upon an empty Stomach, eſpecially in the Morning, effectually provokes the Menſes, and affords inſtantaneous Relief in Caſes where they are diſcharged with violent Pains, and in too ſmall a Quantity. In order to prepare their Coffee, they take of the Berries, freed from the Capſulas, a Pound and an half, or eighteen Ounces: Theſe they roaſt a little over a Fire, and, when roaſted, boil them in twenty Pints of Water. Some of them ſuffer their Berries, when roaſted and triturated, to remain a Day in Infuſion with Water. Others, without any previous Infuſion, boil them to a Conſumption of half the Water, ſtrain the boil'd Liquor off, and keep it for uſe in Earthen Veſſels, cloſe ſtopt. They prepare Coffee from the Capſulas of the Seeds in the ſame Manner; but, for that Purpoſe, uſe a ſmaller Quantity of them; for ſome take only ſix, and others nine Ounces of them, which they boil in twenty Pints of Water, till half of the Liquor is conſumed. According to *Veſlingius*, the *Egyptians* prepare Coffee either from the Seeds alone, or from the ſeminal Capſulas alone, or from both together. In order to prepare it both with the Seeds and their Capſulas, they muſt be powerfully dried, and even a little torrify'd in a Stove, that by this means they may become capable of being reduc'd to a Powder. This Liquor is, among the *Egyptians*, boil'd in well-tin'd Kettles, plac'd in Furnaces elegantly built for this Purpoſe; and the Fire, by which the Operation is perform'd, conſiſts of the Excrements of Animals made up into Balls with Straw. *Alpinus* informs us, that ſome, who love their Coffee rich, uſe a ſmaller Quantity of Water than that already ſpecify'd; whereas others, who chooſe it weak and thin, employ a larger Quantity of Water in preparing it; that there is no Neceſſity for ſtraining the Liquor; and that, in the Coffee-houſes, ſome of them add a ſmall Quantity of the freſh Powder immediately when this weak Decoction is intended for Uſe. *Alpinus* informs us, that this Liquor is highly beneficial to the Stomach. An Ounce or more of it, prepared with boiling Water, is by them ſup'd in the Morning on an empty Stomach; for they are obſerv'd to be as fond of Coffee as our Countrymen are of Debauches of Wine in a Tavern. According to *Veſlingius*, in the City of *Memphis*, now call'd *Grand Cairo*, Coffee is ſold, in ſome thouſands of Taverns, to large Multitudes of Perſons, who ſup it warm either as an Amuſement, or for the ſake of Health, eſpecially when the Heart and Stomach are languid. Some correct the Bitterneſs of the Coffee with Sugar, and candy the Seeds themſelves by way of Sweetmeat. This Practice obtains not only in *Egypt* itſelf, but alſo in the ſeveral Provinces of the *Ottoman* Empire. It is impoſſible to believe what large Quantities of it are drank by Companies of idle Men, who, drinking Coffee and ſmoaking Tobacco by turns, conſume whole Days in the public Houſes: And becauſe, according to the ſame Author, the Capſulas are poſſeſſed of a certain Acidity, whereas the Seeds themſelves are palpably bitter to the Taſte, they neither create a Nauſea, nor overheat the Stomach, tho' drank in a pretty large Quantity, provided they be roaſted and triturated in a Marble Mortar with a Wooden Peſtil. During the Heat of the Summer, the Decoction of the Capſulas is moſt properly exhibited to feveriſh Patients. On the contrary, in Caſes where cold and viſcid Humours obſtruct the Viſcera, and ſeveral Ducts of the Body, a Decoction of the Seeds themſelves, roaſted and ground, is preferable to the other; but Moderation in the Uſe of both is by no means to be neglected. This learned Gentleman thinks, that the Fruit *Cafe*, and its Decoction *Caeva*, are, probably, ſo call'd from their cheriſhing and comforting Qualities. Hence, in the Mouths of Foreigners, aroſe the Names *Caeva alcaeva*, *Chaeva Choube*, *Cave* and *Cafe*; and he confeſſes, that, by means of this Liquor, he has often reſtor'd the Stomach, become languid by drinking Water, when Wine could not be had for that Purpoſe. He alſo aſſerts, that it proves beneficial in Diſorders of the Head, which is frequently affected in conſequence of its Conſent with the other Parts of the Body. We muſt here obſerve, that, according to others, the *Arabic* Word *Cahoua*, which is the Infinitive of a Verb ſignifying *to labour under a loſt Appetite*, denotes not only Wine, but alſo every kind of Liquor, and conſequently Coffee. Hence the *Turks* derived their *Cahveh*, from which again comes the *European* Word *Café*. According to *Bauhine*, we learn from *Rauwolffius*, that Coffee is very much uſed among the *Turks* as well as the *Egyptians*. The Proportion they obſerve, with reſpect to the Ingredients, we are taught by *Du Mont*, who informs us, that, to twenty Parts of Water, eſtimated by Meaſure, they take one Part of the Powder of the Berries, compreſſed with the Hand. The richer Sort to every Diſh add a Drop of the Eſſence of Amber; others boil in their Coffee, Cloves, others the Aniſum Stellatum, and others the leſſer Cardamoms. In *Holland* the Juice of Liquorice, obtain'd by boiling with Water, is ſometimes added to the Coffee; but this Liquor, all over *Europe*, is moſt commonly edulcorated with Sugar, which by ſome is uſed for that Purpoſe in ſo large Quantities, as to transform the Coffee into a kind of Syrup, which affects the Palate with no other Taſte than that of the Sugar. There are ſome who drink their Coffee with new Milk or Cream alone; but moſt are directed in the Quantity of this Liquor they uſe, either by Cuſtom or Appetite. But 'tis needleſs to diſpute about the Method of preparing this Liquor in *Europe*, ſince the Method uſed by each Country is moſt acceptable to itſelf. M. *Juſſieu*, in his Anſwer to that Queſtion propoſed in the Schools of *Paris*, *A.* 1716. Whether the Uſe of Coffee is ſalutary to the *Literati*, and Men of a ſtudious Turn, uſes the following Words: "The Berries, when clean, and "ſtript of their Capſulas, are roaſted in an open Earthen Veſ-"ſel, rather than in a cover'd one of Braſs or Iron. They are "to be roaſted to ſuch a Degree as to become of a bluiſh-black "Colour. As Occaſion requires, they are more commodiouſly "ground in what we call a Coffee-mill, than triturated in a "Mortar. An Ounce of Coffee, thus prepared, is ſufficient "for impregnating a Pint of Water; and this Proportion has, "for forty Years paſt, been generally obſerv'd in *Europe*;" but ſome uſe a far leſs Quantity of the Coffee. Thus *Meiſner* orders only about three Drams of it for ten or twelve Ounces of Water. Coffee-grains are roaſted, that by the Action of the Fire they may be open'd, and diſpoſed for yielding their Tincture; as alſo that the flatulent Qualities, common to all farinaceous Subſtances, may by that means be corrected. Theſe Seeds, when roaſted, ought not to be ground till they are juſt about to be uſed, becauſe they are, in the very Nature of the Thing, leſs ſubject to Exhalation when entire, than when triturated. In order totally to prevent this Exhalation of their volatile Parts, 'tis highly proper they ſhould not even be roaſted till they are to be uſed. From this *Du Mont* ſeems juſtly to conclude, that 'tis better to roaſt them in a cover'd Veſſel, than in one which is open, as Mr. *Juſſieu* directs.

We now come to inquire, what the particular Nature of Coffee-berries is, and what Virtues and Properties the Liquor prepar'd from them is poſſeſſed of. According to *Stenzelius*, in his *Toxicologia*, *Sect.* 3. the celebrated *Taury*, by means of a Chymical Analyſis, obtain'd from Coffee-berries a volatile Salt, a fix'd Salt combin'd with a large Quantity of Sulphur, and an earthy Subſtance. According to *Le Fevre*, M. *Du Tour*, with an Intention to diſcover the conſtituent Parts of Coffee-berries, put a Pound of them into a Glaſs Retort, cover'd with Clay, to which he adapted a large Receiver, luted the Joinings, and applied a Fire gradually. In this Proceſs a limpid Phlegm was firſt diſcharg'd Drop by Drop; then Vapours or Clouds appeared in the Receiver, which were at laſt converted into an Oil, which was firſt of a rediſh, and then of a blackiſh Colour. The Smell of the Coffee exhal'd thro' the Joinings, tho' cover'd with Cement, and diffuſed itſelf thro' all the Laboratory. When the Veſſels were become cold, only half a Pound of the various Elements of the Coffee-berries was taken out of the Receiver, that is, two Ounces and five Drams of a black Oil, which, when rectify'd, aſſum'd an Amber-colour; an Ounce and three Drams of a volatile Spirit; and four Ounces of a Caput Mortuum, which, by Elixiviation, afforded a Dram of fix'd Salt. *Boeclerus* informs us, that one Pound of Coffee-berries, by a Chymical Analyſis, yields about four Ounces of Phlegm and volatile Spirit, and of Oil one Ounce, a Caput Mortuum of above four Ounces being left, whilſt the other Parts were evaporated and carry'd off. M. *Bourdelin*, in a Chymical Analyſis made by a Retort, from three Pounds of the beſt Coffee-berries obtain'd twenty Ounces and ſeven Drams of a Liquor, in which there was a large Quantity of an Acid, mix'd with an oleous ſulphureous Principle, as was diſcover'd by various Proofs and Experiments: A large Quantity of Oil was alſo extracted, that is, eight Ounces and two Drams, not in a liquid, but in a concreted Form. The Caput Mortuum was of a larger Bulk than the Berries originally employ'd, and an Ounce and ſixty Grains of a fixed Salt were extracted from it. *Houghton* ſays, that, by Diſtillation from a Retort, a Pound of clean Coffee-berries yielded ſix Ounces and ſix Drams of Phlegm, of a very thick Oil two Ounces four Drams and two Scruples, whilſt five Ounces and three Drams of a Caput Mortuum remained. He informs us, that both the Oil and the Phlegm were of an ungrateful empyreumatic Taſte, but the Caput Mortuum was inſipid, incapable of being calcin'd to Aſhes, and probably deſtitute of every kind of Salt. The like Analyſis, inſtituted at the ſame time upon common Beans and Grains of Wheat, demonſtrated, that the Quantity of Oil obtained from the Coffee was almoſt double that obtain'd from the Beans, and almoſt triple of that obtain'd from the Wheat. *Caſpar Newmannus*, from one Pound of Coffee, ſubjected to Diſtillation by an open Fire, obtain'd five Ounces five Drams and an half of diſtil'd Phlegm, ſix Ounces and half a Dram of a thick fetid Oil, whilſt there remain'd four Ounces and two Drams of a Caput Mortuum, which, by Incineration and Elixiviation, yielded three Drams of a fixed Salt. From theſe Experiments 'tis obvious, that, by ſubjecting Coffee-berries to Diſtillation, we obtain Phlegm, Oil, and an earthy Subſtance; from which, beſides, every one, except *Houghton*, by Elixiviation, procured a fixed Salt. But Authors vary in their Proportions of the Subſtances now ſaid to

be yielded, according as greater or leſs Care has been taken in the ſeveral Diſtillations they have made. The Method uſed by *Newman* ſeems to be the moſt accurate, ſince, in the Products, he obtained the entire Weight of the Coffee-berries originally ſubjected to the Analyſis. But 'tis to be lamented, that, whilſt he recounts the Experiments of others, which have been either leſs accurately perform'd, or leſs clearly and diſtinctly repreſented, he attacks their Characters with a haughty and ſupercilious Air, which ill becomes a Man of Learning. Except *Bourdelin*, none of the others make mention of an Acid among the Products or Subſtances yielded by the Coffee-berries. But that this Acid is lodged in the Oils poſſeſſed of a thick Conſiſtence, like that of Balſams, is ſufficiently plain; and *Newman* himſelf does not deny, that an Acid is lodged in Coffee-berries, granting at the ſame time, that the alcaline Parts are, by the protracted Action of the Fire, generated during the Diſtillation. If we obſerve, that it is uſual with moſt Chymical Authors, by taking the Whole for a Part, to give the Name of a ſulphureous Principle to that, which they intend ſhould be looked upon as an oleous one, we ſhall perceive, that theſe Authors did not deſerve to be chaſtiſed in ſo contemptuous a Manner by *Newman*. But let us inquire what this Gentleman has diſcovered with reſpect to the Nature of Coffee-berries, by the Application of aqueous and ſpirituous Menſtruums: By Digeſtion and Coction with diſtil'd common Water, from two Ounces of Coffee-berries, he obtained five Drams of an aqueous Extract; and, from the remaining Magma, with highly rectified Spirits of Wine, he obtain'd twenty-ſix Grains of a ſpirituous Extract. As ſoon as he added the Spirit of Wine, he obtained three Drams and an half of a ſpirituous Extract; and, with Water, afterwards extracted from the remaining Matter two Drams of an aqueous Extract. When the rectified Spirit of Wine was diſtil'd from the Coffee-berries, it came off without any Change, and the Water employed alſo came over in a State ſcarce different from that of common diſtil'd Water. From what has been ſaid, we may infer, firſt, that Coffee-berries abound both with reſinous Parts, to which the Spirit of Wine proves a Menſtruum, as alſo with Parts of a gummous Nature, capable of being diſſolv'd by Water. Secondly, that, in theſe Berries, the latter Parts are more numerous than the former. Thirdly, that both the reſinous or oleous, and the gummous or ſaline Parts in Coffee-berries are of ſo fix'd a Nature, as to require a ſtronger Degree of Fire, than that by which the Spirit and the Water are raiſed.

We now come to inquire, what Properties theſe Berries diſcover, or what Principles they yield, when roaſted.

Mr. *Bourdelin* then, from three Pounds of Coffee-berries, roaſted in the ordinary Manner, ſo as to weigh no more than two Pounds and an half, obtain'd, by Diſtillation with a Retort, ten Ounces or more of a Liquor, containing a manifeſt acid and a ſulphureous Principle; that both of them were manifeſtly diſcover'd; but, in the laſt two Ounces and an half of this Liquor, there was a larger Quantity of volatile Salt, than in the reſt of it; for it produced a very conſiderable Effervеſcence with Spirit of Salt. It contain'd ſix Ounces and ſix Drams of an Oil, and nine Drams and an half of fix'd Salt.

To theſe Experiments we may add, that, when Coffee-berries are roaſted, a pinguious or oleous Kind of Subſtance is obſerv'd to be diſcharged from them by way of Sweat. This Subſtance appears on the Surface of the Decoction or Infuſion of theſe Berries in Water; and the *Turks*, when they can have it, ſwallow it very greedily. From what has been ſaid, it is obvious, that, by being roaſted, the Coffee-ſeeds become better diſpoſed for yielding their gummous, as alſo their reſinous Parts, than when they are crude. In roaſted Coffee-berries therefore we are furniſh'd with earthy Parts, which remain undiſſolvable after the Extracts are made, as alſo with Parts of a gummous and oleous Nature. The Infuſion or Decoction of Coffee commonly uſed may therefore be conſider'd as containing a gummous Extract, impregnated with oleous, fix'd, and volatile Parts, perceptible to the Eye and Taſte, and which, in conſequence of theſe farinaceous Berries being roaſted, are diſengag'd and mix'd with the boiling Water. From what has been ſaid, we may juſtly conclude, firſt, that Coffee is poſſeſſed of the diluting Virtues of warm Water. Secondly, that it is furniſh'd with the emollient and moderately nouriſhing Qualities of farinaceous and oleous Subſtances. Thirdly, we may conclude, that, in conſequence of its volatile Principle, it contains Parts, which ſtimulate the Fibres, and rouſe the animal Spirits. And, fourthly, that its oleous, in Conjunction with its ſaline Principle, acts by way of natural Soap, with which when the Water is impregnated, it becomes capable of mixing with the Maſs of Blood, and operates by its reſolving and abſtergent Qualities. The other Virtues of Coffee are to be determin'd by the ſeveral Subſtances, which different Perſons, according to their reſpective Taſtes, uſe in preparing it. Hence we may juſtly affirm, that Coffee contributes to Watchfulneſs, and the baniſhing Sleep; that it allays Thirſt, and checks that preternatural Heat, which attends Fevers and Surfeits; as alſo, that, in Head-achs ariſing from Congeſtions of Blood in the Head, it helps to drive the Humours to the inferior and leſs noble Parts. *Le Fevre* gives his Opinion of Coffee in the following Words: "I am of Opinion, ſays he, that Coffee is proper for the Cure and Prevention of comatous Diſorders, ariſing from a Phlegm, or a too viſcid Blood. Beſides, this Liquor, in conſequence of its aſſiſting Chylification and Sanguification, increaſes the Quantity of the animal Spirits, and repairs the Loſs of them ariſing from preternatural Watching. Coffee alſo, in conſequence of its volatile Salt, removes Obſtructions of the Brain, dries up its ſuperfluous Moiſture, and conſequently reſtores a due Degree of Elaſticity to its Membranes and Veſſels. Since therefore this Liquor contributes ſo much to the Secretion of the Spirits, it is no ſurpriſing Thing, that thoſe who, with an Intention to watch, drink Coffee after Supper, ſhould bear it out for ſeveral Days and Nights, without any conſiderable Loſs of Strength; and that this Liquor ſhould be claſſed among the antiapoplectic Medicines, ſince, by its Means, Obſtructions are removed, the Spirits put into a briſker Motion, the Blood rendered fitter for a due Circulation, the Languor of the ſolid Parts overcome, Drowſineſs carried off, and the Mind rendered gay and chearful." The deobſtruent Virtues of this Liquor, according to *Proſper Alpinus*, are confirmed, by the Reſemblance its Taſte bears to that of a Decoction of Succory. That apoplectic Patients have been rous'd by injecting Clyſters of Coffee, we learn from the *Hiſt. de l'Academie Royale des Sciences* for the Year 1702. From what has been ſaid, we may juſtly infer, that this Liquor is proper for Perſons of a ſtudious Turn, who, by cloſe and intenſe Thoughtfulneſs, perceive their fineſt Humours diſſipated, and the Tone of their Fibres deſtroy'd; whence ariſe Imperfections of the firſt Digeſtion, hypochondriac Flatulencies, a Diminution of all the Secretions and Excretions, a Paleneſs of the whole Body, Languors, Weakneſs, and their ſeveral concomitant Symptoms. Nothing more effectually contributes to prevent theſe Diſorders, than Coffee, as the learned Mr. *Juſſieu* has ſufficiently demonſtrated. To theſe we muſt join the concurring Authority of the incomparable *Baglivi*, who delivers his Sentiments, with reſpect to Coffee, in the following Words: "I muſt, ſays he, "obſerve, that Coffee is an infallible Secret for removing that "Species of Head-ach, which, in conſequence of a bad Digeſtion, ariſes ſome Hours after Dinner. This Effect I have "ſeen produced by Coffee in Numbers of Patients at *Rome*, "and I daily find the Obſervation verified in myſelf; for, ſince "my Stomach is render'd weak, and I begin to be afflicted "with a Head-ach, Liſtleſneſs, and Melancholy, about three "Hours after Dinner, in conſequence of cloſe Thinking, too "extenſive Practice in viſiting the Sick, and indefatigable Induſtry in deſcribing the Natures of their ſeveral Diſeaſes, a "thing abſolutely neceſſary to the Practice of Phyſic, I miraculouſly free myſelf from theſe Diſorders, which proceed "from a weak Digeſtion, by drinking two or three Diſhes of "Coffee. I ſometimes uſe Tea or Chocolate, but not with "ſuch Advantage as ariſes from Coffee, which is an efficacious "Medicine for Diſorders of the Stomach, and the Diſeaſes "ariſing from them; whereas Tea is calculated for Diſorders "of the Head." *Le Fevre*, with an Intention to confirm theſe Sentiments, uſes the following Words: "Coffee is beneficial "to thoſe, who are liſtleſs, who uſe thick and viſcid Aliments, "and who abſtain entirely from Wine. The Method of Living uſed by the *Turks* is a ſufficient Proof, that the Digeſtion "of the Aliments is greatly promoted by Coffee; for tho' they "live upon Pulſes, Fruits, Preparations of Milk, and unleaven'd "Bread not ſufficiently bak'd, yet they are very rarely ſubject "to Diſorders of the Stomach." I might add, that this Liquor ſeems, in a manner, neceſſary to the *Turks*, becauſe they daily uſe ſo large a Quantity of Opium, which is a powerful Narcotic. *Henricus Schulzius*, in his *Diſſertatio de Rebus non-naturalibus*, tells us, that it may ſafely be affirmed, that Coffee, drank warm within an Hour after Dinner, is highly proper for thoſe who are afflicted with Head-achs, in conſequence of a Weakneſs of the Stomach, contracted by cloſe Thinking, and conſtant Study. It is alſo much recommended againſt Head-achs contracted by Drunkenneſs. *Lewenhoek*, in *Epiſt.* 120. uſes the following Words: "If, ſays he, I happen at any time "to ſup more ſumptuouſly, eat more liberally, or drink a "larger Quantity of Wine, than uſual, next Morning, by way "of Medicine, I uſe a ſomewhat larger Quantity of Coffee, "than at other times. This Liquor I drink as hot, and as "quickly, as I poſſibly can; by which means an univerſal Diaphoreſis is generally excited. By this Expedient, I endeavour "not only to expel the Matter, which, in conſequence of my "having eaten or drank too much, proves hurtful to my Blood, "but alſo to ſupply its Place by the Coffee, which I edulcorate with Sugar-candy. If, by this Method, I cannot reſtore "myſelf to Health, none of the Medicines in the Shops can, "in my Opinion, effect it. This was alſo the only "Medicine I uſed ſome Years ago, when I perceiv'd myſelf "feveriſh; only I ſometimes uſed Tea, in order to excite a Diaphoreſis." In the *Ephemerides Nat. Curioſ. Decad.* 2. *a.* 3. *o.* 198. we have an Account of an inveterate Cephalæa cur'd by

by Coffee. In the ſame Work, *Dec. 2. a. 8. o. 5.* we are inform'd, that Coffee, drank thrice a Day, prov'd an effectual Remedy for a Vertigo; and in *Eph. Nat. Curioſ. Vol. 1. 44.* we have an Inſtance of a Diarrhœa remov'd by Coffee. Becauſe anodyne Effects have often been produc'd by this Liquor, in conſequence of its diluting and aperient Qualities, ſome have imagin'd, that it was the Medicine uſed by *Helen* for baniſhing Grief, to which *Homer* gives the Name of *Nepenthe:* But others are of a different Opinion. There are alſo others, who, according to *Muraltus*, extolling Coffee for its Antiquity, call it the *Jus nigrum* of the *Lacedæmonians.* Thus we have taken a View of the Virtues of Coffee, which, in general, for daily Uſe, ſeems more proper for Perſons of phlegmatic Conſtitutions; than for Patients of choleric Habits, ſuch as are extenuated, and thoſe whoſe Blood is eaſily put into Commotions; for theſe are injur'd by uſing it too frequently, and moſt effectually conſult their own Health by drinking it weak, with Milk, and a little good toaſted Bread, drinking a Glaſs of cold Water previouſly. By this means the Stomach is corroborated, and fortified againſt the weakening Qualities of the warm Water, the Digeſtion of the preceding Meal is promoted, and the Body is rendered ſoluble. Some, with an Intention to reſtore the Strength and Tone of the Stomach, put ſome Aromatics, ſuch as Cinnamon, in their Coffee; but they, who love their Coffee rich, and drink it with Milk or Cream, uſe a Liquor, both of whoſe Ingredients are of a nutritive Quality. The celebrated *Lanzonius* preſcrib'd Coffee, prepar'd with Milk inſtead of Water, as a Medicine; and highly extols it in Aſthmas, beginning Hectics, the Gout, the Pleuriſy, the hyſteric Paſſion, the Rheumatiſm, and Barrenneſs in Women. In preparing it, the Milk of Aſſes, Cows, or Goats, may be uſed, as the State and Condition of the Patient require. But we are not to conceal the Diſadvantages generally ariſing from an immoderate and too liberal Uſe of Coffee. Many then, after the Uſe, or rather the Abuſe, of this Liquor, are affected with a Trembling of the Hands, and a Palpitation of the Heart. This, in my Opinion, is to be accounted for, not only from the too large Quantity of hot Water, which reſolves and weakens the Fibres of the Stomach and whole Body, but more particularly from the ſtimulating Virtue of too rich Coffee, eſpecially if the Perſon who uſes it has a nervous Syſtem, too eaſily thrown into Commotions, and when it is drank upon an empty Stomach in a cold Room; for, at that Time, the cutaneous Pores being contracted, the Motion of the Humours is, by its means, more directed to the internal Parts. In Caſes where the Body is not habituated to a due Degree of muſcular Motion, the Coffee, precipitating in the Primæ Viæ, is converted into a kind of farinaceous Glue, which obſtructs the Lacteal Veſſels, and prevents the Diſtribution of freſh Supplies of Chyle to the Body. Hence ariſe all thoſe Diſorders produc'd by a preternatural Viſcidity of the Blood, and a Retention of the uſual Evacuations. Hence we diſcover the Reaſon, why *Waldſchmidius* affirms, that Coffee, unſeaſonably uſed, without any Regard to the Conſtitution of the Patient, paves the Way to a Palſey. *Willis*, in his *Pharmaceutice Rationalis*, uſes the following Words: "In moſt "Diſorders of the Head, ſuch as a Cephalalgia, a Vertigo, a "Lethargy, and a Catarrh, when the Habit is plethoric, the "Conſtitution cold, the Blood aqueous, the Brain too moiſt, "and the Motion of the Spirits too ſlow and languid, Coffee is "often uſed with great Advantage; for, when daily drank, it "ſurpriſingly rouſes the vital and animal Spirits, and removes "every thing that can retard the animal Functions. On the "contrary, thoſe who are lean, who are of a bilious or melancholic Conſtitution, whoſe Blood is acrid or retorrid, whoſe "Brain is hot, or whoſe animal Spirits are ſtimulated to too "briſk and irregular Motions, ought entirely to abſtain from "this Liquor, ſince it diſorders both the Spirits and Humours, "and renders them unfit for performing their ſeveral Fun"ctions; for I have frequently obſerv'd Patients labouring un"der a Penury of Spirits, Cephalalgias, Vertigos, Palpitations "of the Heart, Tremors of the Joints, and Stupors, rendered "worſe by the Uſe of Coffee, and unuſual Languors brought "on." *Boeclerus* informs us, that many, by the continued Uſe of Coffee on an empty Stomach, have become indiſpoſed and extenuated; and that he himſelf knew a certain Man, who, by drinking one or two ſmall Diſhes of Coffee every Morning, was ſeized with a Vertigo, and Dimneſs of Sight, which were not removed till he eat ſomething. From that Quality of Coffee, by which it ſtimulates the Fibres, and exagitates the Humours, we may conclude, that it is, in a particular manner, hurtful, when ſtrong and hot, to plethoric Patients, as alſo in Coughs ariſing from an acrid or too ſubtle a State of the Blood, and in confirmed Conſumptions. But I take the Conſtitution of that Man to be ſingular, to whom, as *Boyle* informs us, a Diſh of Coffee proved a more powerful Emetic, than Emetic-wine itſelf. The Obſervations of great and ſkilful Phyſicians evince, that the above-mentioned Diſorders may be brought on by the too frequent and too liberal Uſe of Coffee. Thus *Hoffman*, in his Diſſertation *De Remediorum benignorum Abuſu*, uſes the following Words: "No one, ſays he, will eaſily believe, "that Coffee is prejudicial to his Health, ſince not only with "the *Turks*, but alſo with our own Countrymen, nothing is "more common than to drink liberally of it early in the Morning, and immediately after Meals; yet we have numerous "Proofs, that this Practice is often attended with bad Conſequences; for a frequent and immoderate Uſe of this Liquor "is highly prejudicial to weakly Perſons, and more eſpecially "Women, whoſe Nerves and Strength are conſiderably impaired by it; and, either in Child-birth, or on the Attack "of any Diſeaſe, ſo conſiderable a Languor is brought on, that "their Strength is hardly able to ſurmount the Symptoms, with "which they are afflicted. I know ſeveral Perſons, who, by "a too frequent Uſe of this Liquor, have contracted a Trembling of the Hands. Others, by its means, I have known "afflicted with an obſtinate Watchfulneſs, and a Debility of "the Senſes; for theſe *Arabian*, as well as other Species of "Beans, abound with an Oil, which is not friendly and balſamic, but hurtful and injurious, to the nervous Syſtem, which "it renders ſtill more weak than it was before." *Slare*, in the Dedication to his Vindication of Sugars, informs us, that he became paralytic by too liberal an Uſe of Coffee; and that his Diſorder was removed by his abſtaining from that Liquor. *Stenzelius*, in the firſt Book of his *Toxicologia*, ſpeaks of the Diſorders ariſing from the Abuſe of Coffee in the following manner: "Coffee often proves a temporary Poiſon, when uſed too "frequently in too large Quantities, or promiſcuouſly by Perſons of every Conſtitution, eſpecially in the Afternoon; for, "by the Roaſting, its ſalino-volatile Parts are carried off, and "there are only left a narcotic Oil, and an Earth, which produce "Obſtructions and Coſtiveneſs. Hence we obſerve, that thoſe, "who have narrow Veſſels, and thick and tenacious Juices, "are, after the Uſe of this Liquor, eſpecially when rich, "afflicted with an Uneaſineſs of the Præcordia, a Palpitation "of the Heart, Anxiety, Reſtleſneſs, Sadneſs, Watchings, "and various other Diſorders; for, by the earthy and oleous "Parts of the Coffee, the Circulation of the already viſcid "Blood through the Apices of the ſmall conic Veſſels is more "and more retarded; the thick, ſlimy, and terreſtrial Juices "ſtagnate here and there; and, when a Coheſion is once begun, by the Accretion and Combination of ſimilar Particles, "Obſtructions and Infarctions are formed in the ſhaggy Extremities of the capillary Veſſels, which, proving a Stop or Hindrance to the ſucceeding Blood, produce a Regurgitation, "and the ſeveral Symptoms ariſing from it. On the contrary, "we find, that the moderate Uſe of this Liquor produces no "bad Effects in Perſons of hot and fine Juices, but rather preſerves their Health, by correcting the acrid Particles of their "Fluids, corroborating the Villi of the ſolid Parts, and promoting the Secretion of the Excrements, Sweat, and Urine." In the Year 1695. it was in the Schools of *Paris* defended as a Theſis, that the daily Uſe of Coffee rendered both Men and Women unfit for Procreation; but no one will affirm this, who conſiders, that as numerous a Progeny is brought into the World ſince the daily Uſe of this Liquor in *Europe*, as before. With reſpect to this Subject, the above-mentioned *Stenzelius* ſpeaks in the following manner: "In briſk and vigorous Perſons, whoſe Genitals are in good Order, and who have a "ſufficient Quantity of gelatinous Juices, Coffee, moderately "uſed, is ſo far from impairing, that it rather promotes Venery. But it produces contrary Effects in weaker Perſons, "who abound with Phlegm, and a Superfluity of earthy Particles, or whoſe genital Organs are languid. Of this Claſs "was the King of *Perſia* Sultan *Mahmud Kaſnin*, who, being "a great Lover of Coffee, could not perform the Office of a "Huſband with due Vigour. The unfortunate Queen aſcrib'd "his Impotence to his immoderate Uſe of Coffee, and was ſo "firmly perſuaded of its ariſing from that Source, that when, "from her Window, ſhe ſaw a Horſe led out, ſhe aſked with "what Intention the People did ſo; and being told, that the "Animal was about to be caſtrated, ſhe replied, that ſuch a "harſh Method was by no means neceſſary, ſince, by the Uſe "of that helliſh Liquor Coffee, he might be enervated, and "rendered like the King." I can by no means agree with thoſe who affirm, that, by the daily Uſe of it, Scurvies, hypochondriac Diſorders, and Melancholy, are rendered more univerſal than in former Times. Without determining whether Coffee contributes more or leſs to Health, according as Perſons love it, we ſhall only ſay, that it has been, in many Caſes, obſerved to produce very happy Effects. The Abuſe of a Thing ought never to deſtroy its Uſe. It was therefore unreaſonable in *Simon Paulli*, a celebrated *Daniſh* Phyſician, univerſally to condemn Coffee. This Author's Opinion, ill-grounded as it was, was afterwards eſpouſed by two learned *French* Phyſicians, *Duncan* and *Hecquet*. Since, from what has been ſaid, we ſee, that Coffee is beneficial to ſome, and hurtful to others, we ſhall here quote the Words of the celebrated *Cheyne*, in his Eſſay on Health and long Life, with reſpect to Coffee: "As to Coffee, "ſays he, it is a mere Calx, or a kind of burnt Horſebean, but "lighter on the Stomach, and of a ſomewhat better Flavour. "The *Turks* uſe it and Opium inſtead of Brandy. But the

"Plea

" Plea which ſome make for running into Exceſs in it, from " this *Mahometan* Cuſtom, is altogether weak and groundleſs; " for thoſe who do ſo there, ſuffer for it as we do here; and " thoſe who debauch in it, turn ſtupid, feeble, and paralytic " by it; eſpecially when they join Opium with it, (as they " frequently do) as thoſe who wallow in theſe do here; and " are as much deſpiſed and expoſed by ſerious Perſons, as our " Topers and Brandy-ſwillers are here. A Diſh of two of " Coffee, with a little Milk to ſoften it, in raw or damp " Weather, or on a wateriſh or phlegmatic Stomach, is not " only innocent, but a preſent Relief. But 'tis as ridiculous, " and perhaps more hurtful, at leaſt in thin and dry Habits, " to dabble in it two or three times every Day, as it would be " for ſuch to drink nothing but ſcalding Lime-water." Dr. *Andry*, in his Treatiſe *des Aliments de Carême*, directs a Method of preparing Coffee, which excels the ordinary Sort, is of a more grateful Taſte and Smell, proves beneficial to the Head and Stomach, removes Crudities, corrects the Acrimony of the Humours, and cures obſtinate Coughs. The Method of preparing it is as follows:

Take of unroaſted Coffee-berries, well excorticated, a Dram: Boil them in eight Ounces of common Water, for half a Quarter of an Hour at moſt, and there will be a Liquor of a Lemon-colour produced; which, after ſettling a little in a cloſe Veſſel, is to be drank warm, with an Addition of Sugar.

The ſame Seeds may be kept for a ſecond, or even a third Infuſion, becauſe they do not impart all their Virtues to the Water at once. If they are long boil'd over a ſtrong Fire, the Liquor becomes greeniſh, which indicates an Admixture of earthy Parts, but the Coffee becomes leſs valuable. But Mr. *Duncan* objects againſt this Method, and maintains, that by it that Principle is not extracted, for the ſake of which the Coffee is prepared; that the Tincture is inſipid, almoſt without Smell, and, in Reality, little elſe than warm Water; for which Reaſon it is to be prefer'd, by ſuch as only drink Coffee for an Amuſement, ſince the Abuſe of it is leſs prejudicial to Health, and leſs expenſive. In order to ſave Expences, various Experiments have been made upon Seeds of the Pulſe and Corn Kind, with a View to diſcover a proper Succedaneum to Coffee, poſſeſs'd of the ſame Taſte and Qualities. It is, then, found, that common Beans, roaſted, come very near Coffee, with reſpect to the Taſte and Smell; but they are heavy on the Stomach, and create a Head-ach. It is alſo found, from Experience, that Rye roaſted, with a ſufficient Mixture of Almonds, for the ſake of the Oil, and boil'd longer than common Coffee, affords a Liquor exactly of the ſame Taſte, Smell, and other Qualities. *Newman* calls the Coffee prepared of Rye, *Café à la Paiſane*, in Imitation of the *Café à la Sultane* of the *French*. D. *Friedel*, in a *German* Treatiſe intituled *Mediciniſche Bedencken*, prepares, what he calls a Drink for Women, from an equal Quantity of ſweet and bitter Almonds, well excorticated, roaſted till they are black, and almoſt reduced to a Powder. This he recommends for weaning thoſe, who are accuſtom'd to drink Coffee, from it; for it is not poſſeſs'd of the ſame Qualities. They who intend to render old and effete Coffee-berries as grateful as if they were freſh and recent, add a little Butter to them, when they are roaſting. We muſt alſo obſerve, that roaſted Coffee-berries are candied with Sugar, and preſented to the Table by way of Deſert; and that, by means of Spirit of Wine, there is a Liquor prepared from Coffee, which the *French* call *Coffee-water*, and which is made in the following manner:

Take of roaſted Coffee, three Ounces; of Spirit of *French* Wine, two Pints: After Digeſtion, diſtil them, and edulcorate the diſtil'd Liquor with a ſufficient Quantity of Sugar. This Preparation is intended for thoſe who are very fond of the Smell of Coffee.

Many have affirm'd, that the Uſe of Coffee was firſt diſcover'd in the *Eaſt* by an Abbot of a Monaſtery, who being inform'd by a Keeper of Goats or Camels, that theſe Animals, upon brouſing on the Leaves, or eating the Fruit, of the Coffee-ſhrub, kept themſelves awake, and danced about all Night, recommended the Seeds of this Shrub to the Monks, that they might be the better enabled to watch, and offer up their Prayers. But this is an erroneous Opinion, ariſing from this, that a certain High Prieſt of the *Mahometan* Law, call'd the Mufti, about the Middle of the fifteenth Century after *Chriſt*, having travel'd from the City *Adde*, in *Arabia Felix*, to *Perſia*, there ſaw the Inhabitants drinking Coffee. This Mufti, returning home, and falling ſick, was cured by Coffee, and procured it a great Reputation; eſpecially becauſe he obſerved, that it removed heavy Pains of the Head, exhilarated the Mind, and prevented Sleep; on account of which laſt Circumſtance, he recommended it to his Devotees, when offering their nocturnal Prayers. From *Arabia* it was introduced into *Egypt*, by Monks of the *Mahometan* Sect, about the Beginning of the ſixteenth Century. At this Time, when he who govern'd at *Mecca* in *Arabia*, as Sultan, ſaw Coffee drank in the Temple, he was ſo enraged at the Affront, that, calling a Council, he condemn'd it by public Authority, becauſe it excited People to do Things inconſiſtent with the *Mahometan* Religion. Some Phyſicians, in the mean time, muſter'd up Arguments againſt its ſalutary Qualities, tho' they were oppoſed by others. But this Edict of the Sultan was ſoon abrogated. After this; both in thoſe Parts of *Arabia* and *Egypt*, which were ſubject to the *Turks*, ſome Hypocrites attempted to diſcountenance the Drinking of this Liquor, but to no Purpoſe; for the Love of it not only more effectually ſeiz'd the *Arabians* and *Egyptians*, but alſo affected the *Turks*, and, thro' *Syria*, reach'd *Conſtantinople*; where, about the Middle of the ſixteenth Century, public Coffee-houſes began to be erected for the Drinking of Coffee. But when, in this Place, the Number of Taverns was enlarged, and Men neglected the public Worſhip in order to attend them, ſome zealous Devotees had Intereſt enough to get Coffee condemn'd by public Authority; alledging, that it was inconſiſtent with the Laws of *Mahomet* to uſe any thing, by way of Aliment, which reſembled Coals, as, ſaid they, Coffee did; and therefore could not be drank by *Mahometans*. And tho', in the Reign of *Amurath* the Third, the Prohibition was reinforced; yet, becauſe Men could not totally abſtain from this Liquor, Liberty was granted, that they ſhould drink it privately who paid a certain ſtated Sum; the Law remaining in Force only againſt thoſe who drank it publicly. At laſt, by another Mufti, the Law was totally abrogated, and a Proclamation iſſued out, That Coffee-berries were not to be conſider'd as Coals, and, conſequently, that their Uſe was not inconſiſtent with Religion: Upon this, People of all Characters drank Coffee, and Coffee-houſes were publicly authoriz'd for the Sale of it. But, when *Kupruli* govern'd for *Mahomet* the Fourth, who was not as yet of Age, it was obſerved, that theſe Coffee-houſes were too commodious for thoſe who wanted to pry too curiouſly into the Meaſures of the State; for which Reaſon they were prohibited at *Conſtantinople*, except a very few. This Liquor is, however, ſtill uſed in private Families, and ſold in the Streets not only of *Conſtantinople*, but alſo publicly in Coffee-houſes in the other Cities of the *Ottoman* Empire. So neceſſary this Liquor is thought among the *Turks*, that Huſbands are bound, by Contract, to provide their Wives with it, as a Thing they cannot poſſibly do without. *Dumont* endeavours to prove, that Coffee has been uſed from Time immemorial in the *Eaſt*, or at leaſt among the *Arabians*; but his Arguments will not bear a rigorous Scrutiny. It ſeems probable, that the *Venetian* Merchants, in their Return from the *Eaſt*, having learnt the Uſe of Coffee either in *Egypt*, or at *Conſtantinople*, made it known to the other Parts of *Europe*. In *France* it is ſaid to have been firſt known at *Marſeilles*, in the Year 1644. In *Paris* Coffee was ſcarcely known till 1669. From the Inhabitants of *Marſeilles*, and eſpecially thoſe of *Paris*, the Uſe of this Liquor ſpread itſelf not only thro' the other Provinces of *France*, but alſo, in all Probability, thro' the other Parts of *Europe*. The firſt Coffee-houſe in *London* is ſaid to have been erected in 1652. but at preſent 'tis computed, that there are three thouſand of them in this City.

The firſt public Coffee-houſe in *London* is ſaid to have been at the *Tilt-yard*.

Geoffroy informs us, that we may diſtinguiſh two Kinds of Coffee, one ſmall and greeniſh, like Horn; the other larger and yelloviſh. This latter Sort is the leaſt valued, and grows in the Iſland of *Bourbon*. Coffee enlivens the Blood, cures Head-aches, ſometimes promotes the Menſes; and, therefore, they who are ſubject to large Hæmorrhages, or an Eryſipelas, ought to abſtain from it; for, till then, they can never be cured. It certainly accelerates the Motion of the Blood, and has been often obſerved to cauſe Bleeding at the Noſe.

If Coffee produces Hæmorrhages, it muſt certainly promote Miſcarriages.

COHOB, COHOPH, COHOBIUM, COHOBATIO. Cohobation. The Returning of a Liquor, diſtil'd from any Subſtance, back again upon the ſame Subſtance, and diſtiling it again, either with or without an Addition of freſh Ingredients. See AQUA.

COHOL. The ſame as ALCOHOL. *Caſtellus* informs us it is uſed, in *Avicenna*, to expreſs dry Collyria for the Eyes, in fine Powder.

COHOS. The ſame as CHAOS.

COHYNE. An *American* Tree, with Leaves like the Laurel. It bears a Fruit as large as a Melon, in the Shape of an Oſtrich's Egg, of which the *Indians* make Cups. This Fruit is not eatable; but the Inſide of it, bruiſed, and applied to the Head, is ſaid to eaſe Pains thereof.

COLATORIUM. A Strainer, of any Kind.

COLATURA. Any ſtrain'd or filtred Liquor is thus call'd.

COLCAQUAHUITL. An *American* Plant; alſo call'd *Johualxochitl, ſeu Flos Orbicularis*. *Nieremberg*.

The Leaves, laid upon the Breaſt, are ſaid to cure a Syncope; drank, with Water, to provoke Sweats; fry'd, the Juice being previouſly expreſs'd, they make thoſe who eat them grow fat; powder'd, and ſprinkled upon obſtinate Ulcers, it is ſaid to cure them. It has alſo the Reputation of being good in Falſies, and Uterine Diſorders. *Raii Hiſt. Plant.*

COLCHICUM.

The Characters are,

The Flower is naked, monopetalous, hexapetaloidal, in the Shape of a very ſlender Tube, which ariſes immediately from the Root. The Ovary, which is lodged within the lower Part of the Flower, is furniſh'd with a long Tube, and becomes a triangular, oblong, tricapſular Fruit, full of round Seeds. The Root is double, tuberous, carnous, barren and wither'd in its outer Part, after one Year; while the other Part, which is incloſed within the former, runs into Fibres, is cover'd with a membranous Skin, and ſends up a Plant. *Boerhaave's Index alter, Par.* 2.

Boerhaave mentions eight Species of this Plant.

1. Colchicum; vernum; Hiſpanicum. *C. B. P.* 69. SPRING-FLOWERING MEADOW-SAFFRON.

2. Colchicum; candidum; multiflorum. *C. B. P.* 68. *M. H.* 2. 341. MANY-FLOWER'D WHITE MEADOW-SAFFRON.

3. Colchicum; commune. *C. B. Pin.* 67. *Raii Hiſt.* 2. 1170. *Synop.* 3. 373. *Hiſt. Oxon.* 2. 340. *Buxb.* 77. *Rupp. Flor. Jen.* 27. *Tourn. Inſt.* 348. *Elem. Bot.* 388. *Boerh. Ind. A.* 2. 117. *Colchicum*, Offic. J. B. 2. 649. Chab. 225. Dill. Cat. Giſſ. 175. *Colchicum purpureum & Anglicum album*, Ger. 127. Emac. 157. Park. Theat. 153. *Colchicum Anglicum purpureum, ac etiam flore albo, ſed rarius.* Mer. Pin. 28. *Colchicum purpureum, ac etiam flore albo ſed rarius.* Merc. Bot. 1. 29. Phyt. Brit. 29. MEADOW-SAFFRON. *Dale.*

It is found in fat and rich Meadows; and the Root is the Part uſed, which is mortal to thoſe who eat it after the manner of Muſhrooms, by ſuffocating them. *Dioſc.*

The Root is ſuppoſed by ſome to be the Hermodactyl of the Shops: It is of a poiſonous Quality, but is recommended in the Gout, being externally apply'd. *Buxb. Dale.*

4. Colchicum; pleno flore. *C. B. P.* 69. *J. B.* 2. 654. *Cluſ. H.* 202. DOUBLE-FLOWER'D MEADOW-SAFFRON.

5. Colchicum; pleno flore, variegato. *C. B. P.* 68. *M. H.* 342.

6. Colchicum; floribus Fritillariæ inſtar teſſellatis; foliis planis. *M. H.* 2. 340.

7. Colchicum; Chionenſe; floribus Fritillariæ inſtar teſſellatis; foliis undulatis. *Hiſt. Oxon.* 2. 341? *Hermodactylus*, Offic. Park. Theat. 1587. Chab. 228. Mil. Cat. 53. *Hermodactylus Officinarum*, Ger. Emac. 164. Raii Hiſt. 2. 1172. *Colchicum radice ſiccatâ albâ.* C. B. Pin. 67. *Colchicum minus malignum, ſive Hermodactylus Officinarum.* J. B. 2. 658. *Colchicum variegatum.* Corn. 173. HERMODACTYLS. *Dale.*

This is a Root which is brought to us from *Turkey*; but what Plant it is the Root of, we have no certain Knowledge; ſome taking it to be the Root of a *Colchicum*, or a *Dens Caninus*; others, of a tuberous *Iris*; and others, of a Species of *Cyclamen*. They are flattiſh on the one Side, and a little convex on the other, ſomewhat in the Shape of a Heart, of a firm compact Subſtance, yet eaſily powdering, of a light-brown Colour without, and white within, having but little Smell or Taſte.

Hermodactyls are a ſtrong Cathartic, purging tough, ſerous, and phlegmatic Humours from the Joints, and are therefore accounted good for the Gout, and rheumatic Pains in the Limbs; and are an Ingredient in the *Electuarium Caryocoſtinum*, and the *Pulvis Diaturpethi compoſitus. Miller's Bot. Off.*

8. Colchicum; vernum; flore pleno, purpureum. *H. Eyſt. Vern. o.* 2. *F.* 1. *Fig.* 3. *Boerhaave's Index alter Plantarum, Vol.* 2.

COLCOTHAR. The Caput Mortuum of Vitriol. See VITRIOLUM.

COLERITIUM. A Liquor prepared of the corroſive and moſt pernicious Parts of Metals, by virtue of which Gold is try'd, when rub'd againſt the Touchſtone, and which no Metal, but Gold, is capable of reſiſting. By this Liquor we know immediately whether Gold be mix'd with any other Subſtance; for this latter will inſtantly change its Colour from the Application of this Liquor, whereas the pure Gold remains unalter'd. *Rulandus.*

COLES, COLIS, κωλὸς, is the ſame as PENIS, which ſee.

COLETTA VEETLA.

The Characters are,

The Leaves are conjugated, and furniſh'd with Prickles: The Flowers monopetalous, quinquefid, and large: The Fruit is bivalve, oblong, containing Seeds.

Boerhaave mentions one Species of this Plant.

Coletta Veetla. *H. Mal.* 9. 77? *Eryngium Zeylanicum, febrifugum, floribus luteis.* Herman. Herbar. Viv. *Melampyro cognata, Maderas patana, ſpinis horrida, an Coletta Veetla.* H. Mal. 9. 77. Plukn. Phyt. 119. 5? H. *Boerhaave's Index alter Plantarum, Vol.* 2.

COLIAS, *Colias, ſive Colia*, Ariſt. *Lacertus maximus minor*, Plinii.

A Fiſh pretty much reſembling a Macarel, but mark'd with black Spots, and oblique Lines upon the Skin. It is good to eat, but its Fleſh is difficult of Digeſtion. They ſalt it.

It has a reſolvent Virtue, being bruiſed, and apply'd. The Brine or Pickle of it, held in the Mouth, cures the Tooth-ach. *Lemery des Drogues.*

COLICA. The Colic.

The Name of this Diſeaſe is one of thoſe not mention'd by *Hippocrates*, and it appears, by the Manner in which *Celſus* ſpeaks of it, to be new in his Time. "*Diocles Caryſtius*, "ſays he, gave the Name of *Chordapſus* to a Diſeaſe of the "ſmall Inteſtine; and call'd another Diſeaſe, which is ſeated "in the great Inteſtine, by the Name of *Ileus*; but, it ſeems, "moſt of our modern Phyſicians call both of theſe Diſorders "the *Colic*." If we may believe *Pliny*, not only the Name, but the Diſeaſe itſelf was new at the Time of the Emperor *Tiberius*. "The Colic, ſays that Author, crept in upon us "*(irrepſit)* under the Empire of *Tiberius*. None was ever "troubled with that Diſtemper before that Emperor; ſo that "when he came to mention it in an Edict, where he ſpoke of "the State of his Health, it was not underſtood at *Rome*, the "Name of *Colic* being unknown till that Time." The Paſſage of *Celſus*, juſt cited, proves, indeed, that the Name of this Diſeaſe was pretty much a Novelty in his Time; but it does not, from hence, follow, that the Diſeaſe itſelf never was known before the Time he ſpeaks of. *Celſus* himſelf is entirely contrary to *Pliny* in that reſpect; for he is poſitive, that *Diocles* gave that Diſeaſe the Name of *Ileus*. *Hippocrates* ſeems to have comprehended the *Colic* under Pains of the Belly, of which he ſpeaks in ſeveral Places.

It is not at all probable, that the Name *Colic* is ſo new as *Pliny* ſays it is; and, when *Celſus* obſerves, that it is the Name which moſt Phyſicians of his Time gave to that Diſtemper, what he ſays does not imply, that this Name was given it preciſely at that Time. It imports only, that the Phyſicians, in the Time of *Diocles* or *Hippocrates*, had another Name for this Diſeaſe; and that the Term *Colic* had not been long uſed. What confirms me in this Opinion is, that *Celſus* himſelf deſcribes a Medicine for the Colic, which was invented by *Caſſius*, and that this Phyſician valued himſelf on that Invention. *Celſus* reckons *Caſſius* among the Phyſicians of his own Age; but ſo as to let us know, that *Caſſius* preceded him. *Caſſius*, ſays *Celſus*, *valued himſelf*; which Expreſſion implies, that *Caſſius* was not living at the Time when *Celſus* wrote. *Cælius Aurelianus*, treating of the ſame Diſtemper, mentions alſo the Remedies which *Themiſon* thought proper in that Caſe. Now *Themiſon* lived under the Reign of *Auguſtus*, and before.

There is another Author, who, I believe, is as antient as the two laſt-named, and ſpeaks of the ſame Diſeaſe, calling it by the ſame Name. This is *Philo* of *Tarſus*, who, among other Virtues which he aſcribes to a Medicine of his own Invention, ſays, it is proper for thoſe who are troubled with Pains of the *Colon*. This is the Name of the Inteſtine which is the Seat of this Diſorder, and was alſo the Name of the Diſorder itſelf, as we may collect from the Paſſage of *Pliny* before quoted. But tho' this Name was in Uſe among the Phyſicians who lived under *Auguſtus*, it was not, perhaps, known among the common Sort under the following Reign. And the ſame Thing might poſſibly happen at any Time, with reſpect to certain Names which Phyſicians give to ſome Diſtempers, and which occur in their Writings; but do not, however, immediately paſs into Uſe among thoſe who are not of the ſame Profeſſion. What *Pliny*, then, ſays, that none ever heard any Talk of the *Colic* in the Time of *Tiberius*, is not true, if we take his Words in an abſolute Senſe, when he ſays, that this Emperor was the firſt of Mankind who was afflicted with this Diſorder.

Sydenham, ſpeaking of the epidemical Diſorders of the Years 1670, 1671. and 1672. ſays, that, during all the Years of this Conſtitution, the Blood was ſignally diſpoſed to depoſit hot and choleric Humours in the Inteſtines, whence the bilious Colic prevail'd more than uſual; which Diſeaſe, tho' it ſhould be reckon'd amongſt thoſe of the chronical Kind, and conſequently foreign to my Purpoſe, ſays he, yet, as it depended on the ſame Diſpoſition of the Blood at that Time, from which moſt of the then prevailing Epidemics aroſe, it ſhould, for this Reaſon, be treated of here; but eſpecially becauſe I perceived, that the ſame febrile Symptoms preceded it, which uſually preceded the reigning Dyſentery of thoſe Times: And ſometimes alſo this Diſtemper ſucceeded the Dyſentery, when it had continu'd a long time, and ſeem'd to be going off. But when it did not ſucceed an inveterate Dyſentery, it generally aroſe from a Fever, which afflicted the Patient only for a few Hours, and ordinarily terminated in this Diſeaſe.

It principally attack'd young Perſons of a warm and bilious Conſtitution, eſpecially in the Summer-ſeaſon. A violent and intolerable

intolerable Pain of the Bowels attends it, which ſometimes ſeem to be tied together, and at others cloſely purs'd up, and bor'd thro', as it were, with a ſharp-pointed Inſtrument; the Pain abates between whiles, and immediately the Fit comes on again. In the Beginning the Pain is not ſo certainly fix'd in one Place, as in the Progreſs of the Diſorder; and the Vomiting is leſs frequent, and the Belly more eaſily moved by Purgatives; but, as the Pain increaſes, it becomes more obſtinately fix'd in one Place, frequent Vomitings ſucceed, and the Belly is leſs ſoluble, till at length the unavoidable Violence of the Symptoms occaſions a total Inverſion of the periſtaltic Motion of the Inteſtines, (unleſs the Patient be reliev'd ſooner) and conſequently an Iliac Paſſion, in which Diſtemper all Cathartics immediately become emetic, and Glyſters likewiſe, together with the Fæces, are forc'd up the inteſtinal Tube, and ejected by Vomit. If the Matter thus ejected be ſincere, it is ſometimes green, ſometimes yellow, or of ſome unuſual Colour.

As all the Signs of this Diſeaſe clearly ſhew it to ariſe from ſome ſharp Humour or Vapour thrown off from the Blood into the Inteſtines, I judge the primary curative Indication to be, firſt, that both the antecedent Humour in the Veins, and that contain'd in the Inteſtines, be evacuated; ſecondly, that the great Tendency of the Humours to the Parts affected be check'd, and the intolerable Pain eaſed by exhibiting Opiates.

In order hereto I bleed freely in the Arm, if no Blood has been taken away before, and, in three or four Hours after, adminiſter an Opiate. The next Day I direct ſome lenient Purgative, and order it to be repeated a ſecond time at a Day's Interval, and ſometimes a third time, according as the Remains of the Humour ſeem to be more or leſs in Quantity. But it muſt be obſerved, that if this Diſeaſe proceeds either from a Surfeit of Fruit, or any other kind of Aliment of difficult Digeſtion, whence depraved and corrupt Juices are firſt receiv'd into the Blood, and thence ſeparated into the Inteſtines; in theſe Caſes the Stomach muſt firſt be well cleanſed by drinking Poſſet-drink plentifully, and vomiting it up again; which being over, an Opiate muſt be given, and a Vein open'd the next Day; and, in other Particulars, the Proceſs above delivered is to be followed.

But when the Violence of the Pain, and the Vomiting, whence the Inteſtines are in a manner inverted, do not yield to Purgatives, they muſt be made ſtronger; for it avails not to exhibit a gentle Cathartic, unleſs, perhaps, the Patient be eaſy to work upon, which ſhould be carefully inquired into, becauſe ſuch a Medicine, being too weak to make its Way thro' the inteſtinal Tube, does more Miſchief, the Vomiting and Pain being increaſed by its languid and ineffectual Motion. A lenitive purging Potion, made of an Infuſion of Tamarinds, Sena, and Rhubarb, in which Manna and Syrup of Roſes may be diſſolv'd, is to be prefer'd to other Purges, becauſe it diſturbs and agitates the Juices leſs. But if this cannot be retain'd in the Stomach, either becauſe the Patient has an Averſion to a liquid Medicine, or on account of the Vomiting, recourſe muſt neceſſarily be had to Pills, amongſt which I eſteem the *Pilulæ Cochiæ* moſt, becauſe they operate the moſt certainly in this and moſt other Caſes. But where, either thro' the Weakneſs of the Stomach, or the Vomiting, Pills cannot be retain'd, I firſt preſcribe an Opiate, and in a few Hours after a Purgative, at ſuch a proper Interval, for Inſtance, that the latter may not be overcome, and rendered ineffectual, but continue long enough in the Stomach to communicate its purging Quality thereto, ſo that it may at length operate immediately after the Virtue of the Opiate is gone off. However, if the Caſe will permit, 'tis beſt to give the Purge a conſiderable time after the Opiate, becauſe it operates with Difficulty, even twelve Hours after the Exhibition of the Opiate.

But becauſe a Purge always increaſes the Pain in this and moſt other Diſeaſes, where Opiates are indicated, at leaſt when the Operation is over, the Patient ſometimes finding Relief whilſt it works, I generally give an Opiate immediately after it has done operating, and order it to be repeated daily, Morning and Evening, on the intermediate Days, that I may more certainly eaſe the Pain, till Purging has been ſufficiently perform'd.

When the Affair of Purging is over, I endeavour to check the violent Motion of the Humours, which is all that now remains to be done, by exhibiting an Opiate every Morning and Evening, which muſt ſometimes be repeated more frequently; nor have I ever been able to eaſe very violent Pains, without adminiſtering a larger Doſe than ordinary, and repeating it. For what might be ſufficient to overcome another Diſeaſe, proves ineffectual in this; the Violence of the Pain deſtroying the Force of the Medicine. Opiates may be ſafely repeated whilſt this Kind of Pain continues violent, but not after it ceaſes; for which Reaſon I repeat the Opiate in proportion to the Violence of the Pain, till it either goes quite off, or abates conſiderably; obſerving, however, to adminiſter it at ſuch convenient Intervals, that I may ſee what Effect is to be hoped for from the former Doſe, before I proceed to give another. But, in general, unleſs the Pain be very ſevere, it will ſuffice to exhibit an Opiate Morning and Evening. The Opiate I commonly uſe is my Laudanum, ſays *Sydenham*, of which I give ſixteen Drops at a time, in ſome diſtil'd cordial Water; or the Doſe may be augmented occaſionally, in proportion to the Violence of the Pain.

This plain Method, whereby the peccant Humour is diſcharged by Bleeding and Purging, and then Eaſe procured by means of Opiates, has always ſucceeded better with me than any other I ever knew; whereas carminative Glyſters, injected in order to expel the ſharp Humours, prolong the Diſeaſe, by raiſing a Diſturbance in the Juices. But I would have it particularly remark'd here, that tho' I have affirm'd, that Bleeding and Purging muſt neceſſarily precede this quieting Method, yet ſometimes, when the Caſe demands it, omitting both, the Cure is to be begun with Opiates. For Inſtance, when, by reaſon of ſome preceding Illneſs, large Evacuations have been uſed not long before the Colic began; for frequently ſuch as have lately recovered from ſome other Diſeaſe, are ſuddenly attack'd with this, from a Weakneſs of the Bowels, eſpecially if a greater Degree of Heat be occaſioned, by too free an Uſe of Wine, or any ſpirituous Liquor. Now, in this Caſe, I eſteem it not only unneceſſary, but detrimental, to raiſe freſh Commotions, by giving more Purges. Not to mention, that the Patient, in this Diſeaſe, has generally cleanſed his Bowels ſufficiently, by the frequent Uſe of Glyſters, before applying to a Phyſician; ſo that, partly upon this Account, and partly on account of the long Continuance of the Diſeaſe, it ſhould ſeem, that only Opiates ought to be exhibited.

In *Auguſt* 1671. I was call'd to *Belvoir-Caſtle* by Lord *Anneſley*, who had been afflicted for ſome Days with a bilious Colic, attended with exquiſite Pain, and frequent Vomiting. He had try'd all kinds of Glyſters, and other Remedies directed by the neighbouring Phyſicians: I immediately adviſed the repeated Uſe of Opiates, in the manner above delivered; and by this means he recover'd in a few Days, and return'd to Town with me in good Health.

As this Pain is more ſubject to return ſpontaneouſly than any other, all Occaſion of Relapſe is to be prevented, by exhibiting an Opiate twice a Day for ſome time; but if it ſhould return upon omitting the Opiate, as it ſometimes happens, I have hitherto diſcover'd nothing that will ſo certainly promote the Cure, as taking long Journeys on Horſeback, or in a Coach, obſerving, in the mean while, to give an Opiate every Morning and Evening; for, by this kind of Exerciſe, the morbific Matter is brought into the Habit of the Body, and the Blood, broken and divided by the continual Motion, as it were, undergoes a new Depuration; and, at length, the Bowels are greatly ſtrengthen'd and refreſh'd by this way of rouſing the natural Heat. Nor do I think it beneath me to own, that I have frequently cur'd this Diſtemper by this Exerciſe, when all other Means had fail'd me. But this muſt not be attempted, unleſs ſufficient Evacuations have been previouſly made; and it muſt be perſiſted in for ſeveral Days afterwards.

During theſe Years, one of my poor Neighbours, yet living, was ſeiz'd with a moſt violent bilious Colic, which he had long endeavoured ineffectually to relieve by Cathartics, Glyſters, and ſwallowing Leaden Bullets. I had recourſe here to the frequent Uſe of Opiates; nor did they prove unſucceſsful, for he remain'd tolerably eaſy whilſt he was taking them; but, perceiving they only palliated, and did not eradicate the Diſorder, for it return'd immediately after the Effect of the Opiate was gone off, I had Compaſſion on the Man, labouring under low Circumſtances, and a violent Diſeaſe, and lent him a Horſe to ride to a conſiderable Diſtance, as above directed; and, after riding a few Days, his Bowels became ſo ſtrong, as to be able to expel the Remains of the Diſeaſe, and he recover'd perfectly by this means without the Aſſiſtance of Opiates.

And, to ſpeak the Truth upon this Occaſion, I have always known this kind of Exerciſe uſed with great Succeſs, not only in this Caſe, but in moſt other Chronical Diſeaſes, provided it was reſolutely perſiſted in. For if we conſider, that the lower Belly, wherein all the Secretory Organs are ſeated, is greatly agitated by this Exerciſe, perhaps ſome thouſand times a Day, we ſhall readily believe, that they are hereby enabled to ſhake off any groſs ſizy Humour fix'd there, and, which is ſtill more material, ſo ſtrengthen'd by this powerful Rouſing of the natural Heat, as to be able to perform the Functions of purifying the Blood, aſſign'd them by Nature, in a proper manner.

In young Perſons of a hot Conſtitution I direct a cooling and incraſſating Diet, ſuch as Cremor of Barley, Panada, and a ſmall Chicken, or a boil'd Whiting, every third Day, if the Appetite continues craving. I allow only Small-beer, or Milk boil'd with thrice the Quantity of Water, for Drink; and I indulge nothing further, unleſs Riding, which is neceſſary to complete the Cure, requires a more nouriſhing Diet, and the Uſe of ſome generous Liquor, to recruit the Loſs of Spirits occaſion'd by Exerciſe.

Moreover, 'tis manifeſt from Obſervation, that when this Diſeaſe, thro' wrong Management, proves of long ſtanding, ſo that the Bowels become weak, and the Patient is extremely emaciated and debilitated, the free Uſe of Plague-water, Aqua Mirabilis,

Mirabilis, or ſome other Cordial, which was moſt grateful to him when in Health, relieves at this time beyond Expectation; for, by this means, the ſmall Remains of the natural Heat are rouſed, and the preternatural Ferment lodged in the Bowels, which occaſions freſh Fits between whiles, rendered inactive.

The ſlender Diet above-mention'd muſt be continued not only thro' the Courſe of the Cure, but for ſome time after the Diſeaſe is gone off; for as it is more ſubject to return than any other, and, beſides, is ſeated in the principal Inſtruments of Concoction, which are the Bowels, already weaken'd thereby, the leaſt Error of this kind will immediately occaſion a Relapſe; and, therefore, all Aliment of difficult Digeſtion muſt be avoided, both in this and all other Diſorders of the Bowels, and Food of eaſy Digeſtion uſed very ſparingly.

Some Women are afflicted with a hyſteric Diſorder nearly reſembling the bilious Colic in the Acuteneſs of the Pain, its Seat, and the yellow and green Colour of the Matter diſcharg'd by Vomit.

Females of a lax and groſs Habit of Body are principally ſubject to it; as are likewiſe ſuch as have formerly had ſome hyſteric Indiſpoſition; or (which frequently happens) thoſe who have juſt recover'd of a difficult Labour, occaſion'd by the Largeneſs of the Infant, whereby the Mother's Strength and Spirits were nearly exhauſted. It attacks the Region of the Stomach, and ſometimes the Parts juſt below it, with as violent a Pain as accompanies the Colic, or Iliac Paſſion, which is ſucceeded by exorbitant Vomitings, ſometimes of green, and ſometimes of yellow Matter; and with theſe Symptoms, as I have frequently obſerv'd, there is joined a greater Lowneſs of Spirits, and Deſpondency, than occur in any other Diſeaſe. The Pain goes off in a Day or two, but returns again in a few Weeks after, and rages with as much Violence as ever, before the Fit terminates. 'Tis ſometimes attended with a remarkable Jaundice, which vaniſhes ſpontaneouſly in a few Days. When the Symptoms are all gone off, and the Patient ſeems pretty well recovered, the leaſt Diſturbance of Mind, whether proceeding from Anger or Grief, to both which Women are extremely liable in this Caſe, is ſubject to occaſion a Relapſe. Walking alſo, or any Exerciſe uſed too ſoon, will do the ſame; ſuch Cauſes being productive of Vapours in lax and weak Conſtitutions. I uſe the Term Vapours with the Vulgar, but whether they be Vapours, or Convulſions of particular Parts, the Phenomena may be equally accounted for.

When theſe Vapours, or Convulſions, attack any particular Part of the Body, they produce ſuch Symptoms as are natural to the Part affected; whence, tho' they every-where conſtitute the ſame individual Diſtemper, yet they artfully reſemble moſt Diſeaſes incident to Mankind, as plainly appears from the Diſeaſe under Conſideration, which exactly counterfeits the bilious Colic, when it attacks the Parts adjacent to the Colon. And this is equally manifeſt alſo in many other Parts of the Body affected with this Diſeaſe. For Inſtance, it ſometimes attacks one of the Kidneys with a violent Pain, occaſioning exceſſive Vomiting; and, being frequently propagated along the Ureters, it counterfeits the Stone; in which Caſe the Pain being increas'd by Glyſters, and other Lithontriptic Medicines, uſed to bring away the Stone, it continues with the ſame Violence for a long time, and ſometimes deſtroys the Patient, contrary to its Nature, as being of itſelf not dangerous. I have alſo known it occaſion a Train of Symptoms, exactly like thoſe of the Stone in the Bladder. I was call'd up lately in the Night to a Counteſs in the Neighbourhood, who was ſeized, on a ſudden, with a very ſevere Pain in the Region of the Bladder, along with a Suppreſſion of Urine; and having learn'd, that ſhe was ſubject to various hyſteric Complaints, I conjectur'd, that the Diſorder was miſtaken, and therefore forbid the injecting a Glyſter, which her Maid had got in Readineſs, as apprehending it might be augmented thereby; and inſtead of this and the Emollients brought by the Apothecary, ſuch as the Syrup of Marſhmallows and others, I adminiſtered an Opiate, which ſoon removed the Diſorder. In reality, no Part of the Body, either external or internal, is quite free from the Attacks of this Diſtemper. Thus, in the Jaws, Hips, and Legs, it cauſes intolerable Pain; and, when it goes off, leaves ſuch a Tenderneſs of the Part behind, that it cannot bear the Touch, as if the Fleſh had been bruiſed with abundance of Stripes.

Having now, by way of Digreſſion, delivered ſome Particulars belonging to the Hiſtory of the hyſteric Colic, to prevent its being taken for the bilious Colic, I will briefly treat of ſome other Particulars relating to the Cure of the Symptom of Pain attending it; for the radical Cure of the Diſeaſe itſelf, which is effected by removing the Cauſe, is a quite different Subject.

Bleeding and repeated Purgation, which are ſo manifeſtly indicated in the bilious Colic, at the Beginning, ſhould be omitted here; for Experience ſhews, that the Pain, and other Symptoms, are increas'd by the Diſturbance cauſed by theſe Evacuations; and I have often obſerved, that the Repetition of the moſt gentle Glyſters have occaſioned a continu'd Train of Symptoms: For, if we take a View of the Cauſes whence this Diſeaſe generally proceeds, both Reaſon and Experience teach, that it is rather owing to an irregular Motion of the Spirits, than to any Depravity of the Juices. Now theſe Cauſes are either copious and preternatural Hæmorrhages, inordinate Paſſions of the Mind, violent Exerciſe of the Body, or the like; in all which, ſuch Medicines as increaſe the Hurry of the Spirits are improper, and Opiates are to be exhibited in their ſtead, tho' the green and ill Colour of the Matter ejected by Vomit ſhould ſeem to indicate the contrary; for the Conſideration of Colours is of too ſubtile and refin'd a Nature to authorize ſuch Evacuations as Experience proves to be detrimental; and I doubt not but this Diſeaſe, which, tho' it be very painful, does no way endanger Life, has proved fatal to abundance of Perſons, thro' Miſtakes of this kind. To this may be added, that, tho' a very powerful Emetic be given To-day, in order to expel the ſuppoſed Cauſe of the Diſeaſe, yet the Patient will the next Day vomit a Matter equally green, or of ſome other bad Colour, like the former.

But it muſt be obſerved, that ſometimes there is ſuch a Fulneſs of Blood and Juices, as reſiſts the Operation of Opiates ſo powerfully, that, how often ſoever they be repeated, they are not ſufficient to quiet the Diſturbance, unleſs Bleeding or Purging precede. I have remarked this in Women of a very ſanguine Conſtitution, and robuſt Make. This being the Caſe, one or more of theſe Remedies, and perhaps both, muſt be previouſly uſed, in order to make way for the Opiate, another Doſe whereof will produce the Effect for which it is given; whereas, before Bleeding or Purging, the largeſt avails not. But this is an uncommon Caſe, and theſe Remedies are not to be repeated. Theſe Particulars being premiſed, where there is a Demand for Opiates, we are to proceed in adminiſtering them according to the Method ſpecify'd in treating of the bilious Colic: They are to be repeated, in point of Frequency, in proportion to the Abatement of the Pain. This Method, indeed, is only adapted to relieve the preſent Symptom of violent Pain; for I have not undertaken to treat of that, in this Place, which removes the Cauſe of the Diſeaſe.

But as this Diſtemper, both in hypochondriac and hyſteric Subjects, often terminates in a Jaundice, which increaſes proportionably as the original Diſorder goes off, it muſt be remark'd, that, in curing this Species of Jaundice, all Purgatives are either wholly to be refrain'd from, or none exhibited except Rhubarb, or ſome other gentle Lenitive; for 'tis to be apprehended, that a new Commotion may be occaſioned by Purging, and conſequently a Return of the Symptoms. In this Caſe, therefore, 'tis more expedient to give no Medicines at all, as the Jaundice, ariſing from this Cauſe, abates by degrees ſpontaneouſly, and totally vaniſhes in a ſhort time; but if it continues long, and ſeems to go off ſlowly, we muſt have recourſe to Medicines. I direct the following.

Take of the Roots of Madder and Turmeric, each an Ounce; the Roots, together with the Leaves of the greater Celandine, and the Tops of the leſſer Centaury, each an Handful: Boil them in equal Quantities of *Rheniſh* Wine and Spring-water to a Quart, to which, when ſtrain'd off, add two Ounces of the Syrup of the Five opening Roots: Mix them together for an Apozem, of which let the Patient take half a Pint warm, every Morning and Evening, till the Cure is completed. *Sydenham.*

As there are ſeveral Species of Colic beſides thoſe taken notice of above, and other Methods of treating theſe, I ſhall add the following Treatiſe on this Subject.

Among other Affections incident to the nervous Syſtem may well be reckon'd thoſe violent Pains which afflict the Inteſtines, as being very ſenſible and nervous Parts, endued with a propulſive Motion, and, by Conſent, affecting other Parts of the nervous Frame, in Places more remote, being productive of very pernicious Diſorders.

As the ſmall and great Inteſtines differ with reſpect to their Contexture, Capacity, Function, and Situation, ſo the Pains which affect them are no leſs diſtinguiſh'd by the Places where they are ſeated, their Degree of Violence, their Danger, and other acceding Diſorders.

It is obſerv'd, that Pains in the ſmall Inteſtines are far more ſevere and acute, than in the great ones. This is abundantly evident from the Effects of ſtrong Cathartics, and Poiſons of a cauſtic Quality, in exciting moſt ſevere, griping, and racking Pains above and below the Navel, as well as in the Middle of the Belly. For this Reaſon *Hippocrates* calls all Pains of the Inteſtines by the general Name of *Iliac*, making no mention in his Writings of the *Colic* Pain; tho', in our Times, almoſt all Pains affecting the Inteſtines are call'd *Colic*, and ſo accounted.

Thoſe Pains are more properly to be accounted *Iliac*, which affect the Middle of the Belly, either by ſpaſmodic Conſtrictions, or extraordinary Inflations; whereas *Colic* Pains are ſeated in the Right and Left Hypochondria, and, by their Preſſure and Diſtention, create a vaſt Uneaſineſs. *Hollerius*, *de Morb. intern. Cap.* 39. gives the following Deſcription of the Pain of the Colic: "It is ſettled in one particular Place, like "a Stake

" a Stake that is fix'd, yet ſometimes makes Excurſions to the " Groins, to the Left Kidney, or both Kidneys; ſometimes " takes a revolving Courſe upwards, ſhifting its Place; accord- " ing to the Flexures of the Colon, which, after it has left the " Rectum, is turn'd towards the Left Groin, from whence it " aſcends to the Left Kidney, where it is narroweſt; and this " Narrowneſs, with its Flexure at the ſame Place, is the " Cauſe why the Pain is more intenſe in that Part. Hence " the Colon, becoming more lax and enlarg'd, is extended to " the Spleen, and proceeds under the Liver, where it ſome- " times adheres to the Gall-bladder, and from thence deſcend- " ing to the Right Ileon, ends at laſt in the *Inteſtinum Cæ-* " *cum*."

We take the whole Region of the Inteſtines for the Seat and Subject of the Pain; yet ſo as that, when one Part of it is affected in an extraordinary Manner, the whole inteſtinal Tube, from the Fauces to the Anus, ſuffers by Conſent; or, to ſpeak more properly, the preternatural Motions, and even the very Inverſions and Injuries of the periſtaltic Motion, are communicated to all the reſt, in ſuch a manner, that, if the Cauſe of the Diſeaſe be very conſiderable, the whole nervous Syſtem is, at the ſame time, affected to an extraordinary Degree.

The more ſevere and threatening Affections and Symptoms, which either accompany or ſucceed the Pains of the Inteſtinum Jejunum, Ileon, Colon, or of the Rectum, in the blind Hæmorrhoids, principally ariſe from a Convulſion of the nervous Parts, and are as follows: A Shivering, a Trembling of the external Parts, cold Sweat, total Loſs of Strength, Reſtleſneſs, Toſſing, extreme Anxiety, and internal Uneaſineſs, Hiccups, Vomiting, Conſtipation of the Belly, Teneſmus, Suppreſſion of Urine, Spaſms of the Bladder, a Fever, a contracted Pulſe, Difficulty of Breathing, and ſometimes epileptic Convulſions, and a Delirium.

As the very Nature, or immediate Cauſe, of all Pain, conſiſts in too ſtrong a Diſtenſion, Diſtraction, or Expanſion, of the Membranes and nervous Parts, or in too violent and convulſive a Conſtriction or Compreſſion of the ſame, ſo the Pains of the Inteſtines proceed from the ſame Cauſe; for either ſome particular Parts of the Inteſtine are diſtended and diſtracted by retained and included Flatulences, in a violent Manner, as if they threaten'd a Solution of Continuity, or theſe Parts are contracted and compreſſed by a ſpaſmodic Conſtriction, cauſing a very painful Senſation from ſome acrid, cauſtic, pungent Humour contain'd within the Inteſtines, or in their membranous Subſtance. For this Reaſon, the old Diſtinction, made by the Schools, of a Pain in the Inteſtines, or Colic, into *flatulent* and *ſpaſmodic*, is ſtill retain'd, not without Reaſon.

In a flatulent Pain of the Inteſtines, the Abdomen becomes turgid and inflated to a ſurpriſing Degree; and ſo great oftentimes is the Force of the Flatulences, as to diſtend the Skin in ſuch a manner, that the Pain is exaſperated by the very Touch; and there are Inſtances of a Hernia Umbilicalis proceeding from the Violence of theſe Flatulences. The Pain, in this Caſe, is acute; the Belly very much conſtipated; there is an extreme Anxiety or Oppreſſion, attended with an Inflation of the Stomach, and a great Difficulty of Reſpiration, which are ſucceeded by Eructations, which afford ſome ſlight Relief; and, as an Acceſſion to the Diſtemper, the Patient is ſeized with cardialgic Affections, and makes fruitleſs Efforts to vomit.

In the ſpaſmodic or convulſive *Colic*, as it is call'd, there is a ſtraiter Compreſſion of the Belly, with a Retraction of the Navel inwards, an extreme Coſtiveneſs, ſo as not to tranſmit a Flatus, and hardly to admit a Clyſter. There is, beſides, a moſt ſevere Pain in the Loins; the Peritonæum itſelf, with the Muſcles of the Abdomen, is violently contracted; and theſe Symptoms are attended with a Refrigeration of the extreme Parts, Trembling, Shivering, a hard and contracted Pulſe, extreme Anxiety, and a great Diſpoſition to fainting.

We think it proper here to obſerve, that there is a remarkable Difference between a Flatulence of the Inteſtines, and a flatulent Pain of the Inteſtines; for the former proceeds only from a Decay of the Tone, Motion, and Strength of the Inteſtines, eſpecially in aged Perſons, and thoſe who have made an intemperate Uſe of cold and flatulent Food, or have their Bodies much weaken'd by ſome preceding Diſeaſe; but the latter never happens without ſeverely affecting the Inteſtines, is not eaſily remov'd, and is attended with more formidable Symptoms; whereas the other ſoon terminates in Eructations, and a flatulent Stool or two.

We muſt not omit alſo to obſerve, that nephritic Pains, which proceed from the Stone in the Kidneys, are carefully to be diſtinguiſhed from thoſe, which have their Cauſe ſeated in the Inteſtines themſelves. The confounding of theſe together has long ſince been complain'd of by *Galen*, and his Followers. How nearly ſoever theſe Diſorders may agree, with reſpect to their Symptoms and Effects, there is this remarkable Difference between them, that the Pain, which proceeds from the Stone in the Kidneys, is more fix'd in the Loins, as well as more obſtinate and acute, than in the ſpaſmodic Colic, which, on the contrary, cauſes a greater Conſtipation of the Belly, than nephritic Pains. Beſides, the Pain of the Colic remits after Evacuation of the Belly by a Clyſter, which does not happen in nephritic Caſes. In theſe latter alſo the Patient is more ſtimulated to an Emiſſion of Urine, which, beſides, appears very thin in the Paroxyſm, aqueous, and ſometimes ſandy. Laſtly, in nephritic Diſorders, the Pain is propagated ſucceſſively through the Tract of the Ureters, which is a Symptom not obſerved in Pains of the Inteſtines. But they, who have laboured under one or two Fits of the Stone, are beſt qualified to diſcern its characteriſtical Marks.

With reſpect to the Theory of Pains of the Inteſtines, there is one thing principally to be obſerv'd, which is, that the Cauſe, from whence they ariſe, has its Seat in a quite different Place from that where the Exacerbations of thoſe Pains are felt. Thus, there never happens an Inflation of an Inteſtine, without a preceding or attending ſpaſtic Stricture, Straitneſs, or Obſtruction from Excrements, or ſome tenacious Humour, of ſome Inteſtine in another Part or Tract. The inteſtinal Tube indeed is never without Flatulences, on account of the Heat and aqueous Humour conſtantly reſident therein; but then theſe Flatulefices create no Uneaſineſs, becauſe they have free Space to expand themſelves on all Sides; but as ſoon as a Bar is put to their Tranſmiſſion, and, by being intercepted, they become collected, confined, and, in a manner, incarcerated, in one particular Place, they exert their expanſive Force with great Violence upon the Membranes of the Inteſtines, by diſtending and diſtracting them to an extraordinary Degree.

Whenever a Convulſion, Stoppage, or extraordinary Compreſſion, is produced in ſome Part of the ſmall Inteſtines, as it happens in a Hernia Scrotalis, or from Worms, or harden'd Fæces; or when there is a Stagnation of a conſiderable Quantity of Excrement in the Beginning of the Colon on the Right-ſide, which cannot be remov'd, there ariſes a great and moſt painful Inflation of the Abdomen above and below the Navel, and in the Middle of the ſame.

If the Inteſtinum Rectum, or lower Part of the Colon, be affected with a violent Convulſion, the great Flexure of the Colon, in the Left Hypochondrium towards the Spleen, together with that Part of it, which is ſeated beneath the Stomach, and near the Liver, becomes inflated in a ſurpriſing Manner. But when it happens, as is frequently the Caſe in hypochondriac and hyſteric Diſorders, that the Beginning of the Jejunum, or End of the Duodenum, is ſpaſmodically affected, there preſently ariſes, on account of the neighbouring ſuperior meſenteric and intercoſtal Branch of the Nerves extended upon the Jejunum, a moſt ſevere Pain in the Loins; the Duodenum and Stomach are filled with Flatulences to a ſurpriſing Degree, and the free Motion of the Diaphragm is obſtructed; whence proceed a great Anxiety of the Præcordia, a Straitneſs of Reſpiration, with frequent, and almoſt endleſs, violent Eructations. I have, more than once, in the ſpaſmodic Colic, obſerv'd the lower Part of the Colon contorted like a Rope, and the ſmall Inteſtines expanded to the Thickneſs of a Man's Arm.

Pains of the Inteſtines are ſo frequent, that no Age, Sex, Habit of Body, or Conſtitution, are exempted from them; but they principally infeſt Infants, Women, and old Perſons, and thoſe who are of a tender and weak Nature, and of a quick and delicate Senſation.

There are different Cauſes of theſe ſevere and bitter Pains of the Inteſtines; and, according to the Nature, Diſpoſition, and Force of thoſe Cauſes, are the Symptoms diverſified, and the Danger more or leſs to be apprehended. A very frequent Cauſe is a Retention and Induration of the Fæces in the large Inteſtines, and ſometimes in the ſmall ones, proceeding, in a great meaſure, from a Load of acido-viſcid Crudities, dry, juiceleſs, and aſtringent Food, immoderate Sleep, and a Way of Life unuſed to Exerciſe and Motion. In this obſtructed and coſtive State of the Belly, whenever it happens, that, upon the Uſe of ſweet Aliments, and ſuch as are ſubject to ferment, of fat Fleſh-meats, eſpecially Mutton, with drinking of cool Liquors, and Refrigeration of the Feet and Belly, the Inflation of the Abdomen is increaſed, and the Pain exaſperated, we may hence diſcern the Nature and Marks of the *flatulent* Colic, which the Antients aſcribed to a cold Cauſe; and whoſe Generation, and frequent Attacks, ſuppoſe an Imbecillity of the Inteſtines, and a Want of due Tone and Strength in thoſe Parts; whence this ſort of Colic is very incident to fat and phlegmatic, as well as old and infirm Perſons, eſpecially if they take not due Care to keep the Cold from their Feet, Back, and Belly.

Another kind of Colic is the *bilious*, which, according to the Antients, owes its Original to a hot Cauſe, and ariſes from a bilious, acrid, corrupted Humour, collected in too great Plenty, and ſtagnating in the ſmall Inteſtines, eſpecially the Duodenum. It frequently ſucceeds a great Fit of Anger, eſpecially in Perſons of a hot and dry Conſtitution, in a hot and ſultry Seaſon, in Youth or riper Years; or it proceeds from an exceſſive Uſe of hot and ſpirituous Liquors, and by cooling Potions, which obſtruct Perſpiration, is exaſperated, and rages with the greater Violence. The moſt remarkable Symptoms, which attend it, are,

are, a Hoarſneſs of the Voice, the Heart-burn, a continual Loathing of Food, a Vomiting of porraceous bilious Matter, the Hiccups, a hot and feveriſh Diſtemperature, Reſtleſneſs, an intenſe Thirſt, a Bitterneſs in the Mouth, high-colour'd Urine, and little in Quantity, which is ſometimes ſucceeded by frequent and bilious Stools.

Infants alſo are ſubject to be moleſted with very ſevere and griping Pains of the Inteſtines, occaſioned by a Stagnation of their Milk, which is very much corrupted, and rendered corroſive, by a Mixture of Bile. Hence the Fæces are, for the moſt part, green, few, and coagulated, and are ſometimes ſucceeded by epileptic and mortal Convulſions, from a Corroſion of the Coats of the Inteſtines.

Children are very ſubject to the Colic, which proceeds from Worms collected together, and fix'd in the Inteſtinum Ileum. This Diſorder is often attended with a continual Fever, Syncope, and a lancinating Pain of the Belly, as if it were perforated with an Auger. We find Inſtances of this kind in *Zacutus Luſitanus*, *Prax. admir. Lib.* 2. *Obſ.* 33. and *Hildanus*, *Cent.* 1. *Obſ.* 57.

Nor are Women in Childbed ſecure from very ſevere Pains of the Abdomen, which principally ſeize them on a Defect of the lochial Flux, and when the Belly is not rightly bound after the Birth, or has had its Parts refrigerated.

The Pain of the Colic, and that to a vehement Degree, is alſo very incident to hypochondriacal Perſons; and principally ſeizes the Sides, ſeating itſelf either in the Right Hypochondrium, under the Os Ileum, when the Beginning of the Colon happens to be ſtuffed with Fæces and Flatulences; or under the Liver, the Flexure, which the Colon there makes, being diſtended with Flatulences and Excrements. But the Pain is moſt intenſe in the Left Hypochondrium, under the Diaphragm and Spleen, becauſe the greateſt Flexure of the Colon is there ſituated; and the attendant Symptoms are a Conſtipation of the Belly, Difficulty in making Urine, Anxiety, Oppreſſion, internal Inquietude, and Decay of Strength; for, in what they call the *hypochondriacal Diſeaſe*, the periſtaltic Motion of the Inteſtines being very much injur'd and vitiated, neither Fæces nor Flatulences have their due Courſe or Deſcent towards the lower Parts, but, ſtopping in the Inteſtines, eſpecially at their Flexures, where their moving, contractile, and elaſtic Force is leaſt powerful, there ſtagnate, and excite thoſe troubleſome and painful Diſtentions.

There are Pains of the Inteſtines, which are of a different Nature and Origin from the preceding, being cauſed by an impure and acrimonious Serum, ſeated within the Coats of the Inteſtines. Such a vitiated Fluid is often obſerv'd in ſcorbutic Bodies, and thoſe who are infected with the ſcorbutic Purples, or the Itch; and even in the Gout, when this corrupted Matter, through a Decay of natural Strength, is retain'd, and not tranſmitted to the extreme Parts; or from theſe, on account of various external Cauſes, by a Metaſtaſis tranſlated within the Body. This Species of Colic, exerting itſelf principally in Convulſions, belongs to the ſpaſmodic Kind, and is attended with very ſevere Symptoms. It is alſo difficult to be cur'd, and threatens an Inflammation, nor eaſily ceaſes to moleſt the Patient, till the noxious Matter be again repel'd to the Extremities. See ARTHRITIS.

Nor muſt we omit to take notice of a very bad and ſpaſmodico-convulſive kind of Colic, by ſome call'd the *ſanguineous* Colic, becauſe it proceeds from Blood collected within the Coats of the Inteſtines, eſpecially of the Colon, there ſtagnating, and very much diſtending the ſenſible nervous Membranes. Women are uſually ſubject to this Diſorder, from a Suppreſſion of the menſtrual Flux, and then it is called *hyſteric*; or it may proceed from a Stoppage of the ſtated Flux of the Hæmorrhoids, and then it is properly term'd *hæmorrhoidal*; and, tho' often occurring in Practice, yet the Cauſe of it is, for the moſt part, unregarded by the Phyſician. Men of a good, robuſt, and ſanguine Conſtitution, who are high Feeders, or indulge themſelves in the free Uſe of Wine, and lead an idle Life, are the uſual Subjects of this Diſtemper. Of this ſanguineous Colic we have many Examples and Obſervations by the very learned *C. Piſo*, in his excellent Treatiſe of *Diſeaſes proceeding from a Collection of corrupt Seroſities*.

There is a very ſevere kind of ſpaſmodic Colic, which has its Origin from Fumes, which fly off in the Working of Lead, and are taken into the Mouth, and ſwallowed with the Spittle. This Diſorder is very common among the Workmen employ'd in melting and purifying Lead, or in ſeparating Lead from Silver in docimaſtic Furnaces, as it is practiſed among the Miners in the *Black Foreſt* in *Germany*, and the *Peak* in *Derbyſhire*, and other Parts of *England*. The Patient is affected with an intolerable Pain of the Inteſtines, an extreme Coſtiveneſs, which, with Difficulty, yields to Clyſters or Laxatives, a Retraction of the Navel inwards, a great Reſtleſneſs, Contraction of the Limbs, Nauſea, and continual Retchings. This Diſorder is very ſubject to terminate in a true Palſy, or a ſpaſmodic Aſthma, and often miſerably torments the Patient for a long time together. Potters, who are employ'd in glaſing Earthen Ware with Lead, are obnoxious to the ſame Diſeaſe; and we are aſſured by practical Obſervations, that Medicines, which have Lead in their Compoſition, as the *Tinctura Antiphthiſica*, or the Magiſtery of Lead, which Quacks frequently uſe for ſuppreſſing a Gonorrhœa, leave behind them an invincible Coſtiveneſs, attended with moſt tormenting Pains. The great and dangerous Inconveniences occaſion'd ſome Years ago in *Suabia*, by edulcorating acid Wines with Litharge, was exquiſitely and learnedly ſet forth in a Diſcourſe made by the Preſident *Zeller*, *De Noxa Vini Lithargyrio Mangoniſati*, "of the Hurtfulneſs of Wine adulterated with Litharge." Hence proceed not only Pains in the Stomach, Abdomen, and the Left Hypochondrium, with obſtinate Coſtiveneſs, but alſo a convulſive Colic, and even a convulſive Aſthma. This Species of Colic is call'd the BELLON.

There is yet another kind of Colic, which may properly be call'd *endemic*, becauſe it is common in ſome Countries. Thus, the Inhabitants of *Moravia*, *Auſtria*, and *Hungary*, are very often afflicted with a very ſevere ſpaſmodic and convulſive colic Pain, the Cauſe of which is nothing but an exceſſive Drinking of the very ſpirituous Wines of thoſe Countries, eſpecially if attended with taking Cold; for, by this means, the Blood being put in too high an Ebullition, and having its Motion increaſed, if it can no-way diſcharge itſelf, either by natural or artificial Evacuation, falls upon the Inteſtines, and, being there accumulated, excites dreadful Symptoms. But this Diſorder alſo may properly be referred to the ſanguineous and ſpaſmodic Colic.

Some Pains of the Colic, of a very bad Kind, are conſequent upon other Diſtempers; and I have known Inſtances, where a Diarrhœa, too ſoon ſuppreſſed by Aſtringents, and a Dyſentery, cauſed by Errors in Diet, as feeding too freely on flatulent and fermentable Aliments, have been ſucceeded by terrible and fatal Pains of the Belly. *Fernelius*, *Pathol. Lib.* 6. *Cap.* 10. relates an Inſtance, which he ſaw, where an immoderate Uſe of Quinces, preſcrib'd in a Diarrhœa, threw the Patient into moſt violent Pains and Gripes of the Belly, which increaſed to the Degree of vomiting up the Excrements, and proved mortal; and I have ſometimes obſerv'd the ſame Effect from too violent Cathartics. They, who are well verſed in the Practice of Medicine, muſt have taken notice, that Intermittents, as a Tertian or Quartan, not well cur'd, and eſpecially if the Patient uſes a bad Diet, have been ſucceeded by moſt dreadful and racking Pains of the Abdomen, Inſtances of which may be ſeen in *Binninger*, *Cent.* 3. *Obſ.* 34. *Cent.* 4. *Obſ.* 41. and *Lib.* 4. *Obſ.* 8, 9. And this Diſorder is uſually very obſtinate; for, in the Diſeaſes which precede it, as before-mention'd, the inteſtinal Tube has been much deprav'd and vitiated, and its Function, which, for the moſt part, dependson a convenient, regular, and ſucceſſive Conſtriction and Dilatation, diſturb'd and injured to ſuch a Degree, as eaſily to retain a Collection of vitious Humours; from whence theſe, and other deſtructive Diſeaſes, may derive their Original.

To proceed, the ſpaſmodic Colic is uſually a frequent and even conſtant Attendant of other Pains and Diſorders: Thus nothing is more common than for a Pain, proceeding from the Deſcent of a Stone in the Kidneys into the Ureters, and forcing its Way to the Bladder, to excite moſt ſevere Pains in the Abdomen, together with the Cardialgia, or Heart-burn, Nauſea, and Vomiting; which are principally owing to the Conſent of thoſe Parts, effected by the intercoſtal Nerve, which is common to them. This is the Cauſe why ſome Phyſicians often confound the Pain of the Colic with that proceeding from the Stone, not being capable of diſcerning one from the other, as we before obſerved. It is alſo an Obſervation in Practice, that the convulſive Colic, with a ſtrong Conſtipation of the Belly, which are ſucceeded at laſt by an Epilepſy, take their Riſe in Infants, from the Pains which they ſuffer in Dentition, on account of the admirable Conſent of the nervous Parts.

Moreover, it appears, among other Proofs, from Diſſections, that a Pain of the Belly may be excited by a biliary Stone detain'd in the Gall-bladder, and vellicating its Duct. Thus *Ballonius*, *Lib.* 2. *Epidem.* and *Miſcellanea Naturæ Curioſorum*, *An.* 6, 7. *Obſ.* 220. inform us, that, in the Bodies of thoſe who have died of the Colic, the Gall-bladder has been found full of Stones. And *Horſtius*, *Lib.* 4. *Obſ.* 47. relates, that a very ſevere Colic was relieved by the Diſcharge of two hundred thirty-three Stones from the Gall-bladder. Here I cannot omit taking notice of a peculiar Cauſe of Colic Pains, obſerved by the celebrated *Tulpius*, *Obſ. Lib.* 2. *Cap.* 37. where he ſays, that "the Pain of the Colic is often cauſed by yellow Bile "affecting the Colon, which is often obſerved in Diſſections, "and probably tranſudes inſenſibly thro' the Membranes of "the Gall-bladder to this Inteſtine, as being the neareſt. It "is by no means adviſeable, therefore, to make a ſtrong Com-"preſſion of the Liver, by bending the Body forwards, becauſe "ſuch a Poſture expreſſes the Bile."

Farther, it is not improbable, that Pains may be excited in the whole Volume of the Inteſtines, by an acrimonious Humour

corroding

corroding the inteſtinal Membranes. And this is confirm'd by Obſervations on diſſected Bodies, in which it has appear'd, that the purulent Matter, from the Rupture of an Abſceſs of the Meſentery, by its adhering to the Inteſtines, has excited moſt ſevere Pains and Torments before the Death of the Patients, as *Willis*, *Benivenius*, and *Wharton*, ſeem to hint in many Places of their Works.

Beſides theſe Pains of the Inteſtines, which are of an *acute* Nature, and ſoon terminate in Death, or a Recovery, there are alſo Pains of the ſame Parts, which are of a *chronical* Kind, and of a longer Duration, afflicting the Patient for Weeks, and even for a whole Year together, tho' with Remiſſions and Exacerbations at Intervals. After Death, at length, the Cauſe of ſo tedious an Illneſs has been found, upon Diſſection, to be a great Narrowneſs, Conſtriction, Scirrhoſity, or Calloſity, in ſome Part of an Inteſtine, by which the Equality of the Motion of the Inteſtines was quite deſtroy'd. To this Purpoſe *Kerckringius*, *Spicileg. Anatom. Obſ.* 50. relates, that in a Boy, who died of the Gripes of the Inteſtines, he obſerved the Parts every-where diſtended with Flatulences; but the Perforation of the Pylorus ſo very ſmall, as hardly to tranſmit a Flatus; and the Sides of the Duodenum and Rectum, ſubſiding, conglutinated, and, as it were, drawn together with a Thread, ſo as that no Flatus could make its Way through. *Hollerius*, *de Morb. intern. Lib.* 1. *Cap.* 41. and *Rhodius*, *Cent.* 2. *Obſ.* 76. give us a Deſcription of a Scirrhus of the Colon. And *Benivenius*, *Lib.* 5. *de Abdit. Cap.* 30. 34. obſerved the Cauſe of the Colic to proceed from a Callus in the Inteſtines. *Rhodius*, *Cent.* 2. *Obſ.* 77. and 82. found a Coalition of the Inteſtines after a Dyſentery: With this may be compared what we find in *Bartholine*, *Cent.* 6. *Obſ.* 38. and 2. and *Miſcellanea Naturæ Curioſorum*, *An.* 1672. on the ſame Subject. *Ballonius*, *Epidem. Lib.* 1. *p.* 58. gives an Account of an Inteſtine which was contracted, and cover'd with a Callus. To theſe we may add, that the celebrated *Waltherus*, Profeſſor at *Leipſic*, has given us a very learned Diſſertation on the Anguſtation, or Narrowneſs, of the Inteſtines, which is very well worth our Peruſal. There has been frequently obſerved alſo, in Diſſections of thoſe who have died of the ſpaſmodic Colic, an Implication or Folding of the Omentum; which is a plain Argument, that this Part alſo is ſubject to ſome ſort of convulſive Motions. That chronical Pains of the Abdomen may ariſe from a Diſorder of the Liver, we have ſeveral times obſerved, when that Part has been found whitiſh and indurated, and the Gall-bladder full of Stones: For, whenever the free Paſſage of the Blood through the Liver is obſtructed, it is not duly depurated from bilious Sordes; and, beſides, its Courſe thro' the Inteſtines is obſtructed, in which, making but ſlow Progreſs, becauſe of its Redundance, and the too great Diſtention of the Veſſels, it makes painful Stagnations in the Membranes of the Inteſtines.

In thoſe who die ſuddenly of an acute Pain of the Inteſtines, theſe Parts are commonly found to be inflamed and ſphacelated. Thus *Spigelius*, in his Treatiſe of a Semitertian, informs us, that, in Diſſections of Perſons who died of this Fever, and had before their Death felt moſt violent Pains, like thoſe of the Colic, he obſerved the Inteſtines inflamed and eryſipelatous. And he adds, that it was pernicious, in theſe Caſes, to omit Phlebotomy, and inſtead thereof to ſubſtitute Purging, as the common Practice is; and we, for our Parts, have ſeen the Inteſtinum Rectum ſphacelated, from an ill Treatment of the blind Hæmorrhoids.

A Fit of the Colic, or a Pain of the Inteſtines, is often happily reſolved by a copious Sweat, an Hæmorrhage at the Noſtrils, or a Flux of the Hæmorrhoids; as alſo by an Expulſion of purple Eruptions to the external Parts, a Fit of the Gout, or any Eruption of ſcorbutic Spots. There are frequent Inſtances, and well worthy of Obſervation, to be met with every-where, of ſevere and ſtubborn Pains of the Colic, occaſion'd by repelling the Gout inwards, and ceaſing, on a Return of the Gout to the outward and extreme Parts. Thus alſo a bilious Colic is reſolved by a Diarrhœa, which carries off the black and putrid Matter. Remarkable to this Purpoſe is that noted Place in *Hippocrates*'s Book of the *Humours*, at the End; where he ſays, that "a Perſon, labouring under a Pain in the Right "Side of the Inteſtines, being taken with a Fit of the Gout, "had his Pain much remitted." It is a good Prognoſtic alſo, when the Pain ſhifts its Seat and Place.

It is a bad Sign, when the Pain of the Colic, eſpecially that of the ſpaſmodic and convulſive Kind, after the Strength has been exhauſted, and the Patient fallen into a colliquative Sweat, changes into a true Palſey, or into a ſpurious one, or into a Stupor of the Hands and Feet; and it is a fatal Prognoſtic, when the Violence of the Pain ſtill increaſes; for, in ſuch a Caſe, an Epilepſy, or Convulſions, or ſome other dangerous Diſorder of the Head, as a Lethargy, Carus, or Apoplexy, puts an End to Life. The Colic alſo is very dangerous, whether it be of the convulſive or bilious Kind, which ſeizes the Patient with an actual Shivering, and rages with extreme Violence; for it is a Sign of an Inflammation, which, if not ſpeedily removed, is ſucceeded by a Sphacelus.

The METHOD *of* CURE.

As to the Method of Cure, it appears, from what has been ſaid, that the Cauſes of this Affection are ſurpriſingly various; and conſequently it may be infer'd, that the Manner of Treatment ought to be vary'd in a Way ſuitable to the Difference of the Cauſes whence a Pain of the Inteſtines proceeds.

When, from a Suppreſſion of the cuſtomary Flux of the Hæmorrhoids or Menſes, eſpecially in Bodies abounding with Blood, there ariſes a violent Pain of the Abdomen, attended with much Heat, and an Acceleration of the Pulſe, we order a Vein to be open'd in the Foot; then preſcribe emollient Clyſters, antiſpaſmodic Powders, with a ſmall Portion of Nitre and Cinnabar, mix'd with a ſmall Quantity of Caſtor; alſo our mineral anodyne Liquor, (*ſee* LIQUOR) mix'd with Eſſence of Caſtor, and vinous Sal Ammoniac, not forgetting Bathing of the Feet, which, by remitting the Intenſeneſs of the Pain, in a ſurpriſing Manner, are ſovereign Remedies in the Time of the Paroxyſm. Under a Remiſſion of the Fit we muſt, in order to prevent its Return, lay hold of the Opportunity, for endeavouring a Reſtoration of the Menſes in Women, and the Hæmorrhoids in Men, to their natural Courſes. Remedies, moſt conducive to this Purpoſe, are the Uſe of the mineral Waters, and Bathing, eſpecially in the Spring; beſides theſe, Bathings of the Feet, with due Motion and Exerciſe of the Body, a proper Diet, balſamic Pills, and Infuſions, in the manner of Tea, of carminative and uterine Herbs, are very proper.

When the Pain of the Inteſtines proceeds from a Redundance of intemperate and cauſtic Bile, the ſame Remedies are of Service as before preſcrib'd. But what exceeds theſe, and all other Remedies, in this Caſe, is a nitrous Powder, mix'd with one or two Drops of the true diſtil'd Oil of *Milleſolium*, (Yarrow) to be taken in three or four Ounces of the Water of common Chamomile-flowers; which may be render'd ſtill more grateful, as well as efficacious, by a Mixture of Syrup of white Poppies, and ſweet Spirit of Nitre, rightly prepared. And as this Water, before-mention'd, is a moſt convenient Vehicle for Remedies in all Pains of the Abdomen, ſo it operates with more Succeſs, when diſtil'd with Beer made of Wheaten-malt. It is better alſo, in this kind of Colic, to exhibit the Remedies in a ſomewhat cool than hot Vehicle, and to abſtain from hot Decoctions and Infuſions, as well as from a ſudorific Regimen, and the Uſe of the hot Bath, which might exaſperate the bilious Humour, and cauſe it to penetrate more deeply into the nervous Parts. We are taught, by practical Obſervations, that the bare Drinking of cold Water, which *Galen* himſelf preſcrib'd in a bilious Colic, has done excellent Service in ſuch Caſes as theſe, and removed the Diſtemper; and this Precept is the more to be regarded, if the Diſorder was excited by a ſudden Fit of Anger.

If the Pain be tenſive, and fix'd in the Right or Left Hypochondrium, or beneath the Stomach, it is a ſure Sign, that the Diſorder proceeds from Flatulences, or Excrements incloſed within the Flexures of the Colon. In this Caſe, the principal Indication directs us to the Uſe of Clyſters of an emollient, diſcutient, and corroborating Quality, not omitting external Applications of carminative and emollient Liniments to the affected Part. The Belly being thus evacuated, and the Flatulences expel'd and diſcuſs'd, our balſamic Pills, prepared after the Example of *Becher*, are to be taken; interpoſing, between the Doſes, ſome digeſtive Salt, Decoction of Manna, Cremor, or Terra foliata, of Tartar, mix'd with a Spoonful or two of Oil of ſweet Almonds.

When the Rectum, and Part of the Colon, particularly on the Left Side, are affected with a ſtrong convulſive Stricture, ſo as to be incapable of tranſmitting either Flatus or Fæces, and a Clyſter cannot conveniently be introduced, the Abdomen is to be fomented all over with hot and rich Oils, by Coction, particularly thoſe of Chamomile, Dill, or Rue boil'd, and with the Fats of a Badger, Dog, Fox, Beaver, or Man; which may alſo be introduced, if poſſible, into the Belly by Clyſters, in order to the Relaxation of the ſpaſmodic Conſtriction: This done, the Infuſion of Manna, before directed, is to be exhibited.

A flatulent Colic, proceeding from Imbecillity and Want of due Tone of the Stomach and Inteſtines, or from crude Meats ill digeſted, and cauſing Inflations, admits of the Uſe of carminative Things ſomewhat hotter than ordinary. Among theſe are ſpirituous carminative Waters, prepared of the Seeds of Cumin and Caraway, Orange-peel, the Flowers of common and *Roman* Chamomile, and Cardamoms, diſtil'd in Wine; the carminative Eſſence of *Wedelius*; the Eſſence of Orange-peel, well ſaturated, and exalted with the Spirit of Sal Ammoniac; the mineral anodyne Liquor, mix'd with our liquid Balſam of Life; or the following carminative Liquor;

Take

Take of ſweet Spirit of Nitre, or of our mineral anodyne Liquor, Eſſence of Orange-peel, Tincture of Tartar, each three Drams; Spirit of Sal Ammoniac, one Dram; Oil of Caraway diſtil'd, Oil of Cumin, Oil of Cedar, Oil of common Chamomile diſtil'd, of each ſix Drams: Mix them. The Doſe is from thirty to fifty Drops.

A Draught of *Vinum Hippocraticum*, as it is call'd, prepared of Aromatics, as Orange and Lemon-peel, Mace, Cloves, Cardamoms, and Sugar, to aged Perſons, and where the Diſeaſe takes its Riſe from a Refrigeration of the Abdomen and external Parts, often affords extraordinary and preſent Relief. It is alſo very uſeful to foment the Region of the Abdomen, now-and-then, with heated Tiles, or Marble, or with Bags full of Oats and common Salt, the Seeds of Caraway and Aniſe, Bay-berries, and Juniper-berries, heated.

When the Pains of the Abdomen are occaſion'd by the Repreſſion, or ſtriking inwards, of ſome exanthematous Matter, or critical Diſcharge, the Itch, Purpura, Gout, Rheumatiſm, or Eryſipelas, a prudent Phyſician, who knows what he has to do, will make it his ſole Care to promote a gentle Diaphoreſis; in which I have ſometimes very happily ſucceeded, by preſcribing Eſſence of Scordium, well ſaturated, extracted with Spirit of Elder-flowers, not highly rectify'd, and mix'd with an equal Quantity of our anodyne Liquor, to be taken, thirty or forty Drops, twice a Day, in ſome warm Fluid. About the Time of going to Bed I exhibit a bezoardic Powder, mix'd with a very ſmall Quantity of Nitre and Cinnabar, in recent Juice of Lemons, not omitting the Uſe of emollient and demulcent Clyſters, and keeping the Body in a gentle Diaphoreſis.

If the Pain of the Inteſtines proceeds from Worms, as it is uſual in younger Subjects, it will be proper, in order to eaſe the Patient, firſt of all, to apply a Cataplaſm to the Abdomen, conſiſting of Emollients and Paregorics, as the Flowers of Elder, common Chamomile, Melilot, and Mullein, the Seeds of Fenugreek, Dill, and Aniſe, prepared with Milk and Saffron, and included in a Hog's Bladder, or in a Linen Cloth. After this, Clyſters, compoſed of the ſame Ingredients, are to be frequently uſed, and they are to be prepared with new Milk. Internally are to be given a Tincture of Rhubarb and Tanſey, which laſt is a true ſpecific Anthelmintic, or Remedy againſt Worms; the Belly is to be evacuated, and ſometimes the Uſe of Water, in which crude Mercury has been boil'd, is to be interpoſed. By theſe means it often happens, that Cluſters of Worms, which oppreſs'd and obſtructed the Paſſages of the Inteſtines, have been expel'd; upon which thoſe ſevere Pains of the Abdomen have ceaſed, and all the dangerous Symptoms ſoon after vaniſh'd.

Here we muſt not omit to take notice of that moſt ſevere, and almoſt intolerable Pain, which affects the nervous Membrane of the Inteſtinum Rectum, a Part of moſt exquiſite Senſation, and communicating its Diſorder, by Conſent, to almoſt all Parts of the Body. It proceeds from hæmorrhoidal Blood oppreſſing and ſtraitening the ſmaller Veſſels, and is known by the Name of the *blind Hæmorrhoids*, requiring a particular Method of Cure. In this Caſe I order a Vein to be open'd, not in the Foot, but in the Arm, for the better Derivation of the Blood from the inferior to the ſuperior Parts. For external Uſe, I have had ample Experience of two Remedies of excellent Virtue: One is a Liniment, prepared of three Drams of Sperma Ceti, one Dram of Oil of Henbane, ſix Grains of Camphire, and ten Grains of Saffron, with which the Tumors muſt be anointed hot. The other Remedy is an Epithem, prepared of Water of Quick-lime, temper'd with Roſe-water, and Elder-flower-water, Sugar of Lead, and camphorated Spirit of Wine, to be apply'd warm upon Linen.

As for that terrible convulſivo-ſpaſmodical Colic, call'd *Saturnine*, (from *Saturnus*, the chymical Term for *Lead*) which afflicts the Workmen employ'd in Smelting, or otherwiſe Manufacturing, of Lead, and torments them to a moſt violent Degree, there is no better Preſervative, hitherto invented, than taking ſome fat Broth in the Morning. For the Cure, Clyſters of pure Oil, with drinking good Quantities of Oil of ſweet Almonds, with or without a Decoction of Manna, are ſufficient to complete the Work. To relieve the Palſey, let the Patient bathe in ſweet Water, and afterwards anoint the Abdomen, and Spine of the Back, with a Liniment prepared of human Fat, expreſs'd Oil of Nutmeg, and of Henbane, Saffron, and Oil of Roſemary: There is ſcarcely a more certain and ſpeedy Remedy. See BELLON.

CLINICAL CAUTIONS *and* OBSERVATIONS.

In a ſpaſmodic and convulſive Pain of the Abdomen and Inteſtines, attended with a great Conſtipation of the Belly, by all means avoid Cathartics, and Clyſters of an acrimonious Quality, which we have known to produce Inflammations, ſucceeded by Death.

After a long Coſtiveneſs, and Oppilation of the Inteſtines with indurated Fæces, it is not ſufficient to give the Patient one Clyſter; for there is often Occaſion for two or three to be injected within the Space of one Hour.

Sometimes it happens, that an indurated and compacted Portion of the Excrements, by fixing itſelf in the Inteſtinum Rectum, intercepts the Paſſage of the reſt, together with the Flatulences: In this Caſe the Anus is to be treated with emollient Fomentations, and the Belly is to be ſolicited with pinguious and ſaline Suppoſitories. Some Ounces alſo of Linſeed-oil, or Rapeſeed-oil, with an emollient Decoction, in which there has been firſt diſſolved a ſufficient Quantity of *Venice* Soap, are to be injected by a Syringe, in order to mollify the Hardneſs of the Fæces.

The Fume of Tobacco alone, convey'd thro' a convenient Syringe, is believed to excel all other Remedies, its happy Succeſs, in theſe Caſes, being atteſted by Obſervations; tho', for my part, I can promiſe nothing, with Certainty, concerning its ſingular Efficacy: But thus far I know, that this Experiment, try'd on Horſes, is of extraordinary Virtue in an obſtinate Coſtiveneſs. I have known alſo ſome of the meaner Sort of People, who labour'd under very ſevere Pains of the Inteſtines, freed from them, in an Inſtant, by only ſwallowing the Smoak of Tobacco.

In all violent Pains of the Inteſtines, heating Carminatives, Sudorifics, and Bathing, are very prejudicial, when uſed before Evacuation of the Belly; for while they convey the bilious or corroſive Matter into the Blood, without expelling it to the exterior Parts, the Anxiety is increaſed, and Palſeys, Contractions, hectic Fevers, and even epileptic Convulſions, are the Conſequence.

Aged or weak Perſons, afflicted with Pains of the Abdomen, are wholly to avoid Opiates, and much more Narcotics; and the ſame Caution is neceſſary, when the Body has been weaken'd and exhauſted with long and ſharp Pains; but more eſpecially to be obſerved, when, after an extreme Weakneſs, the Patient ſweats exceſſively; for I have known a true as well as a ſpurious Palſey, and even a Sphacelus of the internal Parts, produced by ſuch Means.

However, in hypochondriacal Diſorders, and the hyſteric Paſſion, attended with a violent Cough, and ſevere Pains of the Abdomen, with Eroſions, our balſamic Pills, or the *Pilulæ Alephanginæ*, quicken'd with the *Extractum Panchymagogum* of *Crollius*, with an Addition of one or two Grains of rightly prepared Laudanum, or Theriaca Cœleſtis, taking, between the Doſes, ſome nitro-ſaline and abſorbent Powders, afford extraordinary Relief under the Pains and Spaſms. And thus many famous Phyſicians, particularly *Riverius*, *Poterius*, *Cranius*, *Hollerius*, and *Foreſtus*, highly recommend ſome cathartic Pills, mix'd with a ſmall Quantity of Laudanum, in Pains of the Abdomen, and that not without Reaſon; for, on a Remiſſion of the Pain and Spaſms, the Operation of the Cathartic is much facilitated, and the intended Evacuation ſucceſsfully perform'd.

If a ſevere Pain of the Inteſtines returns at certain Intervals of Time, which uſually happens in *March* and *October*, eſpecially when the North Wind blows hard, the Cauſe of it is probably a Collection of Blood within the Coats or Membranes of the Inteſtines; becauſe, at ſuch a Seaſon, the Blood, regurgitating, becomes accumulated in the Veins of the Anus. For this Reaſon, Bleeding in the Foot will be very convenient, in order to promote the Flux of the Hæmorrhoids, if cuſtomary, as a Preſervative. But, if the Patient was never affected with this critical Excretion of Blood, I always found it moſt adviſeable to open a Vein in the Arm, in order to derive the Blood from the inferior to the ſuperior Parts; whereas, if it finds no Paſſage by the hæmorrhoidal Veins, its Impetus and Afflux towards the inferior Parts is increaſed by frequent Veneſection in the Foot.

Hypochondriacal Perſons, and thoſe who are ſubject to a Flux of the Hæmorrhoids, are almoſt continually moleſted with Pains of the Stomach and Inteſtines. If, therefore, the Diſorder be inveterate, and will yield neither to domeſtic nor officinal Remedies, I never found a ſpeedier or more effectual Help than a right Uſe of the hot *Caroline* Springs, or temperate mineral Waters, ſuch as the *Selteran*, or thoſe of *Embſen*, internally; and of the Waters of *Tæplitz*, externally, by bathing in them, eſpecially if the Uſe of theſe Waters be attended with frequent and proper Motion and Exerciſe, and a due Care be taken of the Diet.

The ſame is to be underſtood of our *Bath* Waters.

Women in Childbed are very ſubject to Pains of the Loins and Inteſtines, eſpecially if the Lochia flow not in due Time or Quantity. From theſe Pains ariſe exanthematous Fevers, which, if they increaſe upon the Patient, uſually prove fatal. In this Caſe the Duty of the Phyſician is to uſe his utmoſt Endeavours for the Mitigation of thoſe Pains, which is beſt effected by promoting the Lochial Flux; and, if Medicines prove ineffectual for this Purpoſe, Bleeding in the Foot may very ſafely be uſed; upon which the Lochia oftentimes immediately appear, and

and the Pains entirely ceaſe, as I have found by frequent Experience.

The PRESERVATIVE CURE.

Thoſe who are moleſted with Pains of the Inteſtines and lower Belly, that frequently return upon them, which is the Caſe, as I have often obſerved, of thoſe who are afflicted with the Gout, or Stone in the Kidneys, and alſo of hypochondriacal Perſons, and ſuch as are ſubject to the Hæmorrhoids, ought, before all Things, to be injoin'd a ſtrict Regimen of Diet, and Way of Living. The principal Rules to be obſerved for this Purpoſe are, firſt, to avoid, as much as poſſible, all pernicious Perturbations of Mind, ſuch as Terror, Anger, and Sorrow; for there is nothing ſo injurious to the nervous Syſtem, and ſo likely to excite on a ſudden any latent Diſeaſe in thoſe Parts, as a violent Commotion of the Mind. Then, in the next Place, the Cold of the North Wind is by all means to be avoided, becauſe it has great Influence in promoting the Returns and Exacerbations of nervous Diſtempers; in particular, the Region of the Loins, the Parts about the Præcordia, and the Feet, are carefully to be defended againſt it. Again, as to Diet, ſuch Perſons are adviſed to abſtain from leguminous Aliments, and, among theſe, eſpecially from Peas, Beans, and Cabbage. Eating of fat Mutton, and eſpecially drinking cold Liquors upon it, are to be avoided alſo as prejudicial. Moreover, the Body is not to remain one Day in Idleneſs and Reſt, but to be frequently exerciſed. *Trallian* ſpeaks well, and very much to the Purpoſe, when he recommends Motion for thoſe Diſorders, in the following Expreſſions: "All kinds of Motion and Exerciſe are admirably beneficial to thoſe who have "been ſubject to ſuch a Diſorder, and have frequent Fits of "the ſame, whether it be Walking, Riding on Horſeback, "or Moving in a Ship or Boat; alſo Exerciſes and Frictions of "the whole Body, Change of Place, and long Journeys; for "all theſe Means attenuate, diſcuſs, and render the whole "Body free from excrementitious Incumbrances, corroborating the univerſal Habit to ſuch a Degree, that the affected "Parts ſhall not for the future collect the cold Humour, nor "yet readily receive it by Influx from other Parts." In the laſt place, I would adviſe all Perſons to be ſparing in their Uſe of ſpirituous Liquors, and particularly of the Stomach Cordial-waters, becauſe I have often obſerved, that an exceſſive Drinking of theſe Liquors has been more prejudicial and pernicious, in theſe Caſes, than eating of Fruits; for it is a vulgar and erroneous Notion, that theſe ſpirituous Draughts contribute any thing towards the better Diſſolution and Digeſtion of the Food, which principally depend on the ſalival Humour; ſpirituous Liquors being ſo far from promoting the Solution of the Aliment, that, by precipitating the chylous Parts into the Inteſtines, and by their incraſſating and obſtruent Qualities, they adminiſter Matter for Eructations and Flatulences. *Hoffman, Medic. Rat. Syſtemat.*

As I apprehend, that much the greateſt Number of Colics which occur are real Inflammations, I ſhall make ſome farther Remarks upon this Diſtemper, when I treat on Inflammations of the Inteſtines. See INTESTINA.

COLIFORME OS. The *Os Cribroſum*. See CAPUT.

COLINIL, H. M. *Polygala Indica minor, ſiliquis recurvis*, D. Syen. *Nil, ſive Indiga ſpuria*. The Name of an *American* Plant; the Juice of which, with a little Honey, is ſaid to be a very effectual Topic for Puſtules of the Mouth. *Raii Hiſt. Plant.*

COLIPHIUS *Panis*. A ſort of Bread, which was uſed for Dinner, without any other Food. It was made of fine Wheat-flour, with an Addition of Barm, baked but moderately, and made into Loaves of an oblong Form. *Caſtellus* from *Langius*.

COLLA, κόλλα. Glue.

COLLATENNA. A certain Specific for the Cure of Wounds, mention'd by *Paracelſus* in his Treatiſe *de Vita Longa, L.* 2. *C.* 14.

COLLATITIUM. A ſort of Food, prepared, according to *Blancard*, of the Fleſh of a Capon or Pullet bruiſed, and then mix'd with Mutton-broth, and exhibited with Verjuice or Lemon-juice.

COLLETICA, κολλητικὰ φάρμακα, from κόλλα, Glue. Conglutinating Medicines.

COLLICIÆ. The Union of the Ducts, which convey the Humours of the Eyes from the Puncta Lachrymalia to the Cavity of the Noſe.

COLLICULA. The ſame as NYMPHÆ, which ſee.

COLLIGAMEN. A Ligament.

COLLIQUAMENTUM. An extremely tranſparent Fluid in an Egg, obſervable after two or three Days Incubation, containing the firſt Rudiments of the Chick. It is included in its own proper Membranes, diſtinct from the Albumen. *Harvey* alſo calls it the *Oculus*.

COLLIQUATIO, Colliquation; apply'd to the Blood, when it loſes its Craſis, or balſamic Texture; to the ſolid Parts, when they waſte away; and to animal, vegetable, and mineral Subſtances, which are capable of being melted; and is then the ſame as Fuſion.

COLLISIO. See CONTUSIO.

COLLIX, κόλλιξ, or κόλιξ. A ſort of round Loaf of Bread, or perhaps rather a Cake, made in a round and flat Form. But, in *Hippocrates*, and the other *Greek* medicinal Writers, κόλλιξ imports a ſort of Paſtil, or Troche, of the Form abovemention'd.

COLLODES, κολλώδης. Glutinous. From κόλλα, Glue.

COLLODIUM. A Word mention'd by *Paracelſus* in his Treatiſe *de Vita Longa, L.* 2. *C.* 9. in treating of the Cure of Wounds; but he no-where explains what it is.

COLLUM. See CERVIX.

COLLUTORIUM *Oris*. A Gargariſm. See GARGARISMUS.

COLLYMUS *Lapis*, or *Collinus*. The LAPIS ARTITES.

COLLYRION. The Name of a Bird thus diſtinguiſh'd. *Merula*, Offic. Aldrov. Ornith. 604. Geſn. de Avib. 542. Jonſ. de Avib. 73. Charlt. Exer. 90. Mer. Pin. 177. *Merula nigra*, Schw. A. 300. Bellon. des Oyſe, 320. *Merula vulgaris*, Will. Ornith. 140. Raii Ornith. 190. Ejuſd. Synop. A. 65. *Collyrion*, Turn. THE BLACK-BIRD.

Pliny informs us, that this Bird roaſted, with Myrtle-berries incloſed in it, cures the Dyſentery. The Dung, mix'd with Vinegar, takes off Freckles. *Dale* from *Johnſon*.

COLLYRIUM, κολλύριον, or κολλύριον, from κόλλα, Glue, and οὐρά, a Tail, becauſe the antient Collyria were in the Form of a Rat's Tail, and prepared of Powders made up with ſomething glutinous.

The Word *Collyrium* principally and properly imported a Compoſition under a certain Form. *Oribaſius, Collect. Lib.* 10. *Cap.* 23. ſays, that "a Collyrium muſt be four Fingers long, "and of a Figure repreſenting the Tail of a Rat;" that is, not only round and long, like the *Magdalides* for Plaiſters, (ſee *Scribonius Largus, Cap.* 69.) but diminiſh'd by little and little towards one End, as *Celſus, Lib.* 5. *Cap.* 28. explains it, and as the Etymology of the Word imports. The Materials of a Collyrium were, in general, every thing which could ſerve to make up a Compoſition, or Maſs of Medicine, of a Conſiſtence capable of being reduced into the Form before-mention'd. This Form, being eſſential to the Collyrium, render'd that Name common to Medicines whoſe Ingredients and Uſes were very different: Hence they gave this Name to Suppoſitories, which were a Medicine compoſed of Soap, boil'd Honey, and other Ingredients, and reduced into the Form we ſpeak of, for its more commodious Introduction into the Anus. They call'd by this Name alſo Tents, which were made out of the Compoſitions for Plaiſters, and introduced into Fiſtulas, or deep Ulcers; and uſed the ſame Term for all other ſorts of Tents, which are in Uſe among Surgeons, not only for Wounds and Ulcers, but to put in the natural Cavities, as the Ears, Noſtrils, and Penis. For the ſame Reaſon they gave the Name *Collyrium* to Peſſaries adapted to the Uterus, becauſe their Figure, as well as that of Tents, had a very near Reſemblance to what a Collyrium ought to have. Theſe Sorts of Collyria are commonly call'd *entire* or *form'd* Collyria, becauſe they are uſed entire, or in the ſame Form in which they were made, to diſtinguiſh them from another ſort of Collyria, which were reduced into a Powder, or diluted with ſome Liquor, when they were to be uſed.

It was not neceſſary, that theſe laſt Collyria ſhould always be exactly in the ſame Form as the others; it was ſufficient for them to come pretty near it, and they might be the *Magdalides* of Plaiſters, which were alſo ſometimes call'd *Collyria*; and the ſame Name was given to ſmall Bits of Paſte, with which they cram'd Birds, in order to fatten them. The Medicines, which went by this Name, were made up into a Maſs, the better to preſerve the Virtues of the Ingredients, that they might not evaporate, when not fix'd by Gums, or any other Things proper to reduce them to one ſolid Maſs. When they had Occaſion to uſe them, they pounded them in a Mortar, or levigated them on a Marble, to render the Powder the finer: Theſe laſt Collyria were principally deſign'd for Diſeaſes of the Eyes. *Oribaſius, Collect. Lib.* 10. *Cap.* 23. diſtinguiſhes theſe two ſorts of Collyria in the following Paſſage, which is taken from *Antyllus*: "What we properly call *Collyria* are Medicines ap"ply'd to the Eyes, after Levigation: But the *Collyria*, com"monly call'd *entire*, are uſed in the ſame entire State, and "either apply'd to one Part, or introduced into another. "They are apply'd to the Uterus, and introduced into Fiſtu"las, and ſinuous Ulcers." When *Oribaſius* here ſays, that Collyria, properly ſo call'd, were Medicines for the Eyes, he intends, I think, only to hint, that this ſort of Collyria was the moſt known; tho' they would not probably have had that Name, but on account of their being made, at the Beginning, in the ſame Form with thoſe which were uſed entire. But, as this Form was not eſſential to this Medicine for the Eyes, they

afterwards changed it, but retain'd the firſt Name; whence all Remedies, proper for the Eyes, came to be call'd *Collyria*: One Sort, which was compoſed of dry Ingredients, had the Name of ξηροκολλύεια, "dry Collyria;" the other, being prepared of liquid Subſtances, they call'd ὑγροκολλύεια, "humid "Collyria." The Ingredients of the firſt, which were the ſame as thoſe that enter'd the Compoſition of the *entire Collyria*, were metallic Powders, Cerufs, Pompholyx, burnt Antimony, Verdegriſe, Chalcitis, Cadmia, and others of a like Nature; with theſe were mix'd Powders made of Plants, ſome Juices of Herbs, and ſome Gums, as Saffron, Roſes, Juices of Celandine and Fennel, Aloes, Myrrh, and Opium. All theſe Ingredients were mix'd together, and form'd into Maſſes, which they dry'd, and, when they had Occaſion to uſe them, pulverized. The liquid Collyria were prepared only of liquid Subſtances; for Example, of *Attic* Honey, which was accounted the beſt, Opobalſamum, Gall of a Viper, of a Partridge, or ſome other Animal, and Juice of Fennel. Of theſe they made a Mixture, ſome Drops of which they inſtil'd into the Eyes, in caſe of a weak Sight, or the Beginning of a Cataract. There are various other Preſcriptions for Collyria, both dry and liquid, in *Aetius*, *Galen*, and other Writers. There were Collyria of both Sorts for all other Diſeaſes of the Eyes, as for reſtraining a Defluxion, removing an Inflammation, eaſing Pains, cleanſing and conſolidating Ulcers of the Membranes, diſſipating Specks or Pearls, and, in a Word, for all Diſeaſes incident to the Eyes. A learned Man, who has very well explain'd and commented upon *Horace*, in his Note upon a Verſe of that Poet, *Serm. Lib.* 1. *Sat.* 5. where he ſpeaks of Collyria, ſays, that a *Collyrium* is a Medicine prepared of diſtil'd Waters, and divers other Drugs, for the Eyes. He was not aware, that there was no ſuch Thing as diſtil'd Waters in thoſe Times, and that the Collyrium of *Horace* was not like thoſe which are made now-a-days.

At preſent, *Collyria* commonly ſignify topical Medicines for the Eyes; whether they are ſolid and dry, ξηροκολλύεια, call'd, by the *Arabians*, *Sief*, which are kept in the Form of Troches, and ſprinkled into the Eye in the Form of a very ſubtle Powder; or whether they are liquid or humid, ὑγροκολλύεια, (call'd *Collyria* properly, and by way of Eminence, and often containing ſomething of a Powder) which are either inſtil'd into the Eye, or apply'd by means of a Linen Cloth moiſten'd therewith; or, laſtly, whether they are apply'd to the Eyes in the Form of a Liniment, Ointment, or Cataplaſm, or even by way of Fumes or Vapours.

Their Uſe is underſtood from the different Preparations, Materials, and a thorough Inſight into the Cauſe of the Affection, againſt which the Collyrium is provided; for, as *Gorræus* juſtly obſerves, ſince the Eye is ſubject to a Variety of Diſorders, there is a ſuitable Diverſity of Collyria; ſome are adapted to the Beginning of an Ophthalmy, others to the State of that Diſeaſe, and others to its Decline, in the ſame manner as it happens in Inflammations of other Parts. In general, it ought to be obſerved, that great Caution is to be uſed in the Mixture of oily and pinguious Subſtances in Collyria, becauſe, by relaxing the Veſſels, they uſually diſpoſe them to Defluxions; and it is no leſs worthy of Obſervation, that acrid and aſtringent Matters are prejudicial to the Cornea Tunica, by too much drying it, and by that means inducing a Rigidneſs of that Membrane; or, by their ſtimulating Property, irritating the Defluxion, and by ſuch means exciting or increaſing an Inflammation. "Generally ſpeaking, Collyria are either too acri-"monious, ſuch as thoſe prepared of Water of Quick-lime, "Sal Ammoniac, with white or *Cyprian* Vitriol; or too "aſtringent, ſuch as thoſe compoſed of Alum, Dragon's-"blood, *Armenian* Bole, Lapis Calaminaris, Tutty, and the "White of an Egg; or too refrigerating, of which Kind are "thoſe compoſed of the Water of Frogs-ſpawn, Roſe-water, "Plantain-water, with an Addition of Saccharum Saturni; "or too drying, of which Nature are thoſe prepared of burnt "Hartſhorn, Lapis Calaminaris, and Tutty; or, laſtly, too "much relaxing; ſuch are thoſe compoſed of Mucilage of the "Seeds of Fleabane, Quinces, Fenugreek, with Tragacanth, "and freſh Butter. All theſe Compoſitions, tho' of excel-"lent Service in other Affections of the Eye, yet, in an In-"flammation, eſpecially of the ſanguineous Kind, are ſo far "from being of any Benefit, that they are rather prejudicial; "for, by their means, not only the Diſeaſe is exaſperated, and "takes deeper Root, but the pellucid Humours of the Eye "become turbid, which is ſucceeded by a Tabes, Corrugation, "Cataract, with a chronic, red, dry, and rough Epiphora, "and an Exulceration of the Eyelids." Thus far *Frederic Hoffman*, in his *Medicina Rationalis*, T. 4. P. 1. Among acrimonious Subſtances, which may not ſafely be uſed, *Wedelius*, in his *Amœnitates Materiæ Medicæ*, reckons Opium in the Compoſition of Collyria. "In Pains of the Eyes, ſays he, "Opiates, externally apply'd, are of little Service, becauſe an "ardent Heat is rather excited than mitigated by their bitter "Quality; and if any one ſhould object, that the Eyes de-"light in Things endued with ſomewhat of Acrimony, that, "indeed, is true; but it is better, in ſuch a Caſe, to chuſe "Aloes than Opium, which conſiſts of an obtunding Muci-"lage." We learn from *Dioſcorides*, *Lib.* 4. *Cap.* 60. that the Uſe of Opium, in Collyria, was condemn'd by ſome among the Antients; and *Zecchius*, in his *Conſultationes Medicinales*, lays it down as a Rule perpetually to be obſerved, that, when there is Occaſion for a pretty ſtrong Collyrium, the Eyes are firſt to be waſh'd with new Woman's Milk, or Mulſum very much diluted; and this is to be done not by means of a Sponge, but by gently diſtilling the Liquor into the Eyes, out of a Bottle with a very narrow Neck. But that there are Caſes, in which acrid Subſtances are applied to the affected Eye, without any other Thing, we learn from the *Eph. Nat. Curioſ. Decad.* 3. *a.* 9. *o.* 182. where we have an Inſtance of a Man, above ſixty Years of Age, cured of a membranous Excreſcence in his Right Eye, as large as a Pea, and of a cylindrical Form, attended with a preternatural Weakneſs of Sight, by gradually anointing it with a Drop or two of the Spirit of Vitriol. Various Subſtances are, by different Authors, recommended as proper Materials for Collyria. *Ramazzini* informs us, that the Antients recommended the Squama Æris for this Purpoſe: And *Le Mort* aſſerts, that, in all Diſorders of the Eyes, that Species of Collyrium is proper, which conſiſts of half a Dram of Verdegriſe; Camphire, one Scruple; well rectified Spirit of Wine, about half a Dram; and of the Spirit of Sal Ammoniac, two Drams. The Tincture extracted from theſe, when mix'd, is of a deep Sky-colour, and muſt be kept for Uſe in a cloſe-ſtopt Veſſel. Such a Quantity of it is only to be uſed, as will give a bluiſh Colour to ſome proper Water, ſuch as that of Roſes, Plantain, Eye-bright, or Fennel. But the Collyrium will be ſtill more valuable, if a bluiſh Colour is communicated to the following Mixture by an Affuſion of the Tincture.

Take the White of a new-laid Egg: Let it be thoroughly incorporated with the Waters of Fennel, Eye-bright, and Roſes, of each two Ounces. When it is ſufficiently diſſolved in theſe Waters, add ten Grains of the Sugar of Lead, and ſix Grains of white Vitriol.

The ſame Author, in all Inflammations, Specks, and other Diſorders of the Eyes, calls that an excellent Collyrium, which is compoſed of one Dram of the Flos Æris, or cryſtalliz'd Verdegriſe; Spirit of Sal Ammoniac, one Ounce; and camphorated Alcohol of Wine, an Ounce and an half: When from theſe a bluiſh Tincture is extracted, a few Drops of it are mix'd with an Ounce of ſome proper Water, till it is tinged with a bluiſh Colour, and then three Grains of the Sugar of Lead are to be added. But, for Inflammations of the Eyes, he aſſerts, that no Collyrium is more efficacious than the following:

Take of the Oleum Saturni, twenty Drops; of the Tincture of Copper, ten Drops; of camphorated Spirit of Wine, fifteen Drops; of the Waters of Roſes, and Plantain, or Elder, each an Ounce and an half: Mix all together, and let the Part affected be frequently anointed with the Mixture.

There are numberleſs Forms of Collyriums to be met with, not only in the Works of the Antients, ſuch as *Galen*, *Paulus Ægineta*, *Aetius*, and *Oribaſius*, but alſo among theModerns; in the *Collectanea Leydenſ.* for Inſtance, in the *Pharmacia Acroamatica* of *Wedelius*, in the *Conſult. Zecchii*, in the *Obſervat. Medicin.* of *Foreſtus*, in the Works of *Ettmuller*, and in the *Ephemer. Nat. Curioſ.* There are alſo various Forms of this Medicine in the Shops, which have either their Denomination from their Colour, or their Inventor; ſuch as the *Collyrium album*, in the *Antidotarium Bononienſe*, which is alſo call'd *Sief album*, or the *Trochiſci albi Rhaſis*; the *Collyrium*, or *Sief album Galeni*, which, in the *Antidotarium Florentinum*, is call'd *Trypherum Galeni*; the *Sief album Meſuæ*, in *Antidot. Florentin.* the *Collyrium D. Bruni*, in *Lemery*'s *Pharmac.* which, in *Schroder*'s *Pharmac.* is call'd *Aqua Ophthalmica Bruni*; the *Collyrium Citrinum Meſuæ*, in the *Antidotar. Bonon.* the *Collyrium Damantii*, in *Lemery*'s *Pharmacop.* the *Collyrium Lanfranci*, in the *Phar. Pariſien.* the *Collyrium Libianum*, in the *Antidot. Florentin.* the *Collyrium rubrum aridum Rhaſis*, in *Antidot. Bonon.* the *Sief rubrum Meſuæ*, in *Antidot. Florentin.* the *Collyrium*, or *Sief Viride Antæi*, in the *Pharmacop. Auguſtan.* and ſeveral others in various *Diſpenſatories*.

COLOBOMATA, κολοβώματα. The Meaning of this Word is, in *Celſus*, expreſs'd by *Curta*. Both theſe import Deficiencies in ſome Part of the Body, particularly in the Ears, Lips, or Alæ of the Noſtrils.

COLOCASIA.

The Characters are,

The Root is tuberous, thick, and farinaceous; the Leaves are ſmooth, and have their Peduncle inſerted into their Umbilicus. From the End of the Peduncle proceeds a monophyllous, membranous Calyx, of an oval Figure, hollow beneath, and expanding itſelf above into an acute or ſharp-pointed Vagina, half

half open like a Sheep's Ear. From the Bottom of the Calyx ariſes an Axis, ſurrounded with many ſpherical berry-like Ova, each furniſhed with a long ſlender Tube, like a Filament, and bearing one or two roundiſh Seeds. Round the ſame Axis, above the Ova, grow the maſculine Stamina, in very cloſe Order, and furniſh'd with their proper Teſticuli. Above theſe again, round the ſame Axis, ſtands a third Series of numerous Filaments. The Axis here runs out into a ſlender purple Pedunclc, which at laſt ends in a long black Clava.

Boerhaave mentions five Species of this Plant, which are,

1. Colocaſia. See *Arum maximum, Ægyptiacum, quod vulgo Colocaſia.*

2. Colocaſia; maxima; foliis â parte poſteriore uſque ad pedunculi inſertionem apertis. *H.*

3. Colocaſia; ſtrongylorhiza; Zeylanica; pediculis & limbis foliorum atropuniceis. *Par. Bat.* 85. *Arum maximum, Ægyptiacum, quod vulgo Colocaſia, cauliculis nigricantibus Zeylanica.* H. L. H.

4. Colocaſia; quod Arum Zeylanicum; minus; Colocaſiæ foliis; pediculis punicantibus. *Par. Bat.* 77. *Par. Bat. Pr. Ghahala Zeyl. Arum Ceylonicum, cauliculis nigricantibus, foliis Colocaſiæ ſimilibus.* Commel. Cat. Hort. Med. Amſt. H.

5. Colocaſia; Americana; folio ex viridi & rubro ſpecioſiſſime variegato. *Boerhaave's Index alter Plantarum, Vol.* 2.

COLOCHIERNI. A Name for a Plant call'd *Colochierni Carduus Cretenſibus.* J. B. *Atractylidi et Cnico ſylveſtri ſimilis.* C. B.

It differs very little from the ATRACTYLIS.

COLOCYNTHIS, κολοκυνθὶς. Colocynth, commonly call'd Coloquintida, or the bitter Apple. *Hippocrates* mentions this under the Name of κολοκύνθη ἀγελὰς, wild Cucumber. This he ſometimes directs as an Ingredient in ſtimulating Peſſaries. But I do not remember, that he any-where recommends it as an internal Medicine.

The Characters of the Colocynthis are,

It is in every reſpect like the Gourd, except that the Leaves are deeply jagged; the Fruit is extremely bitter, and not eatable.

There are two Sorts of Colocynth mentioned in Medicine. The firſt is, the

Colocynthis, Offic. Ger. 768. Emac. 915. J. B. 2. 232. Chab. 133. Raii Hiſt. 1. 642. *Colocynthis vulgaris*, Park. Theat. 160. *Colocynthis fructu rotundo minor*, C. B. Pin. 313. Tourn. Inſt. 108. Chomel. 67. COLOQUINTIDA. *Dale.*

The bitter Gourd, in its Manner of growing, and Make of the Leaves, pretty much reſembles the Water-melon; it has ſuch hairy creeping Branches, with Claſpers, by which it climbs upon any thing, like other Gourds. The Leaves are divided into five Laciniæ, or Sections, but ſomewhat broader than the Water-melon-leaves; the Flowers come forth at the Joints with the Leaves, and are alike in Shape, but of a yellowiſh-white Colour. The Fruit is of the Bigneſs, Shape, and Colour of an Orange, but ſmoother, with a hard Shell, or Bark, including a white ſpongy Pulp, full of flatiſh, oval, hard Seed, of a pale-yellow Colour: This Fruit is exceedingly bitter. It grows in *Turkey*, whence it is brought to us with the outſide Orange-colour'd Bark taken off. *Miller's Bot. Off.*

This has been a Drug of great Eſteem in Medicine for many Ages. Its Roughneſs and Violence of Operation has always tortured the ſeveral Hands it has paſſed thro', to determine in what Part of its Compoſition this Quality reſided, that they might the better know how to correct and mitigate it. To ſome it ſeems to reſide in certain reſinous Particles, which ſooneſt join with a ſpirituous Menſtruum, and therefore make ſuch Infuſions too violent; for which Reaſon they direct more aqueous Diſſolvents, and ſuch as are capable of uniting with Salt of Tartar, which would ſeparate the Reſins, and make their Efficacies upon the Fibres more moderate. *Schroder* and *Ludovicus* ſpeak much of this Management, and commend the Extract made by Evaporation of the Liquor with Salt of Tartar for its Corrector: They direct it from three to eight Grains. Others conjecture its cathartic Property to be more in its ſlimy and mucilaginous Parts, which are beſt drawn out and diſſolv'd by plain Water: But moſt aſſign it to a penetrating volatile Salt; and this latter ſeems to have been the Opinion of the Antients, particularly of the *Arabians:* For which Reaſon, in the *Trochiſci Alhandal* (for *Handala*, or *Alhandala*, was the Name by which this Drug was known to them) it ſtands corrected with gummy and mucilaginous Bodies, as they are moſt proper to blunt the Violence of thoſe Spiculæ, and prevent their too great Irritation of the Membranes. *Van Helmont* ſpeaks of this as a thing which might eaſily be diveſted of its purgative Quality, and reduced into an extraordinary Alterative in ſome Chronical Caſes; but this is a Secret not yet found out.

In the Memoirs of the *French* Academy for 1701. Monſieur *Boulduc* has given his Obſervations and Experiments on this Drug, which are worth our Notice. He tells us, that it is the Fruit of a Plant of the Nature of a wild Gourd, and is very purgative, inſomuch that its Operation is ſometimes attended with Excoriations of the Membranes, and a Diſcharge of Blood: Whence many have conjectur'd, that Coloquintida, by its volatile Salts, would render the Blood more fluid; but our Author did not find this true by his own Experience; for he put a good Quantity of it in Powder to new-drawn Blood, which did not prevent it from running into its uſual Coagulations. The little Succeſs of the Means hitherto attempted to correct this Remedy has not hindered Monſieur *Boulduc* from trying others. He fermented four Ounces of its Pulp with ſix Pounds of good Muſt of Wine, for ten or twelve Days together; then he diſtil'd this Mixture in a Vapour-heat by Degrees. The firſt Portion of eight Ounces was very clear, moderately ſpirituous, and exceſſively bitter. The other Portions gradually decreas'd in their Qualities; and, when the Liquor came altogether inſipid, he put an End to the Diſtillation, and evaporated the Remainder into an Extract, which was of a ſufficiently ſolid Conſiſtence, and weigh'd two Ounces and a half.

With theſe, Experiments were made upon the Sick with all neceſſary Precaution. An Ounce of what came away firſt in the Diſtillation caus'd great Nauſeas, and ſevere Colics, which were obliged to be appeas'd by other Remedies; tho' two Ounces of the ſame, upon another Trial, had its Effect, but with Gripings. Of the Extract made after Diſtillation, he gave ten Grains, which operated without Violence or Irritation; which he attributed to the eſſential Salts of the Wine, whoſe Acids had ſuppreſs'd, and, as it were, fix'd the volatile Salt of the Coloquintida.

Next, inſtead of Muſt, Monſieur *Boulduc* made uſe of Water, and put in Digeſtion for fifteen Days ſixteen Ounces of the Pulp, with two Quarts of Water; after which he diſtil'd the Whole. The Liquors, which came away, had nothing in them penetrating or volatile, had no Taſte, and, if taken inwardly, had no Effect; but the Extract made of what remain'd after Diſtillation he found to be very efficacious. It was a gentle Purger, and of ſufficient Force, given in but little Quantity. Perhaps, ſays he, as the Subſtance of the Coloquintida is extremely ſpongy; its mucilaginous Parts, which are in great Number, are the moſt offenſive; and a long Digeſtion, in a large Quantity of Water, may ſo attenuate, ſubtilize, and diſſolve them, that an Extract made in this manner may be a good Preparation; and he believes the following Experiments confirm this Opinion. He drew from the Coloquintida all the Tinctures poſſible with Water, and by Filtration ſeparated the clear from the mucilaginous: Of each of theſe he made a ſolid Extract, of which the former was the more efficacious, tho' a more gentle Purger than the latter. The laſt Trial he made was with Spirit of Wine: From eight Ounces was obtain'd but half an Ounce of a reſinous Extract; whereas he had from the ſame Weight, by the means of Water, near three Ounces of a ſaline one, reckoning both its clear and mucilaginous Parts: Whence he concludes, that the Colocynth contains much more Salt than Oil or Sulphur; and that it is probable the Salts, particularly the more groſs, envelop'd in the mucilaginous Parts, are the Occaſion of its violent Operation.

I ſhall leave the Reader to make the beſt Application of this Account, to his own Practice, he can, and only obſerve, that the common way of making the *Euſtachian* Extract, that is, *Extractum Rudii*, contradicts Monſieur *Boulduc*'s firſt Experiment, of the Spirit's coming over exceſſively bitter and purgative; for the Liquor, in which the Ingredients of this Compoſition, the principal being Colocynth, are infuſed, when it is drawn off by Diſtillation, (which moſt do only for good Huſbandry, as it may ſerve for the ſame Uſe again) has neither Colour, Taſte, or purgative Quality, any more than common Spirit of Wine: So that Monſieur *Boulduc* ſeems to have made a Miſtake in the Experiment, by letting ſome ſmall Quantity of the Infuſion inadvertently paſs over into the Receiver, which, in the leaſt Portion, would give an extreme Bitterneſs to the Whole that came over by Vapour.

This Drug is yet much in the Officinal Compoſitions, but hardly ever met with in extemporaneous Preſcription; its nauſeous Taſte not making it tolerable in any Form but Pills, where it can be covered. It is ſo ſmart a Purger, as not to be ſafe but to athletic Conſtitutions, and ſuch full Habits, where the Fibres are ſufficiently guarded by a large Quantity of Humours, from its vehement Vellications. It is by all eſteem'd very efficacious againſt Worms; but its Roughneſs of Operation makes it hardly ſafe to give to Children, who principally want it upon that Account, unleſs in Glyſters. The *Confectio Hamech*, which our College retain in their *Diſpenſatory*, is never preſcrib'd, becauſe it is ſo irkſome in taking, from the Taſte it has of this Ingredient. *Quincy's Diſpenſatory.*

Geoffroy adds, that the Pulp of this Apple is bitter and purgative; but the Seeds have neither of theſe Qualities in ſo great a Degree, except they have touch'd the Pulp; for then they become very bitter. Coloquintida, taken in a large Doſe, is one of the moſt violent Purges now known. It not only often brings away pure Blood, but produces violent Convulſions, Ulcers in the Inteſtines, and fatal Hypercatharſes. When the Pulp is taken in Subſtance, it ſticks to the Coats of the Stomach and Inteſtines; and therefore it has been judged convenient to divide it

as much as poſſible. Thus having firſt reduc'd it to a fine Powder, it is made up into Lozenges call'd *Trochiſci Albandal*; but even theſe are hurtful to Perſons of weak abdominal Viſcera. When it is thought proper to give it in Clyſters, it ought to be boil'd in a Linen Bag, that no large Pieces of the Pulp may mix with the Decoction. Theſe Clyſters are often ordered in Apoplectic Caſes. Some ſay, that Coloquintida will purge Children, by being reduc'd to a Paſte with Ox-gall, and apply'd to the Navel.

The other Species of this Plant is the

Colocynthis fructu rotundo; major. *C. B. Pin.* 313. *Tourn. Inſt.* 109. *Chomel.* 67. *Boerh. Ind. A.* 2. 80. *Hiſt. Oxon.* 2. 27. *Colocynthis major rotunda*, Park. Theat. 160. THE GREATER COLOQUINTIDA.

This is alſo imported from the *Levant*, and is ſaid to agree with the preceding in Virtues.

COLOCYNTHIS MONOCOCCOS. See SICYOÏDES AMERICANA; FRUCTU ECHINATO; FOLIIS ANGULATIS.

COLOEOS, κολεός. The GRACULUS, which ſee.

COLON. The Name of one of the large Inteſtines. See COELIA.

COLOPHONIA. Colophony, or black Roſin. This Subſtance, when perfectly cold, is hard, dry, and friable, but eaſily becomes fluid on the Application of Heat. It is yelloviſh, or red, pellucid, and almoſt reſembling Glaſs. It is almoſt deſtitute of Taſte and Smell, and is in reality no more than a Roſin boiled to this Conſiſtence by intenſe Heat, after which it becomes more indurated by the Cold, and loſes all its volatile Parts; for which Reaſon it is by ſome Authors alſo call'd *Reſina fricta*, or *toſta*, dry'd Roſin. That Species of Colophony is accounted beſt, which is yelloviſh, pellucid, and conſiſts of large Pieces. It receives its Name from *Colophon*, a City of *Ionia*, becauſe, in former times, the beſt Colophony was brought from that Place. Concerning this Species of Colophony, *Pliny*, in *Lib.* 14. *Cap.* 20. affirms, that it is more yellow than the other Sorts; that, when it is triturated, it becomes white; and that it is of a nauſeous Smell; for which Reaſon it was not uſed by the Unguentarii. Since the Antients make mention of two Sorts of Colophony, one in a dry, and another in a liquid Form, it is probable, that the latter of theſe was liquid Pitch, call'd alſo *Grecian* Pitch, which is nothing but the crude Reſin of the Pine brought from *Colophon*; whereas the former was the *Reſina fricta*, which the *Greeks* call'd ſimply ψυκτή. *Galen*, in his Work *De Compoſ. Med. per Gen. Lib.* 7. *Cap.* 3. informs us, that tho' *Pinea*, *Fricta Reſina*, and *Colophonia*, were promiſcuouſly uſed, there was yet another Species of Colophony at *Chios*, very like to Maſtich, and which, like it and Frankincenſe, had ſomething of an emollient Quality. But the later *Greeks*, according to *Salmaſius*, call'd every Kind of Reſin *Colophony*, becauſe the Reſin of *Colophon* was accounted the beſt. Hence the *Arabians* uſe the Word *Kalphonia* for every Species of Reſin. The Colophony ſold at preſent is Turpentine boil'd in Water, and afterwards dried; but the Caput Mortuum of the Turpentine is better, that is, the Reſin remaining after a Diſtillation of the etherial Oil, which, when it is urged by a more intenſe and long-continu'd Fire, is chang'd into true and genuine Colophony. When Colophony, thus prepar'd, is treated with a Fire of Suppreſſion, it yields a thick Oil, along with a heavy acid Water, which diſcovers the genuine Nature and Properties of a Reſin. Whatever Virtues, therefore, Colophony is poſſeſſed of, may be aſcribed to the Energy of theſe two Principles, combined and blended in one common Subſtance. Hence 'tis obvious, why Colophony, when reduc'd to a Powder, and thrown into the Flame of a Candle, takes Fire, and reſembles Lightning: Its Nature is, therefore, underſtood by that of a Reſin. Colophony, reduced to a Powder, is of ſingular Advantage in Surgery, in Caſes where the Bones are laid bare, or the Perioſteum, Tendons, and Muſcles, injur'd by Burns, Corroſions, Contuſions, Punctures, Lacerations, or partial Diviſions. It alſo prevents Defluxions of Serum on the Joints, and induces Cicatrixes, and checks the fungous Excreſcences of Ulcers, if apply'd in the ſame Manner. Beſides its drying, conſolidating, and lenitive Qualities, it is an Ingredient in ſeveral Plaiſters and Ointments. *Konigius* affirms, that his balſamic Plaiſter is of univerſal Uſe in diſcuſſing Tumors, curing Ulcers and Wounds, and removing arthritic Pains. The Method of preparing it is as follows:

> Take of Colophony and new Wax, each three Ounces; of Gum Elemi and Gum Tragacanth, each one Ounce; of Nitre, an Ounce and an half; of native Sulphur, ſix Drams; of the Powder of red Sanders, red Myrrh, the beſt Maſtich, and Frankincenſe, each half an Ounce; of the Oil of Bays, ſix Drams; and of the Balſam of Peru, two Drams. Infuſe the Sanders for ſome time in Spirit of Wine; then add it to the other Ingredients, and form into a Plaiſter of a proper Conſiſtence.

Some prepare Pills of Colophony, whilſt warm, for the Cure of Gonorrhœas, and other Venereal Diſeaſes. The Powder of it is alſo recommended for expelling the Stone. Some, by diſſolving Colophony in Spirit of Wine, prepare a rediſh Tincture, which they call *Aurum Potabile*, and recommend againſt Chronical Diſeaſes ariſing from Obſtructions. *Hoffman*, in his *Clavis Schrod.* aſſerts, that it is of ſingular Efficacy in carrying off tartarious Sordes by the Urine. Colophony, minutely triturated, mix'd with double the Quantity of dry Sand, paſs'd thro' a Sieve, and diſtil'd from a Glaſs Retort, in a Sand-heat, yields firſt a white and aqueous Liquor, then an oleous and clay-colour'd Liquor, then one of a rediſh Colour, and, laſtly, a thick Subſtance call'd Balſam of Colophony; which, when again diſtil'd, together with the reſt of the oleous Liquor, after a Separation of the Phlegm, is the Oil of Colophony, ſo much extol'd by *Margrave* for curing Wounds, and ſoftening Tumors, for which Purpoſes it may be uſed both internally and externally. A few Drops may be exhibited for a Doſe internally. There is a Preparation of Colophony in the *Antidotarium Bononienſe*, under the Title of *Unguentum Colophoniæ*.

COLOSTRUM. The firſt Milk of any Animal after bringing forth Young, call'd *Beeſtings*. It is remarked, that this Milk is gently cathartic, and purges off the Meconium, ſerving both as an Aliment and Medicine.

An Emulſion, prepared with Turpentine diſſolved with the Yolk of an Egg, is ſometimes call'd by this Name.

COLOTES, κωλώτης. The ſame as ASCALABOTES, which ſee. A Sort of ſpotted Lizard. Hence

COLOTOIDES, κωλωτοειδής. Variegated like the Skin of this Animal. It is apply'd, by *Hippocrates*, to the Excrements.

COLPOS, κόλπος. The ſame as SINUS, which ſee.

COLUBRINA. The *Dracontium* is call'd by this Name, according to *Blancard*; as is likewiſe the *Biſtort*.

COLUBRINUM LIGNUM. A Sort of Wood, or Root, thus diſtinguiſh'd:

Lignum Colubrinum, Offic. *Nux Vomica minor Moluccana*, *Lignum Colubrinum Officinarum*, Parad. Bat. Prod. 357. *Nux Vomica altera*, Raii Dendr. 117. *Radix Colubrina*, *Lignum Colubrinum*, Mont. Exot. 7. *Solanum arboreſcens Indicum*, *foliis Napecæ majoribus magis mucronatis*, *fructu rotundo*, *duro*, *ſpadiceo-nigreſcente*, *ſemine orbiculari compreſſo*, *maximis*, Breyn. Prod. 2. 93. Commel. Flor. Mal. 249. *Fructus orbicularis peregrinus cum granis Nucis Vomicæ ſimilibus*, J. B. 1. 341. *Modira-Caniram*, Hort. Mall. 8. 47. Tab. 24. *An Clematitis Indica foliis Perſicæ*, *fructu Periclymeni*, C. B? *Lignum Colubrinum primum Garciæ*, Park. C. B. SNAKE-WOOD.

This is a Wood, or rather a Root, which comes from the *Eaſt Indies*, of a heavy, cloſe, and ponderous Subſtance. It is covered with an Iron-colour'd Bark, having many Aſh-colour'd Spots on it, and of a bitter Taſte, being ſuppoſed to be the Root of ſome Species of the Tree which bears the Nux Vomica; and though it be commended by ſome as good againſt the Biting of Serpents, and as a Cure for Tertian Agues, yet Dr. *Anton. de Heide*, after ſeveral Trials which he made with it, gives it but an indifferent Character, as a malignant, ſoporiferous, and poiſonous Thing, and therefore better let alone, and neglected, as it is in our Shops. *Miller's Bot. Off.*

COLUM. A Filtre.

COLUMBA, Offic. *Columba domeſtica*, Schrod. 5. 316. Bellon. des Oyſe. 314. *Columba*, *ſive Columbus*, Ind. Med. 39. *Columba domeſtica ſeu vulgaris*, Raii Ornith. 180. Ejuſd. Synop. A. 59. Will. Ornith. 131. *Columba domeſtica*, Aldrov. Ornith. 2. 462. Jonſ. de Avib. 62. Schw. A. 237. *Columba domeſtica*, *Livia*, Charlt. Exer. 84. *Columba vulgaris*, Geſn. de Avib. 245. *Columba*, *vulgaris*, *Livia*, Mer. Pin. 174. THE PIGEON OR DOVE.

The Parts in Uſe are, the living Pigeon, the Blood, the Coat of the Stomach, and the Dung. The live Pigeon, diſſected in the Middle, and applied to the Head while the Blood is hot, mitigates the Violence of Humours, and diſcuſſes Melancholy and Sadneſs; whence it is a very convenient Remedy in the Phrenſy, Head-ach, Melancholy, and the Gout. The warm Blood, inſtil'd into the Eyes, helps Pain and Lippitude, diſcuſſes Cataracts and ſtagnated Blood, cures recent Wounds, has a peculiar Virtue in ſtopping an Hæmorrhage from the Membranes of the Brain, and mitigates the Pain of the Gout. The Coat of the Stomach, dry'd and pulveriz'd, is recommended in the Dyſentery. The Dung is violently heating, on which account it is a Cauſtic and Diſcutient, and excites a Redneſs of the Skin by attracting the Blood thither; whence it is of frequent Uſe in ſtimulating Plaiſters and Cataplaſms. Triturated and ſifted, and applied with the Seed of Naſturtium, is relieves under inveterate Diſorders, as the Gout, Hemicrania, Vertigo, Head-ach, and others; internally it waſtes the Stone, and provokes Urine. *Schrod. Dale.*

There are ſeveral Sorts of Pigeons, which are diſtinguiſhed into two general Claſſes, the tame and wild Pigeon.

You are to chuſe, both of the one and the other, thoſe which are young, tender, fat, fleſhy, well fed, and that have been bred in a pure and ſerene Air.

They are very nouriſhing, ſomewhat binding, ſtrengthening, and provoke Urine: They are looked upon to be good for cleanſing the Kidneys, and to expel the groſs Matter which ſometimes adheres to them.

Some

Some Authors pretend, that the Uſe of Pigeons cures Convulſions, and is a Preſervative againſt peſtilential Diſtempers; but I will not aſſure the Reader, that theſe Pretences are well-grounded.

As a Pigeon grows old, ſo proportionably does its Fleſh become more dry and ſolid, harder of Digeſtion, and productive of groſs and melancholy Humours; and hence it is, that many Authors have condemned the Uſe of Pigeons, and look upon them to be bad Food.

They contain much Oil and volatile Salt, and an indifferent Quantity of earthy Parts.

They agree at all times with any Age and Conſtitution; but thoſe who are melancholy ought to make uſe of them more moderately than other Perſons.

REMARKS.

The tame Pigeon is a Bird well known, for being much uſed by way of Food. When 'tis young, the Fleſh is tender, juicy, and eaſy of Digeſtion; becauſe it contains a juſt Proportion of ſaline, oily, balſamic, and phlegmatic Principles; but as it grows older, ſo proportionably the Juices are more groſs, earthy, and ſubject to render the Fleſh hard, and heavy in the Stomach. In the mean time, this Fleſh being very nouriſhing, and affording ſolid and durable Food, it may be proper for thoſe who have a good Digeſtion, are in continual Exerciſe of Body, and ſpend themſelves much.

We may ſay in general, that all Pigeons are of a dry Nature; and that, in this Particular, they do not differ one from another, but as they are more or leſs ſo. Their Fleſh is nouriſhing, becauſe it contains a great many oily and balſamic Parts. It alſo yields good and ſolid Nouriſhment, becauſe that being compact and cloſe ſet together, it ſticks in ſuch a manner to the ſolid Parts, that it cannot, without Difficulty, be ſeparated from it. Laſtly, the Fleſh of a Pigeon fortifies and binds, not only becauſe it contains many exalted Principles, but alſo becauſe that being but a little moiſt, and full of ſome earthy Parts, the ſuperfluous Moiſtures, which relax the Fibres of the Entrails, are ſwallowed up thereby. *Lemery on Foods.*

COLUMELLA. The UVULA, which ſee.

COLUMELLARES *Dentes* are the *Dentes Canini.*

COLUMNÆ CORDIS. Theſe are ſmall, long, and round fleſhy Productions in the Ventricles of the Heart. See COR.

COLUMNA NASI is the loweſt and fleſhy Part of the Noſe, which forms a Part of the *Septum.*

COLUMNA ORIS is the UVULA.

COLUS JOVIS, in Botany, is the *Sclarea*; *glutinoſa*; *floris lutei, variegati*; *barba ampla, cava.* See SCLAREA.

COLUTEA. Bladder-ſena, or Baſtard-ſena.

The Characters are,

The Pods are membranaceous, and inflated like ſmall Bladders.

Of this *Boerhaave* mentions ſix Sorts.

1. Colutea; veſicaria. *C. B. Pin.* 396. *J. B.* 1. 380. *Chab.* 81. *Raii Hiſt.* 2. 1720. *Jonſ. Dendr.* 377. *Tourn. Inſt.* 649. *Elem. Bot.* 509. *Boerh. Ind. A.* 2. 39. *Colutea*, Offic. Ger. 1116. Emac. 1299. Ind. Med. 39. *Colutea veſicaria vulgaris*, Park. Theat. 226. *Senna Mauritanorum*, Chomel. 1. 42. *Pſeudo-Senna, ſive Senna Europæa*, Boerh. Hiſt. Plant. 468. *Senna Pauperum*, Ejuſd. BASTARD-SENA.

This is a Buſh, or ſmall Tree, which ſends from the Root many Aſh-colour'd ſlender Branches, on which grow long pinnated Leaves of nine or eleven Pinnæ, round, and a little hollow'd in at the End. The Flowers grow in Bunches on the upper Part of the young Shoots, being yellow and papilionaceous, ſucceeded by large ſwell'd thin Bladders, ſomewhat flattiſh on the upper Part; and ſharper and boat-faſhion'd underneath, with a crooked Appendix at the End, full of black Kidney-like Seed. It grows wild in ſeveral Parts of *Italy*, but is with us only in Gardens, and flowers in *July.*

The Leaves of this *Baſtard-ſena*, but eſpecially the Seeds, purge upwards and downwards with much Violence; and therefore ought only to be adminiſtered to ſtrong robuſt Bodies, and then with good Correctives. *Miller's Bot. Off.*

2. Colutea; veſiculis rubentibus. *J. B.* 1. 380. *Deſcr.*

3. Colutea; Orientalis; floré ſanguinei coloris, lutea macula notato. *T. Cor.* 44. *H. R. D.* EASTERN BLADDER-SENA, WITH BLOOD-COLOUR'D FLOWERS SPOTED WITH YELLOW.

4. Colutea; Æthiopica; flore Phœniceo; folio Barbæ Jovis. *Breyn. Cent.* 70. *Prod.* 30. *H.* ETHIOPIAN BLADDER-SENA, WITH SCARLET FLOWERS, AND LEAVES LIKE THE SILVER-BUSH.

5. Colutea; Africana; annua; foliis parvis, mucronatis; veſiculis compreſſis. *H. A.* 2. 87. AFRICAN ANNUAL BLADDER-SENA, WITH SMALL-POINTED LEAVES, AND COMPRESS'D PODS.

6. Colutea; Zeylanica; argentea tota. *H. L.* 169. *Boerhaave's Index alter Plantarum, Vol.* 2.

COLUTEA; SCORPIOIDES. See EMERUS.

COLYMBADES, κολυμβάδες. Pickled Olives. See OLIVA.

COLYMBÆNA; κολυμβαίνα. The Name of a Sort of Shrimp in *Galen.*

COMA, κῶμα, in *Galen's Exegeſis*, is expounded by κατάφορα, *Cataphora*, that is, a preternatural Propenſity to Sleep; and, in the third Chapter of his Treatiſe of a *Coma*, he informs us, that *Coma* includes every *Cataphora*, both the ſleepy and the wakeful. He gives the ſame Expoſition of it in *Com.* 1. *in Prorrhet.* where he ſays, ὡς εἶναι τὸ κῶμα τὸν εἰς ὕπνον καταφοράν, *&c.* "So that a *Coma* is a *Cataphora*, in which the Patients "are incapable of acting as thoſe who are awake, but have a "Deſire to ſhut their Eyes in hopes of ſleeping; but it ſome-"times happens, that they are unable to ſleep after their Eyes "are ſhut, but continue for the moſt part waking, which Diſ-"order *Hippocrates* call'd οὐχ ὑπνώδης κῶμα (a *Coma* not of the "ſleepy Kind); but we have written a whole Treatiſe of the "Signification of a *Coma*, in which we have ſhewn, by ſeveral "Paſſages, that *Hippocrates* call'd every Sort of *Cataphora* by "the Name of *Coma.*" Again, *Com.* 3. *in Prorrhet.* he tells us, that he has written a Treatiſe of a *Coma*, according to the Sentiments of *Hippocrates*, wherein he has ſhewn, that a *Coma* ſignifies τὴν εἰς ὕπνον καταφοράν, "a violent Propenſity to ſleep," under which the Patients are incapable of waking with their Eyes open, and uncertain of ſleeping while they are ſhut, but ſometimes continue waking. Once more, the ſame Author, in *Com.* 1. *in Lib.* 3. *Epid.* ſays, "I call εἰς ὕπνον καταφοράν "a Diſorder when the Patients cannot continue waking, having "their Eyes not open, but winking, being either in a deep "Sleep, a Slumber, or waking. Wherefore there is required "Diſtinguiſhing, with the Help of good Judgment, and great "Experience, in order to know, of a Certainty, under what "kind of comatous Indiſpoſition the Patient labours."

As there are two Sorts of the *Cataphora*, ſo there are of the *Coma*, in *Hippocrates*; for there is the *Coma* (κῶμα) βαρὺ, ὑπνῶδες, ἢ δυσδιεγερτον, "heavy, profoundly ſleepy, or difficult to be "rous'd from." To which is oppoſed λεπτὸς ἢ μικρὸς ὕπνος, "a ſmall or gentle Sleep or Slumber." This Sort of *Coma* is uſually attendant on a Lethargy. Hence κωματώδεις ὕπνοι, in *Coac.* ſignify a profound Sleep, attended with a Sopor, from whence it is difficult to rouſe the Patient. For, according to *Galen*, *Com. ad Aph.* 3. *Lib.* 2. it is call'd a *Coma*, when it is difficult to rouſe the Patient out of it; but when it exceeds what is agreeable to Nature only in reſpect of Time, it is call'd barely a long Sleep: *Coma*, in this Senſe, then, comprehends lethargic Affections, eſpecially if it be attended with Diſorders of the Head, Refrigerations of the whole Body, a Torpor, Heavineſs, and Dulneſs of Senſation, ſuch as in *Coac.* are call'd κωματώδεις νωθροί, "comatous torpid (Indiſpoſitions)." "It "is cuſtomary with the Author of the *Prorrheticon*," ſays *Galen*, "to uſe the Word *Coma* to ſignify a Lethargy; for the "Word λήθαργος occurs not once in the whole Book." They, then, who are oppreſs'd with a Sleep, which is attended with a Sort of Torpor, are ſaid to be κωματώδεις, "under a *Coma.*"

There is another Sort of *Coma*, which *Hippocrates* calls κῶμα οὐχ ὑπνῶδες, ἢ ἄγρυπνον, "the unſleepy or wakeful Coma." This is a uſual Symptom of a Phrenitis, and ſeems to be an Affection made up of Sleeping and Waking. We have it thus expreſs'd by *Hippocrates*, *Lib.* 3. *Epid.* κωματώδεις περὶ πολὺ, καὶ πάλιν ἀγρύπνοι, "they were, for the moſt part, under a Sopor, and "then again moleſted with want of Sleep." Again, in the ſame Book, κατεῖχε δὲ ἢ τὸ κῶμα συνεχὲς οὐχ ὑπνῶδες, ἢ μετὰ πόνου ἄγρυπνοι, "they either laboured under a continual wakeful "*Coma*, or want of Sleep, attended with great Uneaſineſs." *Galen*, *Lib. de Comate*, *Cap.* 3, 4. and *Com.* 3. *in Lib.* 3. *Epid.* explains this Affection in the following Manner: "When the "Patients cannot wake with open Eyes, but lie winking in hope "of ſleeping, but continue waking, we call this Affection a "*wakeful Coma*; and if there be an Uneaſineſs in the Caſe, "they will more manifeſtly appear to be awake, and not ſo "much as in a Slumber. Perſons, under ſuch a comatous Diſ-"poſition, ſeem conſtituted in a middle State between thoſe "who are perfectly awake, and thoſe who are aſleep." The ſame Author, *Com.* 1. *in Lib.* 1. *Prorrhet.* ſays, that this Diſorder is compounded of a Phrenſy and a Lethargy, and is by ſome call'd *Typhomania*, contrary to the Sentiment of *Hippocrates.* See his *Lib. de Comate*, *Cap.* 4. But, in his *Iſagoge Pulſuum*, he tells us, that this Affection wants a proper Name, and that the Knowledge of it muſt be learned from its concomitant Symptoms.

For a farther Account of a *Coma*, ſee LETHARGUS.

For the Cauſes of, and Treatment due to, a *Coma*, conſidered as a Symptom in Fevers, ſee FEBRIS.

COMA AUREA.

The Characters are,

It hath a fibrous perennial Root; the Leaves, which are in great Numbers, are produced alternately on every Side of the Branches; the Cup of the Flower is not ſpacious; the Flowers are yellow, and produced either ſingly, or in an Umbel, upon the Tops of the Branches: To which may be added, it hath the Appearance of a Shrub. *Miller's Dictionary, Vol.* 1.

Boerhaave mentions nine Species of this Plant.

1. Coma aurea; Germanica. *Park.* 688. *Linaria, folioso capitulo luteo, major.* C. B. P. 213. *Linaria aurea.* H. Eyst. Æst. o. 1. F. 14. Fig. 1. *Linaria, aurea, Tragi, sive Linaria tertia.* J. B. 3. 151. *Linesyris Nuperorum.* Lob. Ic. 409. *Virga aurea, Linariæ foliis.* Raii Meth. 189. *Conyza, linariæ folio.* T. 455. *Virga aurea, Linariæ foliis, floribus congestis, & umbellatim dispositis.* M. H. 3. 25. GERMAN GOLDYLOCKS.

2. Coma aurea; Africana; fruticans, foliis linariæ angustis; major. *H. A.* 2. 89. *Conyza Æthiopica, flore bullato, aureo, pinastri brevioribus foliis, læte viridibus.* Plukn. 327. H. R. D. AFRICAN SHRUBBY GOLDYLOCKS, WITH NARROW TOAD-FLAX LEAVES.

3. Coma aurea; Africana; fruticans; foliis Crithmi marini. *H. A.* 2. 89. *H. R. D.* AFRICAN SHRUBBY GOLDYLOCKS, WITH SAMPHIRE-LEAVES.

4. Coma aurea; Africana; fruticans; foliis glaucis & in extremitate trifidis. *H. A.* 2. 97. *H. R. D.* AFRICAN SHRUBBY GOLDYLOCKS, WITH SEA-GREEN LEAVES, which are divided into three Parts at their Extremities.

5. Coma aurea; Africana; fruticans; foliis viridibus & in extremitate trifidis; floribus majoribus. *H. R. D.* SHRUBBY AFRICAN GOLDYLOCKS, WITH LONG NARROW SEA-GREEN LEAVES, which are divided into many Parts, each of which are trifid at their Points.

6. Coma aurea; Africana; fruticans; foliis glaucis, longis, tenuibus, multifidis, apice pinnularum trifido. *H. R. D.*

7. Coma aurea; Africana; fruticans, foliis tenuissimis, longis, trifidis. *H. R. D.*

8. Coma aurea; Africana; fruticans; foliis glaucis succulentis, digitatis, odoratis. *H. R. D.*

9. Comæ aureæ similis frutex; ambarum spirans. Frutex Africanus ambarum spirans. *Volk.* 175. *Plukn.* 183. *H. R. D. b. Boerhaave's Index alter Plantarum, Vol.* 1.

There is nothing said of the Virtues of these Plants; and yet, from their aromatic Quality, and fragrant Smell, there seems Reason to believe, that they are not destitute of useful Properties. The eighth Species is the most fragrant, and is proper for Pains of the Colic proceeding from Acidities. The ninth is used by the Inhabitants of *Africa* in cold Diseases; for it is extremely sweet-scented, but, after the Leaf is bruised, the Smell soon vanishes. It is effectual in Obstructions of the Urine and Menses, dissolves coagulated Blood, and kills Worms.

COMA is the Hair of the Head: Whence

COMÆ imports the Tops of Plants, or the Leaves of Trees. *Raii Hist. Plant.*

COMARUS *Theophrasti.* See ARBUTUS.

COMBUSTIO, in Chymistry, imports Burning, one Sort of Calcination.

COMEDONES. See CRINONES.

COMETZ. Half a Drop. *Rulandus.*

COMISDI. Gum Arabic.

COMISTE, κομιστή. The Epilepsy; so call'd because People were subject to be seized with this Disease in the public Assemblies of the People, call'd *Comitia.*

COMMAGENUM, κομμαγηνόν. The Name of an Ointment mentioned by *Galen*, in his Treatise *De Compositione Med. S. L. Lib.* 2. *Cap.* 1. It is also call'd *Syriacum Unguentum.*

COMMANDUCATIO. Mastication.

COMMANSUM. The same as APOPHLEGMATISMUS. *Blancard.*

COMMELINA. A Plant so call'd by Father *Plumier*, by way of Compliment to Dr. *Commeline*, a famous Professor of Botany at *Amsterdam.*

The Characters are,

The Leaves are produced alternately, and surround the Stalks at their Base, being in Shape somewhat like the Ephemeron: The Stalks trail upon the Ground, and grow very branchy: At the setting on of the Branches, between the Wing of the Leaf and the Stalk, is produced a Flower, which consists of two Leaves, which are placed in the Form of two Wings, much after the Manner of the Butterfly-flowers: From the upper Part of the Flower are produc'd three short Stamina, (or Threads) upon which are fastened yellow Apices, which resemble the Head of a Mushroom: In the under Part of the Flower are produced three other Male Stamina, which are thicker and longer than the others: The Ovary is produced in the Centre of the Flower, which is extended into a long intorted Tube, and becomes an oblong Fruit, divided into two Cells, in each of which is contained one oblong Seed. *Miller's Dictionary, Vol.* 1.

Boerhaave mentions but one Species of this Plant, which is

Commelina; graminea; latifolia; flore cœruleo. *Phim. N. G. Pl.* 48. *Ephemerum, Africanum, annuum, flore bipetalo.* H. L. BROAD GRASS-LEAV'D COMMELINE, WITH BLUE FLOWERS. *Boerh. Ind. alt. Vol.* 1.

There are no Medicinal Virtues attributed to this Plant, that I can find.

COMMI, κόμμι. Gum. When alone, and without any Epithet, it implies Gum Arabic. The κόμμι λευκὸν mention'd by *Hippocrates*, in his second Book *De Morbis Mulierum*, is the same Gum. See GUMMI.

COMMINUTIO. Comminution. The Reduction of a solid Body into finer Particles by any means whatever.

COMMISSURA. Juncture, Joint, or Articulation.

COMMOSIS, κόμμωσις. The first Stratum of gummy Matter, with which Bees line their Hives.

COMMOSIS also imports that Art which is employed in concealing natural Imperfections, with respect to Beauty. This Authors distinguish from the Cosmetic Art, as this last consists in preserving the Beauty which is natural.

COMMUNICANTES FEBRES, according to *Bellini*, are two Fevers, which infest a Person at one and the same time, the Paroxysm of one beginning immediately after the Paroxysm of the other ceases.

COMPASSIO. Compassion, in Nosology, is the Suffering of one Part, on account of an Affection of some other Part. This is call'd suffering by Consent.

COMPEPER, κομπέπερ. A Name in *Myrepsus* for Cubebs. They are call'd by *Actuarius, Compeba*, κομπέβα.

COMPLEXIO. A Constitution or Temperament.

COMPLEXUS. Complex, or complicated.

COMPLEXUS MUSCULUS. There are two Pair of Muscles call'd by this Name. The first is term'd, simply,

COMPLEXUS.

This is a pretty long and broad Muscle, lying on the posterior lateral Part of the Neck, all the Way to the Occiput. It is complicated by reason of the Decussations of its different Portions, from which it has its Name, but is commonly look'd upon to be one Muscle.

It is fixed below by small short Tendons to the transverse Apophyses of all the Vertebræ of the Neck, except the first, to which it is fixed only near the Root of its transverse Apophysis. From thence it runs up obliquely backward, crossing under the Splenius, and often communicating with it, by some Fasciculi of Fibres.

It is afterwards inserted above, by a broad fleshy Plane, in the posterior Part of the superior transverse Line of the Os Occipitis, near the Crista or Spine of that Bone. At its Insertion it joins by one Edge the Complexus of the other Side, and by the other the Splenius, which covers it a little.

Before we dissect the Splenii, we may see, in the Interstice left between their superior Portions, the two Complexi united together on the Spine of the Os Occipitis.

The other is, the

COMPLEXUS MINOR sive MASTOIDÆUS LATERALIS.

This is a long, slender, narrow, indented Muscle, lying along all the Side of the Neck up to the Ear, where it increases a little in Breadth. It is something like the *Complexus Major*, and *Vesalius* took it to be a Portion of that Muscle.

It is fixed by one Extremity in all the transverse Apophyses of the Neck, except the first, by the same Number of Digitations or Branches, mostly fleshy, and disposed obliquely.

From thence it ascends, and, having reached above the transverse Apophysis of the first Vertebræ, it forms a small broad Plane, by which it is inserted in the posterior Part of the Apophysis Mastoidæus. It is here covered by the Splenius, and covers a little the Obliquus superior.

This Muscle is often mistaken for a Portion of the Longissimus Dorsi. *Winslow's Anatomy.*

COMPLICATIO MORBI. A Complication of Diseases. Diseases are said to be complicated, when two or more subsist at once in the same Subject.

COMPOSITI MORBI. Compound Diseases. The same as complicated.

COMPOSITA MEDICAMENTA. Compound Medicines, which consist of many Ingredients; they are thus call'd by way of Distinction from simple Medicines, which contain only one Ingredient.

COMPREHENSIO. The same as CATALEPSIS.

COMPRESSÆ. Compresses, in Surgery, are folded Pieces of Linen Cloth, contrived to make a gentle Pressure upon any particular Part. Their Forms and Uses are specify'd under the Articles of Disorders and Operations where they are employ'd.

COMPUNCTIO. The same as PARACENTESIS, which see.

CONARIUM. The Glandula Pinealis, so call'd from its Form.

CONCAVATIO. The same as ARCUATIO, which see.

CONCAUSSA. A Cause which co-operates with another in the Production of a Disease.

CONCENTRANTIA. Absorbents of Acids are sometimes call'd by this Name.

CONCENTRATIO. This signifies that Operation, by which the most active Parts of any Liquor, and those from which it derives its principal Qualities, are collected together, and

and ſeparated from the other Parts, which dilute and render them weaker. When, for Inſtance, ſpirituous, oleous, and ſaline Liquors, being expoſed to the Cold, have their aqueous Parts congeal'd; whilſt their ſpirituous, oleous, and ſaline Parts, being free from the Congelation, become more pure, and free from the aqueous Parts before mix'd with them. Becauſe the aqueous Parts are thus ſeparated, Concentration may properly be ſaid to be a Species of Dephlegmation. It is alſo call'd Concentration, when, by an Addition of earthy, dry, and abſorbent Subſtances, the Acid of any Liquor is attracted and imbib'd; whilſt the aqueous Parts are left, and the Acid, as it were, convey'd to another Body. The Uſe of this Species of Concentration is obvious, in Caſes where Acidities are to be ſubdued or corrected: Hence Abſorbents are call'd concentrating Medicines. To this belongs that Species of *Concentration*, in which, by an Acid, any Body is corroded, and remains combin'd with it. Thus Vinegar, combined with, and then diſtil'd from Verdegriſe, is much ſtronger than it was before, and, for that Reaſon, is call'd concentrated. There is another Species of Concentration, which is, when alcaline Salts are ſaturated with acid Spirits, which are ſo retain'd in them, that both, in Conjunction, conſtitute neither an Acid, nor an Alcaline, but a neutral Salt. The Uſe of this Species of Concentration is obvious, that is, to procure neutral Salts. Laſtly, Concentration, in an extenſive Senſe, denotes an Union or Combination of a Spirit, a Salt, or a Sulphur, with any Body. Thus, in ſublimate Mercury, which is form'd of Quick-ſilver and the Acid of Sea-ſalt, united together, the Spirit of Salt is ſaid to be concentrated.

CONCEPTIO, Conception. See GENERATIO.

CONCEPTUS. The very firſt Rudiments of the Fœtus in the Uterus after Conception.

CONCHA.

The *Concha* of the *Latins*, the κόγχη and κόγχος of the *Greeks*, correſponds to what, in *Engliſh*, we call a *Shell-animal*. Among ſome Authors, the Word *Concha* ſometimes denotes the Whole of a teſtaceous Animal, and ſometimes only its Shell; ſometimes this Word is reſtrain'd to Fiſhes with two Shells. In the laſt Signification, *Concha* imports every teſtaceous aquatic Animal with two concave Shells, whether large or ſmall, ſo join'd by a kind of natural Hinge, that they may ſhut and open. This Genus comprehends many Species under it. As for the Natural Hiſtory of this Animal, it is to be found in the *Memoires de l' Academie Royale des Sciences*, for the Years 1706. 1710. and in the *Spectacle de la Nature*, T. 1. The Diſeaſes moſt generally found incident to Shell-fiſh are, firſt, in ſuch of them as are old, Moſs adhering to the outer Part of the Shell, like that which generally adheres to Stones, which, penetrating the Shell, makes way for the Water, and proves fatal to the Animal. Secondly, Sea-weeds adhering to the external Surface of the Shell, and to Stones or Rocks at the ſame time, retard the progreſſive Motion of the Animal. Thirdly, a Species of Itch, or Tubercules, ariſing on the internal Surface, which, increaſing, produce an Exfoliation of the Shell. Fourthly, a Diſſolution of the Shell, which gradually becomes ſofter and ſofter. We muſt here obſerve, in general, that Sea Shell-fiſhes are eatable, when boil'd and dreſs'd with a Sauce, according to every one's Taſte; but they are of difficult Digeſtion, and of an alcaleſcent Nature. The Oyſter is alſo eaten crude. In Medicine, the Shells of theſe Fiſh are found to be drying, abſorbent, correcting, and precipitating; for which Purpoſes, thoſe beat to a fine Powder are preferable to thoſe levigated on a Marble with Water, which are commonly call'd *Conchæ præparatæ*. What are uſually kept in the Shops, under this Title, are the Shells of Muſcles, and are recommended for exciting a Diaphoreſis in intermitting Fevers, if a Scruple, or half a Dram, is exhibited, about an Hour before the Paroxyſm, in Carduus-water, or that of the leſſer Centaury; ordering the Patient, at the ſame time, to be kept warm, in order to encourage a Diaphoreſis. But, when the Shells are calcined, they become Lime, and do not abſorb and correct, but ſtimulate and reſolve, in conſequence of the Acrimony they have acquired by Calcination. In this Caſe they are ſo far from correcting the Acrimony of the Juices, that they rather increaſe the Heat of the Stomach and Fauces.

Olaus Wormius, in his *Muſeum*, informs us, that the Aſhes of Shell-fiſh are poſſeſs'd of a cauſtic Quality; that they are recommended againſt Leproſies, Freckles, and Spots of the Skin; that, when they are previouſly waſh'd, like Lime, they cure Ulcers, and Eruptions on the Head; and that, in the *Netherlands*, they are uſed as a Cure for the Hæmorrhoids. *Pliny*, in the ſeventh Chapter of his thirty-ſecond Book, deſcribes their detergent Quality in the following Words: "The "Aſhes of the Shells of Fiſh, if uſed by way of Ointment, "with Honey, remove Spots in the Faces of Women in ſeven "Days time, render the Skin ſmooth, and, on the eighth, "the Part is to be anointed with the Whites of Eggs." There are various Species of Shell-fiſhes deſcrib'd by Naturaliſts, ſuch as the

CONCHA ANATIFERA, ſo call'd, becauſe 'tis fabulouſly reported, that a Species of Bird, of the Duck-kind, is form'd in it.

CONCHA ERYTHRÆA. See CONCHA VENERIS.

Concha Lævigatoria, or *Lævigata*. A Shell-fiſh of an oval Form, with a very ſmooth Shell, uſed by the *Egyptians* in ſmoothing their Linen, and by the *Greeks* and *Turks* in poliſhing their Papers.

CONCHA FOSSILIS, or LAPIDEA. See CONCHITES.

CONCHA MARGARITIFERA. This may be apply'd to every Shell-fiſh, from which Pearls are obtain'd; but, becauſe the beſt Pearls are generally found in the *Indies*, it is confined, for the moſt part, to the *Concha Indica magna*, whoſe Shells are moderately hollow, thick, and, externally, ſomewhat yellowiſh, rough, and uneven, but not ſtriated; internally they are ſmooth, and ſhine like Pearls. The Animal contain'd in this Shell is ſometimes eaten raw by the *Indians*, and ſometimes broil'd. It is ſaid to be ſweet and grateful to the Taſte. It is a Species of Oyſter, found principally in the *Perſian* Sea. The Shell of this Fiſh is the *Mater Parlarum* of the Shops, which ſee.

CONCHA PERSICA. A Shell-fiſh ſo call'd from the *Perſian* Sea, in which 'tis produced. *Aldrovandus* claſſes it among the univalve, but *Bonannus* more juſtly among the bivalve Fiſhes.

CONCHA PICTORUM, ſo call'd, not from its being uſed in mixing or containing the Colours of Painters, but from the Shell being raſp'd down for mixing up Colours, as an Ingredient.

CONCHA SAXATILIS. See CONCHITES.

CONCHA VENEREA, or VENERIS. This is what we call *Venus*'s Shell. It is a Fiſh, whoſe Shell is univalve, wreath'd, and has a ſmall longitudinal and denticulated Chink or Aperture in it. It is alſo call'd *Concha Porcellana*, from its Aperture in ſome meaſure reſembling the Mouth of a Hog; and *Concha Erythræa*, from its being found in the *Red Sea*, which is call'd *Erythræum*. It is alſo call'd *Concha Cytheriaca*, from *Venus*, who received the Epithet *Cytheræa* from *Cythera*, a *Grecian* Iſland. That this Species of Shell-fiſh was uſed by the Antients as an Aliment, we read in *Seneca*, *Epiſt.* 95. *Mundius* aſſerts, that they prove a Stimulus to Venery, and provoke Urine. *Rondeletius* informs us, that theſe Shells are an Ingredient in the *Pilulæ de Bdellio*, for removing Fluxes, and curing Ulcers of the Uterus. But, inſtead of the *Concha Venerea*, Apothecaries generally uſe Cockles. Excellent Dentifrices are prepared from this Species of Shell; which is alſo uſeful for curing Ulcers in the Canthus of the Eye, and the Fiſtula Lachrymalis. It is remarkably drying, without exciting any Heat. *Wormius* informs us, that he has heard Spoons of theſe Shells highly commended for curing the Chin-cough in Children, if they ſup Broths, or other proper Fluids, with them. The Powder of theſe Shells muſt be own'd to poſſeſs an abſorbent drying Quality; but that, on account of their Beauty, or any other Circumſtance, their Powder is preferable to that of other Shells, is by no means probable.

CONCHA, κόγχη. This was a ſort of liquid Meaſure among the *Athenians*, which contain'd two Myſtra, or half an Ounce. As much Oil as it was capable of holding, weigh'd five Drams one Scruple and twenty Grains, according to *Gorr. Defin. Pitiſci Lex. & Eiſenſchom.* Others think, that the *Concha* contain'd three Spoonfuls, ninety-ſix of which fill'd a Pint-veſſel (Sextarius); a Sextarius was, therefore, equivalent to thirty-two Conchæ, and ſix Sextarii made one Congius, a Meaſure equal to our three Quarts, according to *Salmaſ. Exerc. Plinian.* and *Bodæus, in Theophraſt.* According to *Fernelius*, the Concha was equivalent to two Myſtra, or five Spoonfuls; which, according to *Jacobus Sylvius*, are equivalent to ſix Drams. According to *Galen*, in his Work *de Ponderibus & Menſuris, Cap.* 11. the *Concha magna* contain'd the ſame Quantity with the Acetabulum, which, in liquid Meaſure, was an Ounce and an half, and, in Weight, fifteen Drams. The *Concha minor* was, in liquid Meaſure, half an Ounce, and, in Weight, five Drams.

CONCHARUM ANTIFEBRILE. This Medicine is in the *Pharmacop. Bateana*, and directed to be prepared in the following manner:

Pour Vinegar upon Muſcle-ſhells, and macerate them for twenty-four Hours. Wipe off the external Mucus; dry and reduce them to a Powder; during which Operation add a Spoonful of Carduus-water, to prevent the Flying-off of the volatile Part of the Powder. The Doſe is one Dram. This is an excellent Febrifuge, and powerfully promotes a Diaphoreſis.

CONCHIS. This, among the *Romans*, was a Name given to the entire Bean, wrapt up in its Capſula or Follicule. Tho' it was principally uſed as an Aliment by the poorer Sort, yet, according to *Apicius de Opſoniis & Condimentis*, it is a delicate Food, much eſteem'd by the Luxurious, when boil'd with aromatic Subſtances.

CONCHITES.

CONCHITES. This is alſo call'd *Concha Foſſilis*, *Lapidea*, and *Saxatilis*, and, in *Engliſh*, *Cockle-ſtone*. It is a Stone, in Figure, reſembling a certain Shell-fiſh.

CONCHOIDES. This, according to *Breynius*, in his *Diſſertatio de Polythalamiis*, is a Species of Shell-fiſh, whoſe Shell is bivalve, and is at the ſame time made up of ſmaller teſtaceous Portions.

CONCHYLIA, κογχύλια, and ὀστρακοδέρματα, are what, in *Engliſh*, we call Shell-fiſh. Theſe are Animals without Feet, incloſed in a hard, friable, and kind of ſtony Covering, ſometimes more, and ſometimes leſs thick, ſmooth, and even within, to which they adhere, and are join'd by muſcular Ligaments. The ſeveral Species of theſe Animals, the Methods of their Production and Nouriſhment, together with the ſeveral Particulars relating to their Natural Hiſtory, are to be found in *Hebenſtreit's Diſſertatio de Ordinibus Conchyliorum*, in *Wormius's Muſeum*, in *Rondeletius's Hiſtoria Piſcium*, and in the Works of *Paliſſy*, *Bellonius*, *Liſter*, *Leeuwenhoek*, *Helmont*, *Bonannus*, *Cyprianus*, and others, who have been induſtrious in enriching Natural Hiſtory with their Obſervations.

With reſpect to the Uſe of Shell-fiſh as an Aliment, we may obſerve, in general, that the Antients, eſpecially the *Romans*, look'd upon them as an uncommon Delicacy. Hence we read, in *Athenæus*, *L.* 3. *C.* 9. that they were uſed in the rich and delicate Entertainments of Widows. The *Romans* fed Shell-ſnails for the Purpoſes of Luxury; and *Pliny*, in the 34th Chapter of his ninth Book, does not ſcruple to affirm, that the Uſe of Shell-fiſh was a very conſiderable Source of Luxury, and Depravity of Manners: And, in the 57th Chapter of his eighth Book, he informs us, that *Marcus Scaurus*, during his Conſulſhip, prohibited the Uſe of Shell-fiſh for Supper. The Juice of Sea Shell-fiſh is certainly poſſeſs'd of a ſtimulating Quality, and proves a powerful Incentive to Venery, eſpecially when prepared with Aromatics. But as Shell-fiſh were the Incentives to Luxury and Luſt, among the more civiliz'd and delicate Nations; ſo they were the neceſſary Food and Aliment of ſome of the more barbarous Countries. Thus *Strabo*, in his 16th Book, gives us an Account of ſome People in *Aſia*, who, putting Shell-fiſh into a Pit in the Sea, fed them with ſmall Fiſh, and uſed them when the other Fiſhes, on which they lived, were ſcarce. And *Diodorus Siculus*, in *Lib.* 3. *Cap.* 16. tells us, that ſome *Ethiopians*, when labouring under a Penury of Aliments, gather large Shell-fiſh, whoſe Shells they break with Stones, and whoſe Fleſh, which taſtes like that of Oyſters, they eat raw. *Sprat*, in his Hiſtory of the Royal Society, informs us, that the *Indians*, about the Iſland *Java*, eat large Shell-fiſh pickled in Brine, as hard as a Piece of Horn, and whoſe Taſte reſembles that of the Fleſh of a wild Boar. *Celſus*, in the 18th Chapter of his ſecond Book, affirms, that Shell-fiſh nouriſh but little: And *Hippocrates*, in his Book *de Diæta*, *L.* 3. aſſerts, that they are dry, but their Juice renders the Body ſoluble; that Muſcles, Cockles, and Limpins, paſs more eaſily off by Stool than the other Species; and that Muſcles alſo excite a Diſcharge of the Urine. *Diocles Caryſtius*, according to *Athenæus*, *L.* 3. *Cap.* 9. informs us, that Muſcles, Cockles, Baſtard-cockles, and Oyſters, are more efficacious in rendering the Body ſoluble, and exciting a Diſcharge of Urine, than other Shell-fiſhes. *Horace* was no Stranger to this Quality of Shell-fiſhes; for, in *L.* 2. *Satir.* 4. *V.* 27. he gives the following Advice:

> ---------- *ſi dura morabitur Alvus,*
> *Mitulus & viles pellent obſtantia Conchæ.*

According to *Galen*, in his Work *de Alimentorum Facultat. L.* 3. *C.* 33. "All Shell-fiſhes contain a ſaline Juice, fit for "rendering the Body ſoluble. This Effect they produce in "proportion to the Quantity and Quality of their reſpective "Liquors. The Fleſh of the Oyſter is, of all others, the "ſofteſt, and conſequently the moſt purgative; but it is not "poſſeſs'd of a highly nutritive Quality. Thoſe Shell-fiſhes, "on the contrary, which are harder, are with greater Diffi-"culty concocted; but they are more nutritive, and leſs purga-"tive. From theſe a large Quantity of crude Juices are gene-"rated; whereas thoſe, whoſe Fleſh is ſoft, generate Phlegm. "Since, therefore, when they are diveſted of their ſaline Juice, "their Fleſh is with Difficulty diſſolved, and renders the "Body coſtive; ſo when they are pickled with Salt or Garum, "the Liquor yielded by them, if drank, renders the Body "ſufficiently ſoluble, but conveys no Nouriſhment to it. The "Purple-fiſh and Whelk have a harder Fleſh, and thicker "Juice, than the other Species, which are more moiſt and "viſcid, eſpecially the Oyſter." *Janus Plancus*, in his Treatiſe *de Conchis minus notis*, thinks, that in human Life, and for the Propagation of Mankind, Sea Shell-fiſhes are of ſingular Service; ſince, by uſing them as an Aliment, Conſumptions, and other formidable Diſorders, are cured. He alſo informs us, that it has been obſerved, by thoſe who make diligent Scrutinies into Nature, that the Inhabitants of the Sea-coaſts are more prolific, than thoſe who live at a Diſtance from them, on account of their eating Fiſh, eſpecially thoſe of the Shell-kind, whoſe Fibres are ſhort, fit for Digeſtion and Nouriſhment, and conſequently qualified for proving a Stimulus to Venery. Since 'tis obvious, that Shell-fiſhes do, from their own Bodies, ſeparate the Matter of which their Shells are form'd, ſome have aſſerted, that they muſt alſo contribute to the Generation of Stones in the human Body: But, as this is a Piece of Speculation, which can only be determin'd by Experience, the Reader muſt conſult the ſeveral Qualities of Shell-fiſhes under their reſpective Articles. The Antients imagined, that Shell-fiſhes increaſed and decreaſed with the Moon. Some of the Moderns have charged this Opinion with Falſhood; but others have ſtood up in Defence of it. For the Reaſons of this Phenomenon, the Reader may conſult Dr. *Mead de Imperio Solis & Lunæ*. The Shells of theſe Animals, when reduced to a Powder, are, in Medicine, uſed on account of their drying, abſorbent, correcting, and precipitating Qualities. The Virtues and Efficacy of the teſtaceous Powders, ſo much recommended by *Liſter* for aſſiſting the Concoction and Digeſtion of the Aliments, can only be underſtood of the calcined Shells; ſince, in conſequence of the Calcination, they acquire a calcareous and ſeptic Quality, by means of which they reſolve and attenuate Crudities. The learned *Kramerus* obſerves, that the Shells of terreſtrial Animals, when reduced to a Powder, are ſcarce fit for being mix'd with aqueous Vehicles, becauſe they ſwim upon them, by reaſon of the large Quantity of the animal Glue they retain; ſo that they are a very improper Succedaneum to the Shells of Shell-fiſh.

CONCHYLIA FOSSILIA. Theſe are what we call foſſile Shells, concerning which there are ſo many different Conjectures, and ſo many diſagreeing Hypotheſes, that 'tis difficult to diſcover Truth. The Curious may, however, for their Satisfaction, conſult *Morton*, *Paliſſy*, *Woodward*, *Dale*, *Ray*, and other Writers of Natural Hiſtory. Theſe are, by ſome, celebrated for their lithontriptic Virtues.

CONCIDENTIA. A Decreaſe of Bulk in the Whole, or any Part of the Body; or, the ſubſiding of a Tumor.

CONCOAGULATIO. The Coagulation, Concretion, or Cryſtallization of different Salts, firſt diſſolved together in the ſame Fluid.

CONCOCTIO. This implies much the ſame as Coctio, which ſee.

CONCRETIO. Concretion, in Chymiſtry, is the Condenſation of any fluid Subſtance into a more ſolid Maſs, importing the ſame as Coagulation.

In Surgery, Concretion is the growing together of any Parts, which ought, in the natural State, to be ſeparate. Thus there is a Concretion of the Fingers with each other; of the Nares, Eyelids, Sides of the Vagina, and of many other Parts.

CONCURSUS. See Syndrome.

CONDENSATIO, Condenſation. It implies a Contraction of the cutaneous Pores by means of refrigerating, aſtringent, or drying Remedies: Or, it imports an Inſpiſſation of any ſort of Fluid, whether in or out of the Body. Hence, *Condenſantia Medicamenta* are Medicines which condenſe or inſpiſſate the Juices.

CONDER, Frankincenſe, or Olibanum. *Rulandus.*

CONDIMENTUM.

The *Condimentum* of the *Latins*, the ὕδυσμα, the ἄρτυμα, and the ξάμυμα of the *Greeks*, import whatever procures Sweetneſs, and a grateful Taſte, to any Subſtance. Hence thoſe Ointments are called ὑδύσματα, to which Aromatics are added, in order to give them a grateful Smell: But, in a more reſtrain'd Senſe, that is called *Condimentum*, which is uſed in preparing Aliments, whether with an Intention of rendering them palatable, or aſſiſting their Digeſtion. The Uſe of theſe Seaſonings in Aliments is ſufficiently obvious; for they are neceſſary, firſt, in Caſes where a Weakneſs of the Viſcera, and a Difficulty of Digeſtion, require that the concoctive Powers of the Stomach ſhould be excited, that by this means the Body may be recruited by the Aliments uſed: Secondly, they are neceſſary when the Aliments to be taken are too hard to be eaſily brought to undergo that Change, which is abſolutely neceſſary for the Nutrition of the Perſons who take them: Thirdly, they are neceſſary in order to procure a grateful Taſte to Aliments, otherwiſe ungrateful and diſagreeable. In this laſt reſpect we muſt readily perceive, that the ſame Seaſoning does not agree with every Palate, ſince ſome are fond of what is ſweet, and others charm'd with what is bitter, whilſt a third Claſs prefer an Acid to every other Taſte. This particular Taſte may be owing either to a congenial Idioſyncraſy, or Peculiarity of Conſtitution, or it may be acquired by Cuſtom, or it may be the Reſult or Effect of ſome Diſeaſe. When, in a Weakneſs of the Viſcera, Seaſonings are requiſite, 'tis the Buſineſs of the Phyſician to judge from what Cauſe this Weakneſs proceeds: If, for Inſtance, it proceeds from too great a Relaxation, ſtimulating Aromatics, and all thoſe Medicines commonly call'd Corroboratives, are proper for removing it. If it proceeds from a quiet, ſedentary, and idle Life, the digeſtive Powers are moſt effectually roused

by muſcular Motion, and proper Exerciſe. If, on the contrary, this Weakneſs proceeds from Repletion, then Evacuants are principally beneficial; and, according to the Proverb which *Cicero*, in his Treatiſe *De Finibus*, *Lib.* 2. borrows from *Socrates*, *Hunger is the beſt Sauce*. For the other Diſorders ariſing from the Intemperature of the peccant Juices, we are to chooſe ſuch Correctors as are directly oppoſite to the particular Diſorder. Thus, for Inſtance, Diſeaſes ariſing from an alcaline Cauſe are to be removed by Subſtances of an acid and aqueous Nature; whereas thoſe proceeding from an oleous, putrid, or rancid Cauſe, are to be ſubdued by Subſtances of an aceſcent and aqueous Quality. Where the Intention is to produce a ſpeedy Change in hard, dry, and tenacious Aliments, then thoſe Subſtances are proper, which diſſolve what is tenacious, moiſten what is dry, and ſoften what is hard. According to *Boerhaave*, in his *Inſtitut. Medic. Sect.* 54. Salt, Vinegar, Aromatics, and oleous Subſtances, are the principal Materials of which Seaſonings conſiſt. *Diocles*, as the Ingredients of Seaſonings, recommended Rue, Cumin, Coriander, Origanum, Savory, Thyme, Salt, Vinegar, Oil, Cheeſe, Silphium, and Seſamum. This is an Inſtance of the antient *Greek* Simplicity, before their Trade with *Alexandria* paved a Way for the Importation of foreign Aromatics. According to *Salmaſius*, in his *Exercitat. Plinianæ*, Salts were the moſt important of the dry Seaſonings; whereas Vinegar and Oil were the principal among the liquid Kind, which were properly called βάμματα, and ἐμβάμματα; and, according to the different Subſtances with which they were mixed, γαρίλαιον and ὀξύγαρον. From what has been ſaid 'tis obvious, that Seaſonings are intended either to aſſiſt Nature, or gratify the Palate; tho' they are often perverted to the worſt of Purpoſes, and uſed as Incentives to Gluttony. According to *Boerhaave*, Seaſonings of the acid, ſaline, and aromatic Kind are hurtful to ſound Conſtitutions by their noxious Acrimony, prove offenſive to the capillary Veſſels, and, by exciting a falſe Appetite by their Stimulus, load and oppreſs the Body, rather than nouriſh it. On the contrary, pinguious and oleous Subſtances, uſed too liberally, prove deſtructive of Health, by lubricating, relaxing, and debilitating the Solids. Upon the whole, the beſt Seaſoning for Aliments is Hunger, whereas that moſt proper for Drink is Thirſt.

CONDIRE ſignifies either to preſerve with Sugar or Honey, or to pickle with Vinegar or Brine.

CONDITIO. The Condition, State, or Conſtitution of a Patient. *Paracelſus* ſpeaks of *Condition* as relative to one Quality only, as Cold or Heat; whereas Complexion, or Temperament, according to him, conſiſts in a Mixture of Qualities.

CONDITUM. The *Latins*, and lower *Greeks*, underſtood by *Conditum*, or κονδίτον, a Sort of Mulſum, that is, a Wine impregnated with Honey and Aromatics, eſpecially Pepper, a Sort of Metheglin. *Meibomius* takes it for the *Claretum*, or *Vinum Hippocraticum*. But *Conditum*, in the modern Shops, imports what we call *Preſerves*. The principal Uſes of Preſerves in Medicine are, to render nauſeous Remedies more agreeable to the Palate, when mix'd therewith; or to take after diſagreeable Phyſic, in order to remove the Remains of the Taſte. But no great Dependence is had on their Medicinal Virtues. Some, however, are aſtringent, as that of Quinces; and others cooling, as that of Berberies; and, in general, their Virtues may be known by thoſe of the Vegetable preſerv'd.

As this Subject belongs more to the Province of Confectioners or Cooks than Phyſicians, I ſhall only add farther, what the College of Phyſicians have thought proper to direct, in the *London Diſpenſatory*, relative to *Preſerves*.

PRESERVES *of* ROOTS, STALKS, PEELS, FLOWERS, FRUITS, *and* PULPS, *as directed by the College.*

Take of the Roots of Eryngo, any Quantity; let them be cleanſed externally and internally, by taking out the Pith.

Then ſteep them for a Day or too in clear Water, now-and-then ſhifted, and afterwards be rub'd dry with a clean Linen Cloth.

Afterwards take an equal Quantity of Sugar; diſſolve it in a ſufficient Quantity of Roſe-water over the Fire, and ſcum it till it is almoſt of the Conſiſtence of a Syrup; then put in the Roots, and continue it upon the Fire till all ſuperfluous Humidity is evaporated, and it comes up to the Conſiſtence of a Syrup.

The ſame way likewiſe are preſerved the Roots of Angelica, Elecampane, Satyrion, the greater Comfrey, Ginger, and Zedoary.

The ſame way likewiſe are managed the Stalks of Angelica, and others, gathered before too long a Growth.

Take of the freſh Peels of Oranges, any Quantity; ſeparate the outer yellow Peel, and, after three Days Maceration, at leaſt, in Spring-water, frequently ſhifted, put them into Sugar, ordered and boiled as before, ſo that they may be made into a Preſerve, according to Art.

Conformably hereunto are managed the Peels of Citrons and Lemons.

Take of the Flowers of Citrons, as much as you pleaſe; and preſerve them in Sugar, as above directed.

After the ſame Manner Orange-flowers are to be manag'd.

Take of as many Apricots as you pleaſe; pare them, take out their Stones, and put them into an equal Quantity of the fineſt Sugar.

After four Hours take them out again; and, boiling the Sugar without the Addition of any new Liquor, put them in, and ſimmer them together, according to Art.

After the ſame manner, or not much unlike it, are prepared the Fruits of Berberies, Cherries, wild Cherries, Citrons, Quinces, Peaches, common Apples, the five Kinds of Myrobalans, Walnuts, Nutmegs, Raiſins, Pepper in Bunches from *India*, Garden and wild Plums, Pears, and Grapes.

The Pulps alſo are preſerved of Berberies, of the ſolutive Caſſia, or Fruit of the Pudding-pipe-tree, of Citrons, Quinces, Sloes, and others.

Take of Berberies, as much as you pleaſe; boil them in a ſufficient Quantity of Spring-water, till they are tender; then pulp them thro' a Hair Sieve, with a Wooden Peſtil made on purpoſe. Afterwards boil the Pulp in an Earthen Pan over a gentle Fire, ſtirring it frequently for fear of burning, till the watery Part is evaporated; and to ſix Pounds of ſuch Pulp put ten Pounds of Sugar, and boil up together to a due Conſiſtence.

There alſo are ſaid to be preſerved, or pickled, though with Brine and Vinegar, the Buds of Broom, Capers, Olives, and others.

Laſtly, are alſo preſerved the Bark of Cinnamon, the Flowers of Marygold, Almonds, Cloves, Pine and Piſtachio-nuts, and others, as likewiſe Seeds and Buds; but theſe are managed in another manner, and, for the moſt part, incruſted with Sugar dry; and therefore they are more properly call'd Candies, or Confections. *London Diſpenſatory.*

The *Diacydonium* is properly a Confection of Quinces, being the ſame as Marmalade. See CYDONIA.

CONDITURA. The ſame as *Condimentum*. It ſignifies alſo the ſame as BALSAMATIO, or the Embalming of dead Bodies, or any Parts thereof.

CONDRILLA. See CHONDRILLA.

CONDUCTIO, in *Cœlius Aurelianus*, is a Spaſm or Convulſion.

CONDUCTOR. A Chirurgical Inſtrument uſed in Lithotomy. See *Tab.* 49. *Fig.* 2, 3, and 4. It is call'd a Gorget. See LITHOTOMIA.

There are other Inſtruments call'd by this Name, which are uſed for directing the Knife in laying open Sinuſes or Fiſtulas.

CONDURDUM. A Plant mention'd by *Pliny*, *Lib.* 26. *Cap.* 5. which he alſo calls *Herba Solſtitialis Flore rubro*. This, he informs us, if hung about the Neck, repreſſes ſtrumous Swellings. *Parkinſon* takes it for the *Vaccaria*, which, in *Boerhaave's Index alt.* is call'd *Lychnis*; *ſegetum*; *rubra*; *foliis Perfoliatæ*.

CONDYLOMA, κονδύλωμα, from its Reſemblance to a *Condylus*, κόνδυλος, a Joint or Tubercle. It is a Tubercle, or callous Eminence, which ariſes in the Folds of the Anus, or rather a Swelling and Hardening of the Wrinkles of that Part. Theſe Tumors frequently happen about the Orifices of the Uterus and other Parts. See ANUS.

CONDYLUS, κόνδυλος. A Condyle, that is, a Knot in any of the Joints, form'd by the Epiphyſis of a Bone. In the Fingers it is call'd a Knuckle. In Botany it ſignifies the Joints of Plants.

CONEION, κώνειον. In *Hippocrates* it imports the *Cicuta*, Hemlock; but he only ſpeaks of it as an external Remedy. It is ſaid to be call'd by this Name from κωνᾶν, to turn round, becauſe it produces a Vertigo in thoſe who take it internally.

CONESSI. A Sort of Bark, of which I find the ſubſequent Account in the *Edinburgh Medical Eſſays*, in a Letter to Mr. *Monro*.

The Tree, of which I gave you ſome of the Bark as a Specific in Diarrhœas, grows on the *Cormandel* Coaſt in the *Eaſt Indies*, where it is called *Coneſſi*, and is not unlike the *Cadoga pala* of the *Hortus Malabaricus*. The *Coneſſi-ſoca*, or Coneſſi Bark of the ſmall young Branches of the Tree which has leaſt Moſs, or external inſipid Scurf on it, is to be choſen, and all that Scurf is to be ſcraped off.

The clean Bark, being pounded into a very fine Powder, is made into an Electuary with Syrup of Oranges, and taken to the Quantity of half a Dram or more, four times a Day, for three or four Days. The firſt Day it increaſes the Number and Quantity of the Stools, but without increaſing the Gripes.

The ſecond Day the Bark is taken, the Colour of the Stools is mended; and on the third or fourth Day their Conſiſtence generally comes near to a natural State, when it ſucceeds at all.

In recent Diarrhœas, ariſing from Irregularities in Diet, without a Fever, this Medicine ſeldom fails to make a Cure, if a Vomit of Ipecacuanha is given immediately before the Patient begins the Uſe of the Bark. The ſame Management alſo is attended commonly with Succeſs in Perſons of a lax Habit of Body, who are troubled with an habitual Diarrhœa in moiſt rainy Weather, a remarkable Itching in the Skin being felt on the third or fourth Day. To ſuch Patients, eſpecially, the Electuary ought to be given Morning and Evening, for ſome time after they are ſeemingly cured. Their Drink ſhould be Water wherein Rice hath been boiled; and ſometimes Emulſions of the cold Seeds, with Sal Prunellæ, are neceſſary.

If there is a Fever with the Looſeneſs, that muſt be remov'd by Bleedings and cool Emulſions, or the white Decoction with Sal Prunellæ, before the Coneſſi Bark is given.

Sometimes, when the Cauſe of a Diarrhœa, ſtopt by this Medicine, lies beyond the inteſtinal Canal, the Patient, in a few Days after, complains of a Pain in the Right Hypochondrium, or in the Right Shoulder, or over the Stomach towards the Left Side, cauſing often a dull Senſe of Pain, near or above the Left Clavicle, with a feveriſh Pulſe. As ſoon as theſe Symptoms appear, the Patient muſt be blooded, and his Blood will be fizy, or with a tough yelloviſh Cruſt on the Top, when it has coagulated. The Quantity of Blood to be taken away, and the repeating the Veneſection, muſt be determin'd by the Patient's Strength, the Degree of Fever, and Sharpneſs of his Pain. In ſuch Caſes, however, the Bleeding ſeldom removes the Pain entirely; but, after the Fever is brought ſufficiently down by the Loſs of Blood, I have ſeldom miſs'd to complete the Cure, by giving Mercurius Dulcis, or rather Calomel, for ſome Days, in ſmall Quantities, as an Alterative. I ought to obſerve, that the Bark ſhould be freſh powder'd, and the Electuary new made, every Day, or ſecond Day; otherwiſe the Bark loſes its auſtere, but grateful Bitterneſs on the Palate, and its proper Effects on the Inteſtines.

CONFECTA. Comfits, or Sugar-plums; Seeds, or other Subſtances, incruſted with Sugar. Theſe are ſometimes impregnated with cathartic Ingredients, as a Temptation to froward Children. See CONFECTIO.

CONFECTIO. A Confection, in general, ſignifies any thing prepared with Sugar. See *Wedelius's Pharmacia acroamatica*. In particular, it imports the ſame as CONDITUM, "ſomething preſerved," eſpecially dry Subſtances; and is otherwiſe call'd *Confectio ſolida*, "a ſolid Confection." This is either *ſimple* or *compound*, call'd alſo *Medicinal*: Solid, ſaccharine, *ſimple* Confections, as we are taught by *Zwelfer*, in his *Pharmacopœia Regia*, are prepared after the following Manner:

The Sugar, being firſt well clarify'd with pure Water, and the White of an Egg, is boil'd to a Conſiſtence a little thicker than that of a Syrup. Then the Thing which is to be preſerv'd, or incruſted with Sugar, for Inſtance, Cinnamon, Almonds, Aniſeeds, and the like, are put into a large Copper-veſſel, flat-bottom'd, not deep, which is plac'd upon a very gentle Fire, and when it is moderately heated, together with its Contents, the Artiſt ſprinkles ſome of the liquid Sugar, before prepar'd, ſomewhat warm, upon the Things in the Veſſel, juſt enough to moiſten them, and immediately ſtirs them to and fro, ſhakes them, rubs them in his Hands, and toſſes the Veſſel after an artificial manner, in order to prevent the Seeds, or whatever elſe it be, from cluſtering or ſticking together. Then they are to be totally dried by a gentle Coal Fire under the Veſſel. After this as much diſſolv'd Sugar is to be added to the Thing as is ſufficient to moiſten it moderately, and, continuing the Agitation, Commotion, and Rubbing with the Hands, it is to be dry'd. This Operation is to be repeated, moiſtening and drying the Materials by turns, till they are ſufficiently covered with Sugar.

This is the Method of preparing Confections with pure Sugar, without any Adulteration; but, that Confectioners may prepare them with greater Eaſe, and be able to ſell them at a lower Rate, they add Starch to the diſſolv'd Sugar, with which they moiſten them; by which means they not only dry them ſooner, but alſo render them ſufficiently large, at a leſs Expence than otherwiſe they could do. *Helmont*, without Exception, condemns all the Confections of the Shops, not only as inſignificant and trifling, but alſo pernicious and hurtful Medicines. *Ettmuller* declares himſelf of the ſame Opinion, and affirms, that Confections are prejudicial to moſt Patients, eſpecially thoſe labouring under hypochondriacal Diſorders. The Word *Confection* alſo ſignifies a liquid or ſoft Electuary.

There are various Sorts of Confections directed in *Diſpenſatories*; but thoſe ordered in the *London Diſpenſatory* are the following.

CONFECTIO ALCHERMES. See ALKERMES.

CONFECTIO ARCHIGENIS.

The CONFECTION *of* ARCHIGENES.

Take of the beſt Caſtor, of long and black Pepper, Styrax, Spikenard, Coſtus, Galbanum, and Opium, of each half an Ounce; of Saffron, two Drams; of Syrup of Mugwort, a ſufficient Quantity to make the Whole into a Confection.

This hath not been received into any *Diſpenſatory* of the College before the laſt Reformation of it. It is originally a Preſcription of *Meſue, de Tuſſi Humida*, and is in *pag.* 30. of the *Venice* Edition in 1549. It is from thence inſerted into the *Auguſtan Diſpenſatory*, exactly as it ſtands here, unleſs in the Subſtitution of the Syrup of Mugwort for Honey; and is there recommended for Diſtempers of the Breaſt, as alſo in nervous Diſorders; and theſe Intentions it ſeems very well accommodated to. *Zwelfer*, in his Animadverſions upon it, ſays, great Care is to be taken in its Compoſition, notwithſtanding it conſiſts but of few Ingredients; but it ſeems to require no other Skill than is required in the Compoſition of the Capitals, that is, diſſolving and ſtraining the Gums and Opium, ſo as to incorporate them with the Syrup, and then to ſift and ſtir in the reſt of the Ingredients, finely powder'd, together. Its Doſe is from one Scruple to one Dram, to be repeated as Occaſion requires.

CONFECTIO FRACASTORII. See DIASCORDIUM.

CONFECTIO HAMECH.

The CONFECTION *of* HAMECH.

Take of the Barks of yellow Myrobalans, two Ounces; of the Chebulan and black Myrobalans, of Violets, Pulp of Colocynth, and Polypody of the Oak, of each one Ounce and a half; of Wormwood and Thyme, of each half an Ounce; of the Seeds of Aniſe and Fennel, and of red Roſes, of each three Drams. Bruiſe all theſe, and macerate them together for a whole Day in ſix Pounds of Whey; then boil to half its Conſumption, and to the ſtrain'd Liquor, after it has been preſſed out, add of the Juices of Fumitory, of the Pulps of Prunes and Raiſins, of each half a Pound; of white Sugar, and clarify'd Honey, of each one Pound. Boil theſe to the Conſiſtence of Honey; ſprinkling in, at the latter End, powder'd, of the Troches of Agaric, and the Leaves of Sena, of each two Ounces; of Rhubarb, one Ounce and a half; of Epithymum, one Ounce; of Diagrydium, ſix Drams; of Cinnamon; half an Ounce; of Ginger, two Drams; of the Seeds of Fumitory and Aniſe, and of Spikenard, of each one Dram; and make them all together into a Confection. S. A.

This is a very antient *Arabian* Compoſition, and firſt preſcrib'd by *Meſue*, tho' ſince alter'd by *Fernelius*. It is continu'd here much the ſame as in the *Auguſtan Diſpenſatory*, and as it was firſt receiv'd by the College: But it is ſo nauſeous as ſeldom to be preſcrib'd but in Glyſters, and not often in that manner, ſo that the Shops have of late not been much accuſtom'd to make it.

In every Ounce of this Confection are contain'd ſeven Grains and a half of Diagrydium, a Scruple of Sena and Agaric, half a Scruple of Epithymum, and the Decoction of fifteen Grains of Colocynth.

CONFECTIO RALEIGHANA: *Sir* Walter Raleigh's *Confection.*

Take of the Shavings of Hartſhorn, one Pound; of Vipers Fleſh, with their Hearts and Livers, ſix Ounces; of the Flowers of Borrage, Roſemary, Marygolds, Sun-dew, red Roſes, and Elder, of each half a Pound; of the Leaves of Scordium, Carduus Benedictus, Baum, *Cretic* Dittany, Mint, Marjoram, Betony, of each twelve Handfuls; of the Juice of Kermes, of the greater Cardamom-ſeeds, and Cubebs, of Juniper-berries, Mace, Nutmegs, Cloves, and Saffron, of each two Ounces; of the beſt Cinnamon, Saſſafras-bark, and the yellow Peel of Citrons and Oranges, of each three Ounces; of Aloes-wood, and Saſſafras-wood, of each ſix Ounces; of the Roots of Angelica, wild Valerian, Fraxinella, or white Dittany, *Virginia* Snake-root, Zedoary, Tormentil, Biſtort, long and round Birthwort, Gentian, and Maſterwort, of each one Ounce and a half. After theſe are all cut, and groſly bruiſed, put them into a proper Veſſel, to draw out their Tincture, with rectified Spirit of Wine, according to Art. Filtre this Tincture, and evaporate it into an Extract by Diſtillation in *Balneo Mariæ*. Let the Magma, which is preſs'd out, be burnt, and a Lixivium made of its Aſhes, ſo as to procure from it a pure Salt, according to Art, which muſt be added to the aforeſaid Extract; and afterwards, to this Mixture, ſtir in the following Ingredients, according to Art.

Take

Take of Oriental and Occidental Bezoar, of each half an Ounce; of Oriental Pearls, two Ounces; of red Coral, three Ounces; of Oriental Bole, true ſeal'd Earth, and calcined Hartſhorn, of each one Ounce; of Ambergriſe, one Ounce; of Oriental Muſk, a Dram and a half; of white Sugar-candy powder'd, two Pounds: And make into a Confection, according to Art.

This hath not been in any *Diſpenſatory*, that I know of, before, except that of *Bates*. It hath obtain'd a great Name and Eſteem amongſt ſome Perſons, which ſeems to have been the Reaſon why the College have now made it an officinal Medicine. The whole Proceſs is long and troubleſome; but the greateſt Care incumbent upon the Compounder is, that the Extract be, at firſt, left thin enough to receive the Powders, which are afterwards to be mix'd with it, ſo that the Whole may be of a due Conſiſtence. However this Medicine may ſtand in the Opinion of many, it hath now much more Honour done it than it deſerves, all its main Intentions being much better anſwerable with leſs Trouble.

CONFECTIO DE SANTALIS: *Confection of Saunders.*

Take of each ſort of Saunders, one Ounce; of red Coral, *Armenian* Bole, and ſeal'd Earth, of each half an Ounce; of Kermes-berries, Tormentil-root, Dittany, Saffron, Myrrh, red Roſes exungulated, and burnt Hartſhorn, of each three Drams: And make them into an Electuary, with Syrup of Cloves.

This was an Addition to the laſt *College Diſpenſatory*, and ſeems to have been deſign'd for an Aſtringent.

CONFECTIO DE THURE: *Confection of Frankincenſe.*

Take of prepared Coriander-ſeeds, half an Ounce; of Nutmegs, and the whiteſt Frankincenſe, of each three Drams; of Liquorice and Maſtich, of each two Drams; of Cubebs, and prepared Hartſhorn, of each one Dram; of Conſerve of red Roſes, one Ounce; of the whiteſt Sugar, a ſufficient Quantity, to make them into little Balls or Lozenges.

CONFERENS. The ſame as SYMPHERON, which ſee.

CONFERTUS. The ſame as ἀθρόος. See ATHROOS.

CONFERVA. A ſort of barren Moſs, deſtitute of florid Heads, and even of thoſe Knobs or Tubercles, which ſome Moſſes are furniſh'd with, inſtead thereof. It conſiſts entirely of mere ſlender and uniform Leaves or Stalks, divided into very ſlender Capillaments. The Confervæ are divided, in the laſt Edition of *Ray's Synopſis*, firſt, into ſimple, which are thoſe whoſe Leaves or Stalks are equable or ſmooth; ſecondly, geniculated, or thoſe which are interſected with Rings, like thoſe of a Worm; thirdly, nodoſe, or knotted, which are thoſe which have frequent Knots or Tubercles along their Leaves or Stalks.

CONFIRMANTIA MEDICAMENTA. Medicines which reſtore or confirm the Strength of the Body, or any Part of it; or, Medicines which faſten the Teeth in their Sockets.

CONFLUENTIA. A Term, uſed by *Paracelſus*, to expreſs the Agreement, Conjunction, or Confederation of the Microcoſm with the Stars; or of a Diſeaſe with Remedies.

CONFŒDERATIO, in *Paracelſus*, implies the ſame as CONFLUENTIA.

CONFORMATIO, Conformation. Some Diſeaſes are call'd *Morbi malæ Conformationis*, or organical Diſeaſes; that is, which depend upon the ill Conformation of the Parts. Theſe, if external, may admit of a chirurgical Cure; and proper Exerciſe, Regimen, and Medicines, may ſometimes contribute much to the Relief even of thoſe which are internal, or, at leaſt, may render them ſupportable.

CONFORTANTIA MEDICAMENTA. Comforting Medicines. The ſame as Cardiacs, or Cordials. See CARDIACA.

CONFORTATIVA. The ſame as CONFORTANTIA.

CONFRICATIO, in Pharmacy, ſignifies the reducing any eaſily friable Subſtance to Powder, by rubbing it with the Hands, as Starch, for Inſtance: Or, it implies the Rubbing any ſoft and ſucculent Vegetable with the Hands, in order to expreſs out the Juice.

CONFRICATRICES. The ſame as TRIBADES, which ſee.

CONFUSÆ FEBRES. Certain Fevers, which, perhaps, never exiſted, except in the Imagination of *Bellini*. Theſe, according to him, are more Fevers than one affecting a Perſon at the ſame time, beginning and ending together, and ſo confuſed together, as ſcarcely to be diſtinguiſhable from each other.

CONFUSANEUS PANIS. The ſame as ἄρτος ἀνυπεύθυνος. Bread made of Meal, from which the Bran has not been ſeparated. See ARTOS.

CONFUSIO. A Diſorder of the Eyes, which happens, when, upon a Rupture of the internal Membranes, which include the Humours, they are all confounded together.

CONGELATI, or CONGELATICI. Perſons affected with a *Catalepſis* are ſometimes call'd by this Name.

CONGELATIO. Congelation is ſuch a Change, produced by Cold, in a fluid Body, that it quits its former State, and becomes conſiſtent or condenſed. When the Cold is leſſen'd, and reduced to the Degree in which it ſubſiſted before the Concretion, the Body congeal'd again reſumes its fluid State. Thus *Conglaciation* is, when a liquid Subſtance is converted into that Species of hard and conſiſtent Body, which we call Ice. We muſt here obſerve, that the Word *Congelation* is only apply'd to homogeneous Fluids, ſuch as Water, Oils, or pinguious Subſtances, and fuſed Metals, in which, beſides a Concretion in the cold Air, no Change is obſerved. We muſt alſo obſerve, that, by *Congelation*, ſome Bodies, ſuch as Water, are rarefied or expanded; whereas others are condenſed, or render'd more compact, ſuch as fix'd Metals, and pinguious Bodies. In the Shops the Condenſation of any Liquor, in a cold Place, is alſo call'd *Congelation*. The Stones produced in ſome Caverns, from the Drops of a petrifying Water, are alſo call'd Congelations. For one Method, in which Nature forms Stones, is, by ſuch a Congelation as does not ſuffer any thing of an earthy Nature to be ſeparated or precipitated from the whole Maſs, either ſpontaneouſly, or by the Action of Fire; but produces uniform Dryneſs, and Induration of the whole Maſs.

CONGELATIVA MEDICAMENTA, are Medicines which ſtop Fluxions, inſpiſſate, and dry. *Rulandus.*

CONGER, or CONGRUS. The Conger Eel. A very large Sea Eel, commonly call'd a Sea-ſerpent. *Galen* ſays, the Fleſh is hard, and of difficult Digeſtion. It is eſteem'd a very ordinary Food.

CONGESTIO. Congeſtion, or Collection. Some Authors, diſtinguiſhing Congeſtion from Collection, ſay, that a Collection of Humours is made on a ſudden; whereas a Congeſtion is form'd gradually.

CONGIUS.

This Species of Meaſure, uſed among the Antients, is generally determined to be the ſame with the *Chus* or *Choa* of the *Athenians*, which contains ten Pints of Wine, and nine of Oil. In *Lemery's Pharmacopeé univerſalle*, it is diſtinguiſh'd from the *Choa*, and ſaid to contain ten Pints of Wine, or nine of Oil; whereas the *Choa* contains eight Pints of Wine, and ſeven and a Quarter of Oil. But *Lemery* is in an Error, when he affirms, that this *Congius* is a Meaſure of the *Athenians*; for the *Congius* or *Chus*, in uſe among them, weigh'd nine Pounds, and that among the *Romans* ten. *Peireſkius* determines, that the *Roman Congius* was half a cubic Foot in Dimenſions, and contain'd about three *Paris* Pints. In the *Cabinet de la Bibliotheque de St. Genevieve*, and in *Fernellii univerſa Medicina*, it is aſſerted, that it is equal to three *Paris* Pints. The *Roman Congius* is the eighth Part of an Amphora; that is, it contains ten *Roman* Pints of Wine; and its Capacity was equivalent to 168¼ cubical *Pariſian* Inches; ſo that two Congii are almoſt equal to ſeven *Paris* Pints, or three *Straſburg* Meaſures and an half; and three Congii are nearly equivalent to ten *Paris* Pints and an half, or five *Straſburg* Meaſures and a Quarter. According to *Beverinus*, the *Roman Congius* was the eighth Part of an Amphora, contain'd ſix Sextarii, and 120 Ounces of Wine and Water, but only 90 of Corn.

Salmaſius, in his *Exercitat. Plinian.* endeavours to prove, that a *Congius* contain'd ten Pounds of Wine or Water, but only nine of Oil. In the *London* and *Edinburgh Diſpenſatories* eight Pints make the *Congius*. The Meaſure containing two Congii was call'd *Bicongius*, and that containing three *Triconglus*. From the *Congius* came the *Congiarium*, a kind of Gift or Largeſs, publicly diſtributed to the People by the Emperors. This Name it probably received from its being at firſt diſtributed in *Congii*.

CONGLACIATIO. The ſame as COAGULATIO, or CONGELATIO, which ſee.

CONGLOBATA GLANDULA. A conglobate Gland.

Modern Anatomiſts have reduced all the Glands of the Body to two Sorts, that is, the *Conglobate Glands*, and the *Conglomerate Glands*.

A conglobate Gland is a little ſmooth Body, wrapt up in a fine Skin, by which it is ſeparated from all other Parts, only admitting an Artery and Nerve to paſs in, and giving way to a Vein and excretory Canal to come out. Of this Sort are the Glands of the Brain, and the Teſtes. *Keill's Anatomy.*

Under the Title of *Conglobate Glands*, *Winſlow* includes the lymphatic Glands alone; and he calls all the other Glands of the Body by the Name of *Conglomerate*.

CONGLOMERATA GLANDULA. A conglomerate Gland.

A conglomerate Gland is compoſed of many little conglobate Glands, all tied together, and wrapt up in one common Tunicle or Membrane. Sometimes all their excretory Ducts unite, and make one common Pipe, thro' which the Liquor of all of them runs, as the Pancreas and the Parotides do. Sometimes the Ducts, uniting, form ſeveral Pipes, which only communicate with one another by croſs Canals, and ſuch are the Mammæ. Others, again, have ſeveral Pipes, without any Communication with one another, of which Sort are the Glandulæ Lachrymales, and Proſtatæ. And a fourth Sort is, when each little Gland has its own excretory Duct, thro' which it tranſmits its Liquor to a common Baſon, as the Kidneys. *Keill's Anatomy.*

CONGLUTINANTIA. Conglutinating; that is, healing Medicines.

CONGRUS. See CONGER.

CONIA, κονία. Lime. It imports alſo, when join'd with σαχτὴ, a Lixivium, or Lye, of vegetable Aſhes. Hence, in *Hippocrates*, κονιώδεα ὔρεα are high-colour'd Urines, reſembling a Lixivium.

CONIA, κωνία. This is the πισίτης ὄινος, Wine impregnated with the Picea, or Fir. *Dioſcorides*, *L.* 5. *C.* 48. gives the Method of making this Wine; which is, by pouring Muſt upon liquid Pitch, and letting it ferment upon it, previouſly waſhing the Pitch with Brine, or Sea-water. *Galen*, in his *Exegeſis*, gives a ſhort, but obſcure, Deſcription of this Wine. According to him, it is Wine impregnated with the πεύκη, which is the Picea, or Tæda, which muſt be infuſed in the Wine, without taking off the Bark.

CONIFERÆ ARBORES. Coniferous Trees are ſuch as bear Cones; as the Cedar of *Lebanon*, Fir, and Pine. *Miller's Dictionary*, *Vol.* 1.

CONILE, from its Similitude to κώνειον, Hemlock, is the MYRRHIS, which ſee. But, I believe, this is not the Plant which *Oribaſius* calls by this Name, and which he repreſents as a briſk Cathartic.

CONIS, κόνις, Duſt, or fine Powder, or Aſhes. It ſignifies alſo a Nit, or Scurf on the Head; and ſometimes Lime.

CONISTERIUM, κονιστήριον. The ſame as APODYTERIUM, which ſee. It ſignifies alſo the Aſh-hole of a chymical Furnace.

CONJUNCTA CAUSA. The conjunct or immediate Cauſe of a Diſeaſe. See the PREFACE.

CONJUNCTA SIGNA are the pathognomonic Signs of a Diſtemper.

CONJUNCTIVA TUNICA. See ADNATA.

CONNA. A Name for the *Caſſia Fiſtula*.

CONOCARPODENDRON, κωνοκαρπόδενδρον. The Name of a Tree, which is a Native of the Country of the *Hottentots*, near the Cape of *Good Hope*.

The Characters are,

It hath an apetalous ſtamineous Flower, which is ſurrounded by a Number of long Leaves, immediately under the Flower-cup, which conſiſts of five narrow Leaves: Theſe are ſucceeded by Cones, in Shape like thoſe of the Larch-tree. The Seeds are each of them included in a ſeparate Cell. *Miller's Dictionary*, *Vol.* 2.

Boerhaave mentions ten Species of this.

1. Conocarpodendron; foliis argenteis; ſericeis, latiſſimis. SILVER-TREE, WITH BROAD SOFT WHITE LEAVES.

2. Conocarpodendron; folio craſſo, nervoſo, lanuginoſo, ſupra crenato, ibique limbo rubro; flore aureo; cono facilè deciduo.

3. Conocarpodendron; folio rigido, craſſo, anguſto; cono Laricis parvo. SILVER-TREE, WITH A NARROW THICK STIFF LEAF, AND A SMALL CONE.

4. Conocarpodendron; folio rigido, anguſto, apice tridentato, rubro; flore aureo.

5. Conocarpodendron; folio ſubrotundo, craſſo, rigido, valde nervoſo; cono longo, variegato, ex rubro & flavo; flore aureo. SILVER-TREE WITH A ROUNDISH THICK STIFF LEAF FULL OF NERVES, LONG CONES VARIEGATED WITH RED AND YELLOW, AND A GOLD-COLOUR'D FLOWER.

6. Conocarpodendron; folio anguſto, rigido, breviori; cono parvo, aureo, coronâ foliaceâ ſuccincto.

7. Conocarpodendron; acaulon, folio rigido, nervoſo, oblongo, latiori; cono fuſco; ſemine oblongo, in medio quaſi excavato.

8. Conocarpodendron; foliis ſubrotundis, breviſſimis; capituli immaturi, globoſi, parte inferiori fuſcâ, mediâ aureâ, ſupremâ viridi.

9. Conocarpodendron; folio tenuiſſimo, anguſtiſſimo, ſaligno; cono caliculato.

10. Conocarpodendron; folio tenui, anguſto, ſaligno; cono caliculato, coronâ foliaceâ ſuccincto. SILVER-TREE WITH A NARROW WILLOW-LEAF, AND THE CONES GROWING IN SMALL CUPS, WHICH ARE SURROUNDED WITH A CROWN OF LEAVES. *Boerh. Ind. alt. Vol.* 2.

CONOIDES CORPUS, κωνοειδὲς σῶμα. The *Glandula Pinealis*. See CEREBRUM.

CONOPS, κώνωψ. A Gnat. *Hippocrates* mentions Efflorescences on the Skin like the Bites of Gnats, as appearing in certain epidemical Diſtempers, which he deſcribes.

CONQUASSATIO. *Conquaſſation*, is a Species of Comminution, or a particular Operation, by which moiſt concreted Subſtances, ſuch as recent Vegetables, their Fruits, lacteſcent Seeds, and the ſofter Parts of Animals, are ſometimes in a Marble, ſometimes in a Glaſs, ſometimes in an Earthen, and ſometimes in a Metalline Mortar, contuſed and agitated with a Peſtil, either of Metal, Wood, or Stone, till partly, by their proper Succulence, or an Affuſion of ſome Liquor, they are reduced to a ſoft and fine Pulp. Metalline Inſtruments are not to be uſed for this Purpoſe; becauſe not only the manifeſt, but alſo the latent Salts of the Subſtances, ſubjected to this Operation, acting upon theſe Inſtruments, may derive an adventitious and virulent Quality from them, which will not only render ſuch Subſtances unfit for the intended Purpoſes, but alſo nauſeous and hurtful, when exhibited as Medicines.

CONSENSUS. Conſent. The ſame as SYMPATHIA, which ſee.

CONSERVA. A Conſerve is a Medicine of the Conſiſtence of a Pulp, or an Electuary prepared of Flowers, Herbs, their tender Tops, rarely their Roots, and more rarely the Pulps of Fruits, cut into ſmall Pieces, contuſed, and intimately mixed by beating them in a Mortar, eſpecially of Stone, with a wooden Peſtil. Refin'd Sugar, or loaf Sugar, are generally uſed for preparing Medicines of this Kind, unleſs we have a mind to ſubſtitute in their room white powder Sugar; which anſwers the End very well, ſince it is ſometimes intirely diveſted of that Calx, by which the loaf Sugar is form'd into Pyramids, by which means it acquires a certain innocent Acrimony, according to *Wedelius*. The Proportion of Sugar is generally double to the Subſtance to be made into a Conſerve; but ſometimes more, and ſometimes leſs, is uſed. In the *London Diſpenſatory*, triple the Weight of Sugar is preſcrib'd: but ſome, who go more accurately and diſtinctly to work, inform us, that for moiſt Subſtances, double the Weight of Sugar is ſufficient; and that the Pulps of ſome Fruits, ſuch as that of the Dog-hip, require ſtill a ſomewhat ſmaller Quantity; but Subſtances of a drier Nature require more than double the Quantity of Sugar, adding at the ſame time a little of ſome diſtil'd Water, that they may be the more commodiouſly mix'd with the Peſtil. In the *Edinburgh Diſpenſatory*, triple the Quantity of Sugar is preſcribed for making dry Subſtances into Conſerves.

According to *Zwelfer*, in his *Pharmacop. Reg.* "In dry "Subſtances an equal Weight of Sugar is ſufficient: But in "ſucculent and mucilaginous Herbs and Flowers, a Pound and "an half of Sugar is requiſite for one Pound of the Herbs or "Flowers; leſt too large a Quantity of the Sugar ſhould in"creaſe the Price, in'arge the Doſe, create a Nauſea, deſtroy "the Digeſtion by its preternatural Ferment, which, in cla"rifying, it received either from the Quick-lime, or the Clay "of the Moulds; or, laſtly, leſt it ſhould blunt or weaken "the Force of the Medicine, or produce any other unlucky "Effect. We muſt, with *Wedelius*, obſerve, that different Plants require different Quantities of Sugar. Hence, in order to prevent Mouldineſs, the ſofter and more ſucculent the Plant is, the larger Quantity of Sugar is to be uſed, and *vice verſa*. Plants which are too moiſt, ought previouſly to be dried a little in a Shade. The more Sugar is uſed, the ſofter the Conſerve produced will be. For making any highly ſucculent or mucilaginous Plant into a Conſerve, Sugar boil'd to a thick Conſiſtence is ſometimes uſed. Some, for making Conſerves, uſe Honey inſtead of Sugar, as we may ſee in the *Atrium Medicinæ Helvetiorum Conſtantini de Rebecque*. Some prepare Conſerves by laying Flowers and Sugar *ſtratum ſuper ſtratum*, and expoſing them in this State to the Sun. Others make a Julap, which they mix up with the Subſtance of which the Conſerve is to be made. Some boil the Subſtances, of which the Conſerve is to made, as the Roots of Marſhmallows or Comfrey, in Water, till they become ſoft; then they pound them, or even paſs them through a Sierce, and add a ſufficient Quantity of Sugar. The Pulps of Fruits alſo, when bruiſed, are to be paſſed through a Sierce; then adding a ſufficient Quantity of Sugar, they are to be mixed up to a due Conſiſtence. New-made Conſerves are generally expoſed to the Sun for ſome Days, and agitated now-and-then, that they may be the more effectually mix'd. But we muſt take care, leſt they ſhould ferment, and run over the Veſſel, which generally happens to the Conſerves of the Flowers of Borrage and Bugloſs. This Misfortune is beſt prevented by not filling the Veſſel full. Conſerves are beſt preſerved in glaz'd Earthen Veſſels, or in Glaſs Veſſels: They may be eaſily prepared of recent Herbs and Flowers; but they may alſo be had at any Seaſon; if, for Inſtance,

ſtance, the dried Flowers, reduced to a Powder, and form'd in a Maſs, with the diſtil'd Water of theſe Flowers, are mix'd with Sugar diſſolv'd in the like Water. Thus liquid Conſerves are prepared; whereas ſuch as are ſolid, are made by mixing the dried Flowers, reduced to a Powder, with Sugar diſſolved in the Water of the ſame Flowers. We muſt alſo obſerve, that, according to *Hoffman*, in his *Diſſertat. de Natura Sacchari*, the moſt elegant and effectual Conſerves are made by evaporating the Juice of any Vegetable, or by uſing its tender Flowers, Leaves, and diſtil'd Oil. *Conſerves* are the Invention of the *Arabians*, in order to preſerve Vegetables, when their Virtues are loſt by being dried. The principal Uſe of Conſerves is; together with Preſerves and Syrups, to be a Vehicle for Powders, in order to make Boluſes and Electuaries. But they are in a particular manner uſeful, where the Virtue of the Vegetable, reduced to a Conſerve, is wanted to mix ſlowly with the Maſs of Blood. For this Reaſon they are recommended for ſtrengthening the Viſcera in arthritic Diſorders.

Directions given by the *College Diſpenſatory*, for Conſerves, are theſe: The Conſerves of Wormwood, Sorrel; of Orange, Borrage, and Clove-flowers; of Scurvygraſs-leaves; of the greater Comfrey-flowers; of Hips; of Fumatory; of the Flowers of Lavender; Lilies of the Valley, Mallows, and Tops of Marjoram; of the Leaves of Mint; of the Flowers of Damaſk, Red, and Dog-roſes; of Roſemary-flowers; of the Leaves of Rue, of Elder and Violet-flowers; of the yellow Rind of Oranges; of Lemon-peel; of Sloes, and of Berberies; are all made with a triple Proportion of Sugar. But it is to be obſerved, that they are not all to be mix'd in the ſame manner.

Some require to be cut, bruiſed, and gently boiled; and ſome require neither cutting, nor bruiſing, nor boiling; and ſome again require or forbid only ſome of theſe Preparations. But this Caution is ſufficient to prevent any Error in a ſkilful Compounder. *London Diſpenſatory.*

Quincy, in his *Pharmaceutical Prælections*, informs us, that the Galenical Pharmacy furniſhes us with ſeveral Medicines preſerved by Sugar or Honey, under the Titles of Syrups, Honeys, Oxymels, Juices, Candies, Confections, and Conſerves; all which Forms differ in little elſe than the Management, whereby their reſpective Materials are joined with Sugar or Honey; and all of theſe ſeem contrived either to preſerve certain Things, as near as poſſible, to the Condition in which Nature affords them, or elſe to render them more palatable in taking.

In order to judge what Dependence may be had upon theſe Things, in any Intention, which may occur in extemporaneous Practice, we muſt examine the Fitneſs of the Parts of the *Materia Medica* to be ſo mix'd; to which Purpoſe we are to conſider, what it is which the Sugar or Honey does.

In this View, the Materials, thus ordered, may be conſider'd either in their whole Subſtance, with which the Sugar is immediately mix'd, as in the Conſerves; or elſe in their Juices or Decoctions, which are afterwards boiled up with Sugar or Honey into Syrup. And, in ſuch a Review of them, we are to have a great Regard to that particular Quality in the Simples, in which their medicinal Virtue conſiſts, as it is, or is not, capable of Preſervation by this Means; and to its Quantity of Efficacy or Power of Operation, to ſee whether, after this manner, we can have enough of it in a convenient Doſe, to depend upon, as a Medicine, in Caſes of Moment.

Of Things which are immediately mixed in Subſtance with Sugar, thoſe only ſeem fitted for it, whoſe predominant Qualities are thus to be preſerved, and thus to be given as a Medicine, from which ſomewhat may be expected to be done. Thus the Flowers of Lavender, Roſemary, the outer Peels of Oranges and Lemons, and a few more of thoſe ordered in Conſerves, are preſervable with Sugar, in ſuch a manner, that ſmall Quantities of them will anſwer in ſuch Intentions as they are ſuited to anſwer in any other Form. But Mint, Scurvygraſs, Rue, and ſuch Things as require to be taken in large Quantities before we can lay any Streſs upon them, are very unfit for this Treatment; becauſe a Doſe, ſufficient to be truſted to, is enough to nauſeate the Stomach, and do Miſchief otherwiſe, by the Sugar they neceſſarily carry along with them. All Bitters are likewiſe unfit for this Management, as Wormwood, Fumatory, and the like, becauſe they are too nauſeous to be endured; and thoſe of a glutinous and viſcid Texture, as the Comfrey, and others, by lying in Sugar, loſe that very Quality which ought to be expected, and ſoon become good for nothing. The ſame Rule of judging holds likewiſe in all other Forms where Sugar comes in; ſo that, on Examination, we ſhall find few of the Alterants improveable by this means; though, as to Emetics and Cathartics, where a ſufficient Efficacy for a Doſe lies in a little Room, they are conveniently enough thus preſerved. And, indeed, if we conſider a Conſerve, or a Syrup, as a means to join other Things of Efficacy together, and to give to other Forms Conſiſtence, and a Convenience of taking, thus may moſt of them have their Uſe; but little elſe can be ſaid in their Favour.

The Conſerves make a conſiderable Article in the Furniture of an Apothecary's Shop; but, although they are now much abridg'd by the College, they have retained more than are ever preſcrib'd or made, either from their Nauſeouſneſs, or Unfitneſs for this Form. Of thoſe Things which require to be gently boil'd, are only the Sloes and Barberries, becauſe, without it, their Pulps are ſo thin as not to afford a due Conſiſtence with Sugar; but much Boiling is here to be avoided. All other Conſerves require nothing more than barely beating them, in a Mortar, to a ſufficient Fineneſs; but the Labour required to do this makes moſt of them, at beſt, ſo coarſe, that they ought to be pulp'd before they are reduced into Electuaries: Their Aptneſs to candy likewiſe ſubjects them to the ſame Neceſſity.

There is a very conſiderable Overſight in the Liſt of Simples reducible into Conſerves, as it is printed in the laſt *Diſpenſatory*, both in relation to the Method in which they ſtand, and the Diſtinction of the Things themſelves; which it may be neceſſary to take ſome Notice of here, to prevent being led into Miſtakes thereby. The Diſtinctions of *Summitates*, *Flores*, *Folia*, and *Fructus*, are not only intermix'd, and conſequently repeated oftener than a good Method requires; but alſo Things are placed under theſe Diſtinctions, which do not belong to them. Thus, under *Summitates*, are Lavender, and Lilies of the Valley, the fine prick'd Flowers of which only are uſed in Conſerves. Under the *Folia*, likewiſe, are Violets, which are uſed only in Flowers, and Elder, the Leaves of which were never yet made into a Conſerve. The Sloes and Barberries, which ſtand here, belong to the Diſtinction of Fruits, and ſhould be placed with the Hips. There are other Inadvertences not of much Conſequence, and which every Reader can eaſily rectify. *Quincy's Prælect. Pharmac.*

CONSERVATIO, in Pharmacy, is Preſerving, Pickling, or keeping any thing from Putrefaction or Evaporation, by the Addition of ſome other Subſtance.

CONSERVATIVA MEDICINA. That Part of Medicine which relates to the Preſervation of Health.

CONSILIGO. The *Helleboraſtrum*, Setterwort. See *Helleborus*; *niger*; *fœtidus*.

CONSILIUM. The Advice given by one or more Phyſicians, relative to the State of the Patient, and the Method of Cure proper to be purſued.

CONSISTENTIA. When uſed relative to a Diſeaſe, it imports the State or Acme thereof. When apply'd to the Humours, Excrements, or Excretions, it imports their Conſiſtence.

CONSISTENTIA, Conſiſtence. This Word relates to the Thickneſs or Thinneſs of Medicines. What the particular *Conſiſtence* of each Claſs of Medicines is, will be taken notice of under its reſpective Article. Only we muſt here obſerve, with *Jacobus Sylvius*, that not only the Gratefulneſs, but alſo the Operation of Medicines depend, in ſome meaſure, upon their *Conſiſtence*; for Medicines of a thick Conſiſtence are taken into the Stomach, and penetrate into the Body, with greater Difficulty, than ſuch as are thin and liquid; and it requires more Trouble to ſwallow a thick than a thin Medicine: For this Reaſon thick Medicines are generally nauſeous and ungrateful; and this is the Reaſon why cathartic Boluſes are often diſſolved in ſome agreeable Liquor, ſince, in this Form, they are more grateful than in any other: For this Reaſon, alſo, Apozems are generally clarified by the Whites of Eggs, or a Strainer. Thus, Honey is diluted with Water, that it may the more eaſily enter the obſtructed Pores of the Skin, and operate as a Detergent. For this ſame Reaſon a large Quantity of warm Water is more effectual in exciting a Vomiting, than a ſmaller Quantity. On the contrary, a thick Conſiſtence is, on ſome Occaſions, more to be deſired; in Ulcers, for Inſtance, of the Aſpera Arteria and Œſophagus, where we muſt give Medicines made up with Gum Tragacanth, or other Subſtances of a like Nature, which, by their Viſcidity, fix the Medicines, as it were, longer to the Part affected: Hence it happens, that, in Medicines to be inſpiſſated, ſome Things are added, which neither add to nor impair their Operation, but only have a Reſpect to their Conſiſtence; ſuch as Wax, for Inſtance, in Ointments and Plaiſters.

CONSOLIDA. A Name apply'd to many different Plants. Thus the *Conſolida major* is the SYMPHYTUM; the *Conſolida media* is the BUGULA; the *Conſolida minima* is the BELLIS MINOR; the *Conſolida Regalis* is the DELPHINIUM; and the *Conſolida Saracenica* is the DORIA; *quæ Jacobæa*; *Alpina*; *foliis longioribus, ſerratis*. See DORIA.

CONSOLIDANTIA, or CONSOLIDATIVA MEDICAMENTA. Theſe are Medicines calculated for promoting the Cure of Wounds, by removing the ſeveral Impediments to their Conſolidation or Conglutination.

CONSPERSIO. The ſame as CATAPASMA, which ſee.

CONSTANS. When apply'd to the Strength, or vital Powers, it imports Firmneſs, or a good Condition.

CONSTELLATUM UNGUENTUM is an Ointment made of Earth-worms, cleanſed, dried, and powder'd, and made into an Ointment, with the Fat of Boars or Bears. It is eſteem'd good for the Tooth-ach, and for healing Wounds.

CONSTIPATIO. The ſame as ADSTRICTIO, which ſee.

CONSTITUENS. This is no more than that Subſtance which gives a due Conſiſtence to compound Medicines, ſuch as Rob, Honey, or Syrups, in Electuaries; or Wax, and other tenacious Subſtances, in Plaiſters.

CONSTITUTIO. The ſame as CATASTASIS, which ſee.

CONSTRICTIO. The ſame as ADSTRICTIO.

CONSTRICTIVA, Styptics.

CONSTRICTORES MUSCULI. Muſcles which ſhut up or cloſe ſome of the Orifices of the Body, are call'd by this Name. Thus there is the *Conſtrictor Palpebrarum*, otherwiſe call'd *Orbicularis Palpebrarum*: The *Conſtrictor Labiorum*: The *Conſtrictor Alæ Naſi*, call'd alſo *Depreſſor Labii ſuperioris*; all which are deſcrib'd under the Article CAPUT.

CONSTRINGENTIA. The ſame as ASTRINGENTIA, which ſee.

CONSUETUDO. Habit, or Cuſtom. In Medicine it is uſed with reſpect to the Non-naturals.

CONSUMMATUM. In French *Conſommé*. A Broth ſo ſtrong as to concrete into a Jelly, when cold. Frequent Mention is made of this in the *French* medicinal Writers.

CONSUMPTIO. The ſame as ANALOSIS. A Conſumption, meaning a Diſtemper, is the ſame as PHTHISIS, which ſee.

CONTABESCENTIA. The ſame as ATROPHIA.

CONTAGIO, or CONTAGIUM. Contagion, or Infection.

CONTEMPERANTIA. The ſame as TEMPERANTIA.

CONTENTA. Contents. By theſe in Medicine are underſtood any Fluids contained within a ſolid Part of the Body.

Relative to the Urine, the Contents are ſmall Particles collected together as the Urine cools, and appear either at the Top of the Urine, when they are call'd Clouds or νεφέλαι; or are ſuſpended in the Middle, and denominated ἐναιωρήματα; or elſe ſink to the Bottom, and then acquire the Name of ὑπόστασις, or Sediment.

CONTENTIO, or CONTENSIO, ſometimes imports Tenſion, or Stricture. Hence,

CONTENTUS, Stretch'd.

CONTINENS FEBRIS. A continual Fever, which proceeds regularly in the ſame Tenor, without either Intermiſſion or Remiſſion. See SYNOCHOS.

CONTINUA FEBRIS. A Fever attended with Exacerbations, and ſlight Remiſſions, but no Intermiſſions. See SYNECHES.

CONTORSIO. In Medicine has many Significations. Firſt, the Iliac Paſſion is thus call'd. Secondly, an incomplete Diſlocation is thus named, when a Bone is in part, but not entirely, forc'd from its Articulation. Thirdly, a Diſlocation of the Vertebræ of the Back ſideways, or a Crookedneſs of theſe Vertebræ, are called Contorſions thereof. Fourthly, A Diſorder of the Head is thus call'd, in which it is drawn towards one Side, either by a ſpaſmodic Contraction of the Muſcles on the ſame Side; or a Palſy of their antagoniſt Muſcles on the other.

CONTRA-APERTURA. A Counter-opening. This is ſometimes very neceſſary in Wounds made by Puncture, or a Bullet, in order to diſcharge whatever is contain'd in the Wound, and prevent its growing fiſtulous. The Operation, according to *Heiſter*, is thus perform'd: The Surgeon being provided with a particular Sort of Probe or Needle, blunt at the Top, and arm'd with a Button (A), but at the other End furniſhed with a pretty large Eye or Hole (B), (*See Tab.* 26. *Fig.* 1.) introduces it into the Wound or Ulcer, and paſſes it to the Bottom, directing the Button towards the Skin, and preſſing on it with ſome Force, that it may be felt on the external Part by the Finger. After this, if it may be done with Safety, he cuts the Skin, and other Parts, upon the Button, making a pretty large Opening. He then paſſes a long, but narrow Piece of Linen, through the Eye of the Probe or Needle (B), if it was not done before; and, impregnating it with ſome vulnerary Ointment or Balſam, draws it through the recent Wound, and leaves it there in the manner of a Seton; after which, he applies Lint, ſpread with the ſame Balſam or Ointment, to both Wounds, and covers the ſame with Plaiſters, and a Bandage. In every ſucceeding Dreſſing he takes care to cleanſe the Wounds; and, ſpreading upon the upper Part of the Seton, or Piece of Linen, ſome vulnerary Ointment, draws the lower Part, till the other, cover'd with the freſh Ointment, enters the Wound. He continues this Method till the Wound is throughly cleanſed by the new Opening, the Pus greatly diminiſhed, and no Purulences collected at the Bottom; he then removes the Seton, and heals up the Wounds in the uſual Manner.

Garengeot, in his *Traité des Inſtrumens*, *Tom.* 1. deſcribes a triangular Inſtrument, invented by *Petit*, for this Purpoſe, which the *French* call a *Troicar*. With this he makes an Opening at the Bottom of the Fiſtula, and immediately after draws a Piece of Linen, paſſed through the Eye of this Inſtrument, through the whole Cavity of the Wound or Fiſtula (*See Tab.* 25. *Fig.* 1.). But as this Inſtrument of *Petit* is ſtrait, and I have met with Patients, where a new Opening, made by ſuch a ſtrait Inſtrument, could not conveniently nor ſafely be made, I had, long before *Garengeot*'s Book was publiſhed, invented another for the Uſe of a Nobleman, who had a large Abſceſs in the fore Part of the Abdomen, which, open'd near the Navel, on the Right Side, but penetrated to the Groin, on the ſame Side. For, becauſe I thought it very dangerous to attempt a new Opening in this Place with a ſtrait Inſtrument, on account of the adjacent, large, crural Veſſels, I directed one to be made almoſt like thoſe Inſtruments which are uſed in extracting Water from hydropical Perſons, but ſomewhat crooked towards the Point, and of a good Length, becauſe it was a long Fiſtula; this Inſtrument was alſo conceal'd in a Cannula (*See Tab.* 25. *Fig.* 2.). By means hereof, taking care to direct its Apex towards the Skin, a new Opening at the Bottom might ſafely be made without endangering the crural Veſſels. And that I might, at the ſame time, by means of this Inſtrument, introduce a Seton, or Piece of Linen, into the Wound, I contrived a Sulcus, like a Ring, near the Extremity, to which I faſten'd the Piece of Linen, by the Help of a ſtrong Thread, and, by drawing back the Inſtrument, tranſmitted it through the Fiſtula. As often as the Piece of Linen is almoſt ſpent, but the Wound not thoroughly cleanſed, a new one is tied or ſewed on to the upper End, and introduced into the Wound, by drawing as before; then cutting off the foul Linen, we proceed in the ſame manner as before, continuing ſo to do as long as it ſhall be thought proper, and avoiding, by this Method, the Neceſſity of always introducing a new Piece of Linen by means of the Inſtrument. *Heiſter Chirurg.*

CONTRACTIO. Contraction in general; as of the Heart, Arteries, and Muſcles.

CONTRACTURA. An Immobility of any of the Joints, induced by a preternatural Contraction of ſome of the Muſcles deſtin'd, in a natural State, to move them.

CONTRAFISSURA, A Contrafiſſure. This is a Fiſſure in the Cranium, in a Part thereof oppoſite to, or at a Diſtance from, that which received the Injury. This is treated of under the Article CAPUT.

CONTRAHENTIA. Theſe are Medicines, which, by their contractive Force, render the Length of the Solids leſs, but their Thickneſs greater, in conſequence of which they incraſſate the Fibres, and render their mutual Connection the ſtronger. Thoſe are only, for the moſt part, accounted aſtringents, which are of Uſe in a Weakneſs or Laxity of the Fibres, and the Diſorders ariſing from them; but any one, who diligently reflects upon this Subject, muſt perceive, that the Cauſes promoting Contraction may be reduced to theſe following: Firſt, ſuch as produce a Solution of Continuity in the Fibres; for, when the Fibres are wounded or divided longitudinally, they contract themſelves: Hence it follows, that many contracting Medicines act, or produce their Effects, by wounding. Secondly, ſuch things as, by their ſtrong and powerful Action, ſo dilate the Ducts of our Bodies, that their longitudinal Diameter is leſſen'd, and their latitudinal enlarged. Of this Kind are ſuch nutritive Subſtances as fill the Veſſels, ſtimulating Subſtances, and all Corroborants. Thirdly, ſuch things as remove the Cauſes diſtending the Veſſels. Of this Kind are Evacuants; for the emptied Veſſels contract themſelves. The Effects of contracting Medicines may be eaſily underſtood; for, if the Solidity of the Fibres is increaſed, the Strength and Force of the Fibres, Membranes, and Veſſels, muſt of courſe be augmented. *Rieger.*

CONTRAINDICATIO. The ſame as ANTENDEIXIS, which ſee.

CONTRALUNARIS. An Epithet given by *Dietericus* to a Woman who conceives during the menſtrual Diſcharge.

CONTRAYERVA.

Drakena, *Contrayerva*, Offic. Mont. Exot. 7. *Drakena Radix*, Ger. Emac. 1621. Raii Hiſt. 2. 1339. J. Pin. 14. Park. Theat. 218. *Doreſtenia Sphondilii folio*, *dentaria radice*, Plum. Nov. Gen. 29. Tab. 8. COUNTER-POISON.

This is a longiſh knotty Root, encompaſſed on all Sides with ſmall ſlender Fibres. It is of a light reddiſh-brown Colour on the

the Outside, and white within; of a pleasant aromatic Smell, but of no very strong Taste.

It is brought to us from the *Spanish West Indies*, being said to grow in *Peru*. It is not certainly known what Plant this is the Root of, most Botanical Writers believing it to be the Root of a Species of *Granadilla*, or *Passion-flower*; but Father *Camelli*, in his Letters to Mr. *Ray*, (which see in his History, *Vol.* 3. *pag.* 647.) makes it a different Plant, describing it to have thick, nervous, Plantain-like Leaves, woolly underneath, not at all climbing or branching like the Passion-flowers; but his Account of it is so short and obscure, that it has given us but little Light into this Matter. Others will have it to be the Root of a Plant, like a *Virga aurea*, but having solid Seeds. Probably there may be two Species; for I have seen a kind of *Contrayerva*-root, brought over by our *South-Sea* Company's Ships, which was thicker, rounder, and with very few Fibres, appearing like the tuberous Glands of the *Apios Americana*, tho' the Colour and Scent were very like the common *Contrayerva*.

The only officinal Preparation is the *Lapis Contrayerva*. *Miller's Bot. Off.*

Lapis Contrayerva: CONTRAYERVA STONE.

Take of calcin'd Hartshorn in Powder, of red Coral prepar'd, Pearl, white Amber, and Crabs-eyes, of each two Drams; of Contrayerva-root powder'd, and the prepar'd Crabs-claws, of each half an Ounce: Mix them together, and make them up into Balls, with a Solution of Gum Arabic.

This is but very lately brought into the *College Dispensatory*, but now very much used in common Prescriptions, as an Alexipharmic. It was before ordered with Jelly of Vipers, and to be covered with Leaf Gold, but they are neither of them of any Consequence: A Dram and a half of Ambergrise was also left at Discretion to be added; but that is so far out of the Intention of the Composition, as to be now quite neglected. Its Dose is from ten Grains to half a Dram.

The *Contrayerva*-root was call'd *Drakena* by *Clusius*, because it was first imported into *England*, in 1581. by Sir *Francis Drake*, on his having finish'd his Voyage round the World. That Species of the Root, which is at present kept in the Shops, is externally of a reddish, and internally of a whitish Colour. It is thought best when entirely fresh, and free from Rottenness; when its Taste is at first a little astringent, but, when somewhat longer chew'd, a little acrid; and when its Smell is aromatic. From its Smell and Taste it seems, to *Geoffroy*, to be composed of a moderate Portion of a volatile, oleous, and aromatic Principle, wrapt up in earthy Parts. Hence we may account for its aromatic Qualities, that is, those by which it stimulates, incides, attenuates, corroborates, resists Poisons, and increases the Motion of the Humours. Hence it becomes proper in Cases where Perspiration is to be augmented, the Body to be heated, and in Fevers in which Coldness is to be surmounted, and the Causes of the Disorder eliminated thro' the cutaneous Pores. *Clusius* informs us, that the Inhabitants of *Peru* esteem it highly as an Alexipharmic; that it strengthens the Heart and vital Faculties, if the Powder of it is taken in a little Wine in the Morning; and that, in Water, it contributes to allay feverish Heats. *Monardus*, who, according to *Clusius*, was the first of the *Europeans* who wrote upon *Contrayerva*, informs us, "That the Powder of *Contrayerva*, exhibited in White-"wine, is a speedy and efficacious Remedy against Poisons of "all Kinds, except Sublimate, (which can only be cured by "copious Draughts of Milk) since it either throws it up by "Vomit, or evacuates it by a Diaphoresis." It is also reported, that the Powder of it prevents the Effects of Philtres, and dislodges Worms of the Intestines. *Terentius*, in his Notes upon *Hernand. Hist. Lib.* 8. *Cap.* 58. informs us, that a Dram, or a Dram and an half, of the Powder, exhibited in a few Ounces of Water, with a Regimen calculated for promoting a Diaphoresis, expels Poisons, and cures the Plague, and other violent Diseases; as also, that Wine or Water, in which this Root has been infused, if drank daily at Dinner, preserves against the Plague and Melancholy, promotes Digestion, dispels Flatulences, and corroborates the Stomach. But because it seems to act by stimulating, resolving, and putting the Humours into a Commotion, we cannot hence reasonably conclude, that it is an universal Antidote. This, to *Wedelius*, seems too hyperbolical an Assertion, since different Poisons require Remedies of different Virtues. In *Europe Contrayerva* is principally used against malignant Disorders, and in Cases where the Intention is to excite a Diaphoresis. The learned *Paulus Neucrantzius*, in his Treatise *De Purpura*, solemnly affirms, that he has found it highly efficacious in purple Fevers, in which it carries off the peccant Matter by a Diaphoresis, and rarely operates by Vomit. *Simon Pauli*, in his *Quadripartitum Botanicum*, tells us, that he used to mix the Powder of its Root with a Decoction of the Shavings of Hartshorn, which he exhibited to rich Patients, labouring under malignant Disorders; but, for Persons of a meaner Condition, he order'd the Roots of the greater Burdock to be made into a Decoction with Shavings of Hartshorn. According to *Ludovici*, in his *Pharm.* the Root of Zedoary may be commodiously used as a Succedaneum to it. Others substitute in its room Substances possessed of aromatic Qualities. Some, in intermittent Fevers, exhibit the Powder of *Contrayerva*, with double the Quantity of *Peruvian* Bark; and against Dysenteries it is exhibited in Conjunction with Ipecacuanha. According to the celebrated *Juncker*, in his *Conspectus Therapiæ generalis*, it is justly classed among the powerfully heating Medicines, because it strongly agitates the Mass of Blood; for which Reason it ought not to be an Ingredient in Alexipharmic Essences, tho' it has always been celebrated as highly proper for that Purpose: But it is proper against Apoplexies produced by Serum; in a Weakness and want of Tone in the Stomach, arising from a cold Cause; in catarrhous Disorders; in Defluxions, and in flatulent and pituitous Colics. According to *Schulzius*, in his *Prælectiones*, it is beneficial in malignant Disorders, especially such as rage in Camps, and are accompanied with a Dysentery, because it consists of alexipharmic Particles, mixed with sufficiently mild, earthy, and astringent Parts. From half a Scruple to half a Dram of the Powder may be exhibited in Cases where inciding, resolvent, and heating Medicines are proper. In a liquid Form, infused in Wine, the Dose may be double or triple of this. It is an Ingredient in many alexipharmic and bezoardic Compositions. When subjected to a Chymical Analysis by *Wedelius*, its Root, put into a Retort by itself, and distil'd in a Sand-heat, yielded first a Phlegm, then an acid Spirit, like Spirit of Tartar, which produc'd an Effervescence with an Alcali, and whose Colour was at first reddish, but afterwards became obscurely yellow, with a Cast of Red; after this succeeded an Oil, which was thick, acrid, inflammable, and empyreumatical; and from the Caput Mortuum, calcin'd in a very brisk Fire, was obtain'd a fixed alcaline Salt, like Salt of Tartar or Pot-ash. With respect to the Essence of *Contrayerva*, prepared with rectify'd Spirit of Wine, *Schulzius*, in his *Prælectiones*, uses the following Words: "I am afraid," says he, "that the Spirit of "Wine is so far from extracting its Virtues, and conveying "them to the Body of the Patient, that it would be more "proper to exhibit it in Substance. Half a Dram of it may be "exhibited for a Dose, except in Cases where, on account of "the Spirit of Wine, we ought to be more sparing." *Willis*, in his *Pharmaceutice Rationalis*, makes the Dose of this Tincture from half a Dram to a whole Dram. It is surprising, that this Root should be found to communicate more of its Parts to an aqueous, than to a spirituous Menstruum; for, when infus'd in common Water, it yields a larger Quantity of Extract than with Spirit of Wine. Hence we may conjecture, that the Use of the aqueous Extract is safer than that of the spirituous, as it exagitates the Humours less. We must not here forget the Experiments made with the Tincture of this Species of *Contrayerva*, from which every one is at Liberty to draw his own Conclusions, with respect to its Nature. Rain-water then soon extracts a Tincture, obscurely red, from bruised Contrayerva-root. The same Effect is also produc'd by Spirit of Wine, but the Tincture is of a more brisk and lively Colour. The Tincture extracted with Water immediately becomes turbid upon an Admixture of Aqua Fortis, and a large Number of red Flakes subside to the Bottom: It is also render'd turbid by Salt of Tartar, but more slowly; and the subsiding Flakes are smaller, and fewer in Number. The Tincture extracted with Spirit of Wine, when mixed with that extracted with Water, immediately became milky, which it also did with Aqua Fortis; but Salt of Tartar seemed to produce no Change in it. These Experiments are related by *Heide*, in his *Observationes Medicinæ*. There are several celebrated Shop-medicines, in which Contrayerva is an Ingredient; such as the *Lapis Contrayervæ*, in the *London Dispensatory*; the *Syrupus Contrayervæ*, in the *Pharmacop. Argent.* and several others to be met with in the *Dispensatories*.

The *Contrayerva Nova*, commonly distinguished by the Epithet *Mexicana*, was imported into *Europe* after the former Species, and is thought to be produced in *Mexico*. It is pretty large, about two Fingers thick, externally rough, and of a brownish Colour; internally white, with a Pith in the Middle, like the *Contrayerva* already mentioned, of a sweetish aromatic Taste, but little different from the antient *Contrayerva*, to which it is not thought inferior. On account of its alexipharmic, diaphoretic, and antifebrile Qualities, it is prescribed in Conjunction with Absorbents for the Cure of malignant and petechial Fevers, Measles, and the Small-pox. *Contrayerva* is not, therefore, the Product of *Peru* alone, as the *Spaniards* assert; for we learn from Mr. *Des Marchais's Voyage en Guinée*, that Contrayerva, an Inch and an half thick, and four or five Inches long, is produc'd in *Guiana*, a Province of *South America*.

CONTRAYERVA GERMANICA. See ACONITUM.

CONTRAYERVA VIRGINIANA. See SERPENTARIA VIRGINIANA.

CONTRITIO, in Pharmacy, is *Comminution*.

CONTUSA. Contus'd Wounds; that is, Contusions or Bruises.

If an obtuse hard Body, either by its Motion, Resistance, Pinching, or Pressure, causes a Rupture of a great many small

ſmall Veſſels at once, the Injury thus received is call'd a *Contuſion*.

A *Contuſion* is a Solution of Continuity, produced in any Part of the Body, by an Inſtrument whoſe Surface does not riſe by way of Edge, but in any obtuſe Figure. By this means a *Contuſion* is diſtinguiſhed from a Wound, which is a Solution of Continuity produc'd by a ſharp cutting Inſtrument. Hence a *Contuſion*, if all other Circumſtances are alike, poſſeſſes a larger Space than a Wound, becauſe, in the former, a larger Portion of the Surface of the wounding Inſtrument is applied to the Body. Now 'tis ſufficiently obvious, that, ſince Action is equal to Reaction, the Effect will be the ſame, whether the obtuſe Body, put in Motion, ſtrike the Part of the Body, or whether the Part of the Body, put in Motion, ſtrike upon the hard obtuſe Obſtacle in a State of Reſt; whether the obtuſe Subſtance, by its Gravity, acts upon any Part of the Body; or whether that Part of the Body, by any kind of Pinching, is contus'd.

We muſt, therefore, conſider a Contuſion as an Accumulation of minute Wounds, with an Attrition of the Solids, and capillary Veſſels.

In the Place contus'd we may conceive as many ſmall Wounds, as there are Parts injured in the whole Circumference of the Contuſion: Hence the Aggregate, or Sum total, of the minute Wounds adjacent to each other, gives the cleareſt and moſt adequate Idea of a *Contuſion*. Thus, for Inſtance, when an Artery is cut aſunder by a Razor, a Wound is made in that Artery; but when it is divided by a large Number of ſmall Inciſions, made very contiguous to each other, a *Contuſion* of that Artery is nearly repreſented. Thoſe Parts that are hard, ſolid, and conſequently capable of making Reſiſtance, are, by the Cauſe producing the Contuſion, mangled and ſhatter'd into the ſmalleſt Fragments or Portions. Thus, for Inſtance, when the Bone of the Arm is, by any Cauſe, broken in two Pieces, this is call'd a Fracture; but, when it is ſhattered in ſmall Portions, it is then ſaid to be contus'd.

The Effect, therefore, of a Contuſion is,
Firſt, A lacerating Solution of Continuity.

That is Dilaceration, which happens when the ſoft Parts of the Body are, by any diſtractile Force, broken or drawn aſunder. This Diſtraction accompanies every *Contuſion*, which is, by this, diſtinguiſhed from a Wound, in which there is alſo a Solution of Continuity, but not a Diſtraction or Dilaceration, ſince a Wound is inflicted with a ſharp Inſtrument. A Contuſion may, indeed, accompany a Wound; but then the Diſorder is of the complicated Kind.

Secondly, An utter Deſtruction of many of the ſmall Parts.

In a Wound, there is only a ſimple Diviſion of thoſe Parts which before coher'd: Hence it often happens, that the largeſt Wounds are ſucceſsfully cured, whilſt the divided Parts, when brought into mutual Contact, coaleſce, and grow together again. But in Contuſions, the Parts are frequently ſo mangled, and their vital Structure and Make ſo deſtroy'd, that it becomes impoſſible to produce a mutual Union and Coaleſcence among them. Hence, in the Cure of Contuſions of this Kind, a Separation of all theſe Parts is neceſſary, becauſe, being totally deprived of a vital Influx of the Humours, they, of conſequence, become mortify'd, and like a heterogeneous Body, by their Intervention, prevent the Union of the adjacent live Parts. For this Reaſon *Hippocrates*, in his Book *De Ulceribus*, juſtly affirmed, *That contus'd Fleſh muſt neceſſarily be converted into Pus, and ſeparated from that which is ſound.* Hence he adviſ'd a Suppuration to be brought on with all poſſible Expedition.

Thirdly, An Effuſion of Liquids into the adjacent Cavities, or Cavities form'd in conſequence of the Injury; beſides many other bad Effects.

When the Veſſels are broken or dilacerated, the Fluids contained in them are diſcharged, and lodged in other Places, where they ought not to be. *Hippocrates*, in his Treatiſe *De Arte*, did not heſitate to pronounce, that the whole Body was full of Cavities; *For*, ſays he, *every Part of the Body, which is not of a compact or concreted Nature, is full of Cavities, whether it be covered with Fleſh or Skin. The Cavities which are ſound, and in their natural State, are filled with Air, whereas thoſe which are diſorder'd and indiſpos'd, are filled with Ichor.* Hence the diſcharged Humours will every-where find an eaſy Acceſs to theſe Cavities, whether large or ſmall; for almoſt every Veſſel, and every muſcular and tendinous Fibre in the Body, is ſheathed up in a Membrane, which is eaſily dilatable, and which conſiſts of a large Number of ſmall Cells, which have a mutual Communication with each other. Theſe leſſer Cavities, or Cells, are therefore diſperſed thro' the whole Body, and may be fill'd with the Humours diſcharged from the dilacerated Veſſels (ſee CELLULOSA MEMBRANA). This is ſtill more palpable and obvious, with reſpect to the larger and more conſiderable Cavities of the Body, ſuch as the Ventricles of the Brain, the Cavity of the Thorax, the Tracheæ, and Veſicles of the Lungs, the Pericardium, the Abdomen, and the Stomach. But the Humours, thus diſcharg'd, may not only fill the natural, large, and minute Cavities of the Body, but alſo, by being accumulated there, diſtend them, and of courſe ſeparate and disjoin the Parts before contiguous to each other; in conſequence of which, new Cavities are either form'd, or the Capacity and Bulk of ſuch as are natural ſurpriſingly enlarged. Whilſt, for Inſtance, after a violent Contuſion of the Head, in which the Veſſels of the Dura Mater are dilacerated, and the diſcharged Blood collected between it and the Cranium, the Dura Mater is ſeparated from the Cranium, to which it before adher'd; by which means a new and preternatural Cavity is formed.

The whole Train of Symptoms, ſubſequent to a Contuſion, may be reduced to three Claſſes; for, firſt, they ariſe either from this, that when the Solids are deſtroy'd, and the Humours diſcharged, thoſe Functions are aboliſhed, which depend upon a due and determinate Motion of the Fluids through the ſound Veſſels: Or, ſecondly, they ariſe from this, that the diſcharg'd Humours, collected either in the natural or preternatural Cavities of the Body, by their Bulk and Quantity preſs upon the adjacent Parts, and either totally deſtroy, or at leaſt diſturb, their reſpective Functions: Or, thirdly, the Humours, thus diſcharged, may, by their Continuance and Stagnation in the Cavities, acquire ſuch a Degree of Acrimony, as to corrode and deſtroy the adjacent Parts. If theſe three Claſſes are diligently conſidered, and applied to the ſeveral Parts of the Body, it will be ſufficiently obvious, that numberleſs Symptoms may happen, which cannot poſſibly be enumerated. A Caſe, related in the Memoirs of the Royal Academy of Sciences for the Year 1713. ſufficiently informs us, that Contuſions may be followed with a Series of very ſurpriſing Symptoms, and ſuch as cannot be foreſeen by the moſt ſkilful and knowing Surgeons; for a Man of ſixty Years of Age had the Misfortune to have a Carriage or Waggon drawn over his Breaſt, by which his Ribs were ſo contus'd and fractur'd, that a Splinter of one of the Ribs had only gently dilacerated the external Membrane of the Lungs. Hence a Part of the inſpir'd Air, paſſing through this ſmall Wound, inſinuated itſelf into the cellular Membrane, and inflated almoſt the whole Surface of the Body with a ſurpriſing Emphyſema; by which means the miſerable Patient was ſuffocated on the fourth Day. The celebrated *Paré*, in the ſixth Chapter of his twelfth Book, makes mention of ſuch a flatulent Swelling happening about the Ribs after Contuſions, tho' he ſeems not to have been perfectly acquainted with the Cauſe of this Phenomenon. Numberleſs Obſervations occur in practical Authors, which inform us, that, by violent Contuſions, tho' no Injury appear'd in the external Parts, the Liver, the Spleen, and other Organs, have been frequently broken, and a ſudden Death brought on. It has alſo ſometimes been obſerved, that violent Contuſions have been followed by immediate Death, when no remarkable Injury appeared to be done, either to the internal, or the external Parts. *Bohnius*, in his Treatiſe *de Renunciatione Vulnerum*, ſupplies us with a memorable Inſtance of this Nature. A certain Man was ſtruck on the Right Hypogaſtrium by a Stone, weighing ſeveral Pounds, and thrown with conſiderable Force, upon which he dropt down, and died immediately. When, by the Order of the Magiſtrates, *Bohnius* inſpected the Carcaſe, he found no manner of Injury either in the Integuments, Veſſels, or Viſcera; only in that Part of the Diaphragm which was contiguous to the ſpurious Ribs on the Right Side, he obſerved a Kind of Contuſion and Sugillation, the whole Circumference of which ſcarce exceeded that of half an Imperial.

But the worſt Sort of Contuſion is, when the internal Parts are affected in the manner already deſcrib'd, whilſt the Integuments cohere, and confine the extravaſated Fluids within; which, therefore, ſtagnate, coagulate, and putrefy.

The Skin is ſo tough, and the mutual Cohesion of its Parts ſo ſtrong, that it is not eaſily broken with an obtuſe Inſtrument; whereas the Veſſels lying under it, and running thro' the Panniculus Adiposus, are far more tender, and conſequently more eaſily broken. Thus, when any one ſtrikes his Finger with a Mallet, the Skin generally remains ſound, but a black Spot, produced by the Effuſion of the Blood from the ruptured Veſſels under the ſound Skin, deforms the contuſed Part, and renders it unſeemly. This Effect is in a more particular manner produced, when the Veſſels, lying under the Skin, are, by the Cauſe making the Contuſion, forcibly daſh'd againſt the hard ſubjacent Bone. Hence it is, that ſo large Tumors ariſe ſo ſuddenly, when the Head is ſtruck againſt any hard and reſiſting Obſtacle. But the Humours thus diſcharged from the dilacerated Veſſels, being pent up and confin'd by the ſound Skin, are accumulated, ſtagnate, and of courſe coagulate in the cellular Membrane, and may at laſt become putrid; tho' this laſt Accident will not happen very ſoon, if no Acceſs is permitted to the external Air. Various Misfortunes ariſe from this, the principal of which are theſe following:

Firſt,

First, An Ecchymosis.

This is an Effusion of the Humours from their respective Vessels under the Integuments, and which, by *Paulus Ægineta*, in *Lib. 4. Cap.* 30. is defined in the following Words: "When, says he, the Flesh is contused by the violent Colli-"sion of any Object, and its small Veins broken, the Blood "is gradually discharged from them." This Blood, when collected under the Skin, produces what we call an *Ecchymoma*. The Skin, in the mean time, remaining entire, a Tumor, which is soft, yielding to the Touch, livid, and, for the most part, without Pain, is form'd. *Galen* also, in *Commentar. in Aphor.* 20. *Sect.* 6. defines an *Ecchymosis* an Effusion of the Blood into the Cavities or Interstices contiguous to the Vessels; and, in *Commentar.* 3. *in Librum Hippocrat. de Medici Officina*, he uses these Words: "When contused Flesh discharges the "Blood under the Skin, this Disorder is call'd ἐκχύμωμα."

Secondly, A spurious Aneurysm.

When, for Instance, in consequence of the Injury done to a large Artery, a considerable Quantity of discharged Blood is collected in the Panniculus Adiposus under the Skin: Hence if, in consequence of a Rupture or Dilaceration of the smaller Vessels, a moderate Quantity of Blood is collected under the sound Skin, it is call'd an Ecchymosis: But if, in consequence of the Rupture of a large Vessel, the Skin is distended with the extravasated Blood, it is call'd a spurious Aneurysm.

Thirdly, Sugillation.

When the Pressure of the Atmosphere on the Surface of any Part of the Body is either lessen'd, or almost totally removed, whether by Suction, or the Application of Cupping-glasses, the Blood rushes into those Parts which are less press'd upon by the Air, distends the Vessels, and enters the small dilated Vessels, in which there is naturally no red Blood. In these Vessels the Blood is often so firmly impacted, that it cannot return: Hence red, livid, and frequently black Spots, are produced. For this Reason such a Spot, remaining after the Suction of any Part, is call'd Sugillation. But when any Part of the Body is struck with a Mallet, for Instance, the Blood-vessels being suddenly compress'd by this Blow, the Blood may be forced into the serous and lymphatic Vessels, and produce such a Spot, by remarkably changing the Colour of the Skin. Sugillation, therefore, differs from an Ecchymosis in this, that, in the latter, the Blood is discharged from the ruptured Vessels into the adjacent Interstices or Cavities; whereas, in a Sugillation, the Blood, in consequence of the strong Pressure, enters other Vessels, in which it ought not naturally to be; but which, at the same time, remain sound and entire: For this Reason the Sugillation rather appears in the Parts adjacent to that contused, than in itself. But 'tis obvious, that an Ecchymosis and a Sugillation often accompany each other, after violent Contusions; for which Reason these two Words are, by some Authors, frequently confounded, and promiscuously used, as importing one and the same Thing.

Fourthly, Ulcers and Gangrenes.

When, for Instance, the discharged Humours, becoming corrupted in consequence of their Stagnation, inflame or corrode the adjacent Parts. Sometimes also a Suffocation is produced, when, for Instance, the cellular Membrane is preternaturally distended by the discharged Humours; whence Gangrenes, and the most fatal Putrefactions, may ensue.

Fifthly, Caries.

When, for Instance, the above-mention'd Disorders penetrate so deep as to affect the Bone.

Sixthly, Scirrhus and Cancers in the Glands.

Since, from anatomical Discoveries, 'tis certain, that the Glands consist of a large Number of small Arteries, by whose various Disposition there is separated, from the arterial Blood, another Liquor, which, being collected, is discharged through their excretory Ducts; 'tis obvious, that, these Parts being injured by the Contusion, the small Vessels may be by this means destroy'd; or that the Emunctories of the Glands may be so compress'd or obstructed, as to prevent the free Discharge of the Humours secreted thro' the arterial Fabric of the Glands: Hence, from the Stagnation of these Humours, the Exhalation of their more fluid Parts, or their Absorption into the small Veins, arises an Inspissation of the secreted Fluid; by which means a Tumor is produced, which is hard, scarce capable of Discussion, and indolent. This Species of Tumor is, by Physicians, call'd *Scirrhus*; and, when it becomes inveterate, highly hard, rough, and accompanied with Pain, it is call'd a *Cancer*.

Contusions often affect the Bones, and are then productive of Disorders analogous to those which are caused by Contusions of the Head (describ'd under the Article CAPUT): Hence the Marrow is injured; and from this Source arise Ulcers, Fistulas, Caries, and Putrefaction; for the Marrow is situated in the Bones, as the Brain is in the Cranium.

When the Contusion affects the Bones themselves, the Vessels distributed between the small Lamellæ, which constitute the Fabric of the Bones, may be either compress'd, or totally destroy'd: Hence the vital Influx of the Humours into these Lamellæ is abolish'd, which, therefore, becoming mortified, must necessarily be separated from the live subjacent Parts. This Disorder may gradually spread and diffuse itself thro' the whole Substance of the Bone, as is explain'd under the Article CAPUT.

As for Injuries done to the Marrow of the Bones, these are greatly to be dreaded in Contusions; for the Marrow is deposited in the Cavities of the larger Bones, and a Substance of a similar Nature is dispersed thro' the bony Cellulæ. As the Brain is defended from Injuries by a bony Covering, so the Marrow is lodged in the Cavities of the Bones. In like manner, as the Brain is cover'd with a peculiar Membrane, call'd the Pia Mater, which receives and preserves the Vessels, which enter the Substance of the Brain; so the Marrow is surrounded with a very tender Membrane, destin'd for similar Purposes. The arterial Vessels of the Pia Mater appear very tender, after they are divested of their thicker Coats. This same Circumstance holds true, with respect to the Vessels distributed to the Substance of the Marrow. Thus the Marrow, taken from the Thigh-bone of an old Ox, may, by the Fingers, be easily reduced to a kind of oleous colliquated Mass; tho' 'tis certain, that this Marrow receives Supplies from numberless Arteries, which are distributed to it. As, when the Cranium is fissured, fractured, or contused, the Disorders, arising from an Effusion or Corruption of the Humours, may affect the Brain itself; so Injuries done to the Bones may, in like manner, prove prejudicial to the Marrow contain'd in them. As by a violent Concussion of the Head the tender Vessels of the Brain may be destroy'd, whilst, at the same time, the Cranium remains sound and entire; so the like Misfortune may happen to the Marrow, when the Bones, in which it is lodged, are forcibly struck. But when the tender Vessels of the Marrow are injured by having the Disorder of the surrounding Bone communicated to them, or by any other Cause, the medullary Oil, discharged from the ruptured Vessels, will stagnate, acquire a rancid Acrimony of the worst Kind, corrode all the adjacent Parts, and render the Bone itself carious: Hence arise malignant Ulcers, and such as scarcely admit of a Cure; obstinate Fistulas, not to be heal'd till this medullary Corruption is removed; a virulent oleous Putrefaction, preying upon all the adjacent Parts; and numberless other Disorders.

Sometimes the muscular Parts are injured by Contusions; whence considerable Suppurations, Gangrenes, Palsies, and Contractions. But if, from a Contusion, any large Nerve, which sends out a great Number of Branches, is corrupted, then a Palsy, Atrophy, certain and incurable Insensibility, or Gangrene, of all the Parts below the contused Nerve, ensue. And this is in a particular manner true, with respect to the Spine of the Back, and the Medulla thereof.

As for the muscular Parts, when injured, 'tis certain, from anatomical Discoveries, that every visible Muscle may be separated into smaller Bundles of muscular Fibres: Nor hitherto, even by the Assistance of Microscopes, has any End of such a Separation or Division been found; for no one ever yet saw a single muscular Fibre, but only a Congeries of them collected into one common Body. These Bundles of muscular Fibres are inclosed in a thin cellular Membrane, which contains a certain subtile pinguious Fluid, destin'd for the Lubrication of the Fibres. So incredible a Number of Arteries are distributed among the Interstices of these Bundles, and in the cellular Membrane, lying between them, as is certain from the Injections of *Ruysch*, that they seem almost to constitute or make up the whole Substance of the Muscle. These Arteries have also correspondent small Veins and Nerves distributed thro' the Substance of the Muscle. When, therefore, a Muscle is contused, these Vessels may be ruptured, and the Humours discharged into the Cavities of the cellular Membrane, where, being collected, they may compress the adjacent Parts. These extravasated Humours may also be corrupted, and, acquiring an Acrimony, corrode the contiguous Parts: Hence Inflammations, Suppurations, Gangrenes, and other Disorders arising from them, may be produced. Suppurations, proceeding from this Cause, are, of all others, the worst; because the Pus, form'd in the cellular Membrane, surrounding the muscular Fibres, will find out uncommon Ways for itself, and may spread thro' all the Windings and Meanders of this Membrane, and by that means produce the worst of Sinuses and Fistulas. Add to this, that, by a long-continued Suppuration, this cellular Coat being consumed, which not only separates the Bundles of Fibres, but also, in all Probability, the single muscular Fibres from each other, these would coalesce, and grow together;

ther: Hence the free Expanſion of theſe Fibres, by the Cauſes which diſtend the Muſcles, when acting, will be prevented, and muſcular Motion either depraved, or entirely deſtroy'd. The muſcular Fibres themſelves, properly ſo call'd, may alſo be deſtroy'd by a ſtrong Contuſion: Hence muſcular Motion, to which the ſound and entire State of theſe Fibres is requiſite, will ceaſe, and a Palſy of the Muſcle, that is, an Inability of exerting its proper Motion, together with a preternatural Laxity, will be produced. From this Cauſe Contractions may alſo ariſe, when, by a ſtrong Suppuration, the cellular Membrane, which ſeparates the muſcular Fibres, being deſtroy'd, theſe grow together, and become impervious to the fineſt Humours: Hence they are gradually ſhorten'd, and can never afterwards be drawn out, to their former Length, by any Force. From this, ſurpriſing Contractions of the Members may ariſe; as alſo from this, that, when the Action of any Muſcle is deſtroy'd, its antagoniſt Muſcle continues to act, and continually draws the Member, to which it is affix'd, to its Origin; by which means that Member, at laſt, becomes ſtiff; and for this Reaſon 'tis, that Contractions are ſo frequently ſubſequent to long-continued Palſies.

But when, by a Contuſion, ſome of the muſcular Fibres are dilacerated in ſuch a manner, as not to deſtroy the Action of the Muſcle, this ſeems to be another Diſorder, which is, indeed, highly painful; and which the antient Phyſicians call'd σπάσμα, or Divulſion, and ῥῆγμα, a Rupture. *Galen*, in *Commentar. 3. in Librum Hippocrat. de Medici Officina*, when ſpeaking of a Contuſion, uſes the following Words: "It is "certain, that, in the Formation of Ecchymoſes, [ἐκχυμα-"μάτων] the ſmall Veins are divided with the Fleſh: But "Divulſions [σπάσματα] happen in the muſcular Fibres, when "ſome of them are ſo preternaturally diſtended as to break; "and the later Phyſicians call theſe Diſorders *Ruptures*, [ῥήγ-"ματα] which were firſt mention'd by *Hippocrates*." Theſe Ruptures are, by *Hippocrates*, in his Treatiſe *de Morbis, Lib.* 1. *Cap.* 8. deſcrib'd in the following Words: "In ſome Caſes, "ſays he, when gentle Divulſions are made in the Fleſh or "Veins, no Suppuration enſues; but long-continued Pains are "brought on, and theſe Divulſions are call'd [ῥήγματα] Rup-"tures." In the End of the ſame Chapter he adds the following Words: "Divulſions are produced by too violent Ex-"erciſe, by Falls, by Wounds, by lifting too heavy Burdens, "by Running, by Wreſtling, and other Things of a like Na-"ture." He alſo ſeems to have had theſe in his View, when, in his *Coacæ Prænotiones*, he uſes theſe Words: "All Divul-"ſions are indeed troubleſome, and, at firſt, accompany'd with "intenſe Pains; from which they are not entirely free in the "future Courſe of the Diſorder: But Divulſions of this Kind, "happening about the Thorax, are moſt dangerous, and cured "with the greateſt Difficulty." It is to be obſerved, that ſome Tranſlators have render'd the Word σπάσματα by *Convulſions*, but very improperly; ſince the Word σπασμοὶ was, by the *Greeks*, uſed for *Convulſions*. *Galen*, in *Method. Medend. Lib.* 4. obſerves, that the ſmall muſcular Fibres, when thus disjoin'd, are, with Difficulty, reunited; for he was of Opinion, that the divided Fleſh would eaſily coaleſce, if the Ecchymoſis is ſufficiently ſoon diſcuſs'd; but when it was a conſiderable Time before this Effect was produced, he thought, that the collected Sordes interpoſed themſelves between the disjoin'd Fibres, and prevented their Reunion: Hence the Pain is renew'd by too intenſe Exerciſe, the Acceſs of a Fever, too languid a Concoction of the Aliments, and other Cauſes of a like Nature. An Effect, ſomewhat analogous to this, is obſerved, when, after ſtrong Efforts, or the Attempts to lift too heavy Burdens, very intenſe Pains ariſe ſuddenly, which often rack the Patient for a long time, and are increaſed by the leaſt Motion of the Body. 'Tis undeniably confirm'd by Experience, that, in Pains of this Kind, an entire and uninterrupted State of Reſt is the moſt efficacious Cure: And *Hippocrates*, in his Treatiſe *de Morbis, Lib.* 2. in [ῥήγματα] Ruptures of the Breaſt or Back, order'd the Patient to abſtain from Labour for a whole Year. In his Treatiſe *de Morbis internis*, after he has told us, that this Diſorder was produced by immoderate Exerciſe, he informs us, that Reſt is abſolutely neceſſary, otherwiſe the Diſeaſe returns in a more terrible Shape, than that in which it firſt appear'd.

As for the Corruption of large Nerves, in conſequence of a Contuſion, if we conſider the Nerves, with reſpect to their Origin, as ariſing from the Medulla Oblongata, or the ſpinal Marrow, 'tis obvious, that they are highly ſoft. If the Extremities of the Nerves are view'd in thoſe Parts, where, being diveſted of their Coverings, they conſtitute that corporeal Organ, by a Change induced in which, by external Objects, new Ideas are convey'd to the Mind, by means of the Senſes, they appear ſurpriſingly tender. This is ſufficiently confirm'd by the highly ſoft Pulp of the auditory Nerve, and by the Retina of the Eye, which collapſes to a ſhapeleſs Mucus, unleſs preſerved in its natural State by the uniform and equable Preſſure of a circumambient Fluid. But theſe ſurpriſingly tender nervous Stamina are ſafely convey'd to the Extremities of the Body, by being defended and wrapt up in tough Coats. If, therefore, a large Nerve, in its Courſe from its Origin to the Extremities of the Body, ſhould happen to be contuſed, this pulpous and ſurpriſingly ſoft Subſtance may be injur'd, or even deſtroy'd, tho' the Coat or Covering of the Nerve ſhould appear to be unhurt. By this means all thoſe Functions will be deſtroy'd, which depend upon the Soundneſs of the Nerves collected and terminating in this large Nerve. This is obvious from the Experiment made by *Valſalva*, and mention'd under the Article CAPUT; for when that Anatomiſt tightly applied a Thread to the cardiac Nerves of a Dog, and immediately removed it again, the Animal, a few Days after, died in the ſame manner as if theſe Nerves had been cut off; and yet, after the Death of the Dog, no ſenſible Injury appear'd to have been done to theſe Nerves; but the Ligature had ſo compreſs'd the pulpous and nervous Subſtance itſelf, that the free Influx of the Spirits, into theſe Nerves, was totally intercepted.

But the Reaſons why an incurable Gangrene ſhould follow, upon the Deſtruction of a large Nerve, and more eſpecially an Injury done to the ſpinal Marrow, are enumerated under the Article VULNUS; where memorable Caſes are alſo related, in Confirmation of this Truth.

Sometimes Contuſions injure the Viſcera; whence ariſe Inflammations, Suppurations, Gangrenes, Scirrhuſes, and a Depravation of the Functions peculiar to the Part affected.

What terrible Diſorders may ariſe from violent Contuſions of the Head, even when the Brain is not injured by them, is obſerved under the Article CAPUT. The Viſcera, contain'd in the Cavities of the Breaſt, are ſafely incloſed, and everywhere defended by the Ribs, the Sternum, and the Spina Dorſi: Yet the ſurpriſing Caſe already ſpecified informs us, that theſe Viſcera may alſo be injured by Contuſions; ſince, in it, a Splinter of the Rib lacerated the external Membrane of the Lungs, upon which an uncommon Emphyſema and Death enſued. The abdominal Viſcera are more ſubject to be injured by Contuſions, as the greater Part of the Abdomen is only cover'd with ſoft Integuments. The Spleen, however, and moſt Part of the Liver, are defended by the ſpurious Ribs. But that, in conſequence of violent Contuſions, theſe Viſcera have ſometimes been crack'd, and ſudden Death produced, is obvious from the medicinal Obſervations ſpecified under the Article VULNUS. Nor does this appear in the leaſt ſurpriſing, when we conſider, that the Liver and Spleen are ſo tender, that the higheſt Caution is neceſſary, in order to take them entire from a Carcaſe: Hence it is, that violent Contuſions of the Abdomen prove ſo frequently, and ſo ſuddenly, mortal. *Paré* informs us, that, whilſt two Prize-fighters were putting their Strength and Dexterity to the Teſt, the one, who was of a low Stature, but well made, forcibly threw the other, who was taller, on the Ground; but, being enraged at this, he afterwards ſeiz'd his Adverſary, and throwing him down, with his Elbow placed upon the Pit of his Stomach, and thus falling on him with the Weight of his whole Body, he kill'd him on the Spot. In the Carcaſe, when inſpected, a large Quantity of extravaſated Blood was found in the Cavities both of the Thorax and Abdomen. Numberleſs Obſervations occur in practical Authors, from which 'tis certain, that various Viſcera have been ſo injured by violent Contuſions, that Death, or the moſt terrible Diſorders, have enſued; for, by theſe Contuſions, the Veſſels may be ruptured, and the Humours diſcharged; and theſe extravaſated Humours, becoming corrupted, may, by corroding the adjacent Parts, produce very terrible Symptoms; ſuch as an Inflammation, with all its Conſequences, a Suppuration, for Inſtance, a Gangrene, and the other Effects of Inflammation. And ſince all the Functions of the Viſcera depend upon the ſound and entire State of the Veſſels, and the due Circulation of the Fluids thro' them, 'tis alſo obvious, that theſe Functions may not only be depraved, but totally aboliſh'd and deſtroy'd.

From what has been ſaid, many and miſerable Diſorders, the Conſequences of Contuſions, may be readily explain'd and prognoſticated, and theſe both of the acute and chronical Kind.

If what has been already ſaid with reſpect to the true Nature of a Contuſion, and the Effects neceſſarily accompanying every Misfortune of this Kind, be applied to the ſeveral Parts of the Body, which may be injured by Contuſion, it will be ſufficiently obvious, what Symptoms are to be dreaded; and theſe may be ſafely prognoſticated from a Knowledge of the Structure and Uſe of the particular Parts contuſed. Thus, for Inſtance, if any one, by a Fall, has daſh'd his Right Hypochondrium againſt ſome hard and obtuſe Obſtacle, and if ſoon after a preternatural Yellowneſs appears in his Eyes and Skin, we, by this Circumſtance, know, that the repel'd Bile has contaminated the Maſs of Blood; and, conſequently, that the Region of the Gall-bladder, and the Liver itſelf, are injur'd by the Contuſion. Now, if we conſider, that the Subſtance of the Liver is ſo tender, that it reſembles a Sponge full of Blood, 'tis highly

highly to be dreaded, leſt, by a Rupture of its Veſſels, a large Quantity of Blood ſhould be diſcharged into the Cavity of the Abdomen: Hence Convulſions, Faintings, and often ſpeedy Death, will enſue. If, on the contrary, the Diſorder is but ſlight, and only the ſmaller Veſſels, diſtributed through the Subſtance of the Liver, ruptured, the diſcharg'd Humours, by preſſing the adjacent Veſſels, or, if they become corrupted, by corroding them, may produce an Inflammation, a Suppuration, and a Scirrhus, in this Organ: Hence, after ſuffering the moſt intolerable Agonies, a ſlow Death will enſue. If the Region of the Loins is injured by a violent Contuſion, and a Diſcharge of bloody Urine enſues, we, from this Circumſtance, know, that the ſmall Veſſels of the Kidneys are ruptured; by which very terrible Diſorders will be frequently produced; for the Clots of coagulated Blood, falling into the narrow Parts of the Pelvis and Ureters, will entirely intercept the Paſſage of the Urine from the Kidneys to the Bladder: And hence an Inflammation of the Kidneys, and an Iſchury, or Retention of Urine, will be brought on. Beſides, a ſmall Clot of Blood, remaining in theſe Parts, may afford a proper Baſis, around which a Stone may, in Proceſs of Time, be form'd, which will prove a freſh Source of other Diſorders. Now, if we conſider, that the ſame Misfortune may happen in any of the other Viſcera, it will be ſufficiently obvious, that numberleſs Diſorders may enſue, which will either ſoon deſtroy the Patient; when, for Inſtance, the Humours are extravaſated, or when the Fabric and Structure of thoſe Parts, whoſe Soundneſs is abſolutely neceſſary to Life, are deſtroy'd; or elſe, when ſome of the Functions of the Parts are only deprav'd, the Life of the Patient may be preſerved; but, at the ſame time, the State of his Health will be far from being good. From this Source chronical, and often incurable, Diſorders will proceed. This is confirm'd by the lamentable Caſe of a celebrated General, who, when mounted upon a high-mettled Horſe, ruſh'd in upon the Front of his Enemies: But the Horſe, happening to be wounded, ſuddenly ſprung upwards, by which means the Riſing of the Saddle was forcibly daſh'd againſt the Region of the Stomach. This Misfortune was immediately ſucceeded by a copious vomiting of Blood. But as this brave Soldier did not obſerve a moderate Regimen, and not only lived intemperately, but alſo entirely neglected his Misfortune, he, indeed, ſurviv'd the Accident for a conſiderable Time, but was afterwards conſtantly afflicted with various Pains of his Stomach, and then with a troubleſome Vomiting and Dyſentery, till at laſt Death put an End to his Miſery. Upon laying his Body open, a large Part of his Liver, and the Whole of his Pancreas, were found cancerous. Terrible Diſorders are in like manner produced by Contuſions of the Teſticles. *Van Swieten* informs us, that he ſaw one of the Teſticles render'd ſcirrhous by a Contuſion, which, being afterwards unſkilfully treated with emollient and ſuppurating Medicines, grew to ſuch an enormous Bulk, that the Scrotum, with the included Teſticle, almoſt reach'd the Patient's Knee. This Teſticle, as that Author informs us, was afterwards conſumed by a Cancer of the worſt Kind; which, after ſubjecting the Patient to the moſt intolerable Pain, at laſt killed him, though his Conſtitution, in other reſpects, was ſound and vigorous.

A Contuſion is diſcovered, and the Part affected is diſtinguiſhed,

Firſt, By the Sight and Touch.

For when Veſſels are ruptured under the entire Skin, the extravaſated Humours fill and diſtend the Panniculus Adipoſus: Hence the Tumor and Softneſs of the contuſed Part are ſubjected to the Sight and Touch, eſpecially in Contuſions of the Head; becauſe the hard ſubjacent Bone of the Cranium contributes to make the extravaſated Humours raiſe and elevate the Skin more than they would otherwiſe do. Hence it happens, that ſo enormous Tumors are often ſo ſuddenly produced by Contuſions of the Head.

Secondly, By the Effects; as Pain; Stupor; a Senſe of Gravity; a Change of the natural Colour to red, brown, lead Colour, black, yellow, or green; Hæmorrhage; or Gangrene.

Almoſt every Contuſion is accompanied with Pain. But, when, in conſequence of a very violent Contuſion, all the Veſſels are almoſt deſtroy'd, then the Pain is either none at all, or at leaſt very faint and ſlight: In this Caſe, there is a Stupor, and Senſe of Weight, in the Part affected; which denote, that the Nerves in the contuſed Part are either deſtroy'd, or ſo compreſſed by the extravaſated Humours, or the Cauſe producing the Contuſion, that they are render'd incapable of Senſation. But ſince the extravaſated Blood is collected under the Skin, which, for the moſt part, remains entire, the Colour of the contuſed Part is changed in proportion to the Quantity of extravaſated Blood, and the Time elapſed ſince the Contuſion was made; for a ſlight Contuſion is only at firſt ſucceeded by a rediſh Colour of the Part; for when the ſmall Veſſels are ruptur'd, they only diſcharge an inconſiderable Quantity of Blood. But this rediſh Colour will in a few Hours become more dark, and at laſt aſſume a blackiſh Caſt. But, after ſevere Contuſions, the Colour of the Part affected is often ſpeedily chang'd into a lead Colour, or becomes livid, and frequently blackiſh; becauſe a large Quantity of concreted Blood is lodg'd under the Skin, which ſtill remains entire. And though at firſt the Colour of the Part was red, yet afterwards, when the fineſt Part of the extravaſated Blood is diſpel'd, or again abſorb'd, the Remainder of it is of a blackiſh Colour. Nor ought this leaden and livid Colour of the contuſed Part to ſtrike a groundleſs Terror in the Surgeon, becauſe it is not always a Sign of a Gangrene; for a Part, becoming livid in conſequence of a Gangrene, is diſtinguiſhed by its Coldneſs, and by the ſmall Bubbles which ariſe on the Epidermis, and are full of Ichor. When the concreted Blood begins to be gradually reſolved and diſſipated, then the leaden, or even the blackiſh, Colour becomes proportionably fainter, and begins to aſſume a rediſh Caſt. A yellow or ſlight greeniſh Colour, alſo, appears about the Margins of the Contuſion, in proportion as the red Parts of the Blood are gradually reſolved and diſſipated; which denotes, that the extravaſated and concreted Humours begin to be diſſolved. Almoſt every one knows, that when Blood is taken from the Vein of a ſound Man, it is ſoon after ſeparated into two diſtinct Subſtances; that is, the limpid, yelloviſh Serum, and the red, concreted Part, which ſwims in it. If all this Serum is poured away, a few Hours after, a conſiderable Quantity more will appear; whilſt, in the mean time, the red concreted Maſs is gradually leſſen'd, and melted down into Serum; ſo that, by often pouring off the Serum, almoſt the Whole of the red and concreted Part is conſumed. This ſeems alſo to happen in Contuſions, becauſe the concreted Blood is gradually reſolved into a fine Serum. Hence proceeds that Change of Colour obſervable in contuſed Parts, when the Attenuation and Diſſipation of the extravaſated Blood begins to happen. *Hippocrates*, in his Treatiſe *de Fracturis*, when ſpeaking of a Fracture of the Os Calcis, takes particular Notice of this Circumſtance; for he reckons it among the beſt Signs, and ſuch as remove the Dread of a Relapſe: "When "Ecchymoſes [ἐχχυμώμαϛα] blackiſh Spots, and the Parts ad-"jacent to them, aſſume a greeniſh Colour, without any "Hardneſs; this, in every Ecchymoſis, is the beſt and moſt "ſalutary Sign."

But Contuſions are rarely ſucceeded by violent Hæmorrhages, except in Caſes where the Skin is divided by a pretty large Wound; for the Blood diſcharg'd from the ruptur'd Veſſels, being collected in the Panniculus Adipoſus, becomes grumous, and blocks up the Paſſage of the Blood, which would otherwiſe be diſcharg'd. But when the Viſcera, or larger Veſſels, are injured by a Contuſion, a conſiderable Quantity of Blood may be pour'd into the Cavities of the Body; when, for Inſtance, the Liver is thus injur'd. But, in this Caſe, the Paleneſs of the Countenance, the Coldneſs of the Extremities, the preternatural Weakneſs, and the Syncopes, ſufficiently indicate ſuch an internal Hæmorrhage. But when, in conſequence of a violent Contuſion, all the Veſſels of any Part of the Body are ſo deſtroy'd, as totally to prevent the Influx and Efflux of the Humours in this Part, then a Gangrene, or a Mortification of the Part, is produced.

Thirdly, By comparing the Part affected with the Cauſe of the Injury.

When we are appriſed, that a hard obtuſe Body, put in Motion, has ſtruck upon any Part of the Body; or, *vice verſa*, that any Part of the Body, put in Motion, is daſh'd againſt ſuch a hard and obtuſe Obſtacle; we, from either of theſe Circumſtances, know, that a Contuſion is produced. Hence it happens, that Wounds are often accompanied with Contuſions, unleſs when the wounding Inſtrument is ſharp. The Nature and Situation of the Parts injured are carefully to be adverted to. Thus, for Inſtance, the Viſcera of the Thorax are not ſo eaſily and readily injur'd by Contuſions, as thoſe of the Abdomen. Hence we underſtand;

Firſt, That an internal and large Contuſion of any of the more noble Viſcera is incurable, and the frequent Cauſe of Diſeaſes and Death.

For when the Veſſels are ruptur'd, either a mortal Hæmorrhage, and ſuch as cannot be ſtopt, will enſue; or the contuſed Parts muſt, by a Suppuration, be ſeparated from thoſe which are ſound, as *Hippocrates* obſerves in the Paſſage already mentioned. But from internal Suppurations of the Viſcera, Conſumptions frequently ariſe, which ſlowly deſtroy the Patient. Beſides, ſince each of the Viſcera contributes to the Preſervation of perfect Health, after the Suppuration, the Functions of the injur'd Bowel will be ſo diſorder'd, that Life may indeed poſſibly remain, but the Patient will continue in a miſerable and morbid State of Health: But, ſince ſuch Injuries frequently happen from Contuſions, eſpecially in the Liver and Spleen, on account of their tender and friable Nature, hence it is ſufficiently obvious, that the worſt Conſequences are to be expected, that the Cure muſt be very difficult, and that it

is very rarely poſſible to reſtore the Patient to perfect Health; ſince, during the remaining Part of his Life, there almoſt always remains ſomething of a ſcirrhous Nature, which will diſturb the Functions of the injur'd Organ.

Secondly, That Contuſions of the Bones are very dangerous, and difficult to cure; eſpecially when they happen near the Joints; and when the Marrow is injur'd.

For when thoſe Veſſels are ruptur'd, which convey Life and Nouriſhment to the Laminæ of the Bone, theſe Laminæ will of courſe become mortified, and muſt be ſeparated: But if ſuch a Contuſion ſhould happen, eſpecially about the Joints of the larger Bones, no Separation is to be expected; for in theſe Parts the bony Laminæ recede from each other, and form ſmall Cells, in which there are numberleſs Blood-veſſels, and others which contain a very fine and ſubtile Oil, which will, therefore, be deſtroy'd; and the extravaſated Humour, ſtagnating, will become highly corrupted: Hence a Caries of the Bone is produced, and all the Train of Diſorders, which can draw their Origin from it. But, if the Marrow itſelf is thus injur'd, an unhappy Change into a rancid Acrimony, a Corroſion of the Bone, and a Corruption of all the Parts which cover it, will neceſſarily enſue. Add to this, that the Bones cannot be contuſed about the Joints, but the Ligaments, which connect and join the articulated Bones, muſt at the ſame time be injured. Hence the moſt intenſe Pains, Anchyloſes, and other Diſorders, may ariſe.

Thirdly, That Contuſions of the Cranium are worſt of all, on account of the Vicinity of the Brain, as has been already explain'd under the Article CAPUT.

Fourthly, That Contuſions of the larger Glands, as thoſe near the Ears and Armpits, thoſe in the Breaſts, the Pancreas, the Groins, and Uterus, endanger a Scirrhus, a Cancer, and all their Conſequences.

For, in all the Parts here enumerated, there are conſiderable Glands ſituated, from the Contuſion of which, the moſt violent Diſorders often proceed. Among ten Caſes, where there are Scirrhuſes and Cancers of the Breaſts, nine of them, perhaps, ariſe from Contuſions. Thus I ſaw, ſays *Van Swieten*, a miſerable Woman, who had her Breaſt contuſed by her Daughter's Elbow, whilſt, ſleeping in the ſame Bed, ſhe endeavour'd to turn herſelf, by leaning her whole Weight on her Mother's Breaſt. In a few Weeks the whole Breaſt became ſcirrhous, immenſely large, and was at laſt ſeiz'd with a formidable Cancer: Diſorders of the like Nature are obſerved to ariſe from Contuſions about the Parotids, the axillary and inguinal Glands. The Uterus of ſuch Women as are not with Child, is every-where ſufficiently defended by the Bones of the Pelvis; for which Reaſon it cannot be eaſily contuſed. But, in pregnant Women, as the Bottom of the Uterus riſes above the Oſſa Pubis, it may of conſequence be eaſily injur'd by Contuſions, as alſo by the imprudent Management of Midwives, or by difficult Labours; after which, Scirrhuſes of the Uterus are ſo often obſerv'd to degenerate into cancerous Ulcers.

In the Cure of a Contuſion, Reſolution muſt be attempted; Suppuration muſt, if poſſible, be prevented; but much more a Gangrene.

Since, in Contuſions, the ſolid Parts of the Body are mangled and ruptur'd, whilſt at the ſame time the extravaſated Fluids poſſeſs Interſtices, in which they ſhould not actually be; the Intentions of Cure muſt of courſe conſiſt in removing the extravaſated Humours, and uniting the ſolid Parts now ſeparated. Theſe Ends are moſt effectually anſwer'd by reſtoring a due Degree of Fluidity to the concreted Humours; for, by this means, being abſorb'd by the bibulous Veſſels, they will circulate with the reſt of the Juices. This is call'd a Cure by Reſolution. But a Suppuration is, if poſſible, to be prevented, ſince, by its Means, a great Part of the Subſtance of the contuſed Part is always deſtroy'd, whilſt all that, in which the Circulation can no longer be carried on, is ſeparated. Hence unſeemly Scars often remain, and ſometimes, after violent Suppurations, the cellular Membrane being conſum'd, the Muſcles and Tendons grow to the adjacent Parts; by which means their Uſe and Functions are diſturb'd, and ſometimes totally deſtroy'd. Though a Suppuration cannot always be prevented, yet 'tis certain, that, by the Application of the Remedies we ſhall afterwards ſpecify, ſuch Contuſions may often be reſolv'd, as without their Uſe, or with the too late Application of them, would have certainly ended in Suppurations. 'Tis ſufficiently obvious, that a Gangrene is ſtill more carefully to be guarded againſt, ſince, by its means, the vital Influx and Efflux of the Humours, into the Part affected, is totally prevented; and afterwards all the mortified Part muſt be ſeparated, by Suppuration, from the live adjacent Parts.

Reſolution is accompliſh'd by removing the extravaſated Liquids, without any farther Injury to the Veſſels.

In all Contuſions, a Removal of the extravaſated Liquor is univerſally indicated as neceſſary; but, when by making an Inciſion in the contuſed Part, the extravaſated Humours are evacuated, this cannot properly be call'd Reſolution, ſince a new Injury is done to the Parts. This alſo holds true, when the Cure is accompliſh'd by Suppuration; for, in this Caſe, the Ends of the injur'd Veſſels are ſeparated and diſcharged with the extravaſated Humours in the Form of Pus. But, in order to produce a Cure by Reſolution, 'tis neceſſary, that no farther Injury ſhould be done to the Parts, whilſt, at the ſame time, the extravaſated Humours are removed. This is what *Hippocrates*, in his Treatiſe *de Articulis*, calls, *to dry and reabſorb the extravaſated Blood*; for, when treating of thoſe Diſorders which follow Contuſions of the Fleſh about the Ribs, when not fractur'd, after he has preſcrib'd proper Remedies, he adds, that proper Bandage is highly neceſſary, till the Ecchymoſis is dry'd up and reabſorb'd, which is produced by the Rupture, Θλάσει.

This Reſolution is brought about;

Firſt, By rendering the extravaſated Humours fluid.

The Blood, diſcharged from the Veſſels, is immediately concreted, and becomes unfit both to circulate thro' the minute Blood-veſſels, and to be reabſorb'd by the ſmall Mouths of the Veins. The firſt Thing requiſite is, therefore, to procure a due Degree of Fluidity to the concreted Humours; for, if theſe extravaſated Juices can be reduced to the Fineneſs and Subtilty of Water, they will certainly be diſſipated, provided the Conſtitution of the Patient is ſound in every other reſpect. *Hippocrates*, who acknowledg'd, that the whole Body was expirable and inſpirable, in the ſixth Book of his *Epidemics*, aſſerts, *that Fleſh attracts the Fluids both from the Cavities of the Body, and from without*. Hence the bibulous Veins, diffuſed thro' all the Cavities of the Body, whether large or ſmall, will reabſorb the extravaſated Juices, provided they be only ſo attenuated, as to enter their ſmall Orifices.

Secondly, by relaxing the adjacent Veſſels.

The extravaſated Fluids, when ſufficiently attenuated, will be reabſorb'd; but, at the ſame time, they firſt enter the ſmall and minute bibulous Veins, and are from thence convey'd into the larger Ramifications; for 'tis certain, from Experiments accurately made, that ſmall Glaſs Tubes, whoſe Ends are immerſed in any Fluid, attract that Fluid into their Cavities; and that it aſcends higher in them, in proportion to the Narrowneſs of their Diameters, and according as they recline from a perpendicular to an horizontal Direction, but moſt of all, when their other Extremities are turn'd downwards; for then the Gravity of the Fluid aſſiſts that Force, by which it is drawn or attracted into theſe Tubes. The extravaſated Humours, when previouſly attenuated, ſeem to enter the ſmall Veins in the ſame manner, and by the ſame Laws. But ſuch is the Structure of the Valves conſpicuous in the ſmalleſt lymphatic Veins, that the Preſſure of the Fluid retained by them by no means hinders the extravaſated Liquor from being abſorb'd. Flexible Tubes are the more eaſily fill'd, the leſs the Reſiſtance made by their Sides is. Hence, in conſequence of the Laxity of the adjacent Veſſels, theſe ſmall reſorbent Tubes are enabled the more eaſily to convey the Fluid they have abſorb'd to the largeſt Ramifications, which in this Caſe is neceſſary.

Thirdly, By procuring the Reſorption of the extravaſated Humours into the Veſſels, by evacuating theſe Veſſels, or by Frictions.

The Fluids, thus abſorb'd by the minute venous Ducts, will the more eaſily be convey'd thro' the larger Ramifications, the ſmaller the Quantity of the Liquid, to be thus convey'd, is; provided the other Cauſes, promoting the Motion of the venous Blood, remain the ſame. The principal of theſe Cauſes are the Pulſation of the Arteries adjacent to the Veins, and muſcular Motion; for the Muſcles, during their Action, becoming turgid, the adjacent Veins are by that means compreſs'd, and the Blood contain'd in them of courſe propel'd to the Heart. If, therefore, the Quantity of Fluids to be moved is leſſen'd, whilſt, at the ſame time, the moving Cauſes remain equally ſtrong, 'tis obvious, that the Veins muſt be proportionably ſooner emptied, and conſequently that the Fluid to be abſorb'd muſt, with the greater Eaſe, enter the ſmall Mouths of the minute bibulous Veins. This is confirm'd by Experience; for, when certain Men were travelling in the ſcorching Heat of the Sun, their Bodies became rough and ſqualid, their Mouths were parched, and they were tormented with a burning and inſatiable Thirſt; but, after the Uſe of the Bath, they were ſurpris'd to find their Thirſt extinguiſh'd, their Mouths moiſten'd, their whole Bodies ſoft, humid, and free from their former Roughneſs. This Inſtance is brought by *Galen*, in *Comment.* in *Lib.* 6. *Epidem. Hippocr.* in order to prove, that the whole Body is inſpirable; for by violent Motion, in an intenſely hot State of the Atmoſphere, a large Quantity of Moiſture is evaporated and exhaled

exhaled from the Body; in conſequence of which, being render'd dry, it greedily abſorbs the Water contiguous to its external Surface. 'Tis probably for this Reaſon, that, after large Hæmorrhages, the Body is fill'd with aqueous Humours, ſince, in conſequence of the Loſs of Blood, the minute abſorbent Veins can eaſily evacuate the Fluids they have imbib'd into the larger empty Veins. In the mean time, on account of the impair'd Strength, and diminiſh'd Heat of the Patient, this ſubtile aqueous Fluid is accumulated in the large, as well as the ſmall, Cavities of the Body, which, according to *Hippocrates*, in the Paſſage already quoted, in a State of Health contain Air, but in a morbid State Ichor. Hence alſo a Reaſon may perhaps be aſſign'd, why dropſical Patients, after an Extraction of the Waters by the Paracenteſis, or any other Method, become afreſh ſo ſuddenly tumid, tho' they abſtain from drinking; for tho' in the Cavities of a dropſical Body there is a large Quantity of Water collected, yet the other Veſſels collapſe, and empty themſelves. Hence the other Parts of the Body decreaſe, in proportion as the Abdomen is diſtended, in that Species of Dropſy call'd Aſcites; ſo that the Body muſt of courſe become more bibulous.

But Frictions, by the gentle Compreſſion they produce, act principally upon the Veins, becauſe theſe are furniſhed with weaker Coats than the Arteries: Hence the Veins are emptied. But becauſe, in every Species of Friction, there is an alternate Preſſure and Relaxation of the Parts, for this Reaſon the Veins, empty'd by this gentle Preſſure, are immediately fill'd again: Hence, by Frictions, an Effect ſomewhat analogous to Evacuation is produced; for, when the Veins are empty'd, an eaſy Acceſs is procur'd to the Fluids abſorb'd by the ſmall Mouths of the bibulous Veins. Add to theſe Advantages, that by Friction the extravaſated Blood is attenuated and reſolv'd; for if Blood, taken from the Vein of a ſound Perſon, and concreted in the open Air, is triturated in a Glaſs Mortar, it is again reſolved into a frothy Liquid of a rediſh Colour. Hence appears the ſingular Advantage of Frictions in the Cure of Contuſions.

Bleed, therefore, plentifully; ſoon after, exhibit a ſtrong, but not inflammatory Purge; let a penetrating, relaxing, and reſolvent Fomentation be applied to the Part; and let warm Frictions be uſed: Mean time internal Reſolvents, Sudorifics, and Diuretics, are of conſiderable Service.

As for liberal Veneſection, it is a Remedy of the utmoſt Importance in all Contuſions, provided the Patient is furniſh'd with ſufficient Strength to bear it: Hence it ought not only to be boldly performed, but alſo carefully repeated, if the Condition of the Patient requires it; for, by this means, a Fever will be prevented; as alſo violent Inflammations, which, in this Caſe, are highly to be dreaded; for, by Veneſection, the thickeſt Part of the Fluids, that is, the red Blood, is remov'd, the Veſſels empty'd, and an eaſy Acceſs procured to the finer Fluids, to be abſorb'd by them. When alſo the larger Veins are empty'd by Veneſection, the ſmall bibulous Veins can, with the greater Eaſe, convey the Humours they have abſorb'd to the large venous Ramifications. Hence a more quick and ſpeedy Diſſipation of the extravaſated Blood will be produced.

As for Purges which operate violently without producing any inflammatory Effects, 'tis ſhew'd under the Article VULNUS, that purgative Medicines not only evacuate thoſe Subſtances which exiſted in the Body in the ſame State in which they are diſcharged, but alſo that they diſſolve the ſound Humours, and eliminate them by Stool. Hence *Eraſiſtratus*, and his Followers, juſtly maintain'd, *That Purgations were Evacuations, accompany'd with a Corruption and Change of the Subſtances evacuated.* *Galen*, indeed, was of a different Opinion; but the Sentiment of *Eraſiſtratus* ſeems to be founded on Truth; for, when Scammony is exhibited to a ſound and healthy Man, it ſo reſolves the laudable Juices into a fine and ſubtile Water, that they are copiouſly diſcharged by Stool; and if the Uſe of this Medicine is frequently repeated, the whole Body is emaciated, the Veſſels collapſe, and an incredible Weakneſs is brought on. All theſe Circumſtances ſufficiently prove, that Humours, previouſly morbid, have not only been diſcharged, but alſo that the laudable Juices, reſolved by the Force of the Medicine into a fetid Water, have been eliminated: By theſe Remedies, therefore, the Veſſels are empty'd, and the Humours reſolv'd, whilſt, at the ſame time, the ſmall Veins in every Part of the Body, whether internal or external, are rendered highly bibulous and open, as is obvious from the following beautiful Experiment, mentioned by *Simpſon*. A young Man, labouring under a Fever, was ſeized with a Diarrhœa, and an uncommon Stupor of his Senſes. As this Patient would drink nothing, tho' his whole Body was ſcorched with a feveriſh Heat, his Phyſician ordered his Feet to be immerſed in moderately warm Water: After this Step was taken, a ſurpriſing Decreaſe of the Water was obſerved, and ſoon after it was impetuouſly diſcharged from the Anus, almoſt without any Change of Colour. Hence 'tis obvious, that by ſuch Purgatives the Humours are reſolv'd, the Veſſels empty'd, and that Power,

by which the bibulous Veins abſorb the contiguous Humours, increaſed.

But it muſt, at the ſame time, be obſerved, that, in Caſes of this Nature, thoſe Purgatives are by no means proper, which operate by exciting a violent Commotion in the Fluids, ſuch as Coloquintida, the Juice of Spurge, or Euphorbium, and ſome others of a like Nature: But thoſe muſt be preſcrib'd, which, tho' poſſeſſed of an highly efficacious reſolvent Quality, yet produce their Effects without exciting any conſiderable Commotions, ſuch as Scammony, Jalap, Sena-leaves, and ſome otherrs; the Formulas or Methods of preparing which, are theſe following.

PURGES *which operate powerfully, without producing inflammatory Effects.*

Take of Agaric, two Drams and an half; and of Sal Polychreſtus, one Scruple: Mix up for a Purge.

Or,

Take of the recent middle Rind of Elder or Dwarf-elder, one Ounce; triturate it with a ſufficient Quantity of Rain-water; then boil, and expreſs the Liquor, of which four Ounces are to be exhibited for a Doſe.

Or,

Take the Emulſion of Jalap-root, prepared with Sugar, and deſcrib'd under the Article CAPUT.

Or,

Take of Agaric, two Drams; of Sena-leaves, three Drams; of Mechoacan-root, one Dram; and of Tamarinds, two Ounces. Cut and bruiſe theſe together, macerate them for half an Hour in Rain-water, then let them boil gently for half a Quarter of an Hour; and, with every nine Ounces of the ſtrain'd Decoction, mix of Sal Prunellæ, half a Dram; of ſolutive Syrup of Roſes with Sena, nine Drams. Of this Preparation let the Patient take one Ounce every Half-hour, till he is briſkly purg'd.

A PREPARATION, *in leſſer Bulk, anſwering the ſame Intention.*

Take of *Syrian* Scammony, thirteen Grains; of diaphoretic Antimony, twenty Grains; and of ſolutive Syrup of Roſes with Sena, four Drams. With theſe Ingredients, ſufficiently triturated, mix half an Ounce of the diſtil'd Water of Succory for a Draught.

As for penetrating, relaxing, and reſolvent Fomentations, the extravaſated Blood remains coagulated in the contus'd Part, under the Skin, which generally remains entire. This coagulated Blood is to be render'd fluid, but in ſuch a manner as to prevent Putrefaction; for when the coagulated Blood is expos'd to the open Air, it is, indeed, generally colliquated; but, at the ſame time, it becomes putrid. Hence, in Fomentations prepared for this Intention, the Ingredients muſt not only be poſſeſſed of a reſolvent Quality, but alſo of a peculiar Virtue, by means of which they reſiſt every Degree of Putrefaction. Sal Ammoniac, or Sea Salt, diſſolved in twenty times as much Water, adding a fourth Part of Wine, and an eighth Part of Vinegar, make a Fomentation of this Kind, which, when apply'd warm, anſwers all the before-mentioned Intentions; for it relaxes by means of the Water, and the Vinegar and Wine are powerful Reſolvents, whilſt, at the ſame time, they reſiſt and prevent every Kind of Putrefaction. The Urine of a ſound and healthy Man, with the Addition of ſome Vinegar, is a Fomentation of the like Nature, by which the frequent Tumors, produc'd in the Heads of Children by Contuſions, are ſucceſsfully and happily reſolved.

Several Simples, of a reſolvent Quality, may alſo be infuſed in Water for this Purpoſe: Thus, for Inſtance,

Take of white Bryony-root, two Ounces; of round Birthwort, one Ounce; of the recent Leaves of Rue and Savin, each one Handful; of the Flowers of Tanſy, Chamomile, and Feverfew, each one Ounce; and of recent Onions, ſix Ounces. Digeſt theſe for half an Hour in a cloſe Veſſel, with a pretty ſtrong Heat; then let them boil for a Moment; then, with every twenty-five Ounces of the Liquor, ſtrongly expreſſed thro' a Cloth, mix half an Ounce of the Meal of Linſeed. After this let it boil a little again, and with the Whole of the Decoction, when cold, mix of Spiritus Vini Theriacalis, two Ounces; and of Sal Ammoniac, one Ounce. Let this be applied by way of Fomentation, with Woollen Cloths.

This Intention may be alſo anſwered by Cataplaſms and Plaiſters; Formulas of which are theſe following.

Take the Ingredients of the above-mentioned Fomentation, prepare them into a Cataplaſm, and add, of the Meal of Linſeed, a ſufficient Quantity; of Galbanum, diſſolv'd in the Yolk of an Egg, one Ounce; and of the Oil of Chamomile, an Ounce and an half.

A PLAISTER *for the ſame Purpoſe.*

Take of the Powder of Bryony-root, two Ounces; of the Flowers of Sulphur, one Ounce; of Æthiops Mineral, three Drams; of pure and well-diſſolv'd Galbanum, four Ounces; of Melilot-plaiſter, nine Ounces; and of the Oil of Chamomile, a Quantity ſufficient for forming all into a Plaiſter.

Beſides theſe, the following Plaiſters contribute to anſwer theſe Intentions.

Emplaſtrum de Galbano,
——— Baccis Lauri,
——— Betonica,
——— Cumino,
——— Cephalicum,
——— Diachyl. cum Gumm.
——— Diaphoreticum,
——— Iſchiadicum,
——— de Meliloto,
——— Mucilaginibus,
——— Oxycroceum,
——— de Ranis,
——— Idem, cum Mercurio.

Since theſe, by their viſcid and tenacious Nature, ſtrongly adhere to the Skin, they retain the highly ſubtile exhaling Fluid, and, as it were, ſtrike it back on the Part to which they are apply'd. Hence the Part affected is plac'd, as it were, in a Bath of its own Steams, the Veſſels are relaxed, and the fragrant Qualities of the Aromatics, mix'd with theſe Plaiſters, inſinuate themſelves into them, from which very happy Effects are frequently produced; for Fomentations are of ſmall Service, unleſs they could be kept continually warm on the Part affected.

As for warm Frictions, if there is no Inflammation, nor conſiderable Pain, in the contuſed Part, moderate Frictions are of ſingular Service; for, by this gentle Agitation, the concreted Blood is attenuated and divided, by which means it is rendered fit for entering the ſmall Mouths of the bibulous Veins. The Veins are at the ſame time evacuated; and hence the Motion of the abſorb'd Fluids thro' the empty'd Veins is rendered eaſy, as we have already obſerv'd. Thus a certain Man had his whole Face ſo contus'd, that it was rais'd in a formidable and unſeemly Tumor, which, however, was, by the Aſſiſtance of the above-mention'd Fomentations, and gentle Frictions, diſſipated, without any Suppuration; and, which could ſcarce have been expected, his Face and Complexion were perfectly reſtor'd to their former State.

As for internal Reſolvents, theſe are ſuch Medicines as again reduce the coagulated Fluids into the Molecules, of which they originally conſiſted before Concretion. Among theſe the principal is warm Water, partly becauſe, by diluting, it inſinuates itſelf between the ſmall concreted Maſſes, and partly becauſe it is the Vehicle of other reſolvent Medicines; with reſpect to which, ſee the Article STRICTURA. After Veneſection, therefore, and the Uſe of ſuch antiphlogiſtic Purgatives, as powerfully reſolve without producing any violent Commotion, it is proper to exhibit large Quantities of Decoctions, in which there is a great deal of Water; and, at the ſame time, ſuch Medicines are to be preſcribed, as, by their gentle Stimulus, may a little increaſe the Action of the Veſſels upon the Fluids, leſt the languid Water ſhould remain, and be accumulated in the Body: For this Purpoſe ſuch Medicines as alſo reſiſt Putrefaction ſhould be choſen. For this Reaſon the Intention is beſt anſwered by Infuſions of Germander, Rue, and Horehound, as alſo by Decoctions of the Five Roots, and of the three Species of Sanders, mixed with Nitre and Honey; for whilſt, by drinking theſe warm, the Veins, which were before evacuated by Veneſection, and the Uſe of Purgatives, are continually fill'd, and whilſt Fomentations are conſtantly applied to the contuſed Part, and by Frictions their Efficacy deriv'd to the injur'd Part, all the Relief is afforded which can poſſibly be expected from Art. See the Article OBSTRUCTIO. For, by this means, the warm Water, richly impregnated with the reſolvent Quality of theſe Medicines, continually waſhes, as it were, the extravaſated Juices, dilutes, reſolves, and renders them fit for being abſorb'd by the minute bibulous Veins. Thus all the extravaſated Fluid is carry'd off without any additional Injury done to the Veſſels, which, in this Caſe, is requiſite. But ſince all theſe Remedies, taken in large Quantities, are again generally diſſipated, and carry'd out of the Body, either by a Diaphoreſis, or by Urine, hence theſe Remedies, according to different Regimens, are either ſudorific or diuretic; for if the whole Body is placed in a warm Atmoſphere, as, for Inſtance, when the Patient lies in Bed cloſely covered up, a Diaphoreſis will be excited by theſe Medicines; but if the Patient is placed in a ſomewhat cooler Air, a preternatural Diſcharge of Urine is generally excited by the Uſe of theſe Preparations.

The Order in which theſe are to be uſed; the Neceſſity of repeating them, and their reſpective Degrees of Strength, are to be regulated by the Conſideration of what has been ſaid above, and the Danger which is threaten'd.

In every Contuſion all theſe Meaſures are not to be taken indiſcriminately; for ſlight Contuſions are eaſily cured with Fomentations of Urine, Salt, and Vinegar, or other Preparations of a like Nature. But where a violent Inflammation, a Suffocation, and a Gangrene, are dreaded, then all the above-mention'd Methods of Relief are to be uſed. We are, therefore, to begin with Veneſection, which muſt be as liberal as the Strength of the Patient will allow. Then we are to exhibit theſe Purgatives, that by this means the Humours being reſolved, and the Patient brought low, the Body may be render'd as far from a feveriſh and inflammatory State as poſſible. When, by the Application of theſe Remedies, the Tumor, Pain, and Inflammation, are neither remov'd nor leſſen'd, they are boldly, and without any Heſitation, to be repeated, eſpecially if the internal Parts of the Body are injured by the Contuſion; for, in this Caſe, the moſt terrible Conſequences are to be dreaded from a Suppuration; or, when ſuch a Diſorder is not thoroughly removed, an incurable Scirrhus may remain, and prove the fatal Source of a Cancer, and other dreadful Calamities: But when, by an Application of theſe Medicines, the Symptoms begin to be leſſened, if the Hands can have Acceſs to the Part affected, Friction is then the moſt effectual Remedy, but not before; for if the Parts, rendered tenſe by the extravaſated Humours, are inflamed by Friction, eſpecially of the ſevere Kind, they will ſoon be ſeized with a Gangrene.

Whilſt theſe Methods are purſued, a very ſlender Regimen, and one which is oppoſite to Putrefaction, is requir'd.

For 'tis requiſite, that the Humours ſhould be as thoroughly diluted as they poſſibly can; and that the Patient ſhould, indeed, be kept alive, but at the ſame time ſo low, that no Inflammation may be apprehended. And, ſince the extravaſated Humours have a natural Tendency and Diſpoſition to Putrefaction, we muſt chuſe ſuch Kinds of Aliments as reſiſt this Depravation of the Juces. Hence Decoctions of Barley, Oats, Rye, Bread, and other Subſtances of a like Nature, as alſo Milk diluted with Water, boil'd Apples, and Summer Fruit, eſpecially when ripe, are in this Caſe principally beneficial. Weak Fleſh-broths, boil'd with Rye or Barley, with the Addition of a proper Quantity of Lemon-juice, are in like manner ſerviceable. Nor are we in the leaſt to be afraid, that the Patient's Life cannot be ſuſtain'd and ſupported by ſuch weak and low Nouriſhment; for the human Body, when preſerv'd in a State of Reſt, is capable of being ſupported with the lighteſt and weakeſt Aliments. The Truth of this *Boerhaave* experienc'd in his own Conſtitution; for, when rack'd with the moſt violent rheumatic Pains, he liv'd upon Whey alone, for twelve Days; and, at the ſame time, his Habit remain'd ſufficiently ſtrong for performing muſcular Motion, unleſs the intenſe Pain had prevented it. But when by Veneſection, and the Uſe of Purgatives, the Body is previouſly weaken'd, it cannot act ſo powerfully upon the Aliments taken in, as to convert them to a Subſtance of a ſimilar Nature with itſelf. Hence the Aliments will generally retain their own Nature, and incline to a ſpontaneous Depravation. But, becauſe a Putrefaction of the extravaſated Humours is to be dreaded, ſuch Aliments are to be choſen, as have a natural and ſpontaneous Tendency to Acidity. For this very Reaſon, all Fleſhes, Eggs, and Fiſhes, are carefully to be abſtain'd from. All acrid Subſtances and Aromatics would, in this Caſe, prove prejudicial, by increaſing and accelerating the Circulation of the Fluids, which ought rather to be faint and languid. But, in every Diſorder of this Kind, we are to have particular Regard to the Seaſon of the Year; the Conſtitution of the Patient, whether ſound or morbid; his Method of Life; and other Circumſtances mentioned under the Article VULNUS.

If all theſe Cautions relating to Regimen, and the Aids afforded by Pharmacy and Surgery, are carefully obſerv'd, the Event will always be ſucceſsful, provided the Diſorder is curable. As for the numberleſs boaſted Specifics againſt Contuſions, we are not ſo implicitly to confide in them, as to commit the Cure to them alone. Moſt of them are, indeed, innocent, and, conſequently, may be ſafely uſed; but, at the ſame time, we are by no means to neglect the efficacious Means of Relief above ſpecify'd. Thus *Helmont*, in his *Ortus Medicinæ*, orders the Blood flowing from the amputated Teſticles of the Goat, to be dried, and exhibited to ſuch as have fallen from Eminences, with an Intention to diſſipate the

grumous

grumous and coagulated Blood produced by the Contuſion: For this Purpoſe Sperma Ceti, and a Decoction of Madder, are recommended by others.

Sydenham relates, that Sperma Ceti, *Iriſh* Slate, and other Medicines which are eſteem'd Specifics in Contuſions, only miſlead us, and retard the proper Methods required in theſe Caſes; as will appear by trying how much more ſafely and expeditiouſly theſe Accidents may be cured by Bleeding and Purging alternately, without having recourſe to thoſe inſignificant Remedies, which are generally given after the firſt Bleeding, or to raiſing a Sweat, which is uſually continued during the Uſe of them, and heats the Parts, already diſpoſed to an Inflammation, ſo much as to endanger the Life of the Patient without Neceſſity.

If the Contuſion is ſo conſiderable, as not to admit of Reſolution, and is ſo ſituated, as to admit of Aſſiſtance from manual Operation; Scarification, Aperture, and Suppuration, are to ſucceed the Methods of Cure above directed, which, mean time, are not to be diſcontinued. If the Diſorder is already ſo violent, as to produce a Mortification, or ſo conſiderable, that intolerable Pains, Inflammations, Suppurations, Atrophies, Fevers, and Death, can certainly be foreſeen, the Part affected is to be extirpated, if that is poſſible.

If the Diſorder is ſo violent, that it is not to be expected the extravaſated Humours ſhould be removed, without any farther Injury done to the Veſſels, the only Methods of Relief remaining are, provided the Hands can have Acceſs to the Part affected, by an Aperture to procure a free Diſcharge to the extravaſated Humours, by a gentle Suppuration to cleanſe the Part, and reduce it to the State of a ſimple Wound; for, unleſs theſe Meaſures are taken, the extravaſated Humours, by preſſing upon the adjacent Veſſels, may produce an Inflammation, or, which is ſtill worſe, a Suffocation of all vital Motion, that is, a Gangrene in the Part. But if the extravaſated Humours are corrupted, Conſequences of a ſtill more formidable Nature may enſue. In a Caſe, therefore, of this Nature, the contuſed Part is either to be entirely laid open, or ſcarified in ſeveral Places, that the extravaſated Humours may be freely diſcharged. Then the live ſubjacent Parts, being freed from this preternatural Preſſure, will be ſeparated, and expel all the Parts, which, by the Contuſion, were ſo deſtroy'd, that the Juices could no longer circulate in them: But this Method is, in a particular Manner, to be taken, if a Set of formidable Symptoms are to be apprehended from the Inflammation or Corroſion of the adjacent Parts, as is obſerved under the Article CAPUT.

Nor, even in this Caſe, are we to neglect the Methods of Relief above enumerated; for, if there is a very violent Inflammation in the contuſed Part, inſtead of a benign Suppuration, a Gangrene would be produced: Hence Veneſection, and the Uſe of antiphlogiſtic Purgatives, will, in this Caſe, be of ſingular Service; as alſo ſuch Fomentations as reſiſt every Degree of Putrefaction. It will, at the ſame time, be expedient to exhibit large Draughts of reſolvent Decoctions, that the Parts of the corrupted Humours, or of the Pus generated from them, abſorb'd by the bibulous Veins, and infecting the Maſs of Blood, may be eliminated, and diſcharged from the Body, either by a Diaphoreſis, or by Urine; for ſince 'tis obvious, from what has been ſaid, that the extravaſated Blood may be ſo attenuated as to be abſorb'd by the bibulous Veins; ſo 'tis, in like manner, poſſible, that the Pus, or corrupted Ichor, may mix with this Blood, and produce a Cacochymy of the worſt Species: Hence, again, a formidable Train of Symptoms may enſue.

But if, in conſequence of a violent Contuſion, the larger Veſſels are ſo injured, or the natural Structure of the Part ſo deſtroy'd, that the vital Juices can no longer circulate thro' it, a perfect Mortification is produced, and all the Parts will become corrupted. The only Meaſure to be taken, in this Caſe, is to extirpate the Part, and by that means preſerve the Life of the Patient. This Misfortune is diſtinguiſh'd by the following Circumſtances: If, for Inſtance, neither Heat nor Senſation remain in the contuſed Part, when profound Scarifications are made in it; and if, ſoon after, a Putrefaction happening, the Part ſends forth a cadaverous Stench. In this Caſe, unleſs the Part affected is extirpated with all Expedition, the Sphacelus ſpreads, and puts a ſpeedy Period to the Patient's Life. A Misfortune of this Nature happen'd to a ſkilful Coachman, when accuſtoming young Horſes to the Harneſs; for the Horſes, ſtarting with uncommon Fury, threw their Manager from his Seat; and his Legs, happening to be intangled among the Wheels, were ſo miſerably mangled and ſhatter'd, that neither Heat nor Senſation any longer remain'd in them; but, as he would not ſubmit to an Amputation, which was abſolutely neceſſary to the Preſervation of his Life, he died on the fourth Day. This alſo holds true, if, in conſequence of violent Contuſions, the Bones are ſo fractured as to fly into ſmall Splinters; for theſe, by pricking and ſtimulating the nervous Parts, may produce intenſe Pains, violsnt Inflammations, and the miſerable Train of Symptoms ſubſequent to them. Thus *La Motte*, in his *Traité complet de Chirurgie*, gives us an Account of a Man, who, by a Caſk full of Wine, had his Right Hand ſo contuſed, that thoſe Bones of the Metacarpus, which ſuſtain the Ring Finger, the middle Finger, and the fore Finger, were totally ſhatter'd, together with the adjacent Muſcles. A celebrated Surgeon told the Patient, that the only Method of Relief was placed in the Amputation of the Parts ſo mangled; and foretold, that the moſt terrible Symptoms would enſue, if this neceſſary Step was neglected. But the Patient would not ſubmit to the Operation; and, tho' the moſt proper and efficacious Remedies were applied, yet, in two or three Days time, intenſe Pains, a violent Inflammation, and an immenſe Tumor, indicated a future Gangrene. But, upon the contuſed Parts being immediately extirpated, the Patient was happily cured. What incredible Effects, even in the moſt deſperate Caſes, may be produced by the Intrepidity of the Patient, and the Skill of the Surgeon, we learn from a Caſe related by the ſame Author. A certain Captain of a Man of War had his whole Arm, as far as the Humerus, ſo miſerably contuſed by an unlucky Accident, that neither Heat nor Senſation remain'd in the Part: But tho' the Sphacelus had already ſpread beyond the Articulation of the Humerus, and the whole Arm was corrupted, and ſent forth a cadaverous Stench; yet the Surgeon, animated by the Courage of his Patient, and confiding in his own Skill, prefer'd a dubious Remedy to certain Death, and amputated the Arm immediately below the Articulation. Then, aſſiſting Nature by proper Remedies, he ſeparated the reſt of the corrupted Parts, and, in two Months time, the Patient was perfectly recover'd.

The Method of Cure, above ſpecify'd, will perform more than could eaſily be expected; eſpecially as Nature ſpontaneouſly aſſiſts, and that in a very remarkable Manner, in attenuating, reſolving, diſſipating, and expelling what is offenſive to her.

We are not, however, even in the moſt deſperate Caſes, raſhly to proceed to Extirpation; for unexceptionable Inſtances ſufficiently inform us, that Diſorders of this Kind, in all Appearance abſolutely deſperate, have been ſometimes happily cured without it. For this Reaſon it always ſeems expedient previouſly to try the Method above directed, ſince it may be ſafely practiſed, and ſince there are Medicines known, by means of which the mortified Parts may be ſo preſerved, that the Putrefaction will not readily diffuſe and ſpread itſelf. Alliaria, Scordium, Horehound, Sage, and Rue, infuſed in Water, with an Addition of Salt, Vinegar, and Wine, or the Spirit of Wine, make a Fomentation, which, when conſtantly apply'd, infallibly prevents every Degree of Putrefaction. By the Uſe of this, the Surgeon may ſafely wait for ſome Days, to ſee whether Nature attempts any Separation, or whether the Signs of returning Life appear in the Part contuſed. Thus the celebrated *Boerhaave*, when ſpeaking to his Pupils upon this Subject, uſed to tell them, that, by this Method, he cured a *German* of Diſtinction, who, by a Fall from his Chariot, had the Wheels driven over his Legs; by which means the Tibia and Fibula of them both were miſerably ſhatter'd, and the adjacent Parts dilacerated in the moſt terrible Manner; and this Cure he completed, even after a Gangrene was begun in the Parts. *La Motte*, in his *Traité complet de la Chirurgie*, *Tom.* 3. gives us a memorable Inſtance of a young Man, the anterior Part of whoſe Right Cubit was ſo ſeverely ſtruck with a Cudgel, that a violent Contuſion, accompanied with intenſe Pain, appear'd from the Elbow to the Carpus. The Patient applied, to the contuſed Part, Linen Cloths, dipt in Spirit of Wine; but, finding little or no Relief from theſe Applications, he conſulted a Surgeon. When the Pain in the Hand was almoſt removed, but that about the Cubit augmented, the Hand became pale, and entirely cold; whilſt, at the ſame time, the Skin, when roughly touch'd by the Points of the Fingers, came off. Upon the Surgeon's making deep Scarifications, with a Lancet, the Patient felt no Pain; and, even upon paſſing a Lancet entirely thro' the Hand, not a ſingle Drop of Blood was diſcharged. This Coldneſs, and Want of Senſation, reach'd as far as the Middle of the Cubit. The Part was fomented with Spirit of Wine, impregnated with Salt, and the *Unguentum Ægyptiacum*. At the ſame time a Cataplaſm was apply'd, compoſed of the Meal of Barley, Beans, and Lupins, with an Addition of Aromatics and Wine. By theſe Applications the Heat and Senſation of the Parts were reſtored, as far as the Carpus; whilſt the Hand, in the mean time, remain'd cold, and deſtitute of Senſation; but, in five Days time, it neither became fetid nor blackiſh. Freſh Scarifications being made in the Hand, Oil of Turpentine was dropt into them. Thus the other Applications being continued for five Days more, all Things remain'd in the ſame State; but, at laſt, Heat and Life began inſenſibly to be reſtored, and the Patient was cured, without the Extirpation of the Part; but two of his Fingers remain'd contracted, and he could not move the reſt, without ſome Difficulty. Since, therefore, in ſo deſperate

ſperate a Caſe, the contuſed Part was preſerved, it ſeems to be the Duty of every prudent Surgeon never to have recourſe to Extirpation, till all other Methods have been tried in vain; for if, by Veneſection, and the other Methods propoſed, the Impetus and Force of the Blood is ſo allay'd, that there is no Dread of an Inflammation or Gangrene from this Cauſe; if, at the ſame time, ſuch external Applications are uſed as prevent Putrefaction; and if, in Conjunction with theſe, a ſlender Diet, and ſuch as has not the leaſt Tendency to Putrefaction, is preſcrib'd, there is great Reaſon to hope, that the corrupted Parts may be ſeparated from thoſe which are alive, and that ſuch as are deſtroy'd may grow again.

CONVALESCENTIA. A Recovery from Sickneſs.

CONVOLVULUS.

The Characters are,

The Leaves grow alternately on the Branches; the Stalks are generally ſcandent; the whole Plant uſually abounds with a milky Juice; the Flower-cup in ſome is double, one, which is external, being biſoliated; the other, within this, is leſs, quinquefid, and tubulous; in others, the Flower-cup is ſingle; the Flower is monopetalous, campaniform, and pentagonal, with expanded Edges; the Bottom of the Flower being often perforated with five Holes; and five Stamina, ariſing from the Bottom of the Flower, uniting in one Tube; the Ovary becomes a roundiſh membranaceous Fruit, incloſed in the Calix, and ſending forth three Tubes, and divided generally into three Cells, ſeldom into four, and ſometimes, but ſeldom, univaſcular.

Convolvuli with a trailing or ſcandent Stalk.

1. Convolvulus; maritimus; noſtras; rotundifolius. See BRASSICA MARINA.

2. Convolvulus; Syriacus; & Scammonea Syriaca. *Hiſt. Oxon.* 2. 12. *Tourn. Inſt.* 83. *Elem. Bot.* 73. *Boerh. Ind. A.* 245. *Scammonium*, Offic. *Scammonium Syriacum*, Ger. 716. Emac. 866. *Scammonia Syriaca*, C. B. Pin. 294. Raii Hiſt. 1. 722. *Scammonea Syriaca legitima*, Park. Theat. 163. *Scammonea Syriaca, flore majore Convolvuli*, J. B. 2. 163. *Scammonea & Scammoneum*, Chab. 123. SCAMMONY.

The Plant which produces Scammony has a large thick Root, as big as a Man's Arm, having a ſlender hard Pith in the Middle: It is full of a white milky Juice. From this Root ſpring many ſlender climbing Stalks, which twine and wind about any thing in their Way, like our common great *Convolvulus*, or Bindweed, which it pretty much reſembles, having Leaves like it, but more triangular. The Flowers too are much of their Shape and Colour, being white, and Bell-faſhion'd, and are ſucceeded by roundiſh Seed-veſſels, each containing three angular Seeds. It grows in *Syria*. The concreted Juice of the Root is the Scammony of the Shops, whereof the beſt comes from *Aleppo*; that which comes from *Smyrna* being fuller of Droſs and Sand. See SCAMMONIUM.

3. Convolvulus; Canarienſis; ſempervirens; folio molli, incano; flore ex albo purpuraſcente. *H. A.* 2. 101. PERENNIAL CANARY BINDWEED, WITH SOFT HOARY LEAVES, AND WHITISH PURPLE FLOWERS.

4. Convolvulus; minor; arvenſis; flore roſeo. *C. B. Pin.* 294. *Tourn. Inſt.* 83. *Elem. Bot.* 72. *Boerh. Ind. A.* 245. *Helxine ciſſampelos*, Offic. *Helxine ciſſampelos multis, ſive Convolvulus minor*, J. B. 2. 157. *Convolvulus minor vulgaris*, Park. Theat. 171. Mer. Pin. 29. Raii Hiſt. 1. 725. Synop. 3. 275. *Convolvulus minor*, Merc. Bot. 1. 30. Phyt. Brit. 30. Chomel. 761. *Convolvulus vulgaris, flore minore purpureo*, Hiſt. Oxon. 2. 13. *Convolvulus minor; Faſione veterum; Helxine ciſſampelos*, Chab. 121. *Smilax lævis minor*, Ger. 712. Emac. 861. SMALL BINDWEED.

It grows in Fields, and flowers in *June*. The Herb is uſed. The Juice of the Leaves, taken internally, are cathartic.

I know not whether this Plant be purgative, as ſeveral Perſons affirm; but I know, from the Experience of our Peaſants of *Provence*, that, being externally apply'd, it is a good Vulnerary. *Tournefort. Hiſtoire des Plantes*, &c.

5. Eadem (4.); flore albo.

6. Eadem (4.); flore purpureo.

7. Eadem (4.); flore ex albo & roſeo variegato.

8. Convolvulus; vulgaris; major; albus. *Hiſt. Oxon.* 2. 12. *Boerh. Ind. A.* 246. *Smilax lævis*, Offic. *Smilax lævis, Convolvulus major*, Chab. 121. *Smilax lævis ſive lenis major*, Ger. 712. Emac. 861. *Convolvulus major*, J. B. 2. 154. Raii Hiſt. 1. 725. Synop. 3. 275. *Convolvulus major albus*, C. B. Pin. 294. Park. Theat. 163. Tourn. Inſt. 82. Elem. Bot. 72. Mer. Pin. 28. *Convolvulus major flore albo*, Merc. Bot. 1. 30. Phyt. Brit. 30. *Scammoneum Germanicum*, Hoffm. Cat. Altdorff. GREAT BINDWEED.

The Root of the great Bindweed is long, ſlender, and creeping, with ſmall Fibres at every Joint, when broken, yielding a thin Milk: The Stalks are long, ſlender, and frequently contorted, twiſted together, climbing and ramping upon any thing in its Way, and running to a great Length. The Leaves grow alternately on pretty long Foot-ſtalks, large, and ſmooth, hollow'd in, and Heart-faſhion'd next the Stalk, with two ſharp Ears, ending gradually in a ſharp Point: Among theſe, toward the Tops of the Branches, come forth, ſingly, large white Bell-faſhion'd Flowers, with the Brims ſomewhat turn'd outward, growing in a Calyx of five ſmall Leaves, ſet in a Covering made of two more. The Seed-veſſel is roundiſh, containing ſeveral blackiſh angular Seeds. It grows everywhere in the Hedges, flowering all the latter Part of the Summer. *Miller's Bot. Off.*

It grows about Hedges, and in Gardens, and flowers in the Summer. The Root, the Herb, and the Water diſtil'd from it, are kept in the Shops at *Hall* in *Germany*, according to *Dale*. This Plant has the Reputation of purging off bilious, acrid, and ſerous Humours. The Root is cathartic; whence it is call'd, by *Hoffman*, *German Scammony*. The Women uſe a Decoction of this Plant as a Preſervative againſt Miſcarriages, with an Intent to allay wandering Pains, and to prevent any ſudden Frights from affecting them. *Prevotius*, in his *Medicina Pauperum*, recommends a Decoction of this Plant as a mild Evacuant of Bile.

9. Convolvulus; vulgaris; major; flore ex roſeo & albo variegato.

Dale reckons the Jalap, Mechoacan, and Turbith, amongſt the Species of CONVOLVULUS. See theſe under their reſpective Articles.

CONUS, κῶνος. This is a Word uſed by Mathematicians, among whom it ſignifies, a Figure generated by the Circumvolution of a Triangle about one of its Sides. From Geometry, the Word *Conus* has been borrowed by Botaniſts; among whom it imports ſuch a Fruit as ariſes from a broad circular Baſe, terminates in a Point or Apex, and is compoſed of a compact Congeries of woody Layers. Trees, bearing

Fruit of this Kind, are call'd coniferous Trees; ſuch as the Pine, the Fir, and the Larch-tree. And though, according to *Salmaſius*, in his *Exercitationes Plinianæ*, that Fruit is only a Cone, which gradually ariſes from a round Baſe to an Apex or Point; yet thoſe Trees, whoſe Fruits are ſquamous, are alſo reckon'd among the coniferous Trees, though they do not reſemble a Cone, ſuch as the Cypreſs, the Elder, the Thuya, the Birch-tree; for, according to *Cæſalpinus*, *de Plantis*, *L.* 3. *C.* 52. "it is ſufficient to give them this Denomination, "that they be as a compact ſquamous Fruit, under every "Layer of which, Seeds are contained." Hence *Ray*, in his *Methodus Plantarum Emendata*, uſes the following Words: "Cones, ſays he, are theſe ſquamous, hard, and dry Fruits, "wreath'd up in the Form of a Cone or Pyramid, and, for "the moſt part, containing two Seeds under each Layer. "Under this Name I alſo comprehend thoſe Fruits, which "conſiſt of ſeveral cruſtaceous or woody Parts, cloſely join'd "together, and gaping when the Fruit is ripe; ſuch as the "Fruit of the Cypreſs-tree." *Ludwig*, in his *Apheriſmi Botanici*, has an Eye, not only to the Figure, but to the Layers of the Fruit, when he defines a Cone, *A Series of Layers adhering to a common Axis, and containing Seeds in their ſeveral Interſtices.* Coniferous Trees are commonly ſaid to be Proof againſt Corruption, Rottenneſs, and the Impreſſions of Time. *Bodæus in Theophraſt.* accounts for this Phænomenon, from the pinguious Subſtance, with which they abound; which not only ſuffocates all Inſects, but alſo conglutinates and fills up the Cavities of the Wood, as it were, with a kind of Bitumen, which hinders the Air from entering its Pores, and corrupting its internal Parts. *Bodin*, in his *Univerſæ Naturæ Theatrum*, declares himſelf of the ſame Opinion. But I would have this Aſſertion underſtood with ſome Reſtriction, leſt the Hyperbole ſhould be carried too far, to the Diſadvantage of Truth; ſince no more can be juſtly aſſerted, than that thoſe coniferous Trees, whoſe Wood is moſt compact and ſolid, are leaſt ſubject to Rottenneſs and Putrefaction. Beſides, 'tis not improbable, that from recent coniferous Trees Inſects are baniſhed, by the pinguious and bitter Juice they contain. *Theophraſtus*, in his *Hiſt. Plant. L.* 2. *Cap.* 2. has determined, that all coniferous Trees, in general, ariſe from a Seed; and *Bodæus*, in his Commentary on this Paſſage, confirms this Sentiment in the following Words: "I have often attempted "to rear coniferous Trees by ſetting a Twig or Branch, but "I always loſt my Labour; for they never budded; and, if co-"niferous Trees are tranſplanted, they generally decay and "periſh: But," ſays he, in another Paſſage, "whoever "has a Mind to tranſplant theſe Trees, muſt carefully obſerve "what particular Parts of them are turn'd to the South, and "what to the Weſt; for if that Part of the Tree, which "before fac'd to the Weſt, is, upon Tranſplantation, turn'd "to the South, the Tree fades and dies."

Beſides theſe Significations of the Word *Conus*, it occurs in another Senſe in *Dioſcorides*, *L.* 1. *C.* 78. where he ſays, that liquid Pitch is by ſome call'd κῶνος. *Bodæus* ſuſpects this Word, and thinks that nothing more is meant by it, than the Fruit of the Pine, and the Pitch-tree. *Saracenus* alſo confeſſes, that the Word κῶνος is ſcarce any-where elſe uſed for liquid Pitch. Κῶνα, however, ſeems to him to be deduced from it. Hence κωνῶσαι, which *Heſychius* interprets πισσοκοπῆσαι, which is, to bedawb with Pitch.

CONUS FUSORIUS. This is alſo call'd *Pyramis*, and is what we call a Cone. It is a Veſſel, whoſe Figure reſembles that of an inverted Cone. It is made either of Braſs or Iron, and is intended for ſeparating Reguluſes from their reſpective Scoriæ; for whilſt the fus'd Mineral is pouring into the Crucible, it is ſtruck with a Mallet, in order to produce a tremulous Motion in it; by which means the heavier Parts fall to the Bottom, and thoſe which are lighter, ſuch as the Scoriæ, float on the Surface.

CONVULSIO. A Convulſion, or involuntary Contraction, of the Muſcles. See SPASMOS.

For an Account of Convulſions, as Symptoms of Fevers, ſee FEBRIS; as Symptoms of Wounds, ſee VULNUS.

CONVULSIVUS. Convulſive. Spaſmodic.

CONYZA.

The Characters are,

It hath undivided Leaves, which, for the moſt part, are glutinous, and have a ſtrong Scent: The Cup of the Flower is, for the moſt part, ſcaly, and of a cylindrical Form: The Flower is compoſed of many Florets, which are ſucceeded by Seeds, which have a downy Subſtance adhering to them.

Boerhaave mentions ten Species of this Plant; which are,

1. Conyza; latifolia; viſcoſa; ſuaveolens; flore aureo; ex Gallo-provinciâ. *T.* 445. *M. H.* 3. 113. *Eupatoria, conyzoides, maxima, Canadenſis, foliis caulem amplexantibus.* Pluknet. Phyt. 87. 4. b. H.

2. Conyza; major, vulgaris. See BACCHARIS.

3. Conyza; cœrulea; acris. *C. B.* 265. *Raii Hiſt.* 1. 270. *Synop.* 80. *Ger. Emac.* 484. *Hiſt. Oxon.* 3. 315. *Boerh. Ind. A.* 116. *Conyza*, Offic. Germ. *Conyza odorata cærulea* Park. 126. *Conyzoides*, Dill. Cat. 154. *Senecio ſive Erigeron cæruleus, aliis, Conyza cærulea*, J. B. 2. 1043. *Senecio cæruleus*, Chab. 325. *Aſter arvenſis cæruleus acris*, Tourn. Inſt. 481. Buxb. 30. BLUE FLEABANE.

It grows in barren Paſtures, and flowers in *July* or *Auguſt*. This Herb is ſaid to accelerate Suppuration.

4. Conyza; mas; Theophraſti; major Dioſcoridis. *C. B.* 265. *Boerh. Ind. A.* 116. *Conyza major*, Offic. Ger. Emac. 481. Raii Hiſt. 1. 261. *Conyza major vera*, Hiſt. Oxon. 3. 114. *Conyza major verior Dioſcoridis*, Park. 125. *Conyza major Monſpelienſis odorata.* J. B. 2. 1053. *Conyza Pulicaria.* Chab. 327. *Virga aurea major foliis glutinoſis, & graveolentibus.* Tourn. Inſt. 484. GREATER FLEABANE.

It grows in *Italy*, and other Places, near the Highways; where it flowers in *July* and *Auguſt*. The Fume of the Leaves, when burn'd, is ſaid to drive away Gnats, Fleas, and other troubleſome Inſects.

5. Conyza; aquatica; laciniata. *C. B. P.* 266. *Aſter paluſtris, laciniatus, luteus.* T. 483. *Jacobæa aquatica; elatior, foliis magis diſſectis.* M. H. 3. 110. a.

6. Conyza; Cretica; fruticoſa; folio molli, candidiſſimo, & tomentoſo. *T. Cor.* 33. *H.* SHRUBBY FLEABANE FROM CRETE, WITH SOFT, DOWNY, WHITE LEAVES.

7. Conyza; Africana; tenuifolia; ſubfruteſcens; flore aureo. *H.*

8. Conyza; Sicula; annua; lutea; foliis atroviridibus; caule rubente. *Bocc. M. H.* 3. 115.

9. Conyza; minor; flore globoſo. *C. B.* 266. *Boerh. Ind. A.* 116. CONYZA PULICARIA. Offic. *Conyza minor*, Raii Hiſt. 1. 262. Synop. 79. Schw. 56. *Conyza minima.* Ger. Emac. 482. *Conyzæ mediæ ſpecies, flore vix radiato.* J. B. 2. 1050. Chab. 328. *Aſter Paluſtris parvo flore globoſo.* Tourn. Inſt. 483. *Aſter parvus paluſtris, parvo flore globoſo.* Dill. Cat. 160. *Chryſanthemum Conyzoides paluſtre minus flore globoſo.* Hiſt. Oxon. 3. 19. SMALL FLEABANE.

This is a ſmall low Plant, ſeldom growing above a Span high, with many hard rediſh-brown Stalks, ſet with narrow, round-pointed, ſomewhat woolly Leaves, ſcarce an Inch long, and not a Quarter of an Inch broad, ſet on without Foot-ſtalks; on the Tops of the Branches grow many ſmall, round, yellow Flowers, made only of a Thrum, without any yellow Petala, or Border, about them; the Root is ſmall, woody, and periſhing yearly; it grows in moiſt Places, and where Water has ſtood all the Winter, and flowers in *Auguſt* and *September*.

This is the *Pulicaria* of *Lobel*; and ſo call'd, becauſe, by its Smell, it drives away and deſtroys Fleas and Gnats: Tho' the larger Sort, or the *Conyza media*, which is taller, thicker ſet with ſharper-pointed Leaves, and bearing at the Top larger Flowers, having a yellow Border of Petala, about a broad Thrum, of the ſame Colour, has a ſtronger Scent, and, by *Gerard*, and *Parkinſon*, and other Authors, is accounted to be of more Force and Virtue than the former. An Ointment, made with this, is likewiſe commended by ſome for the Itch. *Miller's Bot. Off.*

10. Conyza; Americana; lamii folio. *T.* 455. *Eupatorium, ſenecionis facie, folio Lamii.* Par. Bat. a. AMERICAN FLEABANE, WITH LEAVES OF THE DEAD-NETTLE. *Boerh. Ind. Alt. Vol.* 1.

Beſides the preceding Species of the *Conyza*, *Dale* mentions the two following; which are,

1. CONYZA MEDIA. Offic. Ger. Emac. 482. Raii Hiſt. 1. 262. Synop. 79. Schw. 55. *Conyza media Aſteris flore luteo, vel tertia Dioſcoridis*, C. B. 265. Hiſt. Oxon. 3. 113. *Conyza media Matthioli, flore magno luteo, humidis locis proveniens.* J. B. 2. 1050. Chab. 327. *(cujus Fig. eſt tranſpoſita) Herba Dyſenterica.* Cat. Altdorf. Delis Sylv. *Aſter pratenſis autumnalis Conyzæ folio.* El. Bot. 384. Tourn. Inſt. 482. Buxb. 29. COMMON FLEABANE.

It grows in moiſt and watery Places, and flowers in *July* and *Auguſt*. Some prepare an Ointment of the Root and Leaves of this Plant, which is recommended for the Itch. The Leaves, taken with red Wine, are ſaid to be good againſt a Dyſentery, and Jaundice; to be effectual in promoting the Menſes, and curing a Strangury. A Decoction of the Herb has the Reputation of being diuretic. *Dale.*

2. CONYZA MINOR VERA. Offic. Ger. Emac. 481. Raii Hiſt. 1. 261. Hiſt. Oxon. 3. 114. J. B. 2. 1054. Chab. 328. *Conyza minor vera Penæ.* Park. 127. *Conyza ſemina Theophraſti, minor Dioſcoridis.* C. B. 265. *Virga aurea minor foliis glutinoſis & graveolentibus.* Tourn. Inſt. 484. SMALL TRUE FLEABANE.

It agrees in Virtues with the fourth Species.

Dioſcorides attributes the following Virtues to the *Conyza*. The Plant, with the Leaves ſtrewed, or uſed by way of Fumigation, drives away venomous Inſects and Gnats, and kills Fleas. The Leaves are effectually apply'd to the Bites of

Serpents, Tubercles, and Wounds. The Flowers, with the Leaves, are drank in Wine, in order to provoke the Menſes, and expel the dead Fœtus [ἐμβρύων]; and alſo for the Strangury, Gripes, and yellow Jaundice; the ſame, drank in Vinegar, help the Epilepſy. The Decoction, uſed by way of Inſeſſion, cures Diſorders of the Uterus, and promotes a Diſcharge of the Menſes; but the Juice, in a Peſſary, cauſes Abortion. The Herb, uſed with Oil, cures a Rigor, if the Part affected be anointed with it; and the ſmall Species is effectually apply'd in Cataplaſms for the Cephalalgia, or Head-ach.

The ſame Author deſcribes three Species of the Conyza: The firſt, he ſays, is call'd the ſmall Conyza, which is the moſt fragrant, or ſweet-ſcented; the ſecond is higher than an ordinary Shrub, and has larger Leaves than the former, and a ſtrong Smell; the third Species has a thicker and ſofter Stem, and Leaves of a middle Size, between thoſe of the larger and ſmaller Species, and of a very ſtrong and unpleaſant Smell.

CONYZOIDES. The third Species of *Conyza*, mentioned above, under the Title of *Conyza*; *cærulea*; *acris*.

COOPERTIO. A Covering of any Kind, as Clothes, for Inſtance. The Membranes of the Fœtus, the Uterus, and the Belly, are ſometimes call'd by this Appellation, relative to the Fœtus.

COOPERTORIUM. A Name for the Thyroide Cartilage, according to *Caſtellus*.

COOSTRUM. The middle Part of the Diaphragm. *Rulandus*.

COPAIBA. Balſam of Capivi. See BALSAMUM.

That Balſam of Capivi is eſteem'd genuine, which, when a ſmall Drop of it is taken up on the Point of a Needle, and let fall into cold Water, ſinks to the Bottom, or is ſuſpended in the Middle of it, without altering its Figure. That, on the contrary, which floats on the Surface, expands itſelf, and is diſſolv'd, is eſteem'd ſpurious. This Balſam is frequently adulterated, by a Mixture of leſs valuable Oils; or it is counterfeited by mixing the diſtil'd Oil of Turpentine with expreſs'd Oil of ſweet Almonds; and the fineſt and freſh Turpentine of the Larix is ſold for it: So that it is not very eaſy to procure the Genuine.

The external Application of this Balſam is of ſingular Efficacy in conſolidating all Wounds, except thoſe of the Gunſhot Kind. This Balſam is to be dropt, as hot as the Patient can bear it, into recent Wounds, after expreſſing out the Blood, which flows ſpontaneouſly. The Lips of the Wound, and the adjacent Parts, are alſo to be anointed with it. Then bringing the Lips into Contact, a Pledget, dipt in this Balſam, is to be apply'd, and ſecur'd with proper Compreſs and Bandage. In this State the Wound is to be left for twenty-four Hours; after which, the Compreſs and Bandage is to be removed; and if the Pledget ſhould adhere to the Wound, it is not to be taken off, but a few Drops of the warm Balſam are to be pour'd upon it every twenty-four Hours, till it fall away ſpontaneouſly. According to *Ettmuller*, "When uſed externally, it is a more valuable vulnerary Medicine than Peruvian Balſam; and in twenty-four Hours time conglutinates Wounds, except very large, without leaving any unſeemly Scar, as the *Dutch* often find from Experience." It is apply'd warm, upon Cotton, to Excoriations of the Anus. But this Piece of Practice muſt not be uſed, where the Redneſs of the Parts indicates an Inflammation, or where the Humours of the Patient abound with Acrimony; for, in both theſe Caſes, the Inflammation would be increas'd, and a Gangrene endanger'd. In *Cailus's Hiſtoire Naturelle du Cacao*, it is ordered to be applied warm upon a linen Cloth, in the firſt Aſſaults of the Gout, in Rheumatiſms, and in ſciatic Pains. When internally uſed, it alſo produces the Effects of vulnerary Medicines, and is recommended in all Hæmorrhages ariſing from a Rupture of the Veſſels; ſuch as an Hæmoptyſis, for Inſtance, or a Spitting of Blood. In bloody Fluxes, an Ounce of it is to be mix'd with an anodyne Clyſter, which is to be retain'd as long as poſſible. It is alſo a celebrated Medicine in ſcorbutic and rancid Cachexies, where the Humours have a Tendency to Putrefaction; as alſo in a Gonorrhœa, a Fluor Albus, and in Caſes where the Intention is to purge the Kidneys from Sand and Gravel; for it provokes Urine, extinguiſhes the Heat attending its Diſcharge, and effectually carries off its bloody, loathſome, and purulent Contents. It does not, like moſt other Balſams, give the Urine a Smell like that of Violets, but it communicates to it a manifeſtly bitter Taſte, and ſurpriſingly deſtroys the muriatic Saltneſs, not only of the Urine, but alſo of the Serum, Blood, and Saliva. *Ettmuller* informs us, that it is ſucceſsfully exhibited in Diarrhœas; and more particularly in a Cholera, and Dyſenteries ariſing from an Acrimony of the Humours. It is ſaid to be a highly powerful and efficacious Medicine for Diſorders of the Thorax; becauſe it deterges the Bronchia, procures a due Tone and Soundneſs to the Lungs, and, perhaps, diſſolves crude Tubercles; for dangerous Coughs, and ſuch as palpably threaten'd a Phthiſis, have been obſerv'd to be thoroughly cured by it alone. Though it is intenſely bitter, and evidently hot, yet it proves beneficial to hectic Patients, becauſe it powerfully corrects the Saltneſs and Acrimony of their Juices, and at the ſame time deſtroys the putrid Taint, with which they are infected. The Doſe of this Balſam is generally from five to fifteen Grains; but when two or three Drams of it are exhibited in the Form of a Potion, it proves as purgative as Turpentine. The moſt commodious Methods of exhibiting it are either in the Form of Pills, made up with powder Sugar, or diſſolv'd with the Yolk of an Egg, or mix'd with warm Milk. It may be exhibited twice a Day. Mr. *Labat* extols it as an efficacious Remedy againſt intermitting Fevers, if five or ſix Drops of it are exhibited in about an Ounce and an half of Fleſh-broth, a little before the Paroxyſm. But, for the Cure of continued Fevers, it is to be exhibited in the ſame Form two Hours before Meals. He tells us, that this Doſe muſt be repeated twice in twenty-four Hours; and affirms, that it inſenſibly produces the deſir'd Effect, without either promoting a Diſcharge of the Urine, or exciting a Diaphoreſis. *Ettmuller* highly extols this Balſam, as an uncommon Specific in Gonorrhœas, when exhibited in warm Milk; and adds, "This Medicine was much uſed by *Sylvius* and *Lindanus*, "who every Morning exhibited five or ſix Drops of it in "*Spaniſh* Wine. Theſe Phyſicians, not only in a ſimple, but "alſo in a virulent Gonorrhœa, preſcrib'd this Balſam, in Con"junction with Mercurius Dulcis, with uncommon Succeſs." *Carolus de Maets*, in his *Chymia Rationalis*, endeavours to confirm this ſpecific Virtue of the Balſam of Capivi; and, under the Name of Elixir Antivenereum, prepares from it the following Medicine againſt a Gonorrhœa, the Lues Venerea, and nephritic Diſorders.

> Take of Alcohol of Wine, five Ounces; of the beſt Gum Guajacum, two Drams; of the recent Oil of Saſafras-wood, half a Dram; and of Balſam of Capivi, one Ounce: Let theſe be digeſted together for twenty-four Hours, with the Addition of a ſmall Quantity of the Salt of Tartar.

He ſays this Medicine operates by a Diaphoreſis, and is proper in all Diſorders to be cured by producing that Effect. The Doſe of it is from three Drops to one Scruple, in ſome proper Liquor; ſuch as a Decoction of Guajacum, for Inſtance, in a Lues Venerea. *Quincy* orders forty Drops for a Doſe. Our Countryman, *Turner*, in the Cure of a Gonorrhœa, prefers Balſam of Capivi to Turpentine, and the other native Balſams generally preſcribed againſt this Diſorder; ſuch as thoſe of *Peru*, *Tolu*, and *Gilead*. After the Uſe of proper Purgatives, this Author, in order to complete the Cure, preſcribes about an Ounce of it to be diſtributed into ſeveral Doſes, and exhibited, either in the Form of an Electuary, with Conſerve of Hips, or in the Form of a white Paſte, prepared with white Sugar. The Bulk of a Nutmeg of either of theſe Preparations is to be taken, every Morning and Evening, upon an empty Stomach.

Notwithſtanding the large Encomiums beſtow'd on the Balſam of Capivi by Authors, 'tis neceſſary the young Practitioner ſhould not be hurried away by their Authority, or implicitly rely upon their Words, without any Limitation or Reſtriction; for theſe happy Effects are only produced by this Balſam, when it is genuine and unadulterated; when it is exhibited at a proper Time, in a due Manner, in a juſt Quantity, and by the Directions of a judicious Phyſician: For when too large Doſes of it are exhibited; when the Uſe of it is too long perſiſted in; or when it is adminiſtered at an unſeaſonable Time; by its acrid and balſamic Sulphur, it ſtimulates the delicate and ſenſible Coats of the Primæ Viæ, throws the Humours into Commotions, and, by that means, produces Fevers, Head-achs, Palpitations of the Heart, Pains and preternatural Heats of the Inteſtines, together with ſeveral other Diſorders. But the Abuſe of this Balſam is, in a particular Manner, prejudicial to Patients who labour under a Phthiſis, or Ulcers of the Kidneys; ſince, in theſe Caſes, it generally exaſperates the Cough, brings on an Hæmoptoe, produces a Diſcharge of bloody Urine, and increaſes the ſlow Fever: When exhibited too frequently, or in too large Doſes, to nephritic Patients, it increaſes the Pains and Inflammations of the Kidneys. "I have frequently, ſays *Rieger*, obſerv'd, that this Balſam, exhibited internally, or uſed in Clyſters, to ſuch as labour under malignant Dyſenteries, or ſpurious Lienteries, ariſing from an Abraſion of the nervous Coats of the Stomach and Inteſtines, has excited preternatural and internal Heats. In all Fluxes, therefore, ariſing from the Acrimony of the Humours collected in the Primæ Viæ, and accompanied with a violent Inflammation of the Inteſtines, the Balſam of Capivi is more hurtful than beneficial. It is alſo prejudicial in Diſcharges of bloody Urine and Dyſenteries in old People; becauſe it throws the Blood into a Commotion, and more powerfully ſtimulates the urinary Paſſages already too much afflicted. Nor is the external Uſe of this Balſam always proper; becauſe when applied to Wounds or Ulcers, as yet not ſufficiently deterg'd,

terg'd, or freed from their Pus, it induces a Cicatrix too ſpeedily, and by that means frequently brings on ſinuous Ulcers, which ſoon after break out afreſh, and are not to be cured without the greateſt Difficulty. *Rieger.*

COPAL GUMMI.

Reſina Copal, Offic. Schrod. Phyt. 193. Jonſ. Dend. 357. Raii Hiſt. 2. 1846. *Copal*, J. B. 1. 325. Chab. 70. C. B. Pin. 504. Mont. Exot. 11. *Gummi Copal*, Park. Theat. 1670. Ind. Med. 40. *Copalli quahvith palahoca, ſive Arbor Copallifera latifolia, ſive* II. Hern. 46. *Rhus Virginianum lentiſci foliis*, Raii Hiſt. p. 1799. *Rhoi Obſoniorum ſimilis Americana, Gummi candidum fundens, non ſerrata, foliorum Rachi medio alata*, Pluk. Almag. 318. Phytog. Tab. 56.

This is a Gum or Roſin of a yelloviſh-white Colour, not very hard, ſomething like the common Frankincenſe, but in ſmaller Pieces, and of a much pleaſanter Smell. It is brought from the *Spaniſh Weſt-Indies*, being by our lateſt Writers thought to be the Gum of the *Virginia* Sumach, or a Tree very near akin to it; Dr. *Plukenet* having, as he ſays, gathered a Gum from that Tree very like *Gum Copal.*

This Gum is accounted a Cephalic, and good for the Palſy, and other Weakneſſes of the Nerves; but it is not much uſed. What we in *England* call *Gum Copal*, is call'd *Gum Anime* in foreign Parts; and, on the contrary, what they call *Gum Anime*, we call *Copal. Miller's Bot. Off.*

The Natives of *America* give the Name of *Copal* to all odoriferous Gums, which are tranſparent. The Gum we commonly call by that Name is not much uſed in Phyſic, but is in great Eſteem with the Varniſhers, who diſſolve it in Oleum Spicæ. It has been ſometimes employ'd in Fumigations for violent Defluxions of the Head, and in Cucuphas for the ſame Purpoſe. *Geoffroy.*

COPALXOCOTL *Tepeacenſium.* A Tree mentioned by *Du Laet*, much like the Cherry-tree, whoſe Fruit abounds with a glutinous Juice. Hence they are, by the *Spaniards*, called *Ceraſa Gummoſa. Raii Hiſt. Plant.*

COPAU. A Sort of Wood which grows in *Braſil*, like that of the Walnut-tree. *Raii Hiſt. Plant.* The Tree is call'd *Arbor Braſiliana juglandi ſimilis, nucibus carens.*

COPELLA. A Cuppel. A Sort of Veſſel, or Inſtrument, uſed by the Refiners, and in ſome Chymical Proceſſes. It is made uſually of the Aſhes of calcin'd Bones, moiſten'd with Small-beer or Water, into a Sort of Paſte. But vegetable Aſhes, perfectly freed from the Salts, will ſerve for the ſame Purpoſe. Both theſe bear the utmoſt Degree of Fire, without Fuſion or Vitrification. See CUPELLA.

COPEYA, or COPEIA *Arbor Papyracea.* J. B. *Copey in Inſula Hiſpaniola.* C. B. *Copeia Americanorum.* Nieremberg. A Tree which is a Native of *Hiſpaniola* in *America.* It bears a Leaf which ſerves for Paper, and of which the *Spaniards* make Cards. From this Tree a Sort of Pitch is made, as from the Pine. *Raii Hiſt. Plant.*

COPHOS, κωφός. A Sort of Toad, mention'd by *Nicander.*

COPHOS, κωφός. Deaf, or dumb, or both together. But it is alſo us'd to expreſs a Dulneſs or Weakneſs of any of the Senſes. See AURIS.

COPHOSIS, κώφωσις, from the preceding Word. Deafneſs; ſometimes Dumbneſs, or a Dulneſs of any of the Senſes.

COPIIBA *Braſilienſibus.* Marggr. *Arbor baccifera Braſilienſis, fructu monopyreno, folio ſeſquipedali.* This is a tall Tree, which grows in *Braſil*, to which no Medicinal Virtues are attributed.

COPISCUS, κόπισκος. A Sort of Frankincenſe mention'd by *Dioſcorides, Lib.* 1. *Cap.* 81. This is the ſecond in Goodneſs; and he ſays it is in leſs Fragments, and of a more tawny Colour.

COPOS, κόπος. Laſſitude; Wearineſs; or a morbid Senſation of Laſſitude, which comes on ſpontaneouſly, without any previous Motion, Exerciſe, or Labour. This is a frequent Symptom in acute Diſtempers, and is call'd *ſpontaneous Laſſitude*, κόπος αὐτομάτος. *Galen. Comment. ad Hippocrat. Aph.* 31. *Lib.* 4.

COPOVICH-OCCASSOU. A Tree mentioned by *De Laet*, which grows in the *Weſt Indies.* The Leaves are like thoſe of the Pear-tree. And the Fruit, call'd *Oumery*, is like a large Pear, and, when perfectly ripe, it is eſteem'd an excellent Fruit. *Raii Hiſt. Plant.*

COPPAROSA. Copperas. Green Vitriol. See VITRIOLUM.

COPRAGOGUM, from κόπρος, Dung, and ἄγω, to bring away. The Name of a gently cathartic Electuary mentioned by *Rulandus*, in his *Curat. Empiric. Cent.*

COPRIEMETOS, κοπρίεμετος, from κόπρος, Dung, and ἐμέω, to vomit. A Perſon who vomits up his Excrement, as it ſometimes happens in the laſt Stage of the Iliac Paſſion.

COPROCRITICA MEDICAMENTA, from κόπρος, Excrement, and κρίνω, to ſeparate. Thoſe cathartic Medicines which evacuate only the Inteſtines, and bring away Excrement alone. They are the ſame as the ECCOPROTICA.

COPROPHORIA, from κόπρος, Excrement, and φέρω, to bring away. Purgation. *Blancard.*

COPROS, κόπρος. Dung, or Excrement.

COPROSTASIA, from κόπρος, Excrement, and ἵστημι, to ſtop. A Conſtriction of the Belly, or rendering it coſtive. *Blancard.*

COPTARION, κοπτάριον. A Medicine formed in the Shape of a very ſmall Cake. Theſe were directed for Diſorders of the *Aſpera Arteria* and Lungs, and for many other Intentions, by the Antients. It is a Diminutive from

COPTON, or COPTE, from κόπτω, to beat or pound, becauſe it was formed by beating or pounding the Ingredients into a Paſte. This was the Form of a Medicine uſed by the Antients: It was a ſort of Cake, made generally of vegetable Subſtances, and exhibited internally in various Intentions. *Paulus* mentions a *Copton*, which was directed to be apply'd externally to the Region of the Stomach and Liver.

COPULA. A Ligament.

COQ. An Abbreviation which frequently occurs in Medicinal Writers. It imports *Coque, Coquantur*, Boil, or, Let them be boiled.

COQUENTIA MEDICAMENTA. Medicines which promote Coction or Concoction.

COR. The Heart. This is a muſcular Organ included in the Pericardium, hanging between the Lungs in the Thorax, and affording an Origin to the Trunks of the lower Blood-veſſels, by means of which it receives and emits all the ſeveral Humours in the Body.

The Hearts of Animals, conſidered as an Aliment, are of difficult Digeſtion, and, according to *Paulus Ægineta, Lib.* 1. *Cap.* 85. contain a thick Juice, are with Difficulty concocted, and ſlowly transformed and converted into Nouriſhment. *Oribaſius*, in his *Collect. Lib.* 2. *Cap.* 39. acknowledges, that the Hearts of Animals are fibrous, and conſequently with Difficulty concocted, and ſlowly changed into a State fit for the Purpoſes of the animal Œconomy: But, if they are ſufficiently concocted, they afford a large Quantity of Nouriſhment to the Body, and contain a laudable Juice. *Sennertus*, in his *Inſtitutiones Medicinæ*, advances the ſame things with reſpect to the Hearts of Animals; and adds, that when they are duly concocted, they afford a firm and durable Nouriſhment.

COR, in Botany, ſignifies the Heart of Vegetables, or what is otherwiſe call'd MEDULLA, which ſee. *Cor*, or *Corculum*, alſo ſignifies that minute Portion of any Seed, from which the Root and Bud ariſe. *Raii Hiſt. Plant.*

COR, in Chymiſtry, imports Gold; and ſometimes an intenſe Fire.

ANATOMY *of the* HEART.

The Heart is a muſcular Body, ſituated in the Cavity of the Thorax, on the anterior Part of the Diaphragm, between the two Laminæ of the Mediaſtinum. It is, in ſome meaſure, of a conical Figure, flatted on the Sides, round at the Top, and oval at the Baſis. Accordingly we conſider, in the Heart, the Baſis, Apex, two Edges, and two Sides, one of which is generally flat, and the other more convex.

Beſides the muſcular Body, which principally forms what we call the Heart, its Baſis is accompanied by two Appendices, called Auriculæ, and by large Blood-veſſels; and all theſe are included in a membranous Capſula, named Pericardium.

It is hollow within, and divided by a Septum, which runs between the Edges, into two Cavities, call'd Ventricles, one of which is thick and ſolid, the other thin and ſoft. This latter is generally termed the Right Ventricle, the other the Left Ventricle; tho', in their natural Situation, the Right Ventricle is placed more anteriorly than the Left.

Each Ventricle opens at the Baſis by two Orifices, one of which anſwers to the Auricles, the other to the Mouth of a large Artery; and accordingly one of them may be termed the auricular Orifice, the other the arterial Orifice. The Right Ventricle opens into the Right Auricle, and into the Trunk of the pulmonary Artery; the Left into the Left Auricle, and into the great Trunk of the Aorta. At the Edges of theſe Orifices are found ſeveral moveable Pellicules, called Valves by Anatomiſts, of which ſome are turn'd inward toward the Cavity of the Ventricles, and are called Triglochines, or Tricuſpides; others are turn'd toward the great Veſſels, and call'd Semilunares, or Sigmoidales. The Valvulæ Tricuſpides of the Left Ventricle are likewiſe termed Mitrales.

The inner Surface of the Ventricles is very uneven, many Eminences and Cavities being obſervable therein. The moſt conſiderable Eminences are thick fleſhy Productions call'd *Columnæ.* To the Extremities of theſe Pillars are faſten'd ſeveral tendinous Cords, the other Ends of which are joined to the Valvulæ Tricuſpides. There are likewiſe other ſmall, ſhort, tendinous Ropes along both the Edges of the Septum between

the

the Ventricles. These small Cords lie in an obliquely transverse Situation, and form a kind of Network at different Distances.

The Cavities of the inner Surface of the Ventricles are small deep Fossulæ or Lacunæ, placed very near each other, with small prominent Interstices between them. The greatest Part of these Lacunæ are Orifices of the venous Ducts.

The fleshy or muscular Fibres, of which the Heart is made up, are disposed in a very singular Manner, especially those of the Right or anterior Ventricle; being either bent into Arches, or folded into Angles.

The Fibres which are folded into Angles, are longer than those which are only bent into Arches. The Middle of these Arches, and the Angles of the Folds, are turned toward the Apex of the Heart, and the Extremities of the Fibres toward the Basis. These Fibres differ not only in Length, but in their Directions, which are very oblique in all, but much more so in the long or folded Fibres than in the short ones, which are simply bent.

It is commonly said, that this Obliquity represents the Figure 8; but the Comparison is very false, and can only agree to some bad Figures drawn by Persons ignorant of the Laws of Perspective.

All these Fibres, regard being had to their different Obliquity and Length, are disposed in such a manner, as that the longest form partly the most external Strata on the convex Side of the Heart, and partly the most internal on the concave Side; the Middle of the Arches and the Angles meeting obliquely and successively to form the Apex.

The Fibres, situated within these long ones, grow gradually shorter and straiter all the Way to the Basis of the Heart, where they are very short, and very little incurvated. By this Disposition the Sides of the Ventricles are very thin near the Apex of the Heart, and very thick toward the Basis.

Each Ventricle is composed of its proper distinct Fibres, but the Left Ventricle has many more than the Right. Where the two Ventricles are join'd, they form a Septum, which belongs equally to both.

There is this also peculiar to the Left Ventricle, that the Fibres, which form the innermost Stratum of its concave Side, form the outermost Stratum of the whole convex Side of the Heart, which consequently is common to both Ventricles; so that, by carefully unravelling all the Fibres of the Heart, we find it to be made up of two Bags contained in a third.

The Anterior or Right Ventricle is larger than the Posterior or Left, as was well observed by the Antients, and clearly demonstrated by *Helvetius*. They are both nearly of the same Length in Men; and, in some Subjects, they end exteriorly in a kind of double Apex.

All the Fibres are not directed the same Way, tho' they are all more or less oblique; for some end toward the Right Hand, others toward the Left; some forward, some backward, and others in the intermediate Places; so that, in unravelling them, we find that they cross each other gradually, sometimes according to the Length of the Heart, and sometimes according to its Breadth.

The Tubes which cross each other transversely are much more numerous than those which cross longitudinally; which ought to be taken notice of, in order to rectify the false Notions which have been entertain'd concerning the Motion of the Heart, which is, that it is performed by a Contorsion or Twisting like that of a Screw; or that the Heart is shorten'd in the time of Contraction, and lengthen'd in Dilatation.

The Fibres which compose the inner or concave Surface of the Ventricles, do not all reach to the Basis; some of them running into the Cavity, and there forming the fleshy Columnæ, to which the loose floating Portion of the tricuspidal Valves is fasten'd by tendinous Ropes.

Besides these fleshy Pillars, the internal Fibres form a great many Eminences and Depressions, which not only render the inner Surface of the Ventricles uneven, but give it a great Extent within a small Compass. Some of these Depressions are the Orifices of the venous Ducts, found in the Substance of the Ventricles. The Circumferences of the great Openings at the Basis of the Heart are tendinous, and may be looked upon as the common Tendon of all the fleshy Fibres, of which the Ventricles are composed.

The Valves at the Orifices of the Ventricles are of two Kinds; one Kind allows the Blood to enter the Heart, and hinders it from going out the same Way; the other Kind suffers the Blood to go out of the Heart, but hinders it from returning. The Valves of the first Kind terminate in the Auriculæ, and those of the second lie in the Openings of the great Arteries. The first are termed Semilunar or Sigmoidal Valves, the others Triglochines, Tricuspidal, or Mitral.

The tricuspidal Valves of the Right Ventricle are fixed to its auricular Orifice, and turned inward toward the Cavity of the Ventricle. They are three triangular Productions, very smooth and polish'd on that Side which is turned toward the Auricle; and on the Side next the Cavity of the Ventricle they have several membranous and tendinous Expansions, and their Edges are notched or indented. The Valves of the auricular Orifice of the Left Ventricle are of the same Shape and Structure, but they are only two in Number; and, from some small Resemblance to a Mitre, they have been nam'd Mitrales.

These five Valves are very thin, and fasten'd, by several tendinous Ropes, to the fleshy Columnæ of the Ventricles. The Cords of each Valve are fixed to two Pillars; and between these Valves there are other small ones of the same Figure. They may all be termed Valvulæ Tricuspides, Auriculares, or Venosæ Cordis.

The semilunar Valves are six in Number, three belonging to each Ventricle, situated at the Mouths of the great Arteries; and they may be properly enough nam'd Valvulæ Arteriales. Their concave Sides are turn'd toward the Cavity of the Arteries, and their convex Sides approach each other. In examining them with a Microscope, we find fleshy Fibres lying in the Duplicature of the Membranes, of which they are composed.

They are truly semilunar, or in Form of a Crescent, on that Side by which they adhere; but their loose Edges are of a different Figure, each of them representing two small Crescents, the two Extremities of which meet at the Middle of this Edge, and there form a kind of small Papilla.

The great Artery, which goes out from the Left Ventricle, is term'd Aorta. As it goes out, it turns a little toward the Right Hand, and then bends obliquely backward, to form what is called the Aorta Descendens. From about the Middle of the convex Side of this Curvature three great Branches arise, which furnish an infinite Number of Ramifications to the Head, and upper Extremities of the Body; as the descending Aorta does, in the same manner, to the Thorax, Abdomen, and lower Extremities.

The Trunk of the Artery, which goes out from the Right Ventricle, is call'd Arteria Pulmonaris. This Trunk, as it is naturally situated in the Thorax, runs first of all directly upward for a small Space, then divides laterally into two principal Branches, one for each Lobe of the Lungs; that which goes to the Right Lung, is the longest.

Auriculæ.

The Auricles are muscular Bags situated at the Basis of the Heart, one toward the Right Ventricle, the other toward the Left, and joined together by an inner Septum, and external communicating Fibres, much in the same manner with the Ventricles; one of them being named the Right Auricle, the other the Left. They are very uneven on the Inside, but smoother on the Outside, and terminate in a narrow, flat, indented Edge, representing a Cock's Comb, or, in some measure, the Ear of a Dog; and for that Reason a famous Anatomist of *Leyden* would fain have distinguished this Edge by the particular Name of Auricle, calling the rest the Bag. They open into those Orifices of each Ventricle, which I name auricular Orifices; and they are tendinous at their Opening, in the same manner as the Ventricles.

The Right Auricle is larger than the Left, and it joins the Right Ventricle by a common tendinous Opening. It has two other Openings united into one, and formed by two large Veins, which meet and terminate there, almost in a direct Line, call'd Vena Cava superior and inferior. The notched Edge of this Auricle terminates obliquely in a kind of obtuse Point, which is a small particular Production of the great Bag, and is turned toward the Middle of the Basis of the Heart.

The whole inner Surface of the Right Auricle is uneven, by reason of a great Number of prominent Lines, which run across the Sides of it, and communicate with each other by smaller Lines, which lie obliquely in the Interstices between the former. The Lines of the first Kind represent Trunks, and the others small Branches in an opposite Direction to each other. In the Interstices between these Lines the Sides of the Auricle are very thin, and almost transparent, seeming to be formed merely by the external and internal Coats of the Auricle joined together, especially near the Point.

The Left Auricle is, in the human Body, a kind of muscular Bag or Reservoir, of a pretty considerable Thickness, and unequally square, into which the four Veins open call'd Venæ Pulmonares, and which has a distinct Appendix belonging to it, like a third small Auricle. This Bag is very even on both Sides; for which Reason one might be led to call it the Trunk of the pulmonary Veins, and its Appendix the Left Auricle. However, the Bag and Appendix have but one common Cavity, and therefore may still be both comprehended under the common Name of the Left Auricle. In Men the small Portions may likewise be named the Appendix of the Left Auricle; but, in other Animals, the Case is different.

This small Portion or Appendix of the Left Auricle is of a different Structure from that of the Bag or large Portion. Exteriorly it resembles a small oblong Bag, bent different Ways, and indented quite round the Edges; interiorly it is like the Inside of the Right Auricle. The whole common Cavity of the

Left

Left Auricle is ſmaller in an adult Subject than that of the Right; and the fleſhy Fibres of this Left Auricle croſs each other obliquely, in Strata, differently diſpoſed.

Beſides the great common Veſſels, the Heart has Veſſels peculiar to itſelf, call'd the coronary Arteries and Veins, becauſe they in ſome meaſure crown the Baſis of the Heart. The coronary Arteries, which are two in Number, go out from the Beginning of the Aorta, and afterwards ſpread themſelves round the Baſis of the Heart, to the Subſtance of which they ſend numerous Ramifications.

The exterior Courſe of the Veins is pretty much the ſame with that of the Arteries; but they end partly in the Right Auricle, and partly in the Right Ventricle. They likewiſe terminate in the Left Ventricle, but in ſmaller Numbers; and in both they end by certain venous Ducts, which open into the Foſſulæ or Lacunæ, already taken notice of, in the uneven inner Sides of the Ventricles. There are likewiſe Lacunæ of the ſame Kind in the Auricles, between the prominent Lines; and, in the great Bag of the Left Auricle, we find likewiſe ſmall Holes, which ſeem to have the ſame Uſe.

There are ſeldom more than two Arteries, of which one lies toward the Right Hand, the other toward the Left of the anterior third Part of the Circumference of the Aorta. The Right Coronary Artery runs in between the Baſis and Right Auricle, all the Way to the flat Side of the Heart, and ſo goes half Way round. The Left Artery has a like Courſe between the Baſis and Left Auricle; and, before it turns on the Baſis, it ſends off a capital Branch, which runs between the two Ventricles. Another principal Branch goes off from the Union of the two Arteries on the flat Side of the Heart, which, running to the Apex, there joins the other Branch.

The coronary Veins are diſtributed exteriorly, much in the ſame manner. Their Trunk opens principally into the Right Auricle, by a particular Orifice, furniſh'd with a ſemilunar Valve. All the coronary Veins, and their Ramifications, communicate with each other; ſo that, if we blow thro' a ſmall Hole made in any of theſe Branches, having firſt compreſs'd the Auricles, and large Veſſels, we obſerve, that the Air ſwells all the Veſſels, and the Ventricles alſo, by paſſing thro' the Ductus Venoſi.

The Heart lies almoſt tranſverſely on the Diaphragm, the greateſt Part of it being in the Left Cavity of the Thorax, and the Apex being turn'd toward the bony Extremity of the fixth true Rib. The Baſis is toward the Right Cavity, and both Auricles, eſpecially the Right, reſt on the Diaphragm.

The Origin or Baſis of the pulmonary Artery is, in this natural Situation, the higheſt Part of the Heart on the fore Side; and the Trunk of this Artery lies in a perpendicular Plane, which may be conceived to paſs between the Sternum and Spina Dorſi. Therefore ſome Part of the Baſis of the Heart is in the Right Cavity of the Thorax, and the reſt, all the Way to the Apex, is in the Left Cavity; and it is for this Reaſon, that the Mediaſtinum is turn'd toward that Side.

According to this true natural Situation of the Heart, the Parts, commonly ſaid to be on the Right Side, are rather anterior; and thoſe on the Left Side poſterior; and that Side of the Heart, which is thought to be the fore Side, is naturally the upper Side; and the back Side conſequently the lower Side.

The lower Side is very flat, lying wholly on the Diaphragm; but the upper Side is a little convex, thro' its whole Length, in the Direction of the Septum, between the Ventricles. And it may be proper here to remark, that tho' commonly received Terms of Art may ſtill be retain'd, yet it is neceſſary to prevent their communicating falſe Ideas to thoſe who have not had an Opportunity of making Obſervations themſelves, or of being inſtructed by others.

The Heart, with all the Parts belonging to it, is contain'd in a membranous Capſula, call'd the Pericardium, which is, in ſome meaſure, of a conical Figure, and much larger than the Heart. It is not fix'd to the Baſis of the Heart, but round the large Veins, above the Auricles, before they ſend off the Ramifications, and round the large Arteries, before their Diviſions.

The Pericardium is made up of three Laminæ, the middle and principal of which is compoſed of very fine tendinous Filaments, cloſely interwoven, and croſſing each other in different Directions. The internal Lamina ſeems to be a Continuation of the outer Coat of the Heart, Auricles, and great Veſſels. The Trunks of the Aorta, and pulmonary Artery, have one common Coat, which contains them both, as in a Sheath; and is lined on the Inſide by a cellular Subſtance, principally in that Space which lies between where the Trunks are turn'd to each other, and the Sides of the Sheath. There is but a very ſmall Portion of the inferior Vena Cava contain'd in the Pericardium.

It is the middle Lamina, which chiefly forms the Pericardium; and the Figure of this Bag is not ſimply conical, its Apex, or Point, being very round, and the Baſis having a particular Elongation, which ſurrounds the great Veſſels as amply as the other Portion ſurrounds the Heart.

The Pericardium is cloſely connected to the Diaphragm, not at the Apex, but exactly at that Place which anſwers to the flat or lower Side of the Heart; and it is a very difficult Matter to ſeparate it from the Diaphragm in Diſſection. This adhering Portion is in ſome meaſure of a triangular Shape, anſwering to that of the lower Side of the Heart; and the reſt of the Bag lies upon the Diaphragm, without any Adheſion.

The external Lamina, or common Covering, as it may be call'd more properly, is form'd by the Duplicature of the Mediaſtinum. It adheres to the proper Bag of the Pericardium, by the Intervention of the cellular Subſtance in that Duplicature; but leaves it where the Pericardium adheres to the Diaphragm, on the upper Surface of which it is ſpread, as being a Continuation of the Pleura.

The internal Lamina is perforated by an infinite Number of very ſmall Holes, thro' which a ſerous Fluid continually tranſudes, in the ſame manner as in the Peritonæum. This Fluid, being gradually collected after Death, makes what is call'd the Water of the Pericardium, which is found in conſiderable Quantities in opening dead Bodies, while they remain freſh: Sometimes it is of a rediſh Colour, which may be owing to a Tranſudation of Blood thro' the fine Membrane of the Auricles.

The Heart, and Parts belonging to it, are the principal Inſtruments of the Circulation of the Blood. The two Ventricles ought to be conſider'd as two Syringes ſo cloſely joined together as to make but one Body, and furniſh'd with Suckers, placed in contrary Directions to each other, ſo as that, by drawing one of them, a Fluid is let in, and forced out again by the other.

The Heart is made up of a Subſtance capable of Contraction and Dilatation. When the fleſhy Fibres of the Ventricles are contracted, the two Cavities are leſſen'd in an equal and direct manner, not by any Contorſion or Twiſting, as the falſe Reſemblance of the Fibres to a Figure of Eight has made Anatomiſts imagine. For, if we conſider attentively, in how many different Directions, and in how many Places, theſe Fibres croſs each other, we muſt ſee clearly, that the whole Structure tends to make an even, direct, and uniform Contraction, more according to the Breadth or Thickneſs, than according to the Length of the Heart; becauſe the Number of Fibres ſituated tranſverſely, or almoſt tranſverſely, is much greater than the Number of longitudinal Fibres.

The fleſhy Fibres, thus contracted, do the Office of Suckers, by preſſing upon the Blood contain'd in the Ventricles; which Blood, being thus forced toward the Baſis of the Heart, preſſes the tricuſpidal Valves againſt each other, opens the Semilunares, and ruſhes with Impetuoſity thro' the Arteries, and their Ramifications, as thro' ſo many elaſtic Tubes.

The Blood, thus puſh'd on by the Contraction of the Ventricles, and afterwards preſs'd by the elaſtic Arteries, enters the capillary Veſſels, and is from thence forced to return by the Veins to the Auricles, which, like Retirements, Porches, or Antechambers, receive and lodge the Blood return'd by the Veins during the Time of a new Contraction. This Contraction of the Heart is, by the Anatomiſts, term'd *Syſtole*.

The Contraction or Syſtole of the Ventricles ceaſes immediately, by the Relaxation of their fleſhy Fibres; and, in that time, the Auricles, which contain the venous Blood, being contracted, force the Blood thro' the tricuſpidal Valves into the Ventricles, the Sides of which are thereby dilated, and their Cavities enlarged. This Dilatation is term'd Diaſtole.

In this Manner does the Heart, by the alternate Syſtole and Diaſtole of its Ventricles and Auricles, puſh the Blood thro' the Arteries to all the Parts of the Body, and receive it again by the Veins. This is call'd the Circulation of the Blood, which is carried on in three different Manners.

The firſt and moſt univerſal kind of Circulation is that by which almoſt all the Arteries of the Body are fill'd by the Syſtole of the Heart, and the greateſt Part of the Veins evacuated by the Diaſtole.

The ſecond kind of Circulation, oppoſite to the firſt, is thro' the coronary Veſſels of the Heart, the Arteries of which are fill'd with Blood, during the Diaſtole of the Ventricles, and the Veins empty'd during the Syſtole.

The third kind of Circulation is that of the Left Ventricle of the Heart, thro' the venous Ducts of which a ſmall Quantity of Blood paſſes, without going thro' the Lungs, which is the Courſe of all the remaining Maſs of Blood. See SANGUIS. *Winſlow.*

WOUNDS *of the* HEART.

When the Heart is wounded, a large Quantity of Blood is diſcharged, provided any of its larger Arteries or Veins are pierced; the Pulſe becomes languid, and the Colour highly pale; a cold and fetid Sweat breaks out, and, the Extremities becoming exceſſively cold, Death ſpeedily ſucceeds. If only the Subſtance of the Heart is injured, and the Weapon has not penetrated into the Ventricles, the Patient has ſometimes been obſerved to remain alive for a Day or a Night. But if the

Point of the Weapon reaches the Ventricles, the Extremities forthwith become cold, and a ſudden Death enſues. *Lommii Obſervat. Medicinal.*

Wounds of the Heart are always eſteem'd mortal, and to admit of no Cure. See POLYPUS.

DISORDERS *of the* PERICARDIUM.

The enſuing ingenuous Obſervations, made by Dr. *Freind*, ſhew, that the Pericardium is ſubject to various Diſorders, tho' too ſeldom regarded.

Avenzoar takes notice of an Abſceſs in the Pericardium, which I don't find had been deſcrib'd, or even obſerved, by any of the *Greeks* or *Arabians:* And there is no doubt, but this Membrane, and the Mediaſtinum, to which it is contiguous, are ſubject, as well as the Pleura and Lungs, to an Inflammation. *Salius Diverſus*, who has, with good Judgment, given us an Account of ſeveral Diſtempers, overlook'd by the Generality of Writers, deſcribes this Diſorder in a diſtinct Chapter by itſelf; and ſays, it had been taken notice of by no practical Author before him. His Deſcription of the Symptoms, which follow upon an Inflammation here, is very exact and particular; and, becauſe the Caſe is one pretty much out of the Way, tho', without Diſpute, ſuch as often occurs in Practice, and may be eaſily diſcern'd, if well attended to, I ſhall juſt, in ſhort, give a Sketch of what he obſerves, which, indeed, anſwers to what I have recited from *Avenzoar*. There is an acute Fever, Inquietude, Thirſt, breathing thick and quick, great Heat in the Thorax, little Pain, except at the Sternum; in which Place was perceived an uneaſy Straitneſs, and Stop, rather than an exquiſite Pain, in Reſpiration, a Cough always with it, and the Pulſe hard, juſt as it is in a Pleuriſy: However, Want of acute Pain diſtinguiſh'd it from a Pleuriſy; and a much leſs difficult Degree of Breathing, from a Peripneumony. When the Pericardium was inflamed too, there was a more intenſe Heat, and a frequent Syncope; in one Word, all the Symptoms worſe. He very rightly infers, that there is a leſs Degree of Pain in theſe Membranes, becauſe they are looſe, and not tied to the Ribs, as the Pleura is; only at the Sternum, to which the Mediaſtinum is faſten'd, there was felt ſome Uneaſineſs. And, as a Proof of what he aſſerts, he gives the Caſe of one, who died on the ninth Day after ſome Fits of a Syncope; where, upon Diſſection, there appear'd an Inflammation of the interſepient Membranes, as he calls them, and ſome Part of the Pericardium. And this Diſtemper, I don't queſtion, happens oftener than our Practitioners commonly are aware of. When an Inflammation here ſuppurates, the Matter may burſt into the Cavity of the Mediaſtinum; for, tho' there have been great Diſputes among Anatomiſts, whether it has any Cavity or no, the Knife, I think, decides the Controverſy, and ſhews, that it has one, tho' not ſo large as ſome have deſcrib'd it; at leaſt, as it riſes from the Sternum, its two Membranes lie at ſuch a Diſtance, that it is capable of having a Humour or Pus fall down between them, as *Columbus* firſt obſerved, and which he and *Barbette* order to be taken out by trepanning the Sternum. And *Spigelius* makes this further Obſervation, that he has ſometimes ſeen Surgeons impoſed upon by Wounds, tranſverſely made, in this Place; ſo as to think they had penetrated the Lungs, when, indeed, they had only reach'd into this Cavity. As a further and more convincing Proof of what has been here remark'd, a Gentleman, juſtly eſteem'd for his long Experience, and ſound Judgment, in every thing relating to Surgery, has inform'd me, that Abſceſſes of the Mediaſtinum particularly happen in Venereal Diſtempers; and that, in ſuch Caſes, he has frequently uſed the Trepan with great Succeſs. You may, from hence, be ſatisfied, how little Ground there is for that Hint of *Paré*, where he ſeems to think this Operation a ridiculous Attempt.

Avenzoar, I have remark'd, has mention'd an Inflammation and Abſceſs in the Pericardium: And *Rondeletius*, in his Book of *Diſtinguiſhing Diſeaſes by the Symptoms*, has ſomething concerning the ſame Diſtemper. He takes notice, that, in this Caſe, beſides a leſs Difficulty of Breathing, when they ſpit, they are leſs relieved by it, than in a Peripneumony. In a Perſon he diſſected, he found the Pericardium extremely inflamed, and ſome ſanious Matter round the Heart. A like Example we may ſee in *Hildanus*, where the Quantity of the extravaſated Blood, mix'd with Fluid, amounted to above four Pints; and yet no Part of the Heart itſelf was ulcerated: The chief Complaints of the Perſon, ſome time before his Death, were Pain, which ſhot upwards to his Shoulders, and a violent Palpitation. *Rondeletius* owns this to be as a very acute, and dangerous, ſo a very rare Caſe, and one which nobody had ever obſerved before. As to this Writer, and *Salius*, perhaps neither of them might have been appris'd of what the other had ſaid upon this Argument; for tho' *Rondeletius* died many Years ſooner, yet his Book was not printed till the Year before *Salius* publiſh'd his. Yet, after all theſe new Diſcoveries, as they are call'd by the two mention'd Authors, we ſee, that the Diſeaſe is here very fully and clearly deſcrib'd by *Avenzoar*. And this is no more than what has happen'd, in the like Caſes, to other Moderns, who, for want of reading the Antients, have publiſh'd ſome Obſervations as entirely their own, and ſuch as were never hit upon before.

Our Author ſtill affords us ſomething more relating to the Pericardium. He ſpeaks of its being increaſed by the Generation of ſome new Subſtance, like Cartilages, or Pellicles; a Caſe, which, he ſays, had eſcaped the Obſervation of every body before him. This, I ſuppoſe, muſt be meant of the Coats of this Bag being thicken'd; for, when there is an Obſtruction of the Glands here, or too great a Viſcouſneſs of the Lymph, which ſhould ſupply the Liquor naturally contain'd in its Cavity, the Membranes of the Pericardium often enlarge their Bulk to a great Degree, and very often are found firmly adhering to the Heart; more particularly in tabid and aſthmatic Caſes, ſo as to cauſe a frequent Syncope and Palpitation. And the Adheſion, in this Caſe, not being carefully examin'd, may perhaps have given Occaſion to what *Columbus*, and others, ſay, of their having obſerved Hearts without any Pericardium at all. Certain it is, that the Coalition of this Membrane is much more probable, than the entire Want of it. I have ſeen an Inſtance, where it has been, throughout all its Compaſs, above a Quarter of an Inch thick, and ſo cloſely united with the Heart, that it could not any-where be divided, without tearing. It appear'd very evident, that there had been an Inflammation; for ſome Parts of it were ſcirrhous, and others full of little Abſceſſes: In which Caſe there had been, for ſome time, a great Decay of Strength; then a Fever ſucceeded, with a violent Shortneſs of Breath, and Pain in the Thorax. After this, the Pains were more diſperſed over all the Body, and particularly the Limbs, ſomewhat of the Fever ſtill continuing. Towards the End of the Diſeaſe was obſerved a conſtant Quickneſs, and often great Inequalities and Intermiſſions of the Pulſe, attended with ſtrong Palpitations. At laſt, the Patient died unexpectedly in a Moment; tho', upon conſidering the Caſe, as it appear'd in opening thoſe Parts, it was more wonderful, indeed, that the Circulation could be carry'd on ſo long, ſince, in theſe Circumſtances, the Heart had ſcarce any room to move in: Beſides, that there was a large Polypus both in the pulmonary Artery, and the Left Ventricle of the Heart, which might, perhaps, at firſt owe its Production to the original Diſeaſe of the Pericardium.

A Dropſy in this Part is likewiſe taken notice of by *Avenzoar*; a Caſe, he ſays, he had never ſeen himſelf, nor had *Galen* ever mention'd it: Notwithſtanding this, ſuch a Caſe has been obſerved by others. For tho', in a natural State, and in a ſound Conſtitution, the Water here contain'd is not above two or three Spoonfuls; yet, in morbid Bodies, there is frequently found half a Pint, or more; as likewiſe in old People. *Piſo* gives an Inſtance, where ſeveral Pints were taken out; and we need not be ſurpris'd at ſuch an extraordinary Diſtention of this Membrane, ſince the like happens in many others. *Freind's Hiſtory of Phyſic*, *Vol.* 2.

CORACINE, κορακίνη. An Epithet for a ſort of Paſtil, quoted by *Galen*, from *Aſclepiades*. *De Comp. M. per Gen. L.* 5. *C.* 11.

CORACINUS, Offic. Rondel. de Piſc. 1. 128. Schonef. Ichth. 32. Raii Ichth. 300. Emac. Synop. Piſc. 95. Bellon. de Aquat. 115. Aldrov. de Piſc. 69. Salv. de Aquat. 117. Charlt. de Piſc. 15. Jonſ. de Piſc. 31. *Coracinus ſubniger*, Geſn. de Aquat. 294. THE CROW-FISH.

This is a Fiſh mention'd by *Galen*, *Aldrovandus*, and *Bruyerinus*. It is found in Rivers, particularly in the *Nile* and the *Mediterranean* Sea. Certain Bones, found in the Head of this Fiſh, are ſaid to be poſſeſs'd of ſome medicinal Virtues. They are call'd *Lapides Coracini*, and are recommended againſt nephritical and colical Pains, and the Jaundice, by *Rondeletius*.

CORACOBOTANE, from κόραξ, a Crow, and βοτάνη, a Plant. A Name for the *Laurus Alexandrina*. *Blancard.*

CORACOBRACHIALIS *Muſculus.*

This is a long Muſcle, lying on the Inſide of the upper Half of the Os Humeri, that is, on that Side which anſwers directly to the Hemiſphere of the Head of the Bone, and to the prominent internal Condyle.

It is fix'd above to the Point of the Coracoide Apophyſis, between the Inſertions of the Biceps and Pectoralis minor, by a Tendon, which, as it deſcends, adheres, for a good Way, to the Tendons of theſe two Muſcles. Afterwards it becomes fleſhy, and is inſerted, by a broad thin Extremity, with a ſmall Mixture of tendinous Fibres, in the middle Part of the Os Humeri, cloſe by the ligamentary Frænum of the Latiſſimus Dorſi and Teres major. Its Inſertion is continued down below the Frænum, near the internal Intermuſcular Ligament, to which it likewiſe adheres a little.

This Muſcle paſſes behind the Tendon of the Pectoralis major, and, as it is perforated in the Middle to give Paſſage to a Nerve, it has by ſome been term'd *Perforatus Caſſerii*, that Author being the firſt who gave a particular Figure of it. *Winſlow.*

CORACO-HYOIDÆUS, otherwiſe call'd *Omoplato-hyoidæus*, or *Omo-Hyoidæus*.

This is a very long ſmall Muſcle, much narrower than the Sterno-hyoidæus, and ſituated obliquely on the Side of the Neck or Throat, between the Scapula and Os Hyoides. It is a Digaſtric Muſcle, being divided into fleſhy Portions, join'd endwiſe to a ſhort middle Tendon.

It is commonly fix'd, by the lower Extremity, to the ſuperior Coſta of the Scapula, between the ſmall Notch and the Angle, and ſometimes very near the Angle; and from thence ſome Anatomiſts have given it the barbarous Name of Coſto-hyoidæus.

From thence it paſſes over the Coracoide Apophyſis, adhering ſometimes to it by a kind of Aponeuroſis, or membranous Ligament; and from this Adheſion the Name of Coraco-hyoidæus was given it by ſome, who had not diſcover'd its main Inſertion.

It is likewiſe often fix'd to the Clavicle by ligamentary or fleſhy Fibres; and I have ſometimes ſeen it inſerted in the whole middle Portion of that Bone, being inſeparably united with the Sterno-hyoidæus. In one Subject I found it to be a kind of Biceps, one Portion of it being fix'd to the Angle of the Scapula, the other to the Extremity of the Clavicula.

Having paſs'd the Clavicle, it is bent forward, and runs between the Sterno-maſtoidæus and internal Jugular Vein, the ſmall middle Tendon being ſituated in this Place. From thence it runs up to its Inſertion in the inferior lateral Part of the Baſis of the Os Hyoides, near the Cornu, and Inſertion of the Sterno-hyoides, which it covers a little. *Winſlow.*

CORACOIDES PROCESSUS. A Proceſs of the Scapula, call'd thus becauſe of its Reſemblance to a Crow's Bill. See SCAPULA.

CORACOIDEUS. The ſame as CORACOBRACHIALIS.

CORACUM EMPLASTRUM. A Plaiſter deſcrib'd in *Paulus Æginetа*, *L.* 7. *C.* 17. He recommends it as a proper Topic for the Pudenda, and ſpreading Ulcers.

CORAL. See CORALLODENDRON.

CORALLACHATES. A Species of the *Achates*, which reſembles Coral, with reſpect to Colour.

CORALLATUM. A Name for the *Mercurius Præcipitatus ruber*. See MERCURIUS.

CORALLINA. Offic. J. B. 3. 810. Raii Hiſt. 1. 65. Chab. 577. Tourn. Inſt. 570. Elem. Bot. 444. *Corallina Anglica*. Ger. 1379. Emac. 1571. *Muſcus Maritimus ſive Corallina Officinarum*. C. B. 363. *Muſcus marinus, ſive Corallina alba Officinarum*. Park. 1295. SEA CORALLINE, WHITE WORM-SEED.

This is a ſmall low Plant, of a ſomewhat ſtony Conſiſtence, ſeldom growing above two or three Inches high, much branch'd, full of ſhort, ſmall, jointed, round Stalks, of a white Colour for the moſt part, though it is ſometimes found purpliſh and greeniſh; it is of a ſaltiſh Taſte, and of a pretty ſtrong Smell. It is found growing every-where, upon the Rocks of the Sea, and frequently on Oyſters, and other Shells.

Coralline is only uſed to deſtroy Worms in the Stomach and Bowels, being given from half a Dram to a Dram, in coarſe Powder, in any convenient Vehicle. *Miller's Bot. Off.*

CORALLIUM, Coral. Of this there are many Species mentioned by Botaniſts. But thoſe principally uſed in Medicine, are the following:

CORALLIUM ALBUM. Offic. Raii Hiſt. 1. 62. Calc. Muſ. 7. Worm. 232. Boet. 318. J. B. 3. 805. Ger. 1381. 1576. Hiſt. Oxon. 3. 655. *Corallium album majus*. Park. 1300. *Corallium album Officinarum*. Chab. 572. *Corallium album*. Tourn. Inſt. 572. Elem. Bot. 445. C. B. 366. WHITE CORAL.

There are ſeveral Kinds of white Coral, ſome growing taller and larger, ſome ſhorter and ſmaller; the beſt Sort is pure white, of a firm, ſtony, and ſolid Subſtance, through its whole Body, not hollow, porous, ſcurfy, nor eaſily friable. It grows on the Rocks in divers Parts; the beſt comes from the *Mediterranean*.

White Coral is cooling, drying, and binding, good for the Heart-burn, or any Diſorders which proceed from ſharp acid Juices in the Stomach or Blood. *Miller's Bot. Off.*

It is ſaid to ſtrengthen the Liver, and to ſtop Fluxes of all Kinds.

CORALLUM RUBRUM. Offic. Raii Hiſt. 1. 60. Worm. 231. J. B. 3. 805. Ger. 1381. Emac. 1575. *Corallium rubrum majus*, Park. 1299. *Corallium rubrum*. C. B. 366. Tourn. Inſt. 572. El. Bot. 445. Hiſt. Oxon. 3. 655. *Corallum ſive Corallium*. Chab. 572. *Coralium*. Calc. Muſ. 3. *Corallium verum*. Boet. 318. RED CORAL.

This is a ſtony Plant, which grows upon the Rocks at the Bottom of the Sea, ſpreading out round Branches, like a ſmall Tree, which are rough and whitiſh on the Outſide while growing; but, when poliſh'd, of a pure red Vermilion-colour. It grows in the *Tyrrhenian* Sea, and on the Coaſts of *Spain* and *France*.

This is in much greater Uſe than the *white Coral*, being eſteem'd to have greater Virtue, and to be cordial, drying, and reſtringent, good to ſweeten the Blood, and free the Stomach from acid ſour Juices; it ſtops all Kinds of Fluxes and Hæmorrhages; and, where-ever an Alcali is neceſſary, this will do as much as any.

The only officinal Preparation from *Coral*, is the *Electuarium Diacorallion*. *Miller's Bot. Off.*

DIACORALLION: *The Coral Electuary.*

Take of white and red Coral, of the true *Armenian* Bole, and Dragons Blood, of each one Dram; of Pearls, half a Dram; of Aloes-wood, red Roſes, Gum Tragacanth, and Cinnamon, of each two Scruples; of white and red Saunders, of each one Scruple; of Sugar, diſſolv'd in ſmall Cinnamon-water, four times as much as the Whole; and make them into an Electuary.

This hath been continued through all the Editions of the *College Diſpenſatory* the ſame; and all the Ingredients agree in the main Intention of an Aſtringent; but it hath been hitherto ſo ſeldom ordered in extemporaneous Preſcriptions, that, I believe, it is not to be met with in the Shops.

Whether Coral exhilarates the Heart, or is a Preſervative againſt the Epilepſy, if it be given, to the Quantity of ten Grains, to the new-born Infant, in the Mother's Milk, as *Schroder* adviſes, I ſhall not determine.

Outwardly it is recommended for inearning of Ulcers, obliterating the Marks of Cicatrices, and in Collyria for Eyes ſubject to ſhed Tears; and to quicken the Sight.

Our Nurſes, and old Women, here in *England*, have a Cuſtom of hanging Coral about the Necks of Infants, to promote Dentition; and the Children taking Delight in putting them to their Mouths, and biting them, becauſe they are ſmooth and cold, by that means rub their Gums, and ſo facilitate the Eruption of their Teeth; not that ſuch an Effect proceeds from any Property or occult Virtue of the Coral, as the Vulgar imagine.

The Tincture of Coral is very much commended in peſtilential Fevers. *Boetius de Boot* uſed it with Succeſs; and *Garenciers* ſays, it ſeldom deceived his Expectations in theſe Diſtempers; but it is a Queſtion among the Chymiſts, whether there be any true and genuine Tincture of Coral. *Rail Hiſt. Plant.*

CORALLIUM NIGRUM. Raii Hiſt. 1. 61. Hiſt. Oxon. 3. 655. Worm. Muſ. 233. Calc. Muſ. 10. Miſc. Cur. Dec. 11. *A.* 1. 57. *Corallium nigrum ſive Antipathes*. J. B. 3. 804. Ger. 1382. Emac. 1575. Chab. 573. Park. Theat. 1300. *Corallum nigrum*. C. B. Pin. 366. Rar. Muſ. Beſl. T. 28. *Keratophyton arboreum, nigrum*. Boerh. Ind. A. 6. *Lithophyton nigrum arboreum*. Tourn. Inſt. 574. *Lithophytum nigrum, majus, & craſſius*. Elem. Bot. 446. *Pſeudo-corallium nigrum*. Boet. 319. BLACK CORAL.

It is found ſometimes in the *Italian* Sea; but more frequently in the *American* Seas. It agrees with other Corals in Virtues.

Another Species of the *Corallium* is the

ASTROITES, STELLARIS, ET STELLÆ LAPIS. Mont. Exot. 7. *Aſtroites diſtinctiſſimè Stellas emulat*. Muſ. Swam. 6. *Aſtroites*. Geſn. de Fig. Lap. 35. Worm. Muſ. 68. Plot. Hiſt. Oxon. 87. Tab. 2. f. 6. 7. *Lapidis Aſtroitidis, ſive Stellaris primum genus*. Boet. 298. Cat. Jamaic. 2. Hiſt. Vol. 1. Pag. 54. Tab. 21. *Stellatus Lapis*. Aldrov. Muſ. Metall. 872. Fig. 877, 878, 879. *Stellarius Lapis*. Laet. de Gem. 97. STAR-STONE.

This is found in the Sea near *Jamaica*, and has the ſame Virtues attributed to it as the Coral.

Coral is call'd Lithodendron, that is, a Tree of Stone, it being, in Effect, nothing but a ſtony Plant, which grows under hollow Rocks in many Parts of the *Mediterranean* Sea, where there is the greateſt Depth of Water. There are three different Kinds of it, Red, White, and Black; and we ſometimes meet with little Boughs, which are red in ſome Parts, and black in others: The red Coral is the moſt common, and more uſed in Phyſic, than either the black or white; and the beſt Kind of it is well compacted, ſmooth, and of a ſhining high Colour.

The white Coral is more rare than the red; it ought to be hard, ſmooth, bright, and white as Ivory. The black Coral is the moſt rare, and leaſt uſed in Phyſic; 'tis a kind of *Lithophyton*, call'd by the Antients *Antipathes*, or *Antipathes*; and by *Tournefort*, *Lithophyton nigrum arboreſcens*. We ſhould make Choice of that which is cloſe, heavy, ſmooth, ſhining, and of a deep black. Corals are generally cover'd in the Sea with a tartarous Cruſt, which can be eaſily ſeparated from the Body of the Plant, and probably proceeds from Foam harden'd and petrified. We may diſtil from this Cruſt a Sort of urinous Spirit,

Spirit, replete with volatile Salt, and a little black Oil, which, in a great meaſure, have the ſame Virtue, Taſte, and Smell, as thoſe extracted from Hartſhorn. While Corals are young and tender, the Tops of their Branches are ſurrounded with little thick Balls, as large as our red Goosberries; they are ſoft, and contain an oily milky Liquor, of a ſharp aſtringent Taſte. Theſe little Balls are the Fruit of the Coral, and in them ought we to look for the Seed; for the white Liquor of the Fruit, being ſpilt on Rocks, produces Plants of Coral. Theſe little Balls harden and petrify, in proportion to the Growth of the Tree. Some have affirmed, that the Coral is always ſoft, before it is taken out of the Sea; and that it only grows hard, after it is taken from thence; but Experience has ſhewn us the contrary.

If you ſteep, for a Day or two, red Coral in white Wax, melted on hot Embers, the Coral will loſe its Colour, and become white, and the Wax will aſſume a yellow Dye; but there muſt be a little more Wax than Coral.

If you ſteep another Piece of red Coral in the ſame Wax, it will become brown; and if, a third time, you ſteep red Coral in the ſame Wax, it will come out red. Wax diſſolves a little the Bitumen which is upon the Coral, and makes it red. We may extract the Tincture of Coral, contain'd in the white Wax, by infuſing it in Aqua Vitæ impregnated with Salt of Tartar. Many hang red Coral about their Necks in order to ſtop Bleedings, to cleanſe the Blood, and ſtrengthen the Heart: I am inclin'd to think, that its red Colour, reſembling nearly that of the Blood and Heart, has induced People to believe it had theſe Virtues; but we know by Experience, that the external Application has no Effect.

Coral is to be prepared by grinding it on a Marble into a Powder, as ſmall as poſſible, that it may be the more eaſily diſſolved; and we uſe this Preparation of Coral for ſtopping Dyſenteries, Diarrhœas, the Flux of the Hæmorrhoids, the Menſes, bloody Fluxes, and all other Diſeaſes which proceed from acrimonious Humours. A Doſe of this, from ten Grains to a Dram, may be given in Water of Knot-graſs, or any other Liquor.

The more the red Coral is pounded, the more it loſes of its Colour, and 'tis inſipid to the Taſte. If you have any Curioſity to diſtil red Coral, you may put eight Ounces pulverized in a Retort, and you will only draw off about two Drams of a ſpirituous Liquor, of a dark Hue, mix'd with ſome Particles of black Oil, of a fetid Smell, like what we diſtil from Hartſhorn, and other Parts of Animals, and of a ſalt and bitter Taſte, which proceeds from the volatile alcaline Salt. Though I mention the Quantity of Liquor commonly drawn from Coral, yet there cannot be any general Rule laid down concerning it; for Coral yields more or leſs, in proportion to the Time it has been taken out of the Sea, and has been kept. The black Coral yields more Spirit, volatile Salt, and Oil, than any other Coral.

The red and white Coral, being calcin'd in a Crucible, become both white, and are commonly inſipid to the Taſte; but we ſometimes find white Coral, after it is pulverized, and a little calcin'd, to be very ſalt; and therefore we may conclude, that it had the ſaltiſh Taſte from the Water of the Sea, which it received into its Pores: However that be, I have always obſerved this Coral more porous and ſpongy than the red; and I attribute that to its wanting that bituminous Subſtance, which conſtitutes the red Colour; and, as it ſtops the Pores of the Plant, renders the Coral more compact and cloſe; but, for any thing elſe, the red and white Coral ſeem to be of the ſame Nature, and to have the ſame Qualities in Phyſic. 'Tis, nevertheleſs, worth while, here, to take notice of a Circumſtance which ſeems to denote a ſmall Difference betwixt the Formation of theſe two Plants: If you take diſtil'd Vinegar, and pour it on calcin'd red Coral, it will make a conſiderable Effervеſcence, and boil up to a pretty good Height, and continue for a little time; but, ſhould the ſame be pour'd on white calcinated Coral, it will effervеſce, but weakly, and ſink in an Inſtant. This Difference of Effervеſcence does not hinder the Corals from diſſolving equally, and making each a Salt and a Magiſtery alike in all reſpects.

The Difference in the Effervеſcences of the red and white calcin'd Coral ariſes from hence; that the Pores of the white Coral, which were larger than thoſe of the red in their natural State, are more enlarg'd and worn by Calcination, ſo that they have loſt a great Part of their Reſiſtance; and the Points of the Vinegar entering there, and finding but little Reſiſtance, produce a very eaſy Separation of the Parts; whereas the red Coral, which is more compact in its Parts, preſerves in the Calcination all its Power of Reſiſtance; and the Points of the Vinegar, poured on it, excite a violent Separation.

Out of eight Ounces of red calcin'd Coral, from which the active Principles have been diſtil'd, in the manner abovementioned, by Lixiviation, four Scruples of fix'd alcaline Salt may be procur'd; and this muſt evidently be ſome of the Sea Salts that penetrate into the Coral, which is render'd alcaline by the Fire, during the Calcination of the Matter.

We may draw from calcin'd Coral a great many Particles of Iron, by means of a Knife touch'd with a Loadſtone.

Tincture *of* Coral.

This Operation conſiſts in the Separation of a little of the bituminous red Matter, wherewith all red Coral is ting'd.

Put into a Matras, what Quantity you pleaſe, of red Coral prepar'd, or pulverized in the fineſt manner; pour on it Oil of Tartar per Deliquium, or of fix'd Nitre, till either riſes above the Coral about four Inches; then let the Veſſel be plac'd on warm Sand, and continue there in Digeſtion for eight Hours, only ſhake the Matter now-and-then: Thus the Liquor will be of a red Colour; and, after being filtred, it will be, what we call, the Tincture of Coral. It will preſerve the alcaline Acrimony of its Diſſolvent; but it may be ſweeten'd by mixing an eighth Part of the Spirit of Vitriol in it.

The Tincture of Coral may be alſo extracted by the ſame Method with Aqua Vitæ, mix'd with Salt of Tartar. The Tincture of Coral is reckon'd proper to cleanſe the Blood, to ſtrengthen the Heart, for reſiſting malignant Humours, and driving them out by Perſpiration; to ſtop bloody Fluxes, and Looſeneſs of the Belly. A Doſe, from four to ſixteen Drops, may be given in any Liquor proper for the Diſtemper; but it may be exhibited in much larger Doſes.

REMARKS.

Among all the Kinds of Coral, the Red has met with the Preference in Phyſic, eſpecially from the Antients, becauſe of its Colour; for they pretended, that its red Colour, which approaches to that of Blood, was very proper for cleanſing and ſtrengthening the Heart. They knew it, by Experience, to be aſtringent; but, it does not appear, that they had any Notion of its alkaline and abſorbent Virtues: This principal and diſtinguiſhing Quality was diſcovered by modern Chymiſts; for the Antients believ'd, that its Colour was the Cauſe of its ſtopping Blood, and other Humours.

And, having once given into the Notion, that the red Colour of Coral was of very great Virtue and Efficacy in Medicine, they ſpar'd no Pains to find out the Means of ſeparating that Tincture from the Body of the Coral. Both antient and modern Chymiſts have made it their principal Buſineſs, and have labour'd as much to find out this, as ever they did to make Gold potable; becauſe they were perſuaded, that, after having made this Diſcovery, they could find out a kind of univerſal Medicine or Remedy, for all the Diſorders of the Body. Accordingly we ſee, in Authors, a great Number of Deſcriptions of the Tincture of Coral; and each ſeems to contend for the Honour of his own. It would be tedious to recount them in this Place; but this I can ſay, that though I have made Experiments by moſt of their Deſcriptions, I cannot find any one true Tincture of Coral. This determin'd me to diſregard the Experiments of thoſe who have gone before me, and to have recourſe ſolely to my own. I have applied myſelf to diſcover ſome certain and eaſy Menſtruum for extracting that Tincture, and in this I am inclin'd to think I have ſucceeded; but muſt, however, confeſs, that I cannot give into the Opinion of the Antients, concerning the great Virtues they attribute to the Tincture of Coral: I believe rather, that it is only a little, inſipid, bituminous Matter, with which all Coral is ting'd, and that there is little Virtue in it. Mean time I have not been wanting to make Reſearches into the Matter, as there are many Phyſicians at this Day, who are prepoſſeſſed with an Opinion of theſe great Virtues; and, beſides, Experiments may be of Uſe to Natural Hiſtory.

The Tincture of Coral may be extracted by making a warm Infuſion, for ſome Days, of red pulveriz'd Coral, and the Juice of a Lemon newly ſqueez'd. The firſt Day there will be an Ebullition, occaſioned by the Meeting of the acid and alcaline Particles. When the Tincture is finiſh'd and filtred, it will loſe all the Acidity of the Lemon, and will have ſomewhat of a bitter Taſte; it will not preſerve its Colour long, but will be loſing it by little and little every Day; and, in the Space of a Month, the Liquor will corrupt; tho' this Corruption of the Liquor may be prevented, by pouring the Oil of ſweet Almonds one Inch deep above the Tincture in a Phial. But, as it is an eaſy Matter to prepare this Tincture of Coral with Lemon-juice, People may make it frequently, and not give it time to grow old. It retains the Smell of the Lemon, which makes it a little more agreeable. A Doſe from half a Dram to ten Drams may be adminiſter'd.

One may alſo extract the Tincture of Coral by making an Infuſion, for eight Days, of red Coral prepared, and the Spirit of Honey rectify'd, and made by Diſtillation as clear as Water; and this Menſtruum will extract the Colour of the Coral, and loſe its Acidity, becauſe it will be abſorb'd by the Alcali. One may take of this Tincture from twelve Drops to thirty in any proper Vehicle.

We may, moreover, extract the Tincture of Coral, by making a warm Infuſion and Digeſtion, for eight Days, of ſmall red Coral-branches in the Spirit of Wax rectify'd. The Diſſolvent will be of a deep-red Tincture, and the Coral will have a grey Colour on the Outſide, but inwardly it will continue red, becauſe the Spirit of Wax will not penetrate there. A Tincture alſo of prepared Coral may be thus extracted; but, whatever Way you extract it, it retains ſo diſagreeable a Smell and Taſte of the Menſtruum, that it can ſcarcely be made uſe of in Medicine.

Dissolution *of* Coral.

In order to diſſolve Coral, you may take any Quantity, and reduce it to the ſmalleſt Parts poſſible on a Porphyry; then put it in a large Matraſs, and pour diſtil'd Vinegar upon it, till it riſe four Inches above the Coral. Let your Matter be ſet in Digeſtion on warm Sand for the Space of two Days, and remember to ſhake the Matraſs frequently. Suffer the Coral to ſettle to the Bottom, and pour gently the clear Liquor off. Pour on as much diſtil'd Vinegar as before on the Reſidue, and let it be two Days more in Digeſtion. Separate again the clear Liquor, and continue the pouring on more diſtil'd Vinegar, and to draw off that impregnated, till the Coral be almoſt wholly diſſolv'd: Then mix all the Liquors, which were drawn off, together; and put them into a Glaſs Cucurbit, or a Stone Veſſel: Let two Thirds of the Moiſture evaporate by a Sand-heat, or till there appears on the Top a fine thin Pellicule. Filtre this impregnated Liquor, and keep it to make the Salt and Magiſtery. It will have a greeniſh Colour, and an inſipid Taſte.

It may be adminiſter'd on all Occaſions where the Salt is us'd. A Doſe of it may be from ten to twenty Drops in any proper Liquor.

REMARKS.

Red Coral is moſt commonly uſed, becauſe People are of Opinion, that the Colour adds to its Virtue. The Diſſolution which is made, when the Vinegar penetrates into the Coral, is commonly rank'd amongſt the cold Effervеſcences, or Ebullitions; but I have known, by the Help of a Thermometer, that it had a little Heat. 'Tis ſurpriſing, indeed, that ſo great an Agitation and Ebullition of the Parts ſhould not cauſe ſome ſenſible Heat; but it ought to be conſidered, that the Coral having very large Pores, it may be eaſily diſſolv'd; and conſequently there cannot be ſo great a Colliſion betwixt the Particles of the Coral and the Acids, as would be neceſſary for raiſing any conſiderable Heat.

In this Operation, ſome, inſtead of Vinegar, make uſe of the acid Waſhings of Butter of Antimony, or the pure Spirit of Vitriol, or the Spirit of Copper; but as theſe Spirits impart a great deal of Acridneſs to the Preparations of Coral, I think it far better, in this Caſe, to make uſe of diſtil'd Vinegar, which is but a weak Acid, and incapable of communicating any injurious Impreſſion.

As Coral is an Alcali, the acid Points join with it, and, keeping its Parts ſuſpended, render them imperceptible. For the ſame Reaſon the Vinegar entirely loſes its Acidity, which conſiſting only in the Motion and Activity of its Points, theſe are ſheathed by the Alcali. The Solution acquires no Colour, but, being filtrated, is as clear as diſtil'd Vinegar, and of a ſweetiſh Taſte, inclining a little to bitter.

Should we continue to throw freſh diſtil'd Vinegar on the ſame Coral, in proportion as we ſeparate the Solution from it, there will remain nothing but a very ſmall Quantity of argillaceous Matter, which is indiſſoluble by the ſame Diſſolvent, tho' duly apply'd; but this is neglected as a thing of no Uſe.

If you have a mind, out of Curioſity, to diſtil off the humid Part of your Solution, inſtead of evaporating it, as was directed, you will obtain only an inſipid Water, becauſe the Acid is firmly fixed in the Coral. We evaporate this Water, becauſe it would be of no Service, and would only weaken the Impregnation.

The Solutions of Pearls, Crabs-eyes, burnt Hartſhorn, and other alcaline Subſtances, are perform'd after the ſame manner; Salts and Magiſteries may alſo be made of them, like thoſe of Coral.

It is here to be obſerved, that a Solution of theſe Sorts of alcaline Subſtances, in diſtil'd Vinegar, has ſome Smell of Spirit of Wine, and that a ſmall Quantity of that Spirit may be drawn from it by an Alembic, and a very gentle Fire. The

Reaſon is, that, in the making of the Vinegar, the Acids had in a manner fixed this ſulphureous Spirit; but, when they come to enter the Pores of the Coral, they are forced to abandon it, and leave it to reſume its Volatility.

Magistery *of* Coral.

This Operation is perform'd on Coral firſt diſſolv'd, and afterwards precipitated in very fine and white Particles.

Take any Quantity of diſtil'd Vinegar, impregnated with red or white Coral, as before deſcribed; pour it into a Phial or Matraſs, and inſtil therein Drop by Drop the Liquor of Salt of Tartar *per Deliquium*; there will be produc'd a *Coagulum*, which will be precipitated to the Bottom in the Form of a very white Powder. Let the clear Liquor be pour'd off by Inclination, and, waſhing the Powder in five or ſix Waters, afterwards dry it. This is what we call *Magiſtery of Coral*. Great Virtues are aſcribed to it; it is ſaid to comfort and ſtrengthen the Heart, to reſiſt Poiſon, and to ſtop a Dyſentery, and all Hæmorrhages. The Doſe is from ten to thirty Grains, in any Liquor appropriated to the Diſtemper.

REMARKS.

The Name *Magiſtery* is given only to precipitated Subſtances. The Meaning of the Word is, *ſomething very exquiſite*, but oftentimes there is nothing in it extraordinary; for Magiſteries are no more than Subſtances attenuated and divided by Solution and Precipitation. The firſt Chymiſts invented this Term for ſome particular precipitated Subſtances, but not for all; and we have now no general Idea, or eſtabliſh'd Characteriſtic, to diſtinguiſh Magiſtery from Precipitate; whence they are very much confounded, and we are pleaſed to continue to them both the ſame Name, which has paſſed current for a long time, without troubling ourſelves to inquire into the Reaſon. What may be ſaid on this Subject is, firſt, that every Magiſtery is a Precipitate, but every Precipitate is not a Magiſtery; ſecondly, that Magiſteries are always very white, and lighter than other Precipitates, which is the Reaſon why they are commonly longer in precipitating; thirdly, moſt of thoſe Preparations call'd Magiſteries are made from ſtony Subſtances, as Corals, Shells, Pearls, Crabs-eyes, Hartſhorn, Ivory, Sulphur, Antimony, and Biſmuth; and, in particular, the Magiſtery of Coral is call'd the *Albugo* of Coral, becauſe of its Whiteneſs.

The Liquor of Tartar, which is an alcaline Salt diſſolv'd, encountering with the Acid, makes it quit its Hold of the Particles of Coral, which it held ſuſpended; ſo that they are precipitated by their Weight. This Precipitate is nothing but a Coral reduced to a very fine Powder by the Acids, which divide what ſeemed indiviſible under the levigating Stone into a great Number of Particles. But we ought here to remark, that theſe Preparations, inſtead of rendering the Coral more efficacious, as is pretended, make it almoſt uſeleſs. This is eaſy to be proved, if we conſider, that Coral acts no otherwiſe on the Body than by abſorbing the Acids, and the acrimonious and ſalt Humours, which are the Cauſes of ſeveral Diſeaſes at all times. For Example, it puts a Stop to Hæmorrhages on no other account than by mollifying the pungent Salts which corrode the Membranes of the Veins, or excite Effervеſcences in the Blood, conſiderable enough to cauſe an Extravaſation; it ſtops Diarrhœas only by ſubduing the Acrimony of the Bile, or other Humours; and, in ſhort, that it cures Relaxations of the Uvula, and is a Remedy for ſeveral other Diſorders, is owing purely to its breaking the Force of the Ferments which ſupport them, in the ſame manner as it deſtroys the Acid in Vinegar, or other Liquors. This being the Caſe, as there ſeems to be great Reaſon to believe, it is better to take the Coral without any other Preparation than what the Marble gives it, than to diſſolve it by an Acid, and precipitate it into a Magiſtery; for the Acids or acrimonious Humours of the Body, meeting with the Magiſtery, and finding nothing in it to mollify or blunt their Points, will continue their Activity, and ſo no Effect will follow. The ſame may be ſaid with regard to the Magiſteries of Pearls, Hartſhorn, Crabs-eyes, Ivory, and Shells, which are made after the ſame manner. They are, indeed, ſlight Abſorbents, but are much leſs active and effectual in Diſeaſes than the Subſtances themſelves, with the ſimple Preparation of the Porphyry. Here it may be proper to obſerve, by the way, that, among the alcaline Subſtances, of which I have ſpoken, and which are now very much uſed in Medicine, Coral is the ſtrongeſt Abſorbent, and what appears to me of the greateſt Efficacy in ſtopping an Hæmorrhage.

There is not the leaſt Effervеſcence in this Precipitation, becauſe the acid Points of the Vinegar, being broken, have neither Strength nor Motion enough left to penetrate and diſperſe the Parts of the Salt of Tartar. But if the Solution of the Coral be made with a ſtronger Diſſolvent than

Vinegar, for Inſtance, with Spirit of Vitriol, there will be an Ebullition in the time of Precipitation, becauſe there will remain Activity enough in the broken Points to enter into the Pores of the alcaline Salt, and to rarefy it.

The Powder of red Coral grows whiter, in proportion to its Fineneſs; the Stone changes its red Colour into a pale; but the Acids dividing it yet much more, it acquires a white Colour, which can proceed only from the Diſpoſition of the Parts, which cauſes different Reflexions of the Rays of Light to our Eyes.

Some, who are willing to have their Magiſtery of the Colour of red Coral, tinge the diſtil'd Vinegar, which they uſe for the Solution of the Coral, with dry'd red Roſes.

Salt *of* Coral.

This is a Preparation of Coral, rarefy'd and penetrated by the Acids of the Vinegar.

Take what Quantity you pleaſe of a Solution of Coral in diſtil'd Vinegar; put it into a Glaſs Cucurbit, or a Stone Veſſel, and ſet it to evaporate all its Humidity in a Sand-heat; there will remain at the Bottom a Salt of Coral, which keep in a Phial, well ſtopt. It is given for the ſame Purpoſes as the Magiſtery. The Doſe is but ſmall, being from five to fifteen Grains.

REMARKS.

Coral will yield three Kinds of Salt; the firſt is a volatile Salt, which you obtain in a ſmall Quantity by Diſtillation in a Retort; it is of a urinous Nature, and altogether like that of Salt of Hartſhorn, and of animal Subſtances. The ſecond Kind is a fixed Salt, obtained by Calcination and Lixiviation, and nearly reſembling thoſe Salts which are got out of ſeveral terreſtrial Plants by the ſame Method; but there is a great Probability, that this Salt is a Sea-ſalt, contracted by the Coral during its Growth in the Sea, and rendered porous and alcaline by Calcination. I have ſpoken before of theſe two Salts. The third Kind is the Salt of Coral, of which we are ſpeaking, and which I juſt now deſcribed: It is a Coral penetrated and diſſolved by an Acid, which is condenſed and incorporated with it. This laſt is the only one in Uſe, under the Name of Salt of Coral, there being no Mention, in the Practice of Medicine, of the other two Salts, which, however, may be ſaid to be true Salts of Coral. But, to return to our Operation.

In this Evaporation there only paſs off the aqueous Parts, and, the Acids ſtill adhering to the Body of the Coral, there is form'd a Kind of Salt, which in drying, provided it be not ſhaked, ſhoots into ſmall fine Figures, chanel'd, and interlaced one within another, and repreſenting, as it were, a ſmall Foreſt of Salt, agreeable enough to the Sight. You muſt not think, that theſe Figures owe their Riſe to any particular Manner of Operation; Art has no Share therein; they are form'd conſtantly and naturally in all Operations, whenever repeated, and as ſoon as the Evaporation is a third Part advanced. Part of this Salt, tho' the Fire be but ſmall, is ſublimated, and adheres to the Margin of the Veſſel, and even extends itſelf a little over it.

I ſhould hardly forbear perſuading myſelf, that this Diſpoſition of the Salt of Coral was a kind of Revivification, and that it repreſents, in ſome meaſure, the Branches of the Coral, whence that Salt proceeds, if I were not appriſed, that Salts, obtained by the ſame Proceſs, as thoſe of Pearl, Mother of Pearl, Crabs-eyes, Hartſhorn, and Ivory calcin'd, all aſſum'd the ſame Figure.

When the Solution of Coral is about two Thirds evaporated, it becomes a little turbid, and acquires a brown Colour, becauſe the Particles of the Coral, not being extended in ſo great a Quantity of Liquor as before, collect themſelves into Molecules of a larger Size, and more ſenſible to the Sight; but, towards the End of the Evaporation, the Liquor appears greeniſh; which Colour is not the Effect of Chance, for the ſame thing happens at all times, in the Preparation of this Kind of Salt of Coral. It ſeems to proceed from a Vitriol contained in the Coral; for I have, on another Occaſion, by means of a Knife touch'd with a Load-ſtone, prov'd that Coral contains a conſiderable Quantity of Particles of Iron: Now it is well known, that Iron is form'd of a vitriolic Subſtance, and may be almoſt wholly reduc'd into a Vitriol. The ſame greeniſh Colour of the Liquor continues in the Salt of Coral, till it begin to be condenſed by the Fire; and does not leave it, till it arrives at a good Degree of Dryneſs, when it turns white. It muſt be obſerved, that when we prepare in this manner the Salts of Crabs-eyes, Pearls, Mother of Pearl, and Hartſhorn, this greeniſh Colour does not appear: Hence all theſe Subſtances are void of Iron Particles, and the touch'd Knife diſcovers none in them either before or after Calcination.

If, in order to make that Kind of Salt of Coral before deſcribed, you had taken four Ounces of Coral, well pulverized and dry'd, then wholly diſſolv'd it in diſtil'd Vinegar by repeated Affuſions, and after due Filtration evaporated it, you would have obtained five Ounces and ſix Drams of Salt, of a good Whiteneſs and Dryneſs; there were then incorporated in the Pores of the Coral one Ounce ſix Drams of the Acid of the Vinegar; but the Points are well ſheath'd, for they are no longer ſenſible to the Taſte, and the Salt has only a ſtyptic and bitter Flavour.

Though the Preparation, juſt now deſcribed, be what we call the *Salt of Coral*, we muſt not ſuppoſe, that it is a true Salt of Coral; it is rather a Salt of Vinegar, ſince it is compos'd only of the Acids of Vinegar, detained and fixed in the Pores of the Coral, as in a terreſtrial Subſtance, which only ſerves to incorporate them. For a Proof of this Aſſertion, diſſolve this Salt of Coral in Water, and pour thereon Oil of Tartar *per Deliquium*, there will be formed a Magiſtery, that is, a Coral in Powder, the Acids of the Vinegar, which had brought it into the Form of a Salt, being broken by the Liquor of the Salt of Tartar.

If you put this Salt of Coral into a Retort, and urge it by a Sand-heat, you will obtain a Liquor ſimply ſtyptic, without any conſiderable Acidity; which ſhews, that the Acids are deſtroy'd, and never come out of the Alcali as they enter into it; there will remain a Powder of Coral of a grey Colour, which is of no Uſe. *Lemery, Cours de Chymie.*

CORALLODENDRON.

The Characters are,

It hath the Appearance of a Tree: The Leaves, for the moſt part, conſiſt of three Lobes: The Flowers are papilionaceous: The Standard, or Vexillum, is long, and ſhap'd like a Sword: The Wings on each Side, and the Keel, or Carina, are very ſhort: The Flowers are ſucceeded by knobbed bivalve Pods, which contain ſeveral Kidney-ſhap'd Seeds.

Boerhaave mentions two Species of this Plant.

1. Corallodendron; triphyllon; Americanum; ſpinoſum; flore ruberrimo. *T.* 661. *Arbor Coral.* H. A. 1. 211. *Coral, Arbor, ſiliquoſa.* J. B. 1. 426. *Siliqua, ſylveſtris, ſpinoſa, Arbor Inda.* C. B. P. 402. *Arbuſcula Corallii.* Ferrar. Flor. 381. *Coral, Arbor.* Cluſ. App. 1. H. Prægn. *The three-leav'd* AMERICAN CORAL-TREE, *with deep-red Flowers, commonly call'd in* America THE BEAN-TREE.

2. Corallodendron; triphyllon; Americanum; minus; ſpinis & ſeminibus nigricantibus. *T.* 661. Coral, Arbor, ſiliquoſa, minor, ſpinis & ſeminibus nigricantibus. *H. L.* 189. *H. Prægn. Leſſer three-leav'd* AMERICAN CORAL-TREE, *with blacker Seeds and Spines. Boerh. Ind. alt. Vol.* 2.

Boerhaave ſays, that the Virtues of theſe Trees are not yet diſcovered; but *Ray* has the following Particulars relative to the Medicinal Uſes of the firſt.

The Inhabitants of *Malabar* make Sheaths of the Wood for their Swords and Knives. They uſe the ſame, together with the Bark, in waſhing a ſort of Garments which they call *Saraſſas*, and make of the Flowers the Confection *Caryl.* The Leaves pulverized, and boiled with the mature Nux Indica, or Coco-nut, conſume Venereal Buboes, and eaſe Pains of the Bones; bruiſed, and applied to the Temples, they cure the Cephalæa, and Ulcers: Mixed with the Sugar called *Jagra*, they mitigate Pains in the Belly, eſpecially in Women; and the ſame Effect follows from the Uſe of the Bark, levigated with Vinegar, or ſwallowing the Kernel, ſtript of its red Pellicle: The Juice of the Leaves, taken with the Oil *Sergelim*, mitigates Venereal Pains; drank with an Infuſion of Rice, it ſtops Fluxes; made into a Cataplaſm, with the Leaves of *Beteleira*, it deſtroys Worms in old Ulcers; and, worked with Oil, it cures the Pſora and Itching. *Raii Hiſt. Plant.*

CORALLOIDES.

The Characters are,

It is a dry juiceleſs Subſtance, harder than that of the *Lichen*, brittle, ligneous. In Shape it pretty well reſembles Corals, being ramous, and furniſhed with Apices. On the Apices of the Tops of the Branches grow fungous Tubercles, opening when mature, caducous, and full of a very ſmall ſlender Seed.

Of this *Boerhaave* mentions nine Species.

1. Coralloïdes; cornua cervi referens, corniculis brevioribus. *T.* 565. *Muſcus Coralloïdes, ſaxatilis, cornua Cervi referens.* C. B. P. 361. *Lithobryon coralloïdes.* Col. 2. 83. *Muſco-fungus montanus, corniculatus, minor.* M. H. 3. 632. *Muſcus corniculatus.* J. B. 3. 767.

2. Coralloïdes; cornua cervi referens, corniculis longioribus. *T.* 565. *Muſco-fungus, montanus, corniculatis, major.* M. H. 3. 632. Sect. 15. T. 7. 1. *Muſcus ceranoïdes, major.* C. B. P. 361.

3. Coralloïdes; qui muſco-fungus; ceranoïdes; albus; tuberculatus; apicibus nigris. *M. H.* 3. 633. *Muſcus ceranoïdes, albus, fungoſus, apicibus nigris.* Plukn. Phyt. T. 205. F. 6.

4. Coral-

4. Coralloïdes; qui muſco-fungus; coralloides; montanus; ramoſiſſimus; fuſcus. *M. H.* 3. 633.

5. Coralloides; corniculis candidiſſimis. *T.* 565.

6. Coralloides; candida; ramoſiſſima; exigua.

7. Coralloides; candida; ramoſiſſima; mollis.

8. Coralloides; candida; ramoſiſſima; mollis; capillaris.

9. Coralloides; candida; ramoſiſſima; molliſſima; filis pilo tenuioribus. *Boerh. Ind. alt. Plant. Vol.* 1.

Coralloïdes; fruticoſa; planta; marina; rectior, is the *Titanokeratophyton; quod Lithophyton; marinum; albicans.*

Coralloïdes; granuloſa; alba, is the *Titanokeratophyton; quod Lithophyton; cortice verrucoſo, albo.*

Coralloïdes, minor, bulbifera, is the *Dentaria; heptaphyllos; baccifera.*

These are all call'd *Coralloïdes*, from their Reſemblance to *Coral.* Their Virtues in Medicine are not much celebrated; but they are, however, ſaid to be ſtrengthening and aſtringent.

CORAX, κόραξ. The Raven. See CORVUS.

CORBATUM, Copper. *Johnſon.*

CORCHORUS *Plinii*, C. B. *Corchorus ſive Melocia*, J. B. Park. *Melochia*, Alpin. *Corchorus*, Ger. *Olus Judaicum nonnullis.*

It has a ſmooth Stalk, a Cubit in Length; Leaves pretty like the *Cynocrambe*, or Mercury, but larger. The Pods hang each by a ſhort Pedicle, and are four or five Inches long, mark'd with yellowiſh Striæ, mucronated, quinquefid lengthwiſe, and containing a copious, Aſh-colour'd, angulous, ſmall Seed, of a viſcid Taſte. The Flowers, as *Alpinus* informs us, are ſmall, yellow, leſs than thoſe of the Leucoia, and conſiſting of five broad, ſhort, mucronated Petals. The Plant is a Native of *Egypt.*

There is no ſort of Food more common or grateful to the *Egyptians* than this Plant, for they boil it in Water, or in Broths; but many find themſelves ill, after eating it; for it is of little Nouriſhment, and generates a viſcid Juice, ſo that they who frequently eat it are ſubject to difficult Obſtructions. Of this we are aſſured by *Veſlingius*, who ſays, that a Diſh prepared of boil'd *Melochia* is fit only for vulgar and coarſe Palates, viſcid, and, beſides, inſipid, if it be not ſeaſon'd, as uſual, with Juice of Lemons. The Seeds are very much uſed by the *Egyptians*, for all the Purpoſes for which the Seed of Althæa is recommended; for its Mucilage has a greater Viſcidity than that of Althæa: Two Drams of it, taken, purge all Humours abundantly. The Decoction of the whole Plant, but eſpecially of the Leaves, is beneficial to the Breaſt, by moiſtening it; for which Reaſon, being taken with Sugar-candy, it is a preſent Remedy for rough and dry Coughs. *Raii Hiſt. Plant.*

CORDA, or CHORDA, from χορδή, a Chord of a muſical Inſtrument. A CHORDEE, which ſee.

CORDIALIA. See CARDIACA.

CORDINEMA. See SCORDINEMA.

CORDOLIUM. The Heart-burn.

CORDOSUM FILUM. A contorted Thread.

CORDYLA, κορδύλη. A Name for the *Thunnus*, Tunny Fiſh. See THUNNUS.

CORE, κόρη. The Pupil of the Eye.

COREMATA, κορήματα. Bruſhes or Beſoms. But, in *Paulus Ægineta*, κορήματα imports Medicines for cleaning and ſmoothing the Skin.

CORIANDRUM, Coriander.

The Characters are,

It hath a fibroſe perennial Root. The lower Leaves are broad; but the upper Leaves are deeply cut into fine Segments. The Petals of the Flower are unequal, and ſhaped like a Heart. The Fruit is compoſed of two hemiſpherical (and ſometimes ſpherical) Seeds.

1. Coriandrum; majus. *C. B. Pin.* 158. *Tourn. Inſt.* 316. *Elem. Bot.* 266. *Boerh. Ind. A.* 59. *Coriandrum*, Offic. J. B. 3. 89. Chab. 295. Raii Hiſt. 1. 470. Synop. 3. 221. Ger. 859. Emac. 1012. *Coriandrum vulgare*, Park. Theat. 918. CORIANDER.

The lower Leaves of *Coriander* are a little like Parſley-leaves, roundiſh, and crenated about the Edges. The Stalks are ſmooth, round, and ſtriated, beſet with longer, narrower, and finer Leaves than thoſe below, ariſing to be two or three Foot high, bearing, at the Top, Umbels of ſmall white five-leaved Flowers, which falling away, there follow, in their Places, round, perfectly ſpherical, ſtriated Seed. The whole Plant, whilſt green, has a nauſeous ungrateful Smell, like Bugs; but the Seed, when dry, is of a pleaſant agreeable Scent.

It is generally ſown for the Benefit of the Seed, tho' it is found in various Places, flowering in *June*; and the Seed, which is the only Part uſed, is ripe in *July* and *Auguſt.*

They are grateful and ſtrengthening to the Stomach, help Digeſtion, expel Wind, and are frequently uſed as Correctors in ſtrong purging Medicines. Some commend them as good againſt the King's-evil. *Miller's Bot. Off.*

2. Coriandrum; minus; teſticulatum. *C. B. P.* 158. *M. H.* 3. 269. SMALLER TESTICULATED CORIANDER.

3. Coriandrum; ſylveſtre; fœtidiſſimum. *C. B. P.* 158. *a. Boerh. Ind. alt. Plant. Vol.* 1.

Botaniſts and Phyſicians are not agreed as to the poiſonous Quality of *Coriander. Dioſcorides* writes, that, being drank, it cauſes Hoarſeneſs, with a Diſturbance of the Brain and Reaſon; like what is excited by exceſſive Drinking of Wine. According to *Simeon Sethi*, the Juice, drank, is a mortal Poiſon, and makes the whole Body ſmell of *Coriander.* Many alſo of the *Arabians* have aſcrib'd to *Coriander* a cold narcotic Quality, producing a Stupor, Diſturbance of the Senſes, and fatal Diſorders. With theſe agrees *Matthiolus*, who writes, that the Seed ought never to be uſed in Food or Medicine, unleſs after three Days Maceration in Vinegar. *Tragus* alſo charges the Apothecaries to ſell this Seed to no Perſon, no not with Sugar, before it is prepared in the aforeſaid Manner, if they intend not to give Poiſon inſtead of a Remedy.

On the contrary, *Lobel* and *Alpinus* aſſure us, that the *Egyptians* very commonly uſe the green Herb in Food. However, *J. Bauhine* is of Opinion, that we ought to be cautious in the Uſe of this Plant, eſpecially if unprepared; becauſe of the malignant Quality which ſome, doubtleſs from Experience, have aſcribed to it. The extraordinary rank and noiſom Smell which it yields, upon rubbing it with the Fingers, argues a Malignity; and tho' the *Spaniards*, as we are inform'd by *Amatus*, very frequently uſe it, and look upon it as a Cordial, yet Experience has ſhewn, that many *Spaniſh* Monks have loſt their Reaſon by the Uſe of this Herb, for the Cure of whom ſo many Hoſpitals are erected; and this might alſo be the Caſe, ſays *C. Hoffman*, in *Egypt*, tho' *Alpinus* did not obſerve it.

The Seeds, incruſted in Sugar, or Coriander-comfits, are very much uſed by us, in *Germany*, ſays the fore-mention'd *Hoffman*, to help Concoction; for they have ſomething of Aſtringency, which is alſo the Reaſon why they are of Service in Spitting of Blood, and in Fluxes of the Belly; but, in theſe Caſes, we commonly give it torrefy'd; as we do alſo with an Intent to deſtroy Worms. But I would adviſe thoſe who are ſubject to be too venturous, not to uſe it very often, nor unprepared; for, tho' poſſibly the Seeds may have very little excrementitious Humidity, they are not wholly deſtitute of it. *C. Hoffman.*

The Seeds bruiſed, and ſprinkled upon recent raw Fleſh, prevent it from putrefying ſo ſoon as it would otherwiſe do, in the Summer-ſeaſon, if we may believe *Matthiolus.*

CORIANON. The ſame as CORIANDRUM.

CORIARIA, *Myrtle-leaved Sumach*, vulgo.

The Characters are,

It hath a Flower compoſed of ten Stamina, (or Threads) each having two Apices; theſe ariſe from the Bottom of the Calyx, which is divided into five Parts to the Baſe. When the Flower is paſs'd, the Pointal (which is contain'd in another Cup, divided alſo into five Parts to the Baſe) becomes (jointly with the Cup) a Fruit, containing five Kidney-ſhaped Seeds.

We have but one Species of this Plant, which is,

Coriaria vulgaris. Mem. Acad. Scien. Ann. 1711. MYRTLE-LEAVED SUMACH, *vulgo.*

This Plant is uſed by the Tanners, for dreſſing their Leather, in the South of *France*, where it grows wild, in great Plenty. *Miller's Dictionary, Vol.* 2.

CORINDUM.

The Characters are,
